If 24.7 C.c. of Solution of Arsenous Acid be boiled for a few minutes with 2 Gm. of sodium bicarbonate, the liquid cooled, diluted with water to 100 C.c., and mixed with a little starch T.S., it should require from 49.4 to 50 C.c. of decinormal iodine V.S. to produce a blue tint (corresponding to 1 per cent. of arsenous acid of the required purity).

Uses.—This solution is used as an alternative, in doses of two to five minims (0.12 to 0.3 C.c.).

LIQUOR POTASSII ARSENITIS. U.S. Solution of Potassium Arsenite.**[FOWLER'S SOLUTION.]**

	Metric.	Old form.
Arsenous Acid, in fine powder	10 Gm.	74 grains.
Potassium Bicarbonate	20 Gm.	148 grains.
Compound Tincture of Lavender	30 C.c.	4 fl. dr.
Distilled Water, a sufficient quantity,		
To make	1000 C.c.	1 pint.

Boil the Arsenous Acid and Potassium Bicarbonate with 100 C.c. [old form 1½ fl. oz.] of Distilled Water, until solution has been effected. Then add enough Distilled Water to make the solution, when cold, measure 970 C.c. [old form 15½ fl. oz.], and, lastly, add the Compound Tincture of Lavender. Filter through paper.

When arsenous oxide is boiled with acid potassium carbonate in concentrated solution, carbon dioxide is evolved, and potassium arsenite is produced; but, owing to the fact that the salts are soluble in the quantity of water directed in the formula, a solution can be effected without involving any chemical change. The proportionate quantity of potassium bicarbonate was doubled in the U.S. P. 1890. The corresponding British solution (*Liquor Arsenicalis*) is made from dilute solutions, and its title does not indicate any chemical action. The official quantitative test is as follows:

If 24.7 C.c. of the Solution be boiled with 2 Gm. of sodium bi-

carbonate, the liquid, when cold, diluted with 100 C.c. of water, and some gelatinized starch added, should require from 49.4 to 50 C.c. of decinormal iodine V.S. to produce a blue tint (corresponding to 1 per cent. of arsenous acid of the required purity).

Uses.—Solution of potassium arsenite is largely used as an alterative, in doses of three to five minims (0.18 to 0.3 C.c.).

SODII ARSENAS. U. S. Sodium Arsenate.

For an account of the preparation and uses of this salt, see page 557.

LIQUOR SODII ARSENATIS. U. S. Solution of Sodium Arsenate.

	Metric.	Old form.
Sodium Arsenate, deprived of its water of crystallization by a heat not exceeding 149° C. (300.2° F.) . . .	1 Gm.	87 grains.
Distilled Water, a sufficient quantity,		
To make	100 C.c.	8 fl. oz.

Dissolve the Sodium Arsenate in a sufficient quantity of Distilled Water to make 100 C.c. [old form 8 fl. oz.].

ARSENI IODIDUM. U. S. Arsenic Iodide.

Preparation.—In the former official process this iodide was made by a direct combination of the elements.

Take of Arsenic, 60 grains; Iodine, 300 grains. Rub the Arsenic in a mortar until reduced to a fine powder; then add the Iodine, and rub them together until they are thoroughly mixed. Put the mixture into a small flask or a test-tube, loosely stopped, and heat it very gently until liquefaction occurs. Then incline the vessel in different directions, in order that any portion of the iodine, which may have condensed on its surface, may be returned into the melted mass. Lastly, pour the melted iodide on a porcelain slab, and, when it is cold, break it into pieces, and keep it in a well-stoppered bottle.

By this process it is difficult to secure entire combination, and it has been made by dissolving the iodine in carbon disulphide, and gradually adding the finely powdered metallic arsenic until the purple color, showing the presence of free iodine, has disappeared; the solution is then evaporated and crystallized.

Arseni Iodidum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Glossy, orange-red, crystalline masses, or shining, orange-red, crystalline scales, gradually losing iodine when exposed to the air. By heat the salt is completely volatilized.	Iodine-like odor; iodine-like taste; neutral reaction.	At 15° C. (59° F.), 7 parts. Boiling, Gradually decomposed.	Cold, 30 parts. Boiling, Gradually decomposed.	Soluble in ether and carbon disulphide.

TESTS FOR IDENTITY.

The aqueous solution has a yellow color, and, on standing, gradually decomposes into arsenous and hydriodic acids. On adding hydrogen sulphide T.S. to the solution, acidulated with hydrochloric acid, a lemon-yellow precipitate is deposited. If the salt be heated with diluted nitric acid, vapor of iodine will be given off.

Uses.—The principal use of this compound is in making solution of arsenic and mercuric iodide. The dose is one-sixteenth of a grain (0.004 Gm.) as an alterative.

LIQUOR ARSENI ET HYDRARGYRI IODIDI. U.S. Solution of Arsenic and Mercuric Iodide.

[DONOVAN'S SOLUTION.]

	Metric.	Old form.
Arsenic Iodide	10 Gm.	78 grains.
Red Mercuric Iodide	10 Gm.	78 grains.
Distilled Water, a sufficient quantity,		
To make	1000 C.c.	1 pint.

Powder the Arsenic Iodide, and mix it with the Red Mercuric Iodide by trituration. Add 150 C.c. [old form 2½ fl. oz.] of Distilled Water, and continue the trituration until solution is effected. Filter the solution, and pass enough Distilled Water through the filter to make the product measure 1000 C.c. [old form 1 pint]. Mix thoroughly.

This solution, in which no chemical change occurs, should be of a light straw color; when darker than this, free iodine is probably present, and if a globule of mercury and a few grains of metallic arsenic are dropped into the bottle containing the solution, and the whole well agitated and filtered, the proper color may be restored.

Uses.—Solution of arsenic and mercuric iodide is used as an alterative. The dose is from three to five minims (0.18 to 0.3 C.c.), largely diluted.

Bismuth. Bi; 208.9.

Bismuth is found in the metallic state, and occasionally as a sulphide. It is a crystalline, brittle, pulverizable, brilliant metal, having a silver color with a reddish tint. Its sp. gr. is 9.8. It closely resembles metallic antimony in appearance.

Tests for Salts of Bismuth.

1. Hydrogen sulphide or ammonium sulphide produces in solutions of bismuth salts a black precipitate of sulphide, insoluble in excess.
2. When acid solutions of bismuth salts are poured into water, white precipitates (subsals) are produced.

Official Preparations of Bismuth.

Official Name.	Preparation.
Bismuthi Citras	By boiling bismuth subnitrate with citric acid and water, and adding distilled water to the clear solution.
Bismuthi et Ammonii Citras .	By dissolving bismuth citrate in ammonia water, evaporating the solution, and scaling.
Bismuthi Subcarbonas	By dissolving bismuth in nitric acid, purifying, and precipitating by adding solution of sodium carbonate.
Bismuthi Subnitras	By dissolving bismuth in nitric acid, purifying, and adding the solution in nitric acid to water.

Unofficial Preparations of Bismuth.

Bismuthi Bromidum, BiBr ₃ . Bismuth Bromide.	By treating bismuth with excess of bromine and collecting the steel-gray mass.
Bismuthi Chromas, 3Bi ₂ O ₃ .2CrO ₃ . Bismuth Chromate.	By adding a solution of bismuth nitrate to a moderately concentrated solution of acid potassium chromate in slight excess, and collecting the precipitate.
Bismuthi Lactas. Bismuth Lactate.	By boiling 10 p. bismuth subnitrate with excess of soda, washing the oxide well with water, then mixing with 9 p. lactic acid, digesting the mixture, and drying in a water-bath.
Bismuthi Oxalas, C ₆ Bi ₂ O ₁₃ .15H ₂ O. Bismuth Oxalate.	By mixing bismuth nitrate with a solution of oxalic acid, and collecting the precipitate.
Bismuthi Oxidum, Bi ₂ O ₃ . Bismuth Oxide.	By mixing 4 oz. bismuth subnitrate and 1 pint solution of soda, then boiling for 5 minutes, decanting the liquid, and washing the precipitate with distilled water.
Bismuthi Oxychloridum, BiOCl. Bismuth Oxychloride.	By pouring slowly a solution of bismuth in nitric acid into a solution of sodium chloride, and collecting the precipitate.
Bismuthi Phosphas, BiPO ₄ . Bismuth Phosphate.	By adding bismuth nitrate to a solution of phosphoric acid containing nitric acid, and collecting the precipitate.
Bismuthi Salicylas. Bismuth Salicylate.	By dissolving bismuth nitrate in glycerin and adding a concentrated solution of sodium salicylate, then collecting the precipitate.
Bismuthi Tannas. Bismuth Tannate.	By dissolving 22 p. bismuth nitrate in the least amount of nitric acid, previously diluted with half its weight of water, pouring the solution into an excess of solution of soda, washing the precipitate with water, then triturating the precipitate with 10 p. tannin diluted with water, straining and drying.
Bismuthi Tartaras. Bismuth Tartrate.	By adding a hot, concentrated solution of 4 p. tartaric acid to a hot, moderately strong solution of 5 p. bismuth oxide in nitric acid, then washing the precipitate with an aqueous solution of tartaric acid.
Bismuthi Valerianas. Bismuth Valerianate.	By dissolving bismuth nitrate in the smallest amount of nitric acid, previously diluted with half its weight of water, then adding a concentrated solution of sodium valerianate, washing the precipitate with water mixed with valerianic acid, and, lastly, drying the precipitate.

BISMUTHI CITRAS. U. S. Bismuth Citrate.

	Metric.	Old form.
Bismuth Subnitrate	100 Gm.	8 oz. av. 148 gr.
Citric Acid	70 Gm.	2 oz. av. 148 gr.
Distilled Water, a sufficient quantity.		

Boil the Bismuth Subnitrate and the Citric Acid with 400 C.c. [old form 13 fl. oz.] of Distilled Water for about fifteen minutes, or until a drop of the mixture yields a clear solution with ammonia water. Then add 5000 C.c. [old form 10 pints] of Distilled Water, allow the

suspended matter to deposit, wash the precipitate, first by decantation, and afterwards on a strainer, with Distilled Water, until the washings are tasteless, and dry the residue at a gentle heat.

In this process the bismuth salt is decomposed by the boiling solution of citric acid.

Bismuthi Citras. U. S.	ODOR AND TASTE.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A white, amorphous or micro-crystalline powder, permanent in the air.	Odorless; tasteless.	Insoluble.	Insoluble.	Soluble in ammonia water, and in solutions of the citrates of the alkalies.
TESTS FOR IDENTITY.	IMPURITY.			
When strongly heated, the salt chars, and, on ignition, leaves a more or less blackened residue with a yellow surface, which is dissolved by warm nitric acid. This solution, on being dropped into water, occasions a white turbidity. The ammoniacal solution, when treated with hydrogen sulphide in excess, yields a black precipitate. The filtrate, deprived, by heat, of the excess of hydrogen sulphide and cooled, when boiled with lime water, produces a white precipitate.	<div style="display: flex; align-items: center;"> <div style="margin-right: 10px;">Nitrate.</div> <div style="font-size: 3em; margin-right: 10px;">{</div> <div>When a portion of the filtrate obtained by treating the ammoniacal solution with hydrogen sulphide in excess is deprived of the excess of hydrogen sulphide by heating, and is mixed with an equal volume of concentrated sulphuric acid and again cooled, no brown or brownish-black color should appear around a crystal of ferrous sulphate dropped into the liquid.</div> </div>			

Uses.—This salt may be used for the same purposes as the subnitrate. It was made official because it is used in making the soluble double salt of bismuth and ammonium citrate.

BISMUTHI ET AMMONII CITRAS. U. S. Bismuth and Ammonium Citrate.

	Metric.	Old form.
Bismuth Citrate	100 Gm.	1 oz. av.
Ammonia Water,		
Distilled Water, each, a sufficient quantity.		

Mix the Bismuth Citrate with 200 C.c. [old form 2 fl. oz.] of Distilled Water to a smooth paste, heat the mixture on a water-bath, and gradually add Ammonia Water, until the salt is dissolved, and the liquid is neutral or has only a faintly alkaline reaction. Then filter the solution, evaporate it on a water-bath to a syrupy consistence, and spread it upon plates of glass, so that, when dry, the salt may be obtained in scales.

Keep the product in small, well-stoppered bottles, protected from light.

This is the only soluble salt of bismuth official. If its aqueous solution is not perfectly transparent, it is probably due to the loss of

ammonia on keeping the salt: a drop or two of ammonia water added to the cloudy solution will generally make it transparent.

Liquor Bismuthi.—An aqueous solution of bismuth citrate has been largely used in England. It may be made by dissolving 260 grains of bismuth and ammonium citrate in 14 fl. oz. of distilled water, neutralizing the solution with ammonia water, and adding 2 fl. oz. of alcohol.

Bismuthi et Ammonii Citras. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Small, shining, pearly or translucent scales, becoming opaque on exposure to air. When strongly heated, the salt melts, and finally leaves a more or less blackened residue with a yellow surface, which is dissolved by warm nitric acid. This solution, on being dropped into water, occasions a white turbidity.	Odorless; slightly acidulous and metallic taste; neutral or faintly alkaline reaction.	Very soluble.	Sparingly soluble.

TESTS FOR IDENTITY.	IMPURITY.	TEST FOR IMPURITY.
The aqueous solution of the salt, when boiled with potassium or sodium hydrate, evolves vapor of ammonia, and, when treated with hydrogen sulphide, yields a black precipitate. If the filtrate from the latter be deprived, by heat, of the excess of hydrogen sulphide and cooled, a portion of it, boiled with lime water, produces a white precipitate.	Nitrate.	When a portion of the cooled filtrate, obtained by treating an aqueous solution of the salt with hydrogen sulphide, is deprived of the excess of acid by heating, and is mixed with an equal volume of concentrated sulphuric acid and again cooled, there should be produced no brown or brownish-black color around a crystal of ferrous sulphate when dropped into the liquid.

Uses.—This salt is astringent, and is generally prescribed in solution. The dose is from one to three grains (0.06 to 0.18 Gm.).

BISMUTHI SUBCARBONAS. U.S. Bismuth Subcarbonate.

Preparation.—Bismuth subcarbonate may be made by the former official process, as follows:

Take of Bismuth, in pieces, 2 oz. troy; Nitric Acid $8\frac{1}{2}$ oz. troy; Water of Ammonia 5 fl. oz.; Carbonate of Sodium 10 oz. troy; Distilled Water a sufficient quantity. Mix $4\frac{1}{2}$ oz. troy of the Nitric Acid with 4 fl. oz. of Distilled Water in a capacious glass vessel, and, having added the Bismuth, set the whole aside for twenty-four hours. Dilute the resulting solution with 10 fl. oz. of Distilled Water, stir it thoroughly, and, after twenty-four hours, filter through paper. To the filtered liquid, previously diluted with 4 pints of Distilled Water, slowly add the Water of Ammonia, constantly stirring. Transfer the whole to a strainer, and, after the precipitate has been drained, wash it with 2 pints of Distilled Water, and drain it again. Then place the precipitate in a proper vessel, add the remainder of the Nitric Acid, and afterwards 4 fl. oz. of Distilled Water, and set the solution aside. At the end of twenty-four hours, filter through paper. Dissolve the Carbonate of Sodium in 12 fl. oz. of Distilled Water, with

the aid of heat, and filter the solution through paper. To this, when cold, slowly add the solution of nitrate of bismuth, with constant stirring. Transfer the whole to a strainer, and, after the precipitate has been drained, wash it with Distilled Water until the washings pass tasteless. Lastly, press, dry it on bibulous paper with a gentle heat, and rub it into powder.

As metallic bismuth generally contains arsenic, it is very important to provide that this should be left behind, in the processes for making its medicinal preparations. It is on this account that the above formula is so elaborate. The bismuth is first dissolved in nitric acid, a portion of which oxidizes the metal, with the evolution of nitrous vapors, while another portion combines with the oxide produced to form bismuth nitrate. At the same time the arsenic is also oxidized at the expense of the nitric acid, and unites with a portion of the oxidized metal so as to produce bismuth arsenate. Both of these salts, therefore, are contained in the solution, which is very concentrated. Both have the property, when their solution is diluted with water, of separating into two salts, one an insoluble subsalt which is deposited, and the other a soluble acid salt which is held in solution. But the arsenate is more disposed to the change than the nitrate, and requires for the purpose a smaller amount of water of dilution. The subarsenate is slowly deposited in twenty-four hours, and is then separated by filtration. The addition of a large quantity of distilled water precipitates the bismuth subnitrate, the ammonia being added to separate it more thoroughly by combining with the nitric acid. The precipitate, thus freed from arsenic, is now redissolved in nitric acid partially diluted and added to solution of sodium carbonate; by double decomposition, bismuth subcarbonate and sodium nitrate are thus produced.

Bismuthi Subcarbonas. U. S.	ODOR AND TASTE.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A white or pale yellowish-white powder, of somewhat varying chemical composition, permanent in the air. When heated to redness, the salt loses water and carbon dioxide, and leaves from 87 to 91 per cent. of a yellow residue which is soluble in nitric or hydrochloric acid and blackened by hydrogen sulphide.	Odorless; tasteless.	Insoluble.	Insoluble.	Completely soluble in nitric or hydrochloric acid, with copious effervescence.

IMPURITIES.

TESTS FOR IMPURITIES.

If 3 Gm. of the salt be dissolved in just a sufficient quantity (about 4 C.c.) of warm nitric acid, and the solution poured into 100 C.c. of water, a white precipitate is produced. After filtering and evaporating the filtrate on a water-bath to 30 C.c., again filtering, and dividing this filtrate into portions of 5 C.c., they should respond to the following tests:

Lead.

{ On mixing one portion with an equal volume of diluted sulphuric acid, it should not become cloudy.

Copper.

{ If another portion be precipitated with a slight excess of ammonia water, the supernatant liquid should not exhibit a bluish tint.

TESTS.—Continued.

IMPURITIES.	TESTS FOR IMPURITIES.
Chloride.	Other portions should not be affected by silver nitrate T.S.,
Sulphate.	Or by barium nitrate T.S.,
Silver.	{ Nor yield, with hydrochloric acid, a precipitate which is insoluble in a slight excess of the latter.
Alkalies and Alkaline Earths.	{ If 1 Gm. of the salt be boiled with 10 C.c. of a mixture of equal parts of acetic acid and water, the solution cooled and filtered, and the filtrate freed from bismuth by hydrogen sulphide, and again filtered, the last filtrate should leave no residue on evaporation.
Ammonia.	{ On boiling 1 Gm. of the salt with 10 C.c. of potassium or sodium hydrate T.S., it should not evolve the odor of ammonia.
Nitrate.	{ If 1 Gm. of the salt be added to 10 C.c. of a mixture of equal parts of concentrated sulphuric acid and water tinged slightly blue with indigo T.S., on heating the bluish tint should not be discharged.
Arsenic.	{ If 1 Gm. of the salt be ignited in a porcelain crucible, and the residue, when cold, dissolved in 5 C.c. of stannous chloride T.S. (see List of Reagents, Bettendorff's Test for Arsenic), no dark coloration or precipitate should be produced within fifteen minutes.

Uses.—This bismuth compound is astringent and tonic. It is employed for the same purposes as the subnitrate: the latter is much more frequently used. The dose is five to ten grains (0.3 to 0.6 Gm.).

BISMUTHI SUBNITRAS. U.S. Bismuth Subnitrate.

Preparation.—This important salt may be made by the former official process, as follows:

Take of Bismuth, in pieces, 2 oz. troy; Nitric Acid $8\frac{1}{2}$ oz. troy; Carbonate of Sodium 10 oz. troy; Water of Ammonia 5 fl. oz.; Distilled Water a sufficient quantity. Mix $4\frac{1}{2}$ oz. troy of the Nitric Acid with 4 fl. oz. of Distilled Water, in a capacious glass vessel, and, having added the Bismuth, set the whole aside for twenty-four hours. Dilute the resulting solution with 10 fl. oz. of Distilled Water, stir it thoroughly, and, after twenty-four hours, filter through paper. Dissolve the Carbonate of Sodium in 20 fl. oz. of Distilled Water with the aid of heat, and filter the solution through paper. To this, when cold, slowly add the solution of nitrate of bismuth, with constant stirring. Transfer the whole to a strainer, and, after the precipitate has been drained, wash it with Distilled Water until the washings pass tasteless, and drain again as completely as possible. Then place the moist precipitate in a capacious vessel, gradually add the remainder of the Nitric Acid, and afterwards 4 fl. oz. of Distilled Water, and set the solution aside. At the end of twenty-four hours, filter through paper, and to the filtered liquid, previously diluted with 4 pints of Distilled Water, slowly add the Water of Ammonia, with constant stirring. Transfer the whole to a strainer, and, after the precipitate has been drained, wash it with 2 pints of Distilled Water, drain it again, and press out as much of the liquid as possible. Lastly, dry it upon bibulous paper with a gentle heat, and rub it into powder.

The separation of the arsenic is accomplished by first preparing the carbonate, by adding the acid solution of bismuth to a solution of sodium carbonate in excess, whereby most of the arsenic is retained in

the solution, probably as sodium arsenate, while the insoluble carbonate is precipitated. This is dissolved, with the aid of heat, in nitric acid, so as to make a very concentrated solution of the nitrate, to which, when cold, just so much water is added as to begin to produce a permanent turbidness. The object of this is to allow any arsenic that may be still present to be deposited, which happens for reasons stated in explaining the process for procuring the subcarbonate (see page 750). The deposited matter having been precipitated, only the pure nitrate remains in solution, which is made to yield the subnitrate by large dilution with water, and still more completely by the addition of ammonia.

then

Bismuthi Subnitras. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A heavy white powder, of somewhat varying chemical composition, permanent in the air.	Odorless; almost tasteless; slightly acid reaction.	Almost insoluble.	Insoluble.	Soluble in nitric or hydrochloric acid.

TEST FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
When heated to 120° C. (248° F.), the salt gives off water (between 3 and 5 per cent. of its weight), and when subsequently heated to redness it evolves nitrous vapors, leaving from 79 to 82 per cent. of its weight of a yellow residue which is soluble in nitric or in hydrochloric acid, and blackened by hydrogen sulphide.	Carbonate.	{ On dissolving 3 Gm. of the salt in 3 C.c. of warm nitric acid, no effervescence should occur. If the above solution be poured into 100 C.c. of water, a white precipitate is produced. If the filtrate, separated from the above precipitate, be evaporated on a water-bath to 30 C.c., the liquid again filtered, and the new filtrate divided into portions of 5 C.c. each, these should respond to the tests for purity described under <i>Bismuthi Subcarbonas</i> .
	Water.	
	Insoluble Foreign Salts.	{ No residue should be left by treating 1 part of the salt with 5 parts of nitric acid (sp. gr. 1.200). When further tested as described under <i>Bismuthi Subcarbonas</i> , the salt should be free from alkalies and alkaline earths, And should give no reaction for ammonia.
	Alkalies and Alkaline Earths.	
	Ammonia.	
	Arsenic.	{ If 1 Gm. of the salt be heated, in a porcelain crucible, until nitrous vapors cease to be evolved, and the residue, when cold, dissolved in 5 C.c. of stannous chloride T.S. (see List of Reagents, Bettendorff's Test for Arsenic), no dark coloration or precipitate should be produced within fifteen minutes.

Uses.—Bismuth subnitrate is largely used in intestinal disorders: it is astringent, tonic, and sedative. The dose is from three to ten grains (0.19 to 0.6 Gm.).

QUESTIONS ON CHAPTER XLVII.

ANTIMONY, ARSENIC, AND BISMUTH.

Antimony—Give Latin name, symbol, and atomic weight.

What is its melting-point? How is it found?

What combinations does it form with oxygen?

From which of these oxides are antimonites formed?

From which of these oxides are antimonates formed?

What are the tests for salts of antimony?

Antimony and potassium tartrate—Give Latin name, formula in symbols, and molecular weight.

Describe the process (formerly official) by which this may be made.

Give rationale of the process. Describe odor, taste, chemical reaction, and solubility. What are the tests for identity?

How may the following impurities be detected?—viz.: Sulphate; iron and other metals; calcium; chloride; more than traces of arsenic.

In case of poisoning by an overdose, what is the proper antidote?

Antimony oxide—Give formula in symbols and molecular weight.

Give rationale of the process. Describe odor, taste, chemical reaction, and solubility. What are the tests for identity?

How may the following impurities be detected?—viz.: Chloride; sulphate; iron and other metals.

In what official preparations is it used?

Antimony sulphide—Give Latin name, formula in symbols, and molecular weight.

What was its name in the U. S. Pharm. 1870?

How is it prepared? What is crude antimony? For what is it used?

Purified antimony sulphide—Give Latin name, formula in symbols, and molecular weight.

How is it prepared? What is the object of this process?

Give rationale of the process. Describe odor, taste, chemical reaction, and solubility. What are the tests for identity?

How may the following impurities be detected?—viz.: Other metallic sulphides; more than traces of arsenic.

For what is it used?

Sulphurated antimony—What is its composition?

How is it prepared? Give rationale of the process.

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may impurity of sulphate be detected?

What is the dose?

Compound pills of antimony—Give the Latin name.

What is the composition of this pill? For what is it used?

Antimonial powder—Give the Latin name.

What is its composition? What is the dose?

Wine of antimony—Give the Latin name.

How is it made? What is the dose?

Arsenic—Give the Latin name, symbol, and atomic weight.

Where is it found, and how is it obtained?

What combinations does it form with oxygen?

What combinations does it form with sulphur?

What are the tests for arsenic and its salts?

Arsenous acid—Give Latin name, formula in symbols, and molecular weight.

How is it made?

Chemically, is it regarded as an acid? What is true arsenous acid?

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

What is the dose?

What are the official antidotes to arsenical poisoning?

Solution of arsenous acid—Give Latin name.

What was the name of this solution in the U. S. Pharm. 1870?

Why was the name changed? How is it made?

How can its quality be tested? What is the dose?

Solution of potassium arsenite—What is the Latin name?

How is it made? Give rationale of the process.

Wherein does it differ from the British "liquor arsenicalis"?

How may its quality be tested? What is the dose?

Sodium arsenate—Give Latin name, formula in symbols, and molecular weight.

Arsenic iodide—Give Latin name, formula in symbols, and molecular weight.

What objection is there to this process? How otherwise may it be made?

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

What is the dose?

Solution of arsenic and mercuric iodide—Give the Latin name. How is it made?

How may the color of the solution, which has become dark upon standing, be restored? What is the dose?

Bismuth—Give the symbol and atomic weight.

Give description and specific gravity. Describe odor, taste, and chemical reaction.

How is it found? What are tests for salts of bismuth?

Bismuth citrate—What is its formula in symbols? Give its molecular weight.

How is it made? Give rationale of the process.

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may impurity of nitrate be detected? For what is it used?

Bismuth and ammonium citrate—How is it made?

Why is the solution of this salt sometimes not perfectly transparent, and how may it be made so?

What is liquor bismuthi, and how is it made?

Bismuth and ammonium citrate—Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may impurity of nitrate be detected? What is the dose?

Bismuth subcarbonate—Give formula in symbols and molecular weight.

Why is such an elaborate process adopted for obtaining this salt?

Give rationale of the process.

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Insoluble foreign substances; lead; copper; chloride; sulphate; silver; alkalies and alkaline earths; traces of ammonium; traces of antimony, arsenic, and tin; more than traces of arsenic. What is the dose?

Bismuth subnitrate—How is the separation of arsenic accomplished? Give rationale of the process.

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Carbonate; insoluble foreign salts. What is the dose?

CHAPTER XLVIII.

GOLD AND PLATINUM.

Au; 196.7. Pt; 194.8.

SALTS of these precious metals are official,—the gold salt as a substance in the *materia medica*, the platinum salt as a test-liquid: both are chlorides. Gold and platinum are both found native in the free state. Latin names for these metals are Aurum and Platinum.

Tests for Gold Salts.

1. If hydrogen sulphide be added to the solution of a gold salt, a dark brown, almost black, precipitate (auric sulphide) will be produced, soluble in ammonium sulphide.

2. If ferrous sulphate be added to a solution of a gold salt, metallic gold in the form of a fine precipitate will be produced: this may be fused into a button of gold by the use of the blow-pipe.

3. Stannous chloride if added to dilute solutions of gold salts produces a purple precipitate (purple of Cassius).

Tests for Platinum Salts.

1. If hydrogen sulphide or ammonium sulphide be added to a solution of platinic chloride, a brown precipitate of platinic sulphide will be produced, soluble in excess of ammonium sulphide.

2. If a solution of potassium chloride be added to a solution of platinic chloride acidulated with hydrochloric acid, a yellow precipitate (double chloride) will be formed.

Official Salts of Gold and Platinum.

Official Name.	Preparation.
Auri et Sodii Chloridum . .	Equal parts of dry auric chloride and sodium chloride.
Platini Chloridum	Test-solution of platinic chloride, 1 part of platinic chloride in 20 parts of distilled water.

Unofficial Preparations of Gold.

Auri Bromidum, AuBr ₃ . Gold Bromide.	By dissolving gold in a mixture of nitric and hydrobromic acids, concentrating, then crystallizing.
Auri Chloridum, AuCl ₃ . Gold Chloride.	By dissolving gold in nitrohydrochloric acid, concentrating carefully, then crystallizing.
Auri Iodidum, AuI ₃ . Gold Iodide.	By gradually adding a neutral solution of auric chloride to a solution of potassium iodide, then collecting and drying the precipitate.

AURI ET SODII CHLORIDUM. U.S. Gold and Sodium Chloride.

A mixture of equal parts, by weight, of dry Gold Chloride [$\text{AuCl}_3 = 802.81$] and Sodium Chloride [$\text{NaCl} = 58.87$].

Preparation.—It may be made by dissolving gold in nitrohydrochloric acid, evaporating the solution to dryness, weighing, and dissolving the dry mass in eight times its weight of distilled water. To this solution a weight of pure decrepitated common salt equalling that of the dry gold chloride is added, previously dissolved in four parts of water. The mixed solution is then evaporated to dryness, being constantly stirred with a glass rod.

Auri et Sodii Chloridum. U.S.;	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
An orange-yellow powder, slightly deliquescent in damp air. When exposed to a red heat, it is decomposed and metallic gold is separated. A fragment of the compound imparts a persistent yellow color to a non-luminous flame. Its aqueous solution yields with silver nitrate a white precipitate insoluble in nitric acid.	Odorless; saline, metallic taste; slightly acid reaction.	Very soluble.	Cold, At least one-half should be soluble.

QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
If 0.5 Gm. of Gold and Sodium Chloride be dissolved in 50 C.c. of water, in a porcelain capsule, the solution acidulated with 5 C.c. of dilute sulphuric acid, and, after the addition of 1 Gm. of pure oxalic acid, heated for about 2 hours, on a water-bath, a precipitate of metallic gold will be obtained, which, when washed, dried, and ignited, should weigh not less than 0.15 Gm. (corresponding to at least 30 per cent. of metallic gold).	Free Acid.	{ On bringing a glass rod dipped into ammonia water close to a portion of the compound, no white fumes should make their appearance. The filtrate from the precipitated gold should not be affected by hydrogen sulphide T.S., nor, after being supersaturated with ammonia water, by ammonium sulphide T.S.
	Metallic Impurities.	

Uses.—This salt is used internally as an alterative. The dose is from one-twelfth to one-fourth of a grain (0.006 to 0.016 Gm.).

QUESTIONS ON CHAPTER XLVIII.

GOLD AND PLATINUM.

Gold—What is the Latin name? Give the symbol and atomic weight.

In what form is it official? How is it found?

What are the tests for gold salts?

Platinum—Give the symbol and atomic weight.

What salt of it is official, and for what is it used? How is it found?

What are the tests for platinum salts?

Gold and sodium chloride—What is the composition of this salt?

Give the formulas and equivalents of each of the ingredients.

How is it made?

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may its quality be tested? How may free acid be detected?

What is the dose?

OFFICIAL NAME.	Chemical Composition.	Uses and Dose.	Official Preparations in heavy type; those in which the substance is used, in Roman type.
Acidum Hydrocyanicum Dilutum.	HCN.	Sedative, anodyne; m. ij (0.1 C.c.).	Syrupus Hypophosphitum.
Acidum Hypophosphorosum Dilutum.	HPH ₂ O ₃ .	Tonic, refrigerant; m. x-xxx (0.6-1.8 C.c.).	
Acidum Lacticum. Acidum Nitricum.	HC ₃ H ₅ O ₃ . HNO ₃ .	Solvent. Tonic, antiseptic; m. v (0.3 C.c.).	
Acidum Nitricum Dilutum.		Tonic, antiseptic; m. xx (1.2 C.c.).	Syrup of Calcium Lactophosphate. Diluted Nitric Acid, Nitrohydrochloric Acid, Diluted Nitrohydrochloric Acid, Ferric Chloride, Ointment of Mercuric Nitrate, Pyroxylin, Solution of Ferric Chloride, Solution of Ferric Nitrate, Solution of Ferric Subsulphate, Solution of Ferric Sulphate, Solution of Mercuric Nitrate, Solution of Zinc Chloride, Yellow Mercuric Iodide, Yellow Mercuric Subsulphate.
Acidum Nitrohydrochloricum.		Cholagogue; m. iij (0.19 C.c.).	
Acidum Nitrohydrochloricum Dilutum.		Cholagogue; m. x (0.6 C.c.).	
Acidum Oleicum.	HC ₁₈ H ₃₅ O ₂ .	Vehicle, externally.	Oleate of Mercury, Oleate of Veratrine, Oleate of Zinc. Diluted Phosphoric Acid, Solution of Hydrogen Dioxide, Syrup of Calcium Lactophosphate, Syrup of Iron, Quinine, and Strychnine Phosphates.
Acidum Phosphoricum.	H ₃ PO ₄ .	Tonic, refrigerant; m. v (0.3 C.c.).	
Acidum Phosphoricum Dilutum.		Tonic, refrigerant; m. xx (1.2 C.c.).	
Acidum Salicylicum.	HC ₇ H ₅ O ₂ .	Antirheumatic; gr. x (0.6 Gm.).	Suppositories of Glycerin.
Acidum Stearicum.	HC ₁₈ H ₃₅ O ₂ .	In making glycerin suppositories.	
Acidum Sulphuricum.	H ₂ SO ₄ .	Tonic, refrigerant; m. i (0.06 C.c.).	
Acidum Sulphuricum Aromaticum.		Tonic, astringent; m. x (0.6 C.c.).	Aromatic Sulphuric Acid, Diluted Sulphuric Acid, Ammoniated Glycyrrhizin, Diluted Hydrocyanic Acid, Ethereal Oil, Pyroxylin, Solution of Ferric Subsulphate, Solution of Ferric Sulphate, Spirit of Nitrous Ether, Sulphurous Acid, Yellow Mercuric Subsulphate. Infusion of Cinchona.
Acidum Sulphuricum Dilutum.		Tonic, refrigerant; m. x (0.6 C.c.).	
Acidum Sulphurosus.	SO ₂ .	Antiferment; m. iij (0.18 C.c.).	
Acidum Tannicum.	HC ₁₄ H ₉ O ₆ .	Astringent; gr. iij (0.19 Gm.).	Glycerite, Ointment, Troches, Styptic Collodion. Compound Effervescent Powder, Effervescent Citrated Caffeine, Iron and Ammonium Tartrate, Syrup of Hydriodic Acid.
Acidum Tartaricum.	H ₂ C ₄ H ₄ O ₆ .	Refrigerant; gr. x (0.6 Gm.).	

OFFICIAL NAME.	Chemical Composition.	Uses and Dose.	Official Preparations in heavy type; those in which the Substance is used, in Roman type.
Æther.	$(C_2H_5)_2O$.	Anæsthetic; m. xxx (1.8 C.c.).	Spirit, Compound Spirit, Collo- dion, Deodorized Opium, Tinc- ture of Deodorized Opium, Ethe- real Oil, Extract of Nux Vomica, Oleoresins, Phosphorated Oil, Pills of Ferrous Iodide, Pills of Phosphorus, Pyroxylin, Styptic Colloidion.
Æther Aceticus.	$C_2H_5C_2H_3O_2$.	Stimulant, anti- spasmodic; m. xv (0.9 C.c.).	
Alcohol.	$C_2H_5(OH)$.	Used as a sol- vent.	Diluted Alcohol, Fluid Extracts, Spirits, Tinctures, etc.
Alcohol Absolutum.	$C_2H_5(OH)$.	" "	Spirit of Phosphorus.
Alcohol Deodoratum.	$C_2H_5(OH)$.	" "	Aromatic Elixir, Compound Spirit of Orange, Spirit of Anise, Spirit of Lavender, Spirit of Lemon, Spirit of Nitrous Ether, Spirit of Orange.
Alcohol Dilutum.		" "	Fluid Extracts, Tinctures, etc.
Alumen.	$Al_2K_2(SO_4)_4$ + $24H_2O$.	Astringent, emetic; gr. v- xxx (0.3-1.9 Gm.).	Dried Alum, Aluminum Hydrate.
Alumen Exsiccatum.	$Al_2K_2(SO_4)_4$.	Astringent, escharotic; gr. iij (0.2 Gm.).	
Alumini Hydras.	$Al(OH)_3$.	Astringent; gr. v (0.3 Gm.).	
Alumini Sulphas.	$Al_2(SO_4)_3$ $16H_2O$.	Astringent; gr. v (0.3 Gm.).	
Ammonii Benzoas.	$NH_4C_7H_5O_2$.	Stimulant; gr. v (0.3 Gm.).	
Ammonii Bromidum.	NH_4Br .	Nervine; gr. x (0.6 Gm.).	
Ammonii Carbonas.	NH_4HCO_3 $NH_4NH_2CO_2$.	Stimulant, irri- tant; gr. v (0.3 Gm.).	Aromatic Spirit of Ammonia, So- lution of Ammonium Acetate.
Ammonii Chloridum.	NH_4Cl .	Expectorant; gr. x (0.6 Gm.).	Treches.
Ammonii Iodidum.	NH_4I .	Resolvent; gr. iij (0.2 Gm.).	
Ammonii Nitras.	NH_4NO_2 .	In making Ni- trous Oxide.	
Ammonii Valerianas.	$NH_4C_8H_9O_2$.	Nervine; gr. v. (0.3 Gm.).	
Amyl Nitris.	$C_5H_{11}NO_2$.	Anæsthetic; m. iij (0.2 C.c.).	
Antimonii et Potassii Tartras.	$2K(SbO)C_4H_4$ $O_6 + H_2O$.	Expectorant; gr. $\frac{1}{2}$ - $\frac{1}{4}$ (0.006-0.016 Gm.).	Compound Syrup of Squill, Wine of Antimony.
		Emetic; gr. i (0.06 Gm.).	
Antimonii Oxidum.	Sb_2O_3 .	Alterative, sed- ative; gr. iij (0.2 Gm.).	Antimonial Powder.
Antimonii Sulphidum.	Sb_2S_3 .	Alterative; gr. iij (0.2 Gm.).	Purified Antimony Sulphide (with Ammonia Water).
Antimonii Sulphidum Purificatum.	Sb_2S_3 .	Alterative; gr. iij (0.2 Gm.).	Sulphurated Antimony.
Antimonium Sulphura- tum.	Sb_2S_3 .	Alterative, dia- phoretic; gr. i (0.06 Gm.).	Compound Pills of Antimony.
Apomorphinæ Hydro- chloras.	$C_{17}H_{17}NO_2$ - HCl.	Emetic; gr. $\frac{1}{4}$ (0.016 Gm.).	

OFFICIAL NAME.	Chemical Composition.	Uses and Dose.	Official Preparations in heavy type; those in which the Substance is used, in Roman type.
Aqua. Aqua Ammoniae.	H ₂ O. NH ₃ .	Stimulant, antacid; m. v (0.3 C.c.).	Liniment, Ammoniated Glycyrrhizin, Ammoniated Mercury, Aromatic Spirit of Ammonia, Bismuth and Ammonium Citrate, Iron and Ammonium Citrate, Ferric Hydrate, Fluid Extract of Glycyrrhiza, Fluid Extract of Senega, Purified Antimony Sulphide, Pure Extract of Glycyrrhiza, Solution of Ferric Acetate, Solution of Ferric Citrate, Solution of Ferric Nitrate, Iron and Ammonium Tartrate, Iron and Potassium Tartrate, Soluble Iron and Quinine Citrate, Syrup of Senega, Washed Sulphur.
Aqua Ammoniae Fortior. Aqua Chlori.	NH ₃ .	Stimulant, antiseptic; f3i (3.7 C.c.).	Spirit.
Aqua Destillata. Aqua Hydrogenii Dioxid.	H ₂ O. H ₂ O ₂ .		
Argenti Cyanidum. Argenti Iodidum.	AgCN. AgI.	Externally. Nervine, antisyphilitic; gr. i (0.06 Gm.).	Diluted Hydrocyanic Acid.
Argenti Nitras.	AgNO ₃ .	Stimulant, astringent; gr. ½ (0.016 Gm.).	Diluted Silver Nitrate (with KNO ₃), Moulded Silver Nitrate (with HCl).
Argenti Nitras Dilutus. Argenti Nitras Fusus. Argenti Oxidum.	Ag ₂ O.	Caustic. Caustic. Tonic; gr. ½-ij (0.03-0.13 Gm.).	
Arseni Iodidum.	AsI ₃ .	Alterative; gr. ½ (0.008 Gm.).	Solution of Arsenic and Mercuric Iodide.
Atropina.	C ₁₇ H ₂₃ NO ₃ .	Sedative; gr. ⅞-rii (0.0005-0.0004 Gm.).	
Atropinae Sulphas.	(C ₁₇ H ₂₃ NO ₃) ₂ . H ₂ SO ₄ .	Mydriatic; gr. ⅞ (0.0006 Gm.).	
Auri et Sodii Chloridum.	AuCl ₃ and NaCl.	Alterative; gr. ⅞ (0.004 Gm.).	
Barii Dioxidum. Benzinum.	BaO ₂ . C ₆ H ₁₂ , C ₆ H ₁₄ .	Solvent.	Solution of Hydrogen Dioxide. Mustard Paper, Tincture of Lactucarium.
Bismuthi Citras.	BiC ₆ H ₅ O ₇ .	Nervine; gr. iij (0.19 Gm.).	Bismuth and Ammonium Citrate.
Bismuthi et Ammonii Citras.		Nervine; gr. ij (0.13 Gm.).	
Bismuthi Subcarbonas.		Astringent, antispasmodic; gr. viij (0.5 Gm.).	
Bismuthi Subnitras.		Astringent, antispasmodic; gr. iij (0.5 Gm.).	Bismuth Citrate.
Bromum.	Br.	Alterative, stimulant; gr. ½ (0.03 Gm.).	

OFFICIAL NAME.	Chemical Composition.	Uses and Dose.	Official Preparations in heavy type; those in which the substance is used, in Roman type.
Caffeina.	$C_8H_{10}N_4O_2 + H_2O$.	Stimulant; gr. iij-x (0.19-0.6 Gm.).	Citratcd Caffeine, Effervescent Citratcd Caffeine.
Caffeina Citrata.		Stimulant; gr. iij-x (0.19-0.6 Gm.).	
Caffeina Citrata Effervescent.		Stimulant; gr. lx (3.9 Gm.).	
Calcii Bromidum.	$CaBr_2$.	Stimulant, nerve; gr. xxx (1.9 Gm.).	
Calcii Carbonas Præcipitatus.	$CaCO_3$.	Antacid, astringent; gr. x-xl (0.6-2.5 Gm.).	Compound Powder of Morphine, Syrup of Calcium Lactophosphate.
Calcii Chloridum.	$CaCl_2$.	Alterative; gr. x (0.6 Gm.).	Solution of Chlorinated Soda.
Calcii Hypophosphis.	$Ca(PH_2O_3)_2$.	Alterative; gr. x (0.6 Gm.).	Syrup of Hypophosphites.
Calcii Phosphas Præcipitatus.	$Ca_3(PO_4)_2$.	In making medicated waters.	Antimonial Powder, used as a clarifying agent and absorbent in medicated waters, syrups, etc.
Calcii Sulphas Exsiccatus.	$CaSO_4$.	For surgical purposes.	Sulphurated Lime.
Calx.	CaO .	Escharotic.	Solution, Syrup, Potassa with Lime, Precipitated Sulphur, Solution of Potassa, Solution of Soda, Solution of Chlorinated Soda.
Calx Chlorata.		Disinfectant.	
Calx Sulphurata.	CaS and $CaSO_4$.	Depilatory.	
Camphora Monobromata.	$C_{10}H_{15}BrO$.	Nervous sedative; gr. v (0.3 Gm.).	
Carbonel Disulphidum.	CS_2 .	Solvent.	Mustard Paper.
Cerii Oxalas.	$Ce_2(C_2O_4)_3 + 9H_2O$.	Sedative, tonic, gr. ij (0.13 Gm.).	
Chloral.	$C_2HCl_3O + H_2O$.	Sedative; gr. x (0.6 Gm.).	
Chloroformum.	$CHCl_3$.	Anæsthetic; fʒi (3.7 C.c.).	Emulsion, Liniment, Spirit, Water, Cantharidal Colloidion, Pills of Phosphorus.
Cinchonidinæ Sulphas.	$(C_{19}H_{23}N_7O)_2 H_2SO_4 + 3H_2O$.	Tonic, febrifuge; gr. i-xxx (0.06-1.9 Gm.).	
Cinchonina.	$C_{19}H_{23}N_7O$.	Tonic; gr. i-xxx (0.06-1.9 Gm.).	
Cinchoninæ Sulphas.	$(C_{19}H_{23}N_7O)_2 H_2SO_4 + 2H_2O$.	Tonic; gr. i-xxx (0.06-1.9 Gm.).	
Cocainæ Hydrochloras.	$C_{17}H_{21}NO_4 \cdot HCl$.	Local anæsthetic; gr. ʒ-i (0.016-0.06 Gm.).	
Codeina.	$C_{18}H_{21}NO_2 + H_2O$.	Narcotic; gr. ʒ-i (0.016-0.6 Gm.).	
Cresotum.		Antiferment; m. i (0.06 C.c.).	Water.
Creta Præparata.	$CaCO_3$.	Antacid; gr. lx (0.6-3.9 Gm.).	Compound Powder, Troches, Mercury with Chalk.
Cupri Sulphas.	$CuSO_4 + 5H_2O$.	Tonic; escharotic; gr. ʒ (0.016 Gm.).	

OFFICIAL NAME.	Chemical Composition.	Uses and Dose.	Official Preparations in heavy type; those in which the substance is used, in Roman type.
Elaterinum.	$C_{29}H_{35}O_9$.	Hydragogue cathartic; gr. $\frac{1}{15}$ (0.004 Gm.).	Trituration.
Eucalyptol.	$C_{10}H_{18}O$.	Antiseptic, stimulant; m. v-x (0.3-0.6 C.c.).	
Ferri Carbonas Saccharatus.		Tonic; gr. v-xx (0.3-1.3 Gm.)	
Ferri Chloridum.	$FeCl_3 + 12H_2O$.	Hæmostatic.	
Ferri Citras.		Mild tonic; gr. v-xx (0.3-1.3 Gm.).	Iron and Quinine Citrate, Soluble Ferric Phosphate, Soluble Ferric Pyrophosphate, Soluble Iron and Quinine Citrate.
Ferri et Ammonii Citras.		Tonic; gr. v (0.3 Gm.).	Iron and Strychnine Citrate, Wine of Ferric Citrate.
Ferri et Ammonii Sulphas.	$Fe_2(NH_4)_2(8O_4)_4 + 24H_2O$.	Styptic; gr. v (0.3 Gm.).	
Ferri et Ammonii Tartras.		Tonic; gr. x (0.6 Gm.).	
Ferri et Potassii Tartras.		Tonic; gr. x (0.6 Gm.).	
Ferri et Quininae Citras.		Tonic; gr. v (0.3 Gm.).	
Ferri et Quininae Citras Solubilis.		Tonic; gr. v (0.3 Gm.).	Bitter Wine of Iron.
Ferri et Strychninae Citras.		Tonic; gr. iv (0.25 Gm.).	
Ferri Hypophosphis.	$Fe_2(PH_2O_2)_6$.	Tonic; gr. v (0.3 Gm.).	
Ferri Iodidum Saccharatum.		Tonic, alterative; gr. iij (0.2 Gm.).	
Ferri Lactas.	$Fe(C_2H_3O_2)_3 + 3H_2O$.	Tonic; gr. ij (0.13 Gm.).	Syrup of Hypophosphites with Iron.
Ferri Oxidum Hydratum.	$Fe_2(OH)_6$.	Antidote to Arsenic.	Iron Plaster, Troches of Iron.
Ferri Oxidum Hydratum cum Magnesia.		Antidote to Arsenic.	
Ferri Phosphas Solubilis.		Tonic; gr. v (0.3 Gm.).	Syrup of Iron, Quinine, Strychnine, and Phosphates.
Ferri Pyrophosphas Solubilis.		Tonic; gr. ij-v (0.13-0.3 Gm.).	
Ferri Sulphas.	$FeSO_4 + 7H_2O$.	Astringent, tonic; gr. ij (0.13 Gm.).	Dried Ferrous Sulphate, Granulated Ferrous Sulphate, Compound Iron Mixture, Mass of Ferrous Carbonate, Pills of Ferrous Carbonate, Saccharated Ferrous Carbonate, Solution of Ferric Subsulphate, Solution of Ferric Sulphate.
Ferri Sulphas Exsiccatus.	$2FeSO_4 + 3H_2O$.	Astringent, tonic; gr. i (0.06 Gm.).	Pills of Aloe and Iron.
Ferri Sulphas Granulatus.	$FeSO_4 + 7H_2O$.	Astringent, tonic; gr. ij (0.13 Gm.).	
Ferri Valerianas.		Tonic, nervine; gr. i (0.06 Gm.).	
Ferrum.	Fe.		Ferric Chloride, Saccharated Ferrous Iodide, Solution of Ferric Chloride, Syrup of Ferrous Iodide.

OFFICIAL NAME.	Chemical Composition.	Uses and Dose.	Official Preparations in heavy type; those in which the substance is used, in Roman type.
Ferrum Reductum.	Fe.	Tonic; gr. v (0.3 Gm.).	Pills of Ferrous Iodide, Saccharated Ferrous Iodide.
Glycerinum.	$C_3H_5(OH)_3$.	Solvent, and used externally.	Suppositories, Extracts, Fluid Extracts, Glycerites, Syrups, Tinctures, etc.
Glycyrrhizinum Ammoniatum.		Expectorant; gr. x (0.6 Gm.).	
Hydrargyri Chloridum Corrosivum.	$HgCl_2$.	Antisymphilitic, alternative; gr. $\frac{1}{12}$ (0.006 Gm.).	Ammoniated Mercury, Red Mercuric Iodide, Yellow Mercuric Oxide.
Hydrargyri Chloridum Mite.	Hg_2Cl_2 .	Purgative; gr. v-x (0.3-0.6 Gm.).	Compound Cathartic Pills, Compound Pills of Antimony.
Hydrargyri Cyanidum.	$Hg(ON)_2$.	Alternative; gr. $\frac{1}{12}$ (0.004 Gm.).	
Hydrargyri Iodidum Flavum.	Hg_2I_2 .	Alternative, antisymphilitic; gr. i (0.06 Gm.).	
Hydrargyri Iodidum Rubrum.	HgI_2 .	Alternative, antisymphilitic; gr. $\frac{1}{12}$ (0.004 Gm.).	Solution of Arsenic and Mercuric Iodide.
Hydrargyri Oxidum Flavum.	HgO .	Externally.	Ointment, Oleate.
Hydrargyri Oxidum Rubrum.	HgO .	Externally.	Ointment, Solution of Mercuric Nitrate.
Hydrargyri Subsulphas Flavus.	$Hg(HgO)_2 \cdot SO_4$.	Alternative; gr. $\frac{1}{4}$ (0.016 Gm.).	
Hydrargyrum.	Hg.		Mass, Mercury with Chalk, Ointment, Plaster, Ammoniac Plaster with Mercury, Ointment of Mercuric Nitrate, Yellow Mercuric Subsulphate, Yellow Mercurous Iodide.
Hydrargyrum Ammoniatum.	NH_2HgCl .	Used externally.	Ointment.
Hydrargyrum cum Creta.		Alternative; gr. v (0.3 Gm.).	
Hydrastinis Hydrochloras.	$C_{17}H_{11}NO_4 \cdot HCl$.	Alternative; gr. $\frac{1}{4}$ (0.016-0.03 Gm.).	
Hyoscinæ Hydrobromas.	$C_{17}H_{21}NO_4 \cdot HBr + 3H_2O$.	Sedative; gr. $\frac{1}{16}$ (0.0008 Gm.).	
Hyoscyaminæ Hydrobromas.	$C_{17}H_{23}NO_4 \cdot HBr$.	Sedative; gr. $\frac{1}{16}$ (0.001 Gm.).	
Hyoscyaminæ Sulphas.	$(C_{17}H_{23}NO_4)_2 \cdot H_2SO_4$.	Sedative; gr. $\frac{1}{16}$ (0.001 Gm.).	
Iodoformum.	CHI_3 .	Anæsthetic, antiseptic; gr. i (0.06 Gm.).	Ointment.
Iodum.	I.	Alternative, stimulant; gr. $\frac{1}{4}$ (0.016 Gm.).	Compound Solution, Ointment, Tincture, Pills of Ferrous Iodide, Saccharated Ferrous Iodide, Sulphur Iodide, Syrup of Ferrous Iodide.
Liquor Acidi Arsenosi.		Alternative; m. iv (0.2 C.c.).	
Liquor Ammonii Acetatis.	$NH_4C_2H_3O_2$.	Diaphoretic; $\mathfrak{f}\mathfrak{z}\mathfrak{i}\mathfrak{j}$ (11.1 C.c.).	Solution of Iron and Ammonium Acetate.
Liquor Arseni et Hydrargyri Iodidi.		Alternative; m. v (0.5 C.c.).	
Liquor Calcis.	$Ca(OH)_2$.	Antacid; $\mathfrak{f}\mathfrak{z}\mathfrak{i}\mathfrak{j}$ (60 C.c.).	Lime Liniment.

OFFICIAL NAME.	Chemical Composition.	Uses and Dose.	Official Preparations in heavy type; those in which the Substance is used, in Roman type.
Liquor Ferri Acetatis.	$\text{Fe}_2(\text{C}_2\text{H}_3\text{O}_2)_6$.	Tonic; m. v (0.3 C.c.).	Tincture of Ferric Chloride. Ferric Citrate, Iron and Ammonium Citrate.
Liquor Ferri Chloridi.	Fe_2Cl_6 .	Styptic.	
Liquor Ferri Citratis.		Tonic; m. x (0.6 C.c.).	
Liquor Ferri Nitratis.	$\text{Fe}_2(\text{NO}_3)_6$.	Tonic, astringent; m. v (0.3 C.c.).	
Liquor Ferri Subsulphatis.		Styptic; m. iij (0.18 C.c.).	Ferric Hydrate, Ferric Hydrate with Magnesia, Iron and Ammonium Tartrate, Iron and Potassium Tartrate, Solution of Ferric Acetate, Solution of Ferric Citrate, Solution of Ferric Nitrate.
Liquor Ferri Tersulphatis.	$\text{Fe}_2(\text{SO}_4)_6$.	Styptic; m. iij (0.18 C.c.).	
Liquor Hydrargyri Nitratis.	$\text{Hg}(\text{NO}_3)_2$.	Escharotic.	
Liquor Iodi Compositus.		Alterative; m. v (0.3 C.c.).	
Liquor Magnesii Citratis.		Cathartic; $\text{f}\frac{3}{4}$ xij (355 C.c.).	Cerate, Diluted Solution.
Liquor Plumbi Subacetatis.	$\text{Pb}_2\text{O}(\text{C}_2\text{H}_3\text{O}_2)_2$.	Externally.	
Liquor Plumbi Subacetatis Dilutus.		Externally.	
Liquor Potassæ.	KOH.	Antacid, antilithic; m. x (0.6 C.c.).	
Liquor Potassii Arsenitis.		Alterative; m. v (0.3 C.c.).	Sulphurated Antimony.
Liquor Potassii Citratis.	$\text{K}_2\text{C}_6\text{H}_5\text{O}_7$.	Refrigerant, diaphoretic; $\text{f}\frac{3}{4}$ i (3.7 C.c.).	
Liquor Sodæ.	NaOH.	Antacid, antilithic; m. x (0.6 C.c.).	
Liquor Sodæ Chloratæ.		Stimulant, antiseptic; m. xxx (1.8 C.c.).	
Liquor Sodii Arsenatis.		Alterative; m. v (0.2 C.c.).	Effervescent Lithium Citrate.
Liquor Sodii Silicatis.		Used externally.	
Liquor Zinci Chloridi.	ZnCl_2 .	Disinfectant.	
Lithii Benzoas.	$\text{LiC}_7\text{H}_5\text{O}_2$.	Diuretic; gr. xv (0.9 Gm.).	
Lithii Bromidum.	LiBr.	Nervine; gr. xv (0.9 Gm.).	Effervescent Lithium Citrate.
Lithii Carbonas.	Li_2CO_3 .	Diuretic; gr. v (0.3 Gm.).	
Lithii Citras.	$\text{Li}_3\text{C}_6\text{H}_5\text{O}_7$.	Diuretic; gr. xv (0.9 Gm.).	
Lithii Citras Effervescentes.		Diuretic; gr. lx (3.9 Gm.).	
Lithii Salicylas.	$\text{LiC}_7\text{H}_5\text{O}_2$.	Antirheumatic; gr. xxv (1.6 Gm.).	Ferric Hydrate with Magnesia, Compound Powder of Rhubarb, Mass of Copaiba.
Magnesia.	MgO .	Antacid, laxative; gr. xx (1.3 Gm.).	
Magnesia Ponderosa.	MgO .	Antacid, laxative; gr. xx (1.3 Gm.).	
Magnesii Carbonas.	$(\text{MgCO}_3)_4$. $\text{Mg}(\text{OH})_2 + 5\text{H}_2\text{O}$.	Antacid; gr. lx (3.9 Gm.).	

OFFICIAL NAME.	Chemical Composition.	Uses and Dose.	Official Preparations in heavy type; those in which the Substance is used, in Roman type.
Magnesi Citras Efferves-cens.		Cathartic; gr. lx (3.9 Gm.).	
Magnesi Sulphas.	$MgSO_4 + 7H_2O$.	Cathartic; \mathfrak{z} i (31 Gm.).	Compound Infusion of Senna.
Mangani Dioxidum.	MnO_2 .	Tonic, altera-tive; gr. v (0.3 Gm.).	Chlorine Water.
Mangani Sulphas.	$MnSO_4 + 4H_2O$.	Cholagogue, tonic; gr. x (0.6 Gm.).	
Massa Ferri Carbonatis.		Tonic; gr. xv (0.9 Gm.).	
Massa Hydrargyri.		Purgative; gr. x (0.6 Gm.).	
Menthol.	$C_{10}H_{18}OH$.	Stimulant.	
Methyl Salicylas.	$CH_3C_7H_4O_2$.	Antirheumatic; m. v (0.3 C.c.).	
Morphina.	$C_{17}H_{19}NO_3 + H_2O$.	Sedative; gr. $\frac{1}{2}$ (0.008 Gm.).	
Morphinæ Acetas.	$C_{17}H_{19}NO_3 \cdot C_2H_3O_2 + 3H_2O$.	Sedative; gr. $\frac{1}{2}$ (0.008 Gm.).	
Morphinæ Hydrochloras.	$C_{17}H_{19}NO_3 \cdot HCl + 3H_2O$.	Sedative; gr. $\frac{1}{2}$ (0.008 Gm.).	
Morphinæ Sulphas.	$(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4 + 5H_2O$.	Sedative; gr. $\frac{1}{2}$ (0.008 Gm.).	Compound Powder, Troches of Morphine and Ipecac.
Naphtalinum.	$C_{10}H_8$.	Insecticide.	
Naphtol.	$C_{10}H_7OH$.	Antiseptic; gr. iij (0.2 Gm.).	
Oleum Æthereum.		Anodyne; m. i (0.06 C.c.).	Compound Spirit of Ether.
Paraldehydum.	$C_4H_{12}O_3$.	Sedative; m. xxx (1.8 C.c.).	
Petrolatum Liquidum.		Externally.	
Petrolatum Molle.		Externally.	
Petrolatum Spissum.		Externally.	
Phosphorus.	P.	Aphrodisiac, stimulant; gr. $\frac{1}{100}$ (0.0006 Gm.).	Oil, Pill, Spirit.
Physostigminæ Salicy-las.	$C_{15}H_{21}N_3O_7 \cdot C_7H_5O_2$.	Sedative; gr. $\frac{1}{10}$ (0.0008 Gm.).	
Physostigminæ Sulphas.	$(C_{15}H_{21}N_3O_7)_2 \cdot H_2SO_4$.	Sedative; gr. $\frac{1}{10}$ (0.0008 Gm.).	
Picrotoxinum.	$C_{20}H_{34}O_{12}$.	Sedative; gr. $\frac{1}{10}$ (0.001 Gm.).	
Pilocarpinæ Hydrochlo-ras.	$C_{11}H_{15}N_2O_2 \cdot HCl$.	Diaphoretic; gr. $\frac{1}{2}$ (0.008 Gm.).	
Piperinum.	$C_{17}H_{19}NO_2$.	Stimulant; gr. v (0.3 Gm.).	
Plumbi Acetas.	$Pb(C_2H_3O_2)_2 + 3H_2O$.	Astringent, sed-ative; gr. iij (0.13 Gm.).	Solution of Lead Subacetate.
Plumbi Carbonas.	$(PbCO_3)_2 \cdot Pb(OH)_2$.	Externally.	Ointment.
Plumbi Iodidum.	PbI_2 .	Externally.	Ointment.
Plumbi Nitras.	$Pb(NO_3)_2$.	Externally.	
Plumbi Oxidum.	PbO .	Externally.	Lead Plaster, Solution of Lead Sub-acetate.
Potassa.	KOH.	Escharotic.	Potassa with Lime, Solution, Soft Soap.
Potassa cum Calce.		Escharotic.	
Potassa Sulphurata.		Used in skin diseases; gr. iij (0.2 Gm.).	

OFFICIAL NAME.	Chemical Composition.	Uses and Dose.	Official Preparations in heavy type; those in which the Substance is used, in Roman type.
Potassii Acetas.	$K_2C_2H_3O_2$.	Diuretic; gr. xx (1.3 Gm.).	Effervescent Potassium Citrate, Solution of Magnesium Citrate, Solution of Potassa, Solution of Potassium Arsenite, Solution of Potassium Citrate.
Potassii Bicarbonas.	$KHCO_3$.	Antacid, diuretic; gr. xv (0.9 Gm.).	
Potassii Bichromas.	$K_2Cr_2O_7$.	Eucharotic.	Compound Powder of Jalap, Iron and Potassium Tartrate.
Potassii Bitartras.	$KHC_4H_4O_6$.	Purgative; \mathfrak{Z} i- \mathfrak{Z} iv (3.9-15.5 Gm.).	
Potassii Bromidum.	KBr .	Nervine; gr. xx (1.3 Gm.).	Compound Iron Mixture, Pills of Ferrous Carbonate, Spirit of Nitrous Ether, Sulphurated Potassa, Syrup of Rhubarb.
Potassii Carbonas.	K_2CO_3 .	Antacid, diuretic; gr. xv (0.9 Gm.).	
Potassii Chloras.	$KClO_3$.	Alterative; gr. xv (0.9 Gm.).	Troches.
Potassii Citras.	$K_2C_6H_5O_7 + H_2O$.	Refrigerant; gr. xx (1.3 Gm.).	Syrup of Hypophosphites with Iron.
Potassii Citras Effervescens.		Refrigerant; gr. lx (3.9 Gm.).	
Potassii Cyanidum.	KCN .	Sedative; gr. \mathfrak{r} $\frac{1}{2}$ (0.005 Gm.).	Compound Effervescing Powder.
Potassii et Sodii Tartras.	$KNaC_4H_4O_6 + 4H_2O$.	Purgative; \mathfrak{Z} iv (15.5 Gm.).	
Potassii Ferrocyanidum.	$K_4Fe(CN)_6 + 3H_2O$.	Sedative; gr. x (0.6 Gm.).	Diluted Hydrocyanic Acid.
Potassii Hypophosphis.	KPH_2O_3 .	Alterative; gr. xv (0.9 Gm.).	
Potassii Iodidum.	KI .	Alterative; gr. v (0.3 Gm.).	Syrup of Hydriodic Acid, Syrup of Hypophosphites.
Potassii Nitras.	KNO_3 .	Diuretic; gr. x (0.6 Gm.).	
Potassii Permanganas.	$KMnO_4$.	Disinfectant, emmenagogue; gr. i (0.06 Gm.).	Ointment, Compound Solution of Iodine, Iodine Ointment, Red Mercuric Iodide, Syrup of Hydriodic Acid, Yellow Mercurous Iodide.
Potassii Sulphas.	K_2SO_4 .	Purgative; gr. lx (3.9 Gm.).	
Pyrogallol.	$C_6H_3(OH)_3$.	Externally.	Paper, Diluted Silver Nitrate.
Pyroxylinum.			
Quinidinæ Sulphas.	$(C_{20}H_{24}N_2O_2)_2 H_2SO_4 + 2H_2O$.	Tonic; gr. v (0.3 Gm.).	Colloidion.
Quinina.	$C_{20}H_{24}N_2O_2 + 3H_2O$.	Tonic; gr. v (0.3 Gm.).	
Quininæ Bisulphas.	$C_{20}H_{24}N_2O_2 \cdot H_2SO_4 + 7H_2O$.	Tonic; gr. v (0.3 Gm.).	Iron and Quinine Citrate, Soluble Iron and Quinine Citrate.
Quininæ Hydrobromas.	$C_{20}H_{24}N_2O_2 \cdot HBr + H_2O$.	Tonic; gr. v (0.3 Gm.).	
Quininæ Hydrochloras.	$C_{20}H_{24}N_2O_2 \cdot HCl + 2H_2O$.	Tonic; gr. v (0.3 Gm.).	Syrup of Iron, Quinine, and Strychnine Phosphates.
Quininæ Sulphas.	$(C_{20}H_{24}N_2O_2)_2 H_2SO_4 + 7H_2O$.	Tonic; gr. v (0.3 Gm.).	
Quininæ Valerianas.	$C_{20}H_{24}N_2O_2 \cdot C_5H_{10}O_2 + H_2O$.	Tonic; gr. ij (0.13 Gm.).	
Resorcinum.	$C_6H_4(OH)_2$.	Antipyretic; gr. ij (0.13 Gm.).	

OFFICIAL NAME.	Chemical Composition.	Uses and Dose.	Official Preparations in heavy type; those in which the Substance is used, in Roman type.
Saccharum. Saccharum Lactis.	$C_{12}H_{22}O_{11}$. $C_{12}H_{22}O_{11} + H_2O$.		Syrup, Syrups, Troches, etc. Deodorized Opium, Extract of Nux Vomica, Extract of Opium, Powder of Ipecac and Opium, Saccharated Ferrous Iodide, Saccharated Pepsin, Trituration of Elaterin.
Salicinum.	$C_{15}H_{15}O_7$.	Tonic; gr. x (0.6 Gm.).	
Salol.	$C_6H_5C_7H_5O_3$.	Antipyretic; gr. xv-xxx (0.9-1.8 Gm.).	
Santoninum.	$C_{15}H_{15}O_3$.	Anthelmintic; gr. ij (0.13 Gm.).	Troches.
Sapo.		Antacid; gr. x (0.6 Gm.).	Liniment, Plaster, Compound Extract of Colocynth, Pills of Aloes, Pills of Aloes and Asafoetida, Pills of Asafoetida, Pills of Opium, Pills of Rhubarb.
Sapo Mollis.		Externally.	Liniment.
Soda.	NaOH.	Escharotic.	Solution, Yellow Mercuric Oxide.
Sodii Acetas.	$NaC_2H_3O_2 + 3H_2O$.	Diuretic; gr. xx (1.3 Gm.).	
Sodii Arsenas.	$Na_2HAsO_4 + 7H_2O$.	Alternative; gr. $\frac{1}{8}$ (0.005 Gm.).	Solution.
Sodii Benzoas.	$NaC_7H_5O_2$.	Antirheumatic; gr. lx (3.9 Gm.).	
Sodii Bicarbonas.	$NaHCO_3$.	Antacid; gr. xv (0.9 Gm.).	Troches, Compound Effervescent Powder, Effervescent Citrated Caffeine, Effervescent Lithium Citrate, Effervescent Magnesium Citrate, Mixture of Rhubarb and Soda, Saccharated Ferrous Carbonate.
Sodii Bisulphis.	$NaHSO_3$.	Antiseptic; gr. v (0.3 Gm.).	
Sodii Boras.	$Na_2B_4O_7 + 10H_2O$.	Refrigerant, diuretic; gr. xv (0.9 Gm.).	Ointment of Rose Water.
Sodii Bromidum.	NaBr.	Nervine; gr. xxx (1.8 Gm.).	
Sodii Carbonas.	$Na_2CO_3 + 10H_2O$.	Antacid; gr. x (0.6 Gm.).	Dried Carbonate, Aluminum Hydrate, Mass of Ferrous Carbonate, Solution of Chlorinated Soda, Solution of Soda, Spirit of Nitrous Ether, Suppositories of Glycerin.
Sodii Carbonas Exsiccatus.		Antacid; gr. v (0.3 Gm.).	
Sodii Chloras.	$NaClO_3$.	Alternative; gr. x (0.6 Gm.).	
Sodii Chloridum.	NaCl.	Tonic; gr. xx (1.3 Gm.).	
Sodii Hypophosphis.	$NaH_2PO_3 + H_2O$.	Nervine, tonic; gr. v (0.3 Gm.).	Syrup of Hypophosphites.
Sodii Hyposulphis.	$Na_2S_2O_3 + 5H_2O$.	Alternative; gr. x (0.6 Gm.).	Ointment of Potassium Iodide.
Sodii Iodidum.	NaI.	Alternative; gr. xv (0.9 Gm.).	
Sodii Nitras.	$NaNO_3$.	Diuretic; gr. xv (0.9 Gm.).	
Sodii Nitris.	$NaNO_2$.		Spirit of Nitrous Ether.

OFFICIAL NAME.	Chemical Composition.	Uses and Dose.	Official Preparations in heavy type; those in which the Substance is used, in Roman type.
Sodii Phosphas.	$\text{Na}_2\text{HPO}_4 + 12\text{H}_2\text{O}$.	Purgative; \mathfrak{Zi} (31 Gm.).	Soluble Ferric Phosphate.
Sodii Pyrophosphas.	$\text{Na}_4\text{P}_2\text{O}_7 + 10\text{H}_2\text{O}$.	Purgative; gr. x (0.6 Gm.).	
Sodii Salicylas.	$\text{NaC}_7\text{H}_5\text{O}_2$.	Stimulant; gr. xxx (1.8 Gm.).	
Sodii Sulphas.	$\text{Na}_2\text{SO}_4 + 10\text{H}_2\text{O}$.	Cathartic; \mathfrak{Zij} – \mathfrak{Ziv} (7.7–15.5 Gm.).	
Sodii Sulphis.	$\text{Na}_2\text{SO}_3 + 7\text{H}_2\text{O}$.	Antiferment; gr. x (0.6 Gm.).	
Sodii Sulphocarbolas.	$\text{NaSO}_3\text{C}_6\text{H}_4(\text{OH}) + 2\text{H}_2\text{O}$.	Antiferment; gr. xx (1.3 Gm.).	Iron and Strychnine Citrate, Syrup of Iron, Quinine and Strychnine Phosphates.
Sparteinae Sulphas.	$\text{C}_{15}\text{H}_{25}\text{N}_3\text{H}_3\text{SO}_4 + 4\text{H}_2\text{O}$.	Cardiac stimulant; gr. $\frac{1}{2}$ – $\frac{1}{4}$ (0.01–0.03 Gm.).	
Strontii Bromidum.	$\text{SrBr}_2 + 6\text{H}_2\text{O}$.	Nervine; gr. xx (1.3 Gm.).	
Strontii Iodidum.	$\text{SrI}_2 + 6\text{H}_2\text{O}$.	Alterative; gr. v (0.3 Gm.).	
Strontii Lactas.	$\text{Sr}(\text{C}_2\text{H}_3\text{O}_2)_2 + 3\text{H}_2\text{O}$.	Antirheumatic; gr. x (0.6 Gm.).	
Strychnina.	$\text{C}_{21}\text{H}_{23}\text{N}_3\text{O}_2$.	Tonic; gr. $\frac{1}{80}$ (0.001 Gm.).	Ointment, Compound Powder of Glycyrrhiza, Sulphur Iodide.
Strychninae Sulphas.	$(\text{C}_{21}\text{H}_{23}\text{N}_3\text{O}_2)_2\text{H}_2\text{SO}_4 + 5\text{H}_2\text{O}$.	Tonic; gr. $\frac{1}{80}$ (0.001 Gm.).	
Sulphuris Iodidum.	S.	Externally. Diaphoretic, solvent; \mathfrak{Zi} (3.9 Gm.).	
Sulphur Præcipitatum.	S.	Diaphoretic, solvent; \mathfrak{Zi} (3.9 Gm.).	
Sulphur Sublimatum.	S.	Diaphoretic, solvent; \mathfrak{Zi} (3.9 Gm.).	
Terebenum.	$\text{C}_{10}\text{H}_{18}$.	Expectorant; m. xx (1.2 C.c.).	Precipitated Sulphur, Sulphurated Potassa, Washed Sulphur.
Terpini Hydras.	$\text{C}_{10}\text{H}_{18}(\text{OH})_2 + \text{H}_2\text{O}$.	Expectorant; gr. ii (0.13 Gm.).	
Thymol.	$\text{C}_{10}\text{H}_{14}\text{O}$.	Antiseptic.	
Veratrina.	$\text{Zn}(\text{C}_2\text{H}_3\text{O}_2)_2 + 2\text{H}_2\text{O}$.	Externally.	
Zinci Acetas.	ZnBr_2 .	Externally.	
Zinci Bromidum.		Nervine; gr. v (0.3 Gm.).	Solution of Zinc Chloride.
Zinci Carbonas Præcipitatus.		Externally.	
Zinci Chloridum.	ZnCl_2 .	Escharotic.	
Zinci Iodidum.	ZnI_2 .	Externally.	
Zinci Oxidum.	ZnO .	Externally.	
Zinci Phosphidum.	Zn_3P_2 .	Aphrodisiac; gr. $\frac{1}{4}$ (0.008 Gm.).	Ointment, Oleate.
Zinci Sulphas.	$\text{ZnSO}_4 + 7\text{H}_2\text{O}$.	Astringent; gr. ij (0.13 Gm.).	
Zinci Valerianas.	$\text{Zn}(\text{C}_8\text{H}_9\text{O}_2)_2 + 2\text{H}_2\text{O}$.	Antispasmodic; gr. i (0.06 Gm.).	
Zincum.	Zn.		

PART IV.

ORGANIC SUBSTANCES.

INTRODUCTORY.

THE view formerly held by chemists, that vegetable and animal substances owed their peculiar chemical and physical properties exclusively to the mysterious action of life, was seriously affected by the labors of such chemists as Wöhler, in 1828, and Kolbe and Frankland, in 1847, who succeeded in producing synthetically a number of compounds from mineral substances. These so-called artificial bodies were proved to be identical in chemical composition and physical properties with those obtained from nature, and the subsequent discovery of many others has necessitated a change in the definition of the term *organic chemistry*. This no longer means the study of substances produced through living organisms, but, as all organic bodies have been found upon analysis to contain carbon (generally associated with hydrogen, and often with oxygen and nitrogen), the following modern definition must be accepted: *Organic chemistry is the science which treats of the carbon compounds.*

The plan of this work will not admit of the acceptance of the latest systems of classification which have been advanced, for, notwithstanding the ingenious skill which is clearly perceptible in many of the groupings, they are not well adapted for the study of the carbon compounds from a pharmaceutical point of view. The groups which are characterized in modern organic chemistry as alcohols, ethers, compound ethers, aldehyds, ketones, amines, and amides, necessarily bring together many substances used in the *materia medica* which possess few pharmaceutical or medical analogies. For instance, glycerin, mannit, and carbolic acid are properly regarded as alcohols, and they would have to be grouped together, notwithstanding their physical dissimilarities. The same classification would compel the consideration of such an incongruous pharmaceutical group as spirit of nitrous ether, stearin, and beeswax under the head of compound ethers.

It must not be understood that the present methods of grouping the carbon atoms is not of great value in *studying chemistry* from a purely chemical stand-point. Indeed, with the enormous advances which have been made in theoretical chemistry within the last half-century, it would be impossible to reject the results upon which the present system of classification rests.

In the following pages the carbon compounds are considered in the usual groups only when the substances composing them have similar chemical and physical properties. The opening chapters are devoted to lignin and its derivatives; then its isomer, starch, and the allied products, gums, mucilages, etc.; then the sugars and the products derived from them as the result of decomposition and fermentation, alcohol, ether, etc. Following these the acid saccharine fruits, with the important acids which they contain, are considered, and then the products obtained from them and from other plants,—the volatile oils. Oleoresins, resins, gum-resins, and balsams naturally succeed these, and then the classification is based upon the prominent constituents which are found in the substances, astringents, cathartics, etc., being all grouped together. Drugs containing alkaloids are among the last groups of carbon compounds. The alkaloids are highly organized, and most of them are powerful poisons. This plan thus begins with elementary substances, like lignin, starch, and gum, and leads by regular progression to the most powerful compounds in the *materia medica*, the alkaloids.

A sharp distinction is made between the official and the unofficial preparations, the latter always following the former. This will enable the student to distinguish at a glance the more important compounds, and they can be studied either together or separately at will.

CHAPTER XLIX.

THE CELLULOSE GROUP.

Cellulose. $C_6H_{10}O_5$.

Cellulose.—The woody fibre of plants, which forms the skeleton or framework for the vegetable tissues, is termed *cellulose*, or *cellulin*. During the natural growth of the plant the walls of the cells become filled with various principles, coloring-matter, resins, salts of various kinds, etc., and these give to the plant physical properties which render it useful in medicine. Pharmacy teaches the various methods of extracting the *valuable principles* from plants. Cellulose constitutes the greater part of the inert residues. (See Percolation, page 263.)

The term *lignin* was formerly applied to cellulose; indeed, three words, *lignin*, *cellulin*, and *cellulose*, were used synonymously; a distinction, however, is sometimes made, the substances which are found adhering to the cellulose skeleton of plants and vegetable tissues being called *lignin*. The latter is less digestible than cellulose, and it is believed by Payen and others to vary from it somewhat in chemical composition. *Fungin*, from fungi, *hordein*, from barley, *medullin*, from the pith of various plants, *pollenin*, from pollen granules, are mixed and special forms of cellulose.

Cellulose is seen in a pure form in raw cotton, the hairs of the seed of various species of *Gossypium*, and in many other vegetable products. It is the most useful and valuable substance obtained from plants: fabrics like cotton, linen, or hemp goods are made on an immense scale from cellulose. When pure, cellulose is white, translucent, unalterable in the air, and has the specific gravity of 1.5. It is insoluble in water, alcohol, ether, benzin, and oils, but is soluble in an ammoniacal solution of copper oxide, and this latter fact has been taken advantage of to form many useful articles by partially dissolving a woven cotton material and rolling or pressing it into any desired shape. When cellulose is treated with strong sulphuric acid or phosphoric acid, it is converted into dextrin. If the mixture be diluted with water and heated, glucose is produced. If cellulose in the form of unsized paper is passed through a mixture made from two parts of sulphuric acid of sp. gr. 1.840 and one part of water (*both by measure*), and the whole cooled to 15° C. (59° F.), the valuable product known as *parchment-paper* is produced. The strips of paper should be well washed by passing them through a dilute solution of ammonia and water. This paper is useful as a dialyzing medium; it forms, when perfect, the best septum. (See Dialysis.) When cellulose is treated with nitric acid, pyroxylin, or gun cotton, is produced.

GOSSYPIMUM PURIFICATUM. U.S. Purified Cotton.

[GOSSYPIMUM, PHARM. 1880. ABSORBENT COTTON.]

The hairs of the seed of *Gossypium herbaceum* Linné, and of other species of *Gossypium* (nat. ord. *Malvaceæ*), freed from adhering impurities, and deprived of fatty matter.

Purified cotton wool is cellulose in one of its purest forms. For a long time one of the most important uses of this valuable staple, that of an absorbent and substitute for sponge, was neglected, because a trace of fatty matter was permitted to remain, which coated the filaments and prevented them from absorbing liquids freely and uniformly. The so-called absorbent cotton of commerce was introduced, and it soon became an important product. This is cotton freed from the trace of fatty matter by boiling it in a weak alkaline solution, rinsing it in a weak solution of chlorinated lime to whiten it, dipping it into a very dilute solution of hydrochloric acid, and then thoroughly rinsing it with pure water; the cotton, having been thoroughly dried, is then carded. The loss is about ten per cent. The official tests are as follows: Purified Cotton should be perfectly free from all visible impurities, and, on combustion, should not leave more than 0.8 per cent. of ash. When Purified Cotton, previously compressed in the hand, is thrown on the surface of cold water, it should readily absorb the latter and sink, and the water should not acquire either an acid or an alkaline reaction (evidence of proper purification). Cellulose is employed in pharmacy in the form of filtering paper, in muslin and cotton cloth strainers, for surgical bandages, paper, lint, etc.

Products resulting from the Decomposition of Cellulose.

Under this head will be included—1. The preparations made by decomposing cellulose or lignin by the action of acids or alkalies. 2. Those made by destructive distillation.

Pyroxylin is placed in the first class, primarily because of its importance in pharmacy, medicine, and the arts.

PYROXYLINUM. U.S. Pyroxylin.

[SOLUBLE GUN COTTON. COLLOXYLIN.]

	Metric.	Old form.
Purified Cotton	100 Gm.	$\frac{1}{2}$ oz. av.
Nitric Acid	1400 C.c.	7 fl. oz.
Sulphuric Acid	2200 C.c.	11 fl. oz.
Alcohol,		
Ether,		
Water, each, a sufficient quantity.		

Mix the Acids gradually in a glass or porcelain vessel, and, when the temperature of the mixture has fallen to 32° C. (90° F.), add the Purified Cotton. By means of a glass rod imbue it thoroughly with the Acids, and allow it to macerate, until a sample of it, taken out, thoroughly washed with a large quantity of Water, and subsequently with Alcohol, and pressed, is found to be soluble in a mixture of 1 volume of Alcohol and 3 volumes of Ether. Then remove the Cotton from the Acids, transfer it to a larger vessel, and wash it, first, with

cold Water, until the washings cease to have an acid taste, and then with boiling Water, until they cease to redden blue litmus paper. Finally, drain the Pyroxylin on filtering paper, and dry it in small, detached pellets, by means of a water-bath or steam-bath, at a temperature not exceeding 60° C. (140° F.). Keep the Pyroxylin, loosely packed, in well-closed vessels* containing not more than about 25 Gm., in a cool and dry place, remote from lights or fire.

Schönbein first pointed out the fact that nitric acid acts on cotton and produces a soluble compound. It was subsequently proved that this substance, pyroxylin, or gun cotton, belongs to a series of closely related nitro-compounds in which the nitric acid radicle replaces the hydroxyl of the cellulose formula. This may be shown by taking the double formula for cellulose $C_{12}H_{20}O_{10}$ and the displacement of the HO, thus:

The soluble pyroxylin used in preparing collodion is a varying mixture of the di-, tri-, tetra-, and pentanitratates. The hexanitrate is the true explosive gun cotton, and is insoluble in ether, alcohol, and water.

Uses.—Pyroxylin has been used very largely by photographers for producing the basis of the sensitized film upon which impressions are made. It is now replaced to a great extent by gelatin. The composition known as *celluloid*, which is used so largely for useful and ornamental articles, is made from pyroxylin, camphor, and coloring-matter heated together and powerfully pressed into appropriate moulds. Pharmaceutically, pyroxylin is used in collodions (see page 337).

Official Preparations of Pyroxylin.

Collodium This is made by introducing 30 Gm. of pyroxylin in a suitable bottle and adding 750 C.c. of ether and allowing it to stand for fifteen minutes, to permit the penetration of the ether to all parts of the pyroxylin; 250 C.c. of alcohol are now added, and the mixture shaken until the pyroxylin is dissolved. Pyroxylin, even of the best quality, is never entirely soluble: hence the direction to decant the liquid from any sediment and transfer it to bottles. The sediment consists of little filaments, probably of unaltered cotton: many physicians prefer to shake the bottle so as to incorporate the sediment, under the belief that the film is stronger on account of their presence. Collodion is used to protect inflamed surfaces by applying a small quantity with a brush: a thin, closely adherent film remains after the ether and alcohol evaporate; this film is contractile, and is useful on this account in many minor surgical operations. It is desirable at times to have a flexible film, especially when applied to parts of the body which are required to be in motion. The following preparation may then be used (see page 337).

¹ Notwithstanding the official directions, pyroxylin should not be kept in tin cans or glass bottles having covers or stoppers which fit closely, as decomposition will be almost certain to occur: paper boxes or cartons are proper retainers.

Official Preparations of Pyroxylin.—*Continued.*

- Collodium Flexile** . . . This is made by mixing 50 Gm. of Canada turpentine and 30 Gm. of castor oil with 920 Gm. of collodion. If an astringent application is needed to a bleeding surface, the styptic collodion may be employed (see page 338).
- Collodium Stypticum** . This is made by placing 20 Gm. of tannic acid in a graduated bottle, adding 5 C.c. of alcohol, 25 C.c. of ether, and sufficient collodion to make 100 C.c., then agitating until the tannic acid is dissolved. If a blistering effect is desired, the cantharidal collodion may be used (see page 338).
- Collodium Cantharidatum.**
Cantharidal Collodion. This is made by percolating 60 Gm. of powdered cantharides with commercial chloroform until the cantharides are exhausted, then recovering by distillation all but one-fifth of the percolate, and, after evaporating the residue by a water-bath to 15 Gm., mixing it with 85 Gm. of flexible collodion. Cantharidin, the vesicating principle of cantharides, is very soluble in chloroform, and, although the first cost of the menstruum is greater than that of ether (the solvent formerly used), it has the advantage over ether of not being inflammable. There is considerable loss of menstruum in carrying out the process practically. The percolator shown on page 433 may be used, and distillation very carefully performed with a condenser having a large refrigerating surface (see page 338).

ACIDUM OXALICUM. *Oxalic Acid.*

This acid was omitted from the alphabetical list of chemical substances in the U. S. Pharmacopœia: it is found, however, in the official test-solutions.

Preparation.—Oxalic acid may be made by acting on cellulose, sugar, or starch with nitric acid, with the aid of heat, but is prepared on a commercial scale by heating saw-dust with a mixture of two molecules of caustic soda and one molecule of potassa. The mixture of caustic alkalies and saw-dust is made in a thick paste, and then heated for several hours to a temperature of 200° C. (392° F.) to 220° C. (428° F.). The gray mass is then washed with sodium carbonate, whereby the potash is removed as carbonate, the less soluble sodium oxalate remaining. This is converted into calcium oxalate by milk of lime, and the calcium salt is then decomposed with sulphuric acid. The impure oxalic acid is then purified by recrystallization.

It occurs in small, colorless, prismatic crystals, which are odorless and have a very sour taste; it is slightly efflorescent in dry air, fusible at 98° C. (208° F.), and entirely volatile at a red heat.

The crystals should dissolve in not less than eight to ten parts of distilled water at 15° C. (59° F.) (greater solubility indicating contamination with adherent nitric acid). It is soluble in 4.5 parts of absolute alcohol, and in 7 parts of alcohol, and almost insoluble in ether, chloroform, benzol, and benzin. It fuses in its water of hydration at 98° C. (208.4° F.), although continued exposure to a heat of 60° C. (140° F.) to 70° C. (158° F.) will render it perfectly anhydrous. Solutions of oxalic acid at 100° C. (212° F.) lose acid by sublimation, and at 157° C. (314.6° F.) it sublimes rapidly. If the heat rise to 160° C. (320° F.), much loss of acid occurs.

It combines with salifiable bases, and forms salts called oxalates. The most important of these are the three *potassium salts*,—*oxalate*, *bi-oxalate*, and *quadroxalate* (acid potassium oxalate plus free oxalic acid),

ammonium oxalate (used as a test), and *calcium oxalate*. The binoxalate and quadroxalate, both popularly called *salt of sorrel* or *essential salt of lemons*, are employed for removing iron moulds from linen, and act by their excess of acid, which forms a soluble salt with the ferric oxide constituting the stain.

This acid in solution combines readily with lime, and forms with it an insoluble white precipitate consisting of calcium oxalate, which is insoluble in an excess of oxalic or acetic acid, but is dissolved by dilute hydrochloric acid.

Uses.—This acid is used analytically in volumetric estimations, particularly of alkalis. It is valuable in this connection, because a pure acid may be easily obtained. The indications afforded are generally distinct, and the solution may be made quickly. (See Test-Solutions.)

The best antidote to poisoning by oxalic acid is a paste made by mixing prepared chalk or powdered chalk with water or lime water: it must be administered promptly and freely.

Products resulting from the Destructive Distillation of Cellulose and Lignin.

When wood is distilled in close vessels many products are obtained. These vary with the kind of wood used, the care used in the distillation, and the temperature at which the distillation is effected. When dry hard woods (oak, walnut, or beech) are distilled, about 25 per cent. of charcoal is obtained, the liquid portion amounts to about 53 per cent., whilst the remainder, 22 per cent., is represented by waste products, principally uncondensable gases, carbon dioxide, carbon monoxide, etc. The principal solid, liquid, and gaseous products are shown by the following list:

Solids.—Charcoal, inorganic salts, etc. **Liquids.**—1. Aqueous liquid, containing *acetic, formic, butyric, crotonic, capronic, propionic acids, acetone, methylic alcohol, furfural, methylamine, pyrocatechin*, and small quantities of empyreumatic oils and resins. 2. *Tarry liquid*, containing *toluol, xylool, cumol, methol, mesitylene, pseudocumol, phenol, cresol, guaiacol, creasol, phlorol, and methylcreasol, naphthalene, paraffin, pyrene, chrysene, retene, mesit.* **Gases.**—Carbon dioxide, carbon monoxide, marsh-gas, acetylene, ethylene, propene, and others. The most important products are charcoal, tar, acetic acid, acetone, methylic alcohol, and creasote. Of these, charcoal has been considered in Part III.

ACIDUM ACETICUM. U.S. Acetic Acid.

A liquid composed of 86 per cent. of absolute Acetic Acid [$\text{HC}_2\text{H}_3\text{O}_2$; 59.86] and 64 per cent. of water.

Preparation.—The best acetic acid for pharmaceutical and medical uses is now made by subjecting oak wood, cut into small billets, to a carefully regulated heat, the temperature being much less than that necessary to produce charcoal. The advantages are that the production of the empyreumatic substances which constitute the most objectionable impurities in the commercial acid is largely curtailed, the process being

at the same time more economical, as the residue of slightly darkened wood is more valuable than the completely charred carbon left by the ordinary process (see U. S. Dispensatory, 17th edition, p. 19).

Acetic acid is also made by distilling *vinegar*, a liquid made by the oxidation of dilute alcoholic liquids, such as cider, wine, etc. In Germany acetic acid is made by mixing alcohol with water in the proportion of eight parts of the former to ninety-two parts of the latter, and then pouring it upon beech-wood shavings, so that as it trickles through it is oxidized by the action of the air in contact. Aldehyde is an intermediate product in this process.

Acidum Aceticum. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.

	Fixed Impurities.		
	Empyreumatic Substances.		
	Sulphuric Acid.		
	Hydrochloric Acid.		
	Sulphurous or Formic Acid.		

Two strengths of acetic acid are found in commerce,—the official acid, which has the sp. gr. 1.048, and the No. 8 acid, as it is called, which is still very largely used: the latter has the sp. gr. 1.040, and is 20 per cent. weaker than the official acid. It is termed “No. 8” because it was formerly used in the proportion of one part in eight to make the ordinary diluted acetic acid, or distilled vinegar. The salts of acetic acid are termed acetates; they are all soluble in water, and may be recognized by heating with sulphuric acid, when the odor of

acetic acid will be developed; a neutral solution of an acetate is colored deep red by a solution of ferric chloride, and, if the mixture is boiled, a brownish-red oxyacetate is precipitated.

ACIDUM ACETICUM DILUTUM. U.S. Diluted Acetic Acid.

	Metric.	Old form.
Acetic Acid	100 Gm.	8 fl. oz.
Distilled Water	500 Gm.	42 fl. oz.
To make	600 Gm.	50 fl. oz.

Mix them.

This is the liquid which is used as the menstruum for the official vinegars (see page 436): it contains 6 per cent. of absolute acetic acid, $\text{HC}_2\text{H}_3\text{O}_2$, and has the sp. gr. 1.008. To neutralize 24 Gm. of Diluted Acetic Acid should require 24 C.c. of potassium hydrate V.S. (each C.c. corresponding to 0.25 per cent. of the absolute acid), phenolphthalein being used as indicator. Diluted acetic acid is superior to vinegar as a menstruum, because of its greater purity, more uniform strength, and freedom from color.

ACIDUM ACETICUM GLACIALE. U.S. Glacial Acetic Acid.

Nearly or quite absolute Acetic Acid.

Preparation.—This acid (which is termed “glacial” because of its glassy appearance at low temperatures) is made by fusing carefully fifty-four parts of pure crystallized sodium acetate; the residue is coarsely powdered, placed in a retort, mixed with forty parts of pure concentrated sulphuric acid, and distilled: the distillate is glacial acetic acid.

Acidum Aceticum Glaciale. U.S.	IMPURITIES.	TESTS FOR IMPURITIES.
A clear, colorless liquid, of a strong, vinegar-like odor, and a very pungent, purely acid taste. Somewhat below 15° C. (59° F.) the Acid becomes a crystalline solid. When crystallized by cold, it becomes liquid again at about 15° C. (59° F.). At 117°–118° C. (242.6°–244.4° F.) it boils, evolving inflammable vapors. When the Acid is cooled to a temperature as near as possible to 15° C. (59° F.), but yet in a liquid form, its specific gravity should not be higher than 1.058, corresponding to at least 99 per cent. of absolute acid. To neutralize 3 Gm. should require not less than 49.5 C.c. of potassium hydrate V.S. (each C.c. corresponding to 2 per cent. of the absolute acid), phenolphthalein being used as indicator.	Empyreumatic Substances.	Tint produced by adding 2 drops of decinormal potassium permanganate V.S. to 2 C.c. of the Acid diluted with 10 C.c. of water, contained in a clean glass-stoppered vial, should not be changed to brown within two hours.

The specific gravity of glacial acetic acid (100 per cent.) is 1.0553, and the specific gravity of 43 per cent. acid is nearly the same, 1.0552, whilst 80, 79, 78, and 77 per cent. acids have exactly the same density,

—namely, 1.0748. It will thus be seen that specific gravity cannot be relied upon as a criterion for strength. The glacial acid may, however, be distinguished from the 43 per cent. acid by adding 10 per cent. of water, when, if the density increases, the specimen is the stronger acid. (See Oudemans' table, U.S. Dispensatory, 17th ed., page 19.)

Uses.—Glacial acetic acid is a solvent for oil of lemon and other oils; it is used in the solution of ferric acetate, and, medicinally, it is a caustic and vesicant when applied externally. It is often sold in various disguises as a corn-solvent.

PIX LIQUIDA. U.S. Tar.

An empyreumatic oleoresin obtained by the destructive distillation of the wood of *Pinus palustris* Miller, and of other species of *Pinus* (nat. ord. *Coniferae*).

Tar is usually obtained as a by-product in the manufacture of charcoal or acetic acid (see page 775). It is thick, viscid, semi-fluid, blackish-brown, heavier than water, transparent in thin layers, becoming granular and opaque by age; having an acid reaction, an empyreumatic, terebinthinate odor, and a sharp, empyreumatic taste; slightly soluble in water, soluble in alcohol, in fixed or volatile oils, and in solution of potassa or of soda. The volatile products of tar are expectorant, and tar inhalations are often used. Externally, tar is stimulating, and is used in skin diseases.

Official Preparations.

- Syrupus Picis Liquidæ** . . . Made by washing 75 Gm. of tar, mixed with 100 Gm. of sand, with cold water, pouring 400 C.c. of boiling distilled water upon the residue, adding 100 C.c. of glycerin, filtering the solution, and dissolving 800 Gm. of sugar in the filtrate (see page 307). Dose, one to two fluidrachms (3.7 to 7.4 C.c.).
- Unguentum Picis Liquidæ** . . . Made by mixing 500 Gm. of tar with 125 Gm. of yellow wax and 375 Gm. of lard, straining, and stirring until cold.
- Tar Ointment.**

OLEUM PICIS LIQUIDÆ. U.S. Oil of Tar.

A volatile oil distilled from Tar.

Oil of tar is an almost colorless liquid when freshly distilled, but soon acquires a dark, reddish-brown color, having a strong, tarry odor and taste, and an acid reaction. Sp. gr. about 0.970. It is readily soluble in alcohol.

The constituents of oil of tar are complex and numerous (see page 775): the residue left after the distillation of tar is *black pitch*. The oil is preferred to tar for most medicinal uses, because the insoluble and inert substances have been separated.

OLEUM CADINUM. U.S. Oil of Cade.

[OLEUM JUNIPERI EMPYREUMATICUM.]

A product of the dry distillation of the wood of *Juniperus Oxycedrus* Linné (nat. ord. *Coniferae*).

Oil of cade is a dark brown, clear, thick liquid, having an empyreumatic odor and burning taste. Sp. gr. about 0.990. It is almost insoluble in water, only partially soluble in alcohol, but completely soluble in ether, chloroform, and carbon disulphide. Its uses in medicine are the same as those of tar and oil of tar.

CREOSOTUM. U. S. Creosote.

Preparation.—This is a product of the distillation of wood-tar, consisting mainly of the following phenols: *guaiacol*, or *oxyeresol*, $C_7H_8O_2$, boiling at $200^\circ C.$ ($392^\circ F.$), *creosol*, $C_8H_{10}O_2$, boiling at $217^\circ C.$ ($422.6^\circ F.$), *methyl-creosol*, $C_9H_{12}O_2$, boiling at $214^\circ C.$ ($417^\circ F.$) to $218^\circ C.$ ($424.4^\circ F.$), and *phlorol*, $C_8H_{10}O_2$, boiling at $219^\circ C.$ ($426.2^\circ F.$).

The lower oily layer which forms in the distillate from wood-tar is treated with potassium carbonate to neutralize the acid present. Fractional distillation is now resorted to, with alternate treatment of the distillate with sulphuric acid and solution of potassa to separate impurities; the liquid is finally distilled, and the portion coming over between $205^\circ C.$ ($401^\circ F.$) and $220^\circ C.$ ($428^\circ F.$) is considered to be creosote. Nearly all the liquid sold for and labelled "creosote" in the market is impure carbolic acid or coal-tar creosote. It may be distinguished from true wood creosote by the tests given below. The odor of each is distinctive and characteristic.

Creosotum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Other Solvents.
An almost colorless or yellowish-pinkish, highly refractive, oily liquid, turning to reddish-yellow or brown by exposure to light. It begins to boil at about $205^\circ C.$ ($401^\circ F.$), and most of it distils over between 205° and $215^\circ C.$ (401° – $419^\circ F.$). When cooled to $-20^\circ C.$ ($-4^\circ F.$) it becomes gelatinous, but does not solidify (difference from <i>carbolic acid</i>). It is inflammable, burning with a luminous, smoky flame. When applied to the skin, it produces a white stain.	Penetrating, smoky odor; burning, caustic taste; neutral or only faintly acid reaction. Sp. gr. not below 1.070 at $15^\circ C.$ ($59^\circ F.$).	At $15^\circ C.$ ($59^\circ F.$), 150 parts to a somewhat turbid liquid. Hot, 120 parts, forms a clear liquid which on cooling becomes turbid from the separation of minute oily drops. The filtrate from this yields a reddish-brown precipitate with bromine T.S. (distinction from <i>carbolic acid</i>).	Dissolves, in all proportions, in absolute alcohol, ether, chloroform, benzin, carbon disulphide, acetic acid, and fixed and volatile oils.
TESTS FOR IDENTITY.		IMPURITIES.	TESTS FOR IMPURITIES.
Creosote may be distinguished from carbolic acid by the following tests. Creosote does not coagulate albumen or collodion. If 1 volume of Creosote be mixed with 1 volume of glycerin, a nearly clear mixture will result from which the Creosote will be separated by the addition of 1 or more volumes of water. On adding to 10 C.c. of a saturated aqueous solution of Creosote 1 drop of ferric chloride T.S., the liquid acquires a violet-blue tint, which rapidly changes to greenish and brown, with formation, usually, of a brown precipitate. If 1 C.c. of Creosote be mixed with a warm, 20-per-cent. solution of potassium hydrate in absolute alcohol, a solid, crystalline mass will form upon cooling.		Neutral Oils. Coerulignol and some other high boiling constituents of Wood-tar.	On mixing 2 C.c. of Creosote with 8 C.c. of a 7.5-per-cent. solution of sodium hydrate, a clear, pale yellowish liquid results which becomes turbid when diluted with water, but clears up after 50 C.c. have been added. If 1 C.c. of Creosote be shaken with 2 C.c. of benzin and 2 C.c. of freshly prepared barium hydrate T.S., upon separating, the benzin should not be blue or muddy, and the aqueous layer should not have a red tint.

Uses.—Creosote is a powerful antiseptic. It is used as a caustic application, and is frequently applied upon cotton to exposed nerves in teeth, when it acts as a local anæsthetic. It is also hæmostatic when applied to bleeding surfaces. In the form of creosote water it is used internally to check nausea. When taken internally, undiluted, and in large doses, it is a powerful poison. The administration of mucilaginous drinks, and the prompt evacuation of the stomach by the stomach-pump, would be the best treatment, no antidote to poisoning by creosote being known. In phthisis it is given internally in doses of fifteen minims (1 C.c.) per day.

Official Preparation.

Aqua Creosoti. . . One-per-cent. aqueous solution of creosote (see page 289). Dose, one to two fluidrachms (3.7 to 7.4 C.c.).
Creosote Water.

Unofficial Products of the Destructive Distillation of Cellulose and Allied Substances.

Acetone, C_3H_6O .

Di-methyl-ketone.

Pyroacetic Spirit.

A colorless, limpid liquid, of a peculiar ethereal odor and a burning taste. It is an excellent solvent for nearly all resins, gums, camphor, and fats. Acetone occurs largely in some varieties of wood spirit, and is a constant product of the dry distillation of acetates; it is also obtained from the residue left after manufacturing aniline by the distillation of nitrobenzene with acetic acid and iron.

Acetophenone, C_6H_5O , or

$C_6H_5CO.CH_3$.

Hypnone. Phenyl-methyl-ketone.

Hypnotic. Dose, three to ten grains (0.19 to 0.6 Gm.).

Methylic Alcohol, CH_3HO .

It occurs among the products of the dry distillation of wood. The watery liquid is separated from the tar and distilled; then the first portion of the distillate is rectified over slaked lime, so as to remove acid, etc., and the product treated with sulphuric acid to remove tar and neutralize ammonia and methylamine, and, lastly, redistilled. It is a colorless, limpid liquid, of a peculiar odor, resembling alcohol and acetic ether, and of a warm taste. It is a good solvent for volatile oils, fats, and many resins.

Products resulting from the Natural Decomposition of Cellulose and Lignin and their Derivatives.

Coal is fossil fuel, which is found in the earth at various depths, and which has been formed by the decomposition of the cellulose, lignin, and other constituents of vegetable matter under the changing influences of moisture, temperature, and pressure to which it is subjected. The differences in the structure and composition of coal are undoubtedly due to the variations in these influences, as well as to the alterations in the character of the vegetable substances.

Coal-Tar.—Many valuable compounds have been contributed by recent researches to the arts and medicine from this formerly useless by-product. Coal-tar is a residue left after the dry distillation of bituminous coal in the process for making illuminating gas (see page 113). It is a very complex substance: its composition varies considerably with the temperature at which the distillation of the coal is effected, the yield of solid bodies and of gases being larger when the temperature is higher, while at a lower temperature the liquid portion of the tar is in increased amount. When coal-tar is submitted to distillation and rectification, it yields a brown, oily liquid, known technically as *light oil*, and consisting

of benzol, toluol, etc.; then a black liquid, *dead oil*, is obtained, which contains aniline, naphthalin, phenol, etc.; the residue in the still is pitch, sometimes called *asphalt*. The products may be arranged in three classes.

1. *Solids*.—Naphthalin, $C_{10}H_8$, methyl-naphthalin, $C_{11}H_{10}$, acetyl-naphthalin and diphenyl, $C_{12}H_{10}$, fluoren, $C_{13}H_{10}$, anthracen and phenanthren, $C_{14}H_{10}$, fluoranthen, $C_{15}H_{10}$, methyl-anthracen, $C_{15}H_{12}$, reten, $C_{16}H_{12}$, chrysen, $C_{18}H_{12}$, pyren, $C_{16}H_{10}$, and carbazol, $C_{16}H_{11}N$.

2. *Liquids*.—These may be neutral hydrocarbons, acids, and ethers of the same, or bases. The *neutral hydrocarbons* are benzol, C_6H_6 , toluol, C_7H_8 , methyl-toluol and iso-xylol, C_8H_{10} , pseudocumol and mesitylen, C_9H_{12} , and cymol, $C_{10}H_{14}$. The *acid constituents* are phenol, C_6H_5O , kresol, orthokresol, parakresol, and metakresol, C_6H_5O , phlorol, C_7H_5O , rosolic acid, $C_{20}H_{16}O_3$, pyrocatechin, $C_6H_5O_2$, and kresot, consisting of the methyl ethers of pyrocatechin and its homologues, $C_7H_5O_2$, $C_8H_{10}O_2$, and $C_9H_{12}O_2$. There are also present, probably in combination with the ammonia of the ammoniacal liquor, acetic, butyric, carbonic, hydrocyanic, sulphocyanic, and hydrosulphuric acids. The *bases* are ammonia, NH_3 , methylamine, CH_3NH_2 , ethylamine, $C_2H_5NH_2$, phenylamine, $C_6H_5NH_2$, pyridine, C_5H_5N , picoline, C_6H_5N , lutidine, C_6H_7N , collidine, $C_8H_{11}N$, leukoline, C_9H_7N , iridoline, $C_{10}H_9N$, kryptidine, $C_{11}H_{11}N$, acridine, $C_{12}H_9N$, coridine, $C_{10}H_{15}N$, rubidine, $C_{11}H_{17}N$, and viridine, $C_{13}H_{19}N$.

3. *Gases*.—(a.) *Illuminating gases*. Acetylen, C_2H_2 , ethylen, C_2H_4 , propylen, C_3H_6 , butylen, C_4H_8 , allylen, C_3H_4 , crotonylen, C_4H_6 , teren, C_5H_8 , and vapors of benzol, C_6H_6 , styrolene, C_8H_8 , naphthalin, $C_{10}H_8$, methyl-naphthalin, $C_{11}H_{10}$, fluoren, $C_{13}H_{10}$, fluoranthen, $C_{15}H_{10}$, propyl, $(C_3H_7)_2$, and butyl, $(C_4H_9)_2$.

(b.) *Heating and diluting gases*. Hydrogen, H_2 , marsh-gas (methane), CH_4 , and carbon monoxide, CO .

(c.) *Impurities*. Carbon dioxide, CO_2 , ammonia, NH_3 , cyanogen, $(CN)_2$, methyl-cyanide, CH_3CN , sulphocyanic acid, $CN.SH$, hydrogen sulphide, H_2S , carbon disulphide, CS_2 , carbon oxysulphide, COS , and nitrogen, N_2 .

NAPHTALINUM. U. S. Naphthalin.

$C_{10}H_8 = 127.7$.

[NAPHTALENE.]

A hydrocarbon obtained from coal-tar. It should be kept in well-stoppered bottles.

On subjecting coal-tar to distillation this substance passes over into the condensing vessels immediately after the naphtha.

Naphthalinum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Colorless, shining, transparent laminae. Slowly volatilized on exposure to air.	Strong, characteristic odor, resembling that of coal-tar; burning, aromatic taste; neutral reaction.	Insoluble, but when boiled with it the latter imparts a faint odor and taste to the water.	At 15° C. (59° F.), 15 parts. Boiling, Very soluble.	Very soluble in ether, chloroform, carbon disulphide, and fixed and volatile oils.

TESTS FOR IDENTITY.	IMPURITIES.	TEST FOR IMPURITIES.
Naphtalin volatilizes slowly at ordinary temperatures; rapidly when heated. It also volatilizes with the vapors of water or alcohol. At 80° C. (176° F.) it melts, and at 218° C. (424.4° F.) it boils. Its vapor is inflammable, burning with a luminous and smoky flame. When ignited, it is consumed, leaving no residue.	Contaminations derived from Coal-tar.	On shaking a small portion of Naphtalin with concentrated sulphuric acid, the acid should remain colorless, and should not acquire more than a pale reddish tint if the mixture be heated for five minutes on a water-bath.

Uses.—Naphtalin, or *coal-tar camphor*, is used almost exclusively as an insecticide, to prevent the ravages of moths in woollen clothing. For this purpose it has to a large extent replaced camphor.

NAPHTOL. U. S. Naphtol.

[BETA-NAPHTOL.]

A phenol occurring in coal-tar, but usually prepared artificially from naphtalin. Naphtol should be kept in dark amber-colored, well-stoppered bottles.

When naphtalin is digested with sulphuric acid, two acids are formed. When one of these (alpha-naphtalin sulphonic acid) is heated with sulphuric acid, the beta variety is formed; and when the latter is fused with an alkaline hydrate, beta-naphtol (the official naphtol) is produced.

Naphtol. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Colorless or pale buff-colored, shining, crystalline laminae, or a white, or yellowish-white, crystalline powder, permanent in the air. When heated, Naphtol sublimates easily. It is also volatilized with the vapors of alcohol or water. It melts at 122° C. (251.6° F.), and boils at 286° C. (546.8° F.). On ignition it is consumed, leaving no residue.	Faint, phenol-like odor, and a sharp and pungent but not persistent taste; neutral reaction.	At 15° C. (59° F.), 1000 parts. Boiling, 75 parts.	At 15° C. (59° F.), 0.75 part. Boiling, Very soluble.	Very soluble in ether, chloroform, or solutions of caustic alkalies.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
A cold, saturated, aqueous solution of Naphtol, when mixed with ammonia water, exhibits a faint bluish fluorescence. Chlorine or bromine water added to the aqueous solution produces a white turbidity, which disappears on adding ammonia water in excess. On adding about 0.1 Gm. of Naphtol to about 5 C.c. of an aqueous solution (1 in 4) of potassium hydrate, then about 1 C.c. of chloroform, and gently warming, the aqueous layer will acquire a blue tint, changing after a while to green and brown. Ferric chloride T.S. colors the aqueous solution of Naphtol greenish, and, after some time, causes the separation of white flakes, which turn brown upon the application of heat. A piece of pine wood dipped into an aqueous solution of Naphtol, and afterwards moistened with diluted hydrochloric acid, becomes green on exposure to daylight.	Naphtalin. Other Organic Impurities. Absence of, and distinction from, <i>alpha-naphtol</i> , which produces at once a crimson color, turning deep blue in the upper part of the zone on standing.	Naphtol should dissolve in 50 parts of ammonia water without leaving a residue, And the solution should not have a deeper tint than pale yellow. If 0.1 Gm. of Naphtol be mixed, in a test-tube, with 1 drop of syrup and 5 C.c. of water, and about 3 C.c. of concentrated sulphuric acid be then poured into the tube held in a slanting position, so that the liquids may form separate layers, a yellowish-brown color will appear at the zone of contact, which becomes darker on standing.

Uses.—Naphtol is used as an antiseptic in skin diseases. It retards the growth of bacteria, and has been given internally in doses of three to five grains (0.2 to 0.33 Gm.).

ACETANILIDUM. U. S. Acetanilid.

[PHENYLACETAMIDE.]

An acetyl derivative of aniline.

Acetanilid, or *antifebrin*, is made by heating a mixture of aniline and glacial acetic acid to the boiling point; the cooled, congealed residue is purified by sublimation or recrystallization.

Acetanilidum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
White, shining, micaceous, crystalline laminae, or a crystalline powder, permanent in the air.	Odorless, having a faintly burning taste; neutral reaction.	At 15° C. (59° F.), 194 parts. Boiling, 18 parts.	At 15° C. (59° F.), 5 parts. Boiling, 0.4 part.	In 18 parts of ether, easily soluble in chloroform.
TESTS FOR IDENTITY.		IMPURITIES. TESTS FOR IMPURITIES.		
When heated to 113° C. (235.4° F.), Acetanilid melts. Upon ignition, it is consumed without leaving a residue. When agitated with colorless, concentrated sulphuric acid, in a clean test-tube, it dissolves without imparting color to the liquid. On boiling 0.1 Gm. of Acetanilid for several minutes with 2 C.c. of hydrochloric acid, a clear solution results which, when mixed with 3 C.c. of a 5-per-cent. aqueous solution of carbofic acid, and afterwards with 5 C.c. of a filtered, saturated solution of chlorinated lime, acquires a brownish-red color, becoming blue upon supersaturation with ammonia.		Isonitril.	On heating about 0.1 Gm. of Acetanilid with a few C.c. of concentrated solution (1 in 4) of potassium or sodium hydrate, the characteristic odor of aniline becomes noticeable. On now adding chloroform, and again heating, the disagreeable odor of isonitril (which is poisonous) is evolved. A cold saturated, aqueous solution of Acetanilid, added to ferric chloride T.S., should not affect the color of the latter.	
		Aniline Salts and various Allied Substances.		

Uses.—Acetanilid is an antipyretic, reducing temperature, and in moderate doses producing diaphoresis. The dose is from five to ten grains (0.3 to 0.6 Gm.).

ACIDUM CARBOLICUM CRUDUM. U. S. Crude Carbofic Acid.

A liquid consisting of various constituents of coal-tar, chiefly cresol and phenol, obtained by fractional distillation.

Preparation.—That portion of the heavy oil obtained by distilling coal-tar which comes over between 165° C. (329° F.) and 190° C.

(374° F.) is technically called "dead oil," which name was given to this fraction of the crude distillate because it was formerly believed to have no value. When "dead oil" is redistilled, the product is crude carbolic acid: if the latter is redistilled, the first distillate is principally water, until the temperature of 165° C. (329° F.) is reached. From this point to 185° C. (365° F.) nearly pure and crystallizable phenol, or carbolic acid, will distil over, whilst the portion received between the temperatures of 185° C. (365° F.) and 195° C. (383° F.) will not crystallize, but will consist mainly of cresol and other phenols. At temperatures from 195° C. (383° F.) to 211° C. (411.8° F.), cresol, C_7H_8O , and xylene, $C_8H_{10}O$, are obtained. Crude carbolic acid consists of phenol, with small quantities of cresol and other phenols. According to Dr. Squibb, however, it is principally the second distillate above mentioned, from 185° C. (365° F.) to 195° C. (383° F.), and consists mainly of cresol.

Acidum Carbolium Crudum. U. S.	TESTS FOR IDENTITY.
<p>A nearly colorless or reddish-brown liquid, of a strongly empyreumatic and creosote-like odor; having a benumbing, blanching, and caustic effect on the skin or mucous membrane; slightly acid reaction in aqueous solution; gradually turning darker on exposure to air and light.</p>	<p>Bromine water produces, in an aqueous solution of Carbolic or Cresylic Acid, a white, flocculent precipitate. The crude Acid should not dissolve in less than 15 parts of water, nor should the solution have an alkaline reaction.</p> <p>If 50 volumes of the crude Acid be diluted with warm water and the mixture well shaken, cooled, and allowed to separate, the amount of undissolved impurities should not exceed 5 volumes, or 10 per cent. by volume of the crude acid.</p>

Uses.—Crude carbolic acid is a powerful antiseptic, and is largely used in hospitals and in domestic practice as a disinfectant. It is well adapted for this purpose; and if it is of the official quality, it is superior to pure carbolic acid, as cresol is known to be more energetic than phenol. For profuse use, two parts of crude carbolic acid should be thoroughly agitated with eighty-eight parts of water, and, after the mixture has been allowed to stand a short time, the solution filtered.

ACIDUM CARBOLICUM. U. S. Carbolic Acid.

A constituent of coal-tar, obtained by fractional distillation, and subsequently purified.

Preparation.—This valuable product is properly termed phenol, and it belongs to a well-marked class of hydrocarbons of which it is the type. It is made by distilling crude carbolic acid, and separating and purifying the distillate by repeated crystallizations. When perfectly pure, carbolic acid is devoid of the odor of creosote, but it has a peculiar aromatic odor, which is not disagreeable.

Acidum Carbolium. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Colorless, separate, or inter-laced, needle-shaped crystals, or a white, crystalline mass, sometimes acquiring a reddish tint, deliquescent on exposure to moist air. When gently heated, Carbolio Acid melts, forming a highly refractive liquid. When liquefied by a gentle heat and slowly cooled, under constant stirring, until partly recrystallized, the semi-liquid mass should show a temperature not lower than 35° C. (95° F.); boiling point should not be higher than 188° C. (370.4° F.). The crystals melt at 35°-42° C. (95°-107.6° F.), and boil at 181°-188° C. (357.8°-370.4° F.),—the higher melting and the lower boiling points being those of the pure and anhydrous acid. On continued heating the Acid is completely volatilized. The vapor of the Acid is inflammable.	Distinctive, slightly aromatic odor resembling that of creosote; when diluted, a sweetish taste, with a slightly burning after-taste; faintly acid reaction.	15 parts. 100 parts of the crystals are liquefied by the addition of about 8 parts of water. The solubility in water varies according to the degree of hydration of the Acid.	Very soluble.	Very soluble in ether, chloroform, benzol, carbon disulphide, glycerin, and fixed and volatile oils. Almost insoluble in bensin.
TESTS FOR IDENTITY.		IMPURITIES.	TESTS FOR IMPURITIES.	
Carbolic Acid coagulates albumen or collodion (difference from <i>creosote</i>). With bromine water its aqueous solution forms a white precipitate, which at first redissolves, but becomes permanent as more of the reagent is added, and appears crystalline under the microscope. On adding to 10 C.c. of a 1-per-cent. aqueous solution of the Acid 1 drop of ferric chloride T.S., the liquid acquires a violet-blue color which is permanent.		Creosote and Cresylic Acid.	One volume of cold, liquefied Carbolic Acid, containing 8 per cent. of water, forms, with 1 volume of glycerin, a clear liquid which is not rendered turbid by the addition of 3 volumes of water.	

QUANTITATIVE TEST.

If 0.039 Gm. of Carbolic Acid be tested by the method immediately following, there should be required for its complete conversion into tribromophenol not less than 24 C.c. of decinormal bromine V.S. (each C.c. of the volumetric solution corresponding to 4 per cent. of absolute Phenol).

Valuation of Carbolic Acid.—Dissolve 1.563 Gm. of the Carbolic Acid to be valued in a sufficient quantity of water to make 1000 C.c. Transfer 25 C.c. of this solution (containing 0.039 Gm. of the acid) to a glass-stoppered bottle having a capacity of about 200 C.c., add 80 C.c. of decinormal bromine V.S. (which is 5 C.c. more than would be required if the carbolic acid in the solution were absolute phenol, the excess being added to promote the formation and separation of tribromophenol), then 5 C.c. of hydrochloric acid, and immediately insert the stopper. Shake the bottle repeatedly in the course of half an hour, then remove the stopper just sufficiently to introduce quickly 5 C.c. of a 20-per-cent. aqueous solution of potassium iodide, being careful that no bromine vapor escape, and immediately stopper the bottle. Shake the latter thoroughly, remove the stopper and rinse it and the neck of the bottle with

a little water, so that the washings may flow into the bottle, and then add, from a burette, decinormal sodium hyposulphite V.S., until the iodine tint is exactly discharged, using towards the end a few drops of starch T.S. as indicator. Note the number of C.c. of decinormal sodium hyposulphite V.S. consumed. Deduct this from 80 (the number of C.c. of bromine V.S. originally added), and multiply the remainder by 4. The product will, approximately, represent the percentage of absolute Phenol in the Carbolie Acid tested.

Carbolic acid, as it is found in commerce, varies in the proportion of water that it contains, and a slight variation materially alters the melting and boiling points. The congealing point is regarded by Dr. Squibb as a better test of the quantity of real phenol present in a sample than the melting point; the congealing point should be between 29.4° C. (85° F.) and 38.5° C. (101° F.), and is ascertained by melting some of the acid in a beaker and stirring with a thermometer until it completely crystallizes. The mercury rises in the thermometer and remains constant for a considerable length of time during the congelation.

Uses.—Pure carbolic acid is largely used as an antiseptic; it is often found of two qualities, known as "No. 1 gold label" and "No. 2;" the former should be exclusively used in antiseptic surgery and for making preparations intended for internal use. It is a good practice to add one fluidounce of water to a pound of carbolic acid in the bottle, and warm the whole up on a water-bath until the solution is effected. The contents may then be used in a liquid form without the troublesome necessity of weighing the crystals.

Official Preparations.

Glyceritum Acidi Carbolici Made by mixing 20 Gm. of carbolic acid and 80 Gm. of glycerin. (See page 319.)
Unguentum Acidi Carbolici 5 Gm. of carbolic acid; 95 Gm. of ointment. (See Unguenta.)

RESORCINUM. U. S. Resorcin.

[RESORCINOL. METADIOXYBENZOL.]

A diatomic phenol. Resorcin should be kept in dark amber-colored vials.

Preparation.—Resorcin is usually prepared by fusing sodium benzol disulphonate with caustic soda; it may be made in several other ways, —by the destructive distillation of brazilin, or by the fusion of either galbanum, ammoniac, sagapenum, asafetida, or acroides with caustic potassa. Resorcin is a diatomic phenol isomeric with *pyrocatechin* and *hydroquinone*.

Resorcinum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Colorless or faintly reddish, needle-shaped crystals or rhombic plates. Resorcin acquires a reddish or brownish tint by exposure to light and air. When heated to a temperature between 110° and 119° C. (230° and 246.2° F.), Resorcin melts, a higher melting point indicating a greater degree of purity. At a higher heat it is completely volatilized.	Faint, peculiar odor; disagreeable, sweetish, and afterwards pungent taste. Neutral or faintly acid reaction.	At 15° C. (59° F.), 0.6 part.	At 15° C. (59° F.), 0.5 part.	Readily soluble in ether or glycerin. Very slightly soluble in chloroform.
		Boiling, Very soluble.	Boiling, Very soluble.	

TESTS FOR IDENTITY.	IMPURITIES.	TEST FOR IMPURITIES.
<p>On adding a few drops of ferric chloride T.S. to 10 C.c. of a dilute aqueous solution (1 in 200) of Resorcin, the liquid assumes a bluish-violet color.</p> <p>If 0.1 Gm. of Resorcin be dissolved in 1 C.c. of potassium hydrate T.S. and a drop of chloroform added, the mixture, upon being heated, will assume an intense crimson color. If a slight excess of hydrochloric acid be then added, the color will change to a pale straw-yellow.</p> <p>On cautiously heating 0.05 Gm. of Resorcin with 0.1 Gm. of tartaric acid and 10 drops of concentrated sulphuric acid, a thick, carmine-red liquid will be formed, becoming pale yellow when diluted with water.</p>	<p>Emphyreumatic Bodies.</p>	<p>A concentrated aqueous solution (1 in 2) of Resorcin should be colorless, and when gently heated should not emit the odor of phenol.</p>

Uses.—Resorcin is an antiseptic closely resembling carbolic acid in its physiological action. It is used mainly externally in various skin diseases. The dose of resorcin is two to three grains (0.13 to 0.19 Gm.).

ACIDUM SALICYLICUM. U. S. Salicylic Acid.

Preparation.—Although salicylic acid may be obtained from several natural sources, it is now obtained, according to Kolbe's patent, by treating sodium phenol (or carbolate) with carbon dioxide. For this purpose, the most concentrated caustic soda solution is evaporated with the corresponding amount of phenol to a dry powder; this is then heated to 100° C. (212° F.), while a stream of dry carbon dioxide is passed over it. The temperature is gradually raised to 180° C. (356° F.), and increased to 220° C. (428° F.) as soon as phenol distils over, and finally raised to 250° C. (482° F.), until no more phenol distils. In the retort, the half of the phenol used remains as sodium salicylate, while the other half has distilled over unchanged. The reaction is as follows:

The sodium salt thus obtained is dissolved in water, decomposed by hydrochloric acid, and the salicylic acid filtered off, washed, and crystallized out of hot water, or purified by sublimation in a current of superheated steam or dialyzed.

Acidum Salicylicum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Fine, white, light, prismatic, needle-shaped crystals, permanent in the air, free from odor of carbolic acid.	Having sometimes a slight aromatic odor; sweetish and slightly acid taste; acid reaction.	Cold, 450 parts. Boiling, 14 parts.	Cold, 2.4 parts. Boiling, Very soluble.	Soluble in 2 parts of ether, in 2 parts of absolute alcohol, and in 80 parts of chloroform.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>When heated to about 156° C. (312.8° F.), the Acid begins to melt, and is completely melted at 157° C. (314.6° F.); at about 200° C. (392° F.) it begins to sublime; at a higher temperature it is volatilised and decomposed with odor of carbolic acid, and without leaving more than 0.6 per cent. of fixed residue. The saturated, aqueous solution is colored intensely bluish-violet and violet-red, in high dilution, by ferric chloride T.S.</p> <p>On adding to a small portion of the Acid, in a test-tube, about 1 C.c. of concentrated sulphuric acid, then, cautiously, about 1 C.c. of methylic alcohol, in drops, and heating the mixture to boiling, the odor of methyl salicylate will be evolved.</p>	<p>Hydrochloric Acid.</p> <p>Iron, Carbolic Acid, or Coloring Matter.</p> <p>Readily Carbonised Organic Impurities.</p> <p>Carbolic Acid.</p>	<p>A solution of 0.5 Gm. of the Acid, in a clean test-tube, in 10 C.c. of alcohol, mixed with a few drops of nitric acid, should remain unaffected upon the addition of a few drops of silver nitrate T.S.</p> <p>A saturated solution of the Acid in absolute alcohol, when allowed to evaporate spontaneously in an atmosphere free from dust, should leave a perfectly white crystalline residue, without a trace of color at the points of the crystals.</p> <p>On treating about 0.5 Gm. of the Acid, in a clean test-tube, with 10 C.c. of concentrated sulphuric acid, no color should be imparted to the latter within fifteen minutes.</p> <p>If 1 Gm. of the Acid be dissolved in an excess of cold sodium carbonate T.S., the liquid agitated with an equal volume of ether, and the ethereal solution allowed to evaporate spontaneously, the residue, if any, should have no odor of carbolic acid.</p>

Uses.—Salicylic acid is an important product. It is used as an antipyretic, in doses of seventy-five grains, given in divided doses until the temperature is lowered. Its principal use is in rheumatism and gout, the dose being ten grains (0.6 Gm.). Three solid salts of the acid are official,—sodium, lithium, and physostigmine salicylates. The first is a very valuable salt, and is generally relied upon now for the internal administration of the acid. Methyl salicylate, or artificial oil of wintergreen, was added at the last revision of the U. S. Pharmacopoeia.

SALOL. U. S. Salol.

The salicylic ether of phenol.

Preparation.—Salol is prepared by heating salicylic acid with phenol in the presence of phosphorus pentachloride or phosphorus oxychloride; the elements of water are withdrawn by this action, and the phenyl group is caused to unite with the salicylate radical.

Salol. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A white, crystalline powder, permanent in the air. When heated to 42°–43° C. (107.6°–109.4° F.), Salol melts. When heated on platinum, it takes fire, and is consumed, leaving no residue.	Odorless, or having a faintly aromatic odor; almost tasteless; neutral reaction.	Almost insoluble.	At 15° C. (59° F.), 10 parts. Boiling, Very soluble.	Soluble in 0.3 part of ether. Readily soluble in chloroform, and in fixed or volatile oils.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>On warming a small portion of Salol with enough sodium hydrate T.S. to dissolve it, and then supersaturating the liquid with hydrochloric acid, salicylic acid will separate, and the odor of phenol will become perceptible.</p> <p>In an alcoholic solution of Salol, bromine water, added in excess, produces a white precipitate.</p> <p>On adding a few drops of dilute ferric chloride T.S., made by diluting the test-solution with 20 volumes of water to 10 C.c. of an alcoholic solution (1 in 50) of Salol, the liquid will acquire a violet tint. If, however, a few drops of the alcoholic solution of Salol be added to 10 C.c. of the diluted ferric chloride T.S., a whitish cloudiness, but no color, will be produced on shaking.</p>	<p>Uncombined Carbolic or Salicylic Acid.</p> <p>Sulphate or Phosphate. Chloride.</p>	<p>On shaking 1 Gm. of Salol with 50 C.c. of water, the filtrate should not be affected by ferric chloride T.S. previously diluted with 20 volumes of water.</p> <p>Nor by barium chloride T.S.,</p> <p>Nor by silver nitrate T.S.</p>

Uses.—Salol is used as an internal antiseptic, it being decomposed in the small intestine, when in contact with alkaline fluids, into carbolic and salicylic acids. The dose is from fifteen to thirty grains (0.97 to 2 Gm.).

Unofficial Products of the Destructive Distillation of Coal-Tar.

Acetylphenylhydrazin, $C_6H_5NH_2 \cdot NH \cdot CH_3CO$ (Pyrodin, Hydracetin).	Antipyretic. Powerful remedy. Dose, one-half to one grain (0.03 to 0.06 Gm.) per day.
Agathin, $C_6H_4(OH)CH = N \cdot N(CH_3) \cdot C_6H_5$, Salicyl- α -methyl-phenyl-hydrazone.	Antiseptic and anti-neuralgic. Dose, eight to ten grains (0.52 to 0.65 Gm.).
Aniline, C_6H_5N .	Prepared by treating an alcoholic solution of nitrobenzol with ammonia and hydrogen sulphide until a precipitation of sulphur takes place. The brown liquid is again saturated with hydrogen sulphide until sulphur ceases to be deposited. The liquid is then mixed with excess of acid, filtered, boiled, and then distilled with excess of caustic potash. A colorless, limpid, oily, inflammable liquid, of a peculiar wine-like odor and burning, aromatic taste. It is used chiefly in the preparation of aniline dyes.
Antipyrin (Phenyl-dimethyl-pyrazolon), $C_6H_5(CH_3)_2C_6H_4NH_2O$.	It is found as a white, crystalline powder which is very freely soluble in cold water. It gives an intense red coloration with ferric chloride; with nitrous acids or nitrites it turns emerald-green. It is one of the most successful of the antipyretics. Dose, fifteen to forty grains (0.9 to 2.6 Gm.).
Antiseptin (Asepsin, Monobromacetanilid, Parabromacetanilid), $C_6H_4Br \cdot NH(C_2H_5O)$.	Antipyretic, analgesic, and antiseptic. Dose, six to seven grains (0.40 to 0.46 Gm.).
Antithermin (Phenylhydrazin-levulinic Acid), $C_6H_5N_2H = C(CH_3) \cdot C_2H_5O_2$.	In colorless crystals, insoluble in cold water. Dose, three grains (0.2 Gm.).
Asaprol (Calcium α -mono-sulphonate of β -naphтол), $C_{10}H_7 \begin{cases} OH \\ SO_3 \\ SO_3 \\ OH \end{cases} > Ca$	Antipyretic, anti-rheumatic. Dose, fifteen to sixty grains (0.971 to 3.88 Gm.).
Benzol, C_6H_6 .	Obtained by subjecting coal-tar to fractional distillation. A thin, colorless, very inflammable liquid, having an aromatic odor. Nearly insoluble in water; soluble in alcohol, ether, etc. It is a valuable solvent. In Europe it is often termed <i>benzene</i> , and it is sometimes employed as a thermo-cautery.
Benzo-Naphtol (Benzoyl-Naphtol, Benzoate of Naphtol).	Antiseptic. Dose, four to eight grains (0.260 to 0.518 Gm.), repeated frequently.

Unofficial Products of the Destructive Distillation of Coal-Tar.—Continued.

Benzosol (Benzoyl-Guaiacol), $\text{C}_6\text{H}_5 \begin{cases} \text{OCH}_3 (1) \\ \text{OCO.C}_6\text{H}_5 (2). \end{cases}$	Dose, seven grains (0.5 Gm.).
Betol (Naphthalol), Salicylate of β -Naphtol, $\text{C}_{10}\text{H}_7\text{OH.COOC}_6\text{H}_5$.	Antiseptic, in place of salol. Dose, five to twenty grains (0.3 to 1.2 Gm.).
Borophenol. Chinoline, $\text{C}_9\text{H}_7\text{N}$.	Disinfectant. A combination of borax and carbolic acid. By mixing aniline, nitrobenzol, glycerin, and sulphuric acid, heating, then diluting with water and distilling to drive off nitrobenzol; on rendering the residue alkaline and distilling with steam, chinoline passes over. A colorless, mobile liquid, having a pungent, somewhat bitter-almond odor, and a bitter taste. Sp. gr. 1.081.
Chlorphenol, Monochlorophenol, $\text{C}_6\text{H}_4\text{Cl.OH}$.	Germicide and antiseptic. Used by inhalation, and as a local application.
Creolin.	Said to be an emulsion of cresol obtained by means of resin soap.
Cresol Iodide (Iosophan), $\text{C}_6\text{H}_4(\text{CH}_3)\text{OH}$.	A yellow powder, containing 80 per cent. of iodine. Soluble in alcohol, insoluble in water. Used as an external application in skin diseases, in the form of a solution or of an ointment.
Cresol-Naphtol.	A brown, viscous, tar-like liquid, having active germicide properties.
Cresotinic Acid (Cresotic Acid), $\text{C}_6\text{H}_3 \begin{cases} \text{CH}_3 \\ \text{OH} \\ \text{COOH} \end{cases}$.	The para-acid is used as an antipyretic and antirheumatic.
Dinitrocresol, $\text{C}_6\text{H}_3(\text{NO}_2)_2 \begin{cases} \text{CH}_3 \\ \text{OH} \end{cases}$.	"Saffron Substitute" is a mixture of the potassium salts of dinitro-, ortho-, and para-cresols.
Dioxynaphthalene, $\text{C}_{10}\text{H}_6\text{O}_2$.	Tonic. Dose, three grains (0.194 Gm.) a day.
Di-phenyl-methyl-pyrazole.	A substitute for antipyrin in the form of white needles, not very soluble in water or ether; easily soluble in alcohol and glacial acetic acid.
Dithio-salicylic Acid, $\text{C}_6\text{H}_3(\text{OH})\text{COOH.S} >$ $\text{C}_6\text{H}_3(\text{OH})\text{COOH.S} >$.	Antirheumatic. Dose, three grains (0.194 Gm.).
Eosin, $\text{C}_{20}\text{H}_2\text{Br}_4\text{O}_6$.	A bronze-colored, crystalline powder, obtained from the action of phthalic acid upon phenols. Eosin is largely used as a dye, and for making a brilliant red ink, by dissolving 5 grains in a fluidounce of water in which 10 grains of acacia have been dissolved.
Europhen, Di-isobutyl-ortho-cresol-iodide, $2 \left(\text{C}_4\text{H}_9 \begin{cases} \text{CH}_3 \end{cases} \right) \text{C}_6\text{H}_3\text{O}.\text{HI}$.	Microbicide. A local irritant. Dose, one-half to one and a half grains (0.03 to 0.1 Gm.). Used also hypodermically, dissolved in oil.
Fluorescin, $\text{C}_{20}\text{H}_{12}\text{O}_6$.	Yellowish-red or dark red powder. Soluble in alcohol with yellow-red color and green fluorescence.
Fuchsin (Rosaniline), $\text{C}_{20}\text{H}_{12}\text{N}_6$.	A non-volatile, colorless, bitter substance, produced whenever a mixture of aniline and toluidine is heated to about 180° C. with an oxidizing agent of moderate power, as, for example, arsenic acid. The solutions of some of its acid salts are used largely for dyeing silk and wool a magnificent crimson.
Gallacetophenol, $\text{C}_6\text{H}_3 \begin{cases} \text{OH}_2 \\ \text{CH}_2\text{CO} \end{cases}$.	Proposed as a substitute for pyrogallie acid as a local application.
Guaiacol (Oxyeresol) (Methyl Ether of Pyrocatechin).	Dose, one to one and one-half grains (0.06 to 0.1 Gm.).
Hydro-quinone, Hydrochinone, $\text{C}_6\text{H}_4(\text{HO})_2$.	Prepared by oxidising aniline with chromic acid mixture. Dose, five to ten grains (0.3 to 0.6 Gm.).
Hypnone (Acetophenone), $\text{C}_6\text{H}_5\text{O}$.	A colorless liquid, having an almond-like odor, insoluble in water or glycerin, soluble in alcohol and ether. Used as a hypnotic in doses of ten to twenty minims (0.6 to 1.2 C.c.).

Unofficial Products of the Destructive Distillation of Coal-Tar.—*Continued.*

- Ichthyol.**
A tarry-looking substance, obtained from a brownish mineral, containing animal residues of fish, etc., found in Sufeld, in Tyrol. Purified by distillation and treatment with sulphuric acid. Ichthyol has an herb-like odor, and is faintly alkaline. Used for skin diseases. Dose, ten to fifteen grains (0.6 to 0.9 Gm.).
In rhombic flakes. Melting at 181.5° C. Very slightly soluble in cold water, readily soluble in alcohol.
- Iodantifebrin,
Iodacetanilid,
C₆H₄INH(C₂H₅O).
Iodophenacetin (Iodophenine).
Oleum Suicini,
Oil of Amber.**
A powerful germicide.
Amber is a fossil resin of an extinct coniferous wood, found principally upon the Baltic coast. By destructive distillation an acid liquor containing succinic acid is produced, together with crude oil of amber: the latter is redistilled, and rectified oil of amber is the product. It is a pale yellow liquid, having an empyreumatic odor and a warm, acid taste. Sp. gr. 0.926. It is soluble in alcohol, and when mixed with fuming nitric acid acquires a red color and is subsequently converted into a brown resinous mass known as *artificial musk*.
Antiseptic, antipyretic. Poisonous.
- Orcin,
Dihydroxytoluene,
C₆H₃(CH₃)(OH)₂.**
**Orexin,
Phenyldihydrochinasolin Hydrochlorate,
C₆H₄ { CH₂N.C₆H₅
 N=CHHCl.**
Stomachic. Dose, four to seven grains (0.26 to 0.42 Gm.) two to three times a day.
- Orthin,
Orthohydrasin-paraoxybenzoate.**
A feeble antipyretic.
- Orychinasseptol (Diaphtherin),
C₆H₄(SO₂) { O-NH.C₆H₄(OH)
 { O-NH.C₆H₄(OH).**
A powerful antiseptic.
- α-Oxy-naphthoic Acid,
C₁₀H₆ { OH
 COOH.**
Antisympotic, disinfectant. Used in the form of a 5-per-cent. ointment.
- Phenacetin (Para-acet-phenetidin).**
Prepared by acting on para-phenetidin with glacial acetic acid. A valuable and largely used analgesic. Dose, ten to fifteen grains (0.6 to 0.9 Gm.).
- Phenolphthalein,
C₂₀H₁₄O₄.**
Prepared by digesting 10 parts phenol, 5 parts phthalic anhydride, and 4 parts concentrated sulphuric acid for several hours at 120°–130° C., then boiling the residuum with water to remove soluble matter. The resinous substance so left is boiled in benzol for purification. It is a yellowish-brown powder. The test-solution used as an indicator is prepared by dissolving 1 part phenolphthalein in 30 parts 90 per cent. alcohol.
- Phenylhydrazine,
C₆H₅.NH.NH₂.
Phthalic Acid,
C₈H₆O₄.**
Poisonous. Used as a test for sugar in urine.
- Picric Acid,
C₆H₃N₃O₇.**
Produced by heating salicylic acid with a mixture of sulphuric acid and potassium ferrocyanide, and, when the reaction is ended, treating the resulting mass with ether, which extracts the phthalic acid. It occurs in nacreous laminae or shining monoclinic prisms. Soluble in alcohol, ether, and benzol.
- Pyrazole,**
C₂H₄N₂ { CH=N
 |
 CH=CH } NH.
- Prepared by dissolving crystallized carbolic acid in strong sulphuric acid, and adding nitric acid to the resultant sulphophenic acid. It is purified by neutralizing with sodium carbonate and filtering to separate resin, then adding to the filtrate excess of sodium carbonate, when sodium picrate is precipitated. This salt is decomposed by sulphuric acid, and the picric acid crystallized. It is much employed for dyeing wool and silk yellow, also for staining wood.
Dose, fifteen to thirty grains (0.972 to 1.94 Gm.) daily.

Unofficial Products of the Destructive Distillation of Coal-Tar.—*Continued.*

- Pyridine,
 C_5H_5N .
Remedy for asthma. Five to twenty drops in two ounces of water may be used by an atomizer, or five drops may be inhaled directly. Dose, six drops, gradually increased to twenty-five, daily.
- Pyridine Nitrate,
 $C_5H_5N.HNO_3$.
Colorless needles. Easily soluble in water, less so in alcohol.
- Pyridine Sulphate,
 $(C_5H_5N)_2.SO_4H_2$.
Crystalline. Very soluble in water or in alcohol.
- Rosolic Acid
(Corallin).
Obtained by acting on commercial phenol with oxalic and sulphuric acids.
- Salicylamide,
 $C_6H_4 \begin{cases} OH \\ CONH_2 \end{cases}$.
Analgesic and antipyretic. Dose, three grains (0.194 Gm.).
- Salicyl Bromanilid (Antinervine).
Antipyretic and analgesic. Dose, five to ten grains (0.324 to 0.648 Gm.).
- Salipyrin,
Antipyrin Salicylate.
Antipyretic, antirheumatic, antineuralgic. Dose, seven to fifteen grains (0.45 to 0.97 Gm.), in capsule or tablet.
- Salol-Camphor.
A local anæsthetic, a mixture of salol and camphor.
- Salophen,
Acetylparamidophenyl-salicylate,
 $C_6H_4 \begin{cases} OH \\ COOC_6H_4NH(C_2H_5O) \end{cases}$.
Antirheumatic and intestinal antiseptic. Dose, forty-five to seventy-five grains during the day (2.9 to 4.85 Gm.).
- Sozolic Acid,
Orthophenolsulphonic Acid,
 $C_6H_4(HSO_3)OH$.
Antiseptic. A 33½-per-cent. solution is called aseptol.
- Succinic Acid,
 $C_4H_6O_4$.
Used with advantage in delirium tremens.
- Sulpho-Carbolic Acid
(Sulphophenic Acid),
 $C_6H_6SO_4$.
This substance is produced by the direct action of concentrated sulphuric acid upon carbolic acid. It is soluble in water and in alcohol. The acid is a decided antiseptic, and its solutions coagulate albumen.
- Tetrahydro- β -Naphthylamine,
 $C_{10}H_7.H_4.NH_2$.
A local mydriatic, used in from 1- to 5-per-cent. solution.
- Thalline (Tetrahydroparaquinanisol),
 $C_9H_8H_4N(OCH_3)$.
An antipyretic. The sulphate and tartrate are most used. The dose of either is from two to five grains (0.1 to 0.3 Gm.).
- Tribromphenol,
 $C_6H_3Br_3.OH$.
Antiseptic.
- Trichlorphenol,
 $(C_6H_3Cl_3OH)$.
Used in erysipelas, in the form of a glyceride containing 5 to 10 per cent., applied to the parts twice daily.
- Tropæolin.
Dye-color used as an indicator in volumetric analysis.
- Tumenol.
Used as a local application in eczema, in a 10-per-cent. solution.
- Xylol (Xylene),
 C_8H_{10} .
By treating the oily liquid separating from diluted crude wood-spirit and from the light oil of wood-tar or coal-tar, first with sulphuric acid, and afterwards subjecting these liquids to fractional distillation, collecting only that portion which distils between 136° and 140° C. (277° and 286° F.). A thin, colorless, oily liquid, resembling benzol. It has a burning taste. Soluble in alcohol. Dose, twenty to thirty grains (1.2 to 1.9 Gm.).

QUESTIONS ON CHAPTER XLIX.

THE CELLULOSE GROUP.

- What is cellulose? What is its formula in symbols? What is lignin?
- What are some other special forms of cellulose?
- Give an example of pure cellulose. Describe it, and give specific gravity.
- In what solution is it soluble, and to what purpose is this fact applied?
- When cellulose is treated with strong sulphuric acid, what change takes place?
- If the mixture be diluted with water and heated, what will be produced?
- How is parchment paper made, and for what is it used?
- When cellulose is treated with nitric acid, what is produced?
- Cotton—What is the Latin official name? What kind of cotton is meant?
- How is it obtained? For what purposes in pharmacy is cellulose used?
- Pyroxylin—What is the Latin official name? How is it made?
- What compounds are made by the action of nitric acid on cellulose?
- Explain the reactions which take place in their formation.
- What is celluloid? For what purposes is it used?
- Oxalic acid—Give its formula in symbols and molecular weight.
- How may it be made? Describe odor, taste, chemical reaction, and solubility.
- In combination with bases, what salts does it form?
- What are the most important of these salts?
- What is "salt of sorrel" or "essential salt of lemons"?
- How do these act in removing iron rust from linen?
- For what is oxalic acid used?
- In case of poisoning by oxalic acid, what is the best antidote?
- What is the result when wood is distilled in close vessels?
- From dry hard woods about what per cent. of charcoal is obtained, and about what per cent. of liquid products?
- Name some of the principal solid, liquid, and gaseous products.
- Of these products, which are the most important?
- Acetic acid—What is the official Latin name?
- How much absolute acetic acid does it contain? Give its formula in symbols and molecular weight.
- How is the best acid for medicinal purposes obtained?
- How is acetic acid made in Germany? Describe odor, taste, chemical reaction, and solubility. Give tests for its identity.
- How may the following impurities be detected?—viz.: Lead, copper, tin; iron; calcium; copper; acetic acid and fixed impurities; empyreumatic substances; organic substances; nitric acid; sulphuric acid; hydrochloric acid; sulphurous acid.
- What two strengths of acid are found in commerce?
- Why is one of them called No. 8?
- What is the specific gravity of each of these acids?
- What is the difference between the two kinds?
- What are the salts of acetic acid called? How may they be recognized?
- Diluted acetic acid—What is the Latin name? Give description and specific gravity.
- How is it made, and for what is it used?
- How much absolute acetic acid does it contain?
- Why is it superior to vinegar as a menstruum?
- Glacial acetic acid—What is the Latin official name? Give its formula in symbols and molecular weight.
- How is it made? Give rationale of process. Describe odor, taste, and chemical reaction. What is its specific gravity? How may its strength be tested?
- Can its specific gravity be relied on as a criterion of its strength? Why?
- How may the glacial acid be distinguished from the weaker acid having the same specific gravity?
- For what substances is glacial acetic acid a solvent? What are its uses?
- Tar—What is the Latin official name? What is it, and how is it obtained?
- Describe its physical properties. What are its uses?
- What official preparations are there of tar?
- Oil of tar—What is the Latin official name? How is it obtained? Give description and specific gravity.

What is black pitch?

Why is it generally preferred to tar for medicinal uses?

Oil of cade—What is its Latin official name? How is it obtained? Give description and specific gravity. What are its uses?

What is creosote, and of what phenols does it consist?

How is it obtained? Describe odor, taste, chemical reaction, and solubility.

How may it be distinguished from carbolic acid? What are its uses?

In case of poisoning by it, what would be the proper treatment?

What official preparation is there of creosote?

What is the strength of it, and what is the dose?

What is coal? Explain the differences in its structure and composition.

What is coal tar?

When coal tar is subjected to distillation and rectification, what products does it yield? 1. Solids; 2. Liquids; 3. Gases.

Naphtalin—What is its Latin official name? How is it obtained? Give description, tests, and uses.

Naphtol—What is its Latin official name? How is it obtained? Give description, tests, dose, and uses.

Acetanilid—What is its Latin official name? What other names are used for it? How is it made? Describe its appearance, tests, and solubilities. What are its medical properties? Give the dose.

What is crude carbolic acid? What is the Latin official name?

What is "dead oil"?

When dead oil is redistilled, what is the product?

Is this product uniform in composition?

Of what does it consist, and how may its constituents be separated?

According to Dr. Squibb, of what does crude carbolic acid mainly consist,

Describe odor, taste, and chemical reaction.

For what purpose and how is it used?

Carbolic acid—Give formula in symbols and molecular weight.

What is carbolic acid? Describe odor, taste, chemical reaction, and solubility.

Give tests for identity.

How may the following impurities be detected?—viz.: Creosote and cresylic acid; water. What is a good test of the quantity of phenol present?

Are the official tests for solubility in water and that for showing the amount of water present correct?

For what purpose is it used? What official preparation is there of it?

What is the strength of the ointment?

Resorcin—What is its Latin official name? What other names are given to it? How is it obtained? Describe its appearance, tests, and solubilities. What are its medical properties? Give the dose.

Salicylic acid—Give Latin name, formula in symbols, and molecular weight.

Describe Kolbe's patent process for obtaining it. Give rationale of the process.

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Hydrochloric acid; organic impurities and iron; foreign organic matter; carbolic acid.

What is the dose? What salts of this acid are official?

Salol—What is its Latin official name? What other name is sometimes used for it? How is it obtained? Describe its appearance, tests, and solubilities. What are its medical properties? Give the dose.

CHAPTER L

AMYLACEOUS AND MUCILAGINOUS PRINCIPLES AND THEIR PRODUCTS.

STARCH has the same chemical composition as cellulose, $C_6H_{10}O_5$, and is closely allied to it in its properties. Starch is stored up in plants in anticipation of future usefulness in the formation of their cell-walls, growing tissues, or other constituents. It exists in the form of granules, which in young and small plants appear to be always spherical; their shape subsequently becomes ovoid, lenticular, polyhedral, or irregular, and it is possible to identify the varieties of starch obtained from various plants, with the aid of the microscope, by the shape and size of the granules.

The granules consist of layers of different densities, arranged concentrically around a central point termed the hilum, which is usually at one end of the granule. Corn starch is official.

AMYLUM. U. S. Starch.

The fecula of the seed of *Zea Mays* Linné (nat. ord. *Gramineæ*).

Starch is present in many drugs, and is an important constituent of many vegetable foods.

Preparation.—Starch is made from potatoes by first grating them, and then pressing the soft mass upon a sieve, which separates the cellular substances and permits the starch granules to fall through. These must be thoroughly washed, the quality of starch depending largely upon the purity of the water that is used in washing it. In making starch from wheat or corn the gluten must be separated. This is generally done by permitting it to become sour and disintegrated through acetous fermentation; stopping the fermentation before the starch is affected. Upon the small scale, starch may be made from wheat flour by placing it in a fine linen bag and kneading it whilst a small stream of water is trickling on it. The starch is carried off with the water, whilst the gluten remains as a soft mass in the bag.

Starch by the action of diluted acids, diastase, or heat is converted into *dextrin*, a substance resembling gum in appearance and properties. *Dextrin* is largely dissolved by water, hot or cold, and forms a mucilaginous solution, from which it is precipitated by alcohol. Large quantities of dextrin are now made both here and abroad, and employed for various purposes in the arts, under the name of *artificial gum* or *British gum*. It is found in the market in the form of a white, brilliant powder, and in small masses or fragments resembling natural gum. It may be distinguished from gum arabic by the taste and smell of potato oil which it always possesses.

Starch is completely dissolved by calcium and zinc chlorides in concentrated solution. *Inulin*, $C_{12}H_{20}O_{10}$, is a substance closely allied to starch. It is found particularly in the plants belonging to the order Compositæ, as *Inula*, *Taraxacum*, etc. It has also been found, according to Kraus, in plants of the Campanulaceæ, Goodeniaceæ, Lobeliaceæ, and Stylidæ. It differs from starch in the following particulars: it is colored yellow by iodine, does not gelatinize with water, and is not found in plants in the form of granules having concentric layers like starch.

Amylum. U.S.	ODOR AND TASTE.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvent.
In irregular, angular masses, which are easily reduced to powder of a white color. Under the microscope appearing as granules, mostly very minute, more or less angular in form, and indistinctly striated, but with a distinct hilum near the centre.	Inodorous; tasteless.	Insoluble.	Insoluble.	Insoluble in ether.

TESTS FOR IDENTITY.

Triturated with cold water, it gives neither an acid nor an alkaline reaction with litmus paper. When boiled with water, it yields a white jelly having a bluish tinge, which, when cool, requires a deep blue color on the addition of iodine T.S. When completely incinerated, Starch should leave not more than 1 per cent. of ash.

Uses.—Starch was made official because it is used in making glycerite of starch. It is used externally as an absorbent, and is applied to the skin by dusting.

Official Preparation.

Glyceritum Amyli . . Starch jelly, made with 10 Gm. of starch, 10 C.c. of water, and 80 Glycerite of Starch. Gm. of glycerin (see page 319).

Unofficial Amylaceous Substances and Derivatives.

Acorn.	From the genus <i>Quercus</i> . Acorns contain besides starch a peculiar saccharine substance, <i>quercite</i> .
Bean.	From <i>Faba vulgaris</i> and <i>Phaseolus vulgaris</i> .
Barley.	<i>Hordeum distichon</i> . Contains 60 to 68 per cent. of starch, also gluten, gum, and sugar.
Canna.	From the rhizome of <i>Canna edulis</i> . Nat. Ord. Marantaceæ. Cannæ. Indigenous to Peru and Brasil. The starch granules are very large, and exhibit a glistening or satiny appearance. It forms a cloudy but very tenacious jelly with boiling water.
Cassava.	From the root of <i>Manihot utilisima</i> . Nat. Ord. Euphorbiaceæ. Habitat, Tropical America. The starch granules are about half the size of the potato granules, in somewhat translucent pieces, inodorous, having an insipid taste.
Tapioca.	
Manioc.	
Curcuma.	From the rhizome of <i>Curcuma longa</i> . Nat. Ord. Zingiberaceæ. Habitat, Southern Asia, cult. The starch granules are rather larger than those of maranta.
Turmeric.	
Maranta.	From the rhizome of <i>Maranta arundinacea</i> . Nat. Ord. Marantaceæ. Indigenous to West Indies and Tropical America. Prepared by removing the scales from the rhizome, mashing and grinding in a mill until reduced to a pulp, then suspending this in water, and separating the fibrous portion, either by hand or sieve; lastly, washing thoroughly, and drying with a gentle heat. The yield is from 13 to 20 per cent. of fecula. It forms an opaque jelly with concentrated hydrochloric acid.
Arrowroot.	
Oats.	From <i>Avena sativa</i> . Nat. Ord. Graminææ. Habitat, Asia, cult. The grain contains 64 to 66 per cent. of starch, besides protein compounds, fat, salts, etc.

Unofficial Amylaceous Substances and Derivatives.—Continued.

- Pea.** From *Pisum sativum*. It yields about 37 per cent. of starch.
- Potato.** From the tubers of *Solanum tuberosum*. Nat. Ord. Solanaceæ. Habitat, Europe and America. Prepared by drenching washed and rasped potatoes in a sieve with a continuous stream of cold water, allowing the liquid to stand for a short time, and washing repeatedly the granules which collect at the bottom of the liquid; lastly, drying carefully. The yield is about 20 per cent. It is largely used as an adulterant.
- Sweet Potato.** From *Convolvulus Batatas*. The yield of starch is about 16 per cent.
- Rice.** From *Oryza sativa*. Prepared by heating rice with weak soda-lye, which dissolves the nitrogenous impurities and leaves pure starch, then adding a solution of borax to facilitate the separation of the starch from the gluten. The yield is about 88 per cent.
- Rye.** From *Secale cereale*. The yield of starch is about 64 per cent.
- Sago.** From the pith of *Metroxylon Sagu*. Nat. Ord. Palmæ. Prepared by powdering the pith of the tree, washing with water to remove woody tissue and other impurities; lastly, drying carefully and granulating.
- Wheat.** From *Triticum vulgare*. Nat. Ord. Graminæ. Formerly official, now replaced by corn starch.
- Malt.** The seed of *Hordeum distichon* Linné (Nat. Ord. Graminæ), caused to enter the incipient stage of germination by artificial means and dried. When barley is steeped for two or three days in water, it swells, becomes somewhat tender, and the water is colored reddish-brown. If the water is drained off, and the barley is spread about two feet thick upon a floor (a stone floor is generally used), it heats spontaneously, and germination begins, the radicle making its appearance first. The growth of the grain is partially stopped at this stage by spreading it more thinly, and turning it over for two days. It is then raked into heaps and allowed to stand a day, when it becomes hot, and is subsequently thoroughly dried in a kiln by a slow, regulated heat. This is malt, and it differs in quality according as it is more or less soaked, drained, germinated, dried, or baked. It is distinguished by its color, being pale, amber, brown, or black malt, according to the degrees of heat used in drying it. The object of converting grain into malt is to change the starch, naturally present in the grain, into maltose, a peculiar kind of sugar, and dextrin. This is effected through the presence of diastase, a peculiar and powerful ferment, which is developed during the partial germination to which the grain is subjected in malting. A portion of the starch is always left unchanged by the process of germination, its conversion into maltose being completed during the heating in the kiln. The diastase which is developed is capable of converting into maltose much more starch than is contained in the grain in which it is produced: hence, if good malt be added to a certain quantity of unmalted grain, the starch in the latter may be also converted into maltose. Malt seldom contains diastase in larger proportion than two parts in a thousand. It is obtained by bruising fresh malt, adding about half its weight of water, expressing strongly, treating the viscid liquid thus obtained with sufficient alcohol to destroy its viscosity, then separating the coagulated albumen, and adding a fresh portion of alcohol, which precipitates the diastase in an impure state. To render it pure, it must be redissolved as often as three times in water, and precipitated by alcohol. Diastase is solid, white, tasteless, soluble in water and in weak alcohol, but insoluble in the latter fluid when concentrated. Though without action upon gum and sugar, it has the extraordinary property, when mixed, in the proportion of only one part to two thousand, with starch suspended in water, and maintained at a temperature of about 71.1° C. (160° F.), of converting that principle into dextrin and maltose. Although malt has been manufactured in large quantities for centuries for brewing purposes, it has only recently been employed in medicine, in the form of extracts of malt, malt foods, etc. Its usefulness in this connection is due to the fact that the amount of diastase present in good malt has the power of rendering soluble starchy substances which are taken into the stomach as food; and good preparations of malt are not only easily digested food-products themselves, but also actively aid in the digestion of other substances. Some of the commercial malt extracts consist of glucose colored with caramel and slightly flavored with extract of malt.
- Extractum Malti.** Made by macerating and digesting 100 parts of malt, first with cold water, and then with water warmed to a temperature not exceeding 55° C. (131° F.), straining the mixture, and evaporating the strained liquid in a vacuum or at a low temperature to the consistence of thick honey.
- Extract of Malt.**

CETRARIA. U. S. Cetraria. [ICELAND Moss.]

Cetraria islandica Acharius (class *Lichenes*).

This lichen is found in northern latitudes on both continents. It contains 70 per cent. of *lichenin*, $C_{12}H_{20}O_{10}$, a substance which is allied to starch, and which swells up when soaked in water; about 3 per cent. of *cetraric acid*, $C_{18}H_{16}O_8$, a very bitter crystalline body; *lichenstearic acid*, $C_{14}H_{24}O_4$; sugar, oxalic acid, fumaric acid, and cellulin.

Uses.—It is used as a demulcent and nutritive when made into a jelly or decoction.

Official Preparation.

Decoction Cetrariae. . . . Made by macerating 50 Gm. of cetraria in 400 C.c. of water, expressing and throwing away the liquid (this is done to separate the bitter principle cetraric acid), then boiling the cetraria with 1000 C.c. of water, straining, and making the product up to 1000 C.c. The bitter principle may be more effectually separated by boiling the cetraria with an alkaline solution (see page 352).

CHONDRUS. U. S. Chondrus. [IRISH MOSS. CARRAGEEN.]

Chondrus crispus Stackhouse, and *Gigartina mamillosa* J. Agardh (class *Algae*).

This alga grows in the Atlantic Ocean. It contains 70 per cent. of a mucilaginous principle, which has been termed *carrageenin*. This differs from *gum* by not precipitating with alcohol, from *starch* by not becoming blue upon the addition of iodine, and from *pectin* by not being precipitated by lead subacetate.

Uses.—Chondrus is used principally to form a sick-diet jelly, one part being sufficient to form a jelly with sixty parts of water. It should be previously soaked in a small quantity of water, to dissolve adherent salts, and this water thrown away.

Gums and Mucilaginous Substances.

The proximate principle *arabin* (formerly termed gum) may be described as a vegetable substance, which forms with water a thick glutinous liquid, is insoluble in alcohol, and, when treated with nitric acid, is converted into mucic and oxalic acids. Three proximate principles are found in gums: 1. *Arabin*, or Arabic acid, $C_{12}H_{22}O_{11}$, the soluble form, found largely in acacia. 2. *Bassorin*, $C_{12}H_{20}O_{10}$, or insoluble gum, found in tragacanth. 3. *Cerasin* (insoluble), found in cherry gum.

Some exudations are composed of both soluble and insoluble gum. Vegetable mucilage and insoluble gum appear to be "degradation products," or compounds produced by subsequent changes in the substance of the organized structures of plants, which are of no further use to the plant in the work of building up new cell-walls. *Gums* differ from *starch*, or *cellulin*, by being soluble in water, or by swelling up in contact with it. They differ from sugars by being incapable of vinous fermentation with yeast. There will be frequent occasion to refer to the uses of gum in the subsequent chapters.

ACACIA. U. S. Acacia. [GUM ARABIC.]

A gummy exudation from *Acacia Senegal* Willdenow (nat. ord. *Leguminosæ*).

This valuable gum consists mainly of arabic acid, or arabin, combined with lime, potassa, or magnesium, and hence it may be called calcium, potassium, or magnesium arabate. It is in roundish or amorphous pieces, or irregular fragments, of various sizes, more or less transparent, hard, brittle, pulverizable, and breaking with a shining fracture. It is usually white, or yellowish white, but frequently presents different shades of red, and is sometimes of a deep-orange or brownish color. It is bleached by exposure to the sun. In powder it is always white. It is inodorous, has a feeble, slightly sweetish taste, and when pure dissolves wholly in the mouth. The sp. gr. varies from 1.31 to 1.525 for the dried gum.

The gum dissolves at ordinary temperatures slowly, in an equal weight of water, forming a thick glutinous liquid of distinctly acid reaction. It is insoluble in alcohol, ether, and the oils. One hundred parts of diluted alcohol containing 22 per cent. of alcohol by volume dissolve fifty-seven parts of gum, diluted alcohol containing 40 per cent. of alcohol takes up ten parts, whilst 50 per cent. alcohol dissolves only four parts.

Neutral lead acetate does not precipitate its aqueous solution, but the basic acetate forms even in a very dilute solution a precipitate. Soluble silicates, borates, and ferric salts render solution of gum turbid, or thicken it to a jelly. No alteration is produced by silver salts, mercuric chloride, or iodine. Gum dissolves in an ammoniacal solution of cupric oxide.

Uses.—In pharmacy, acacia is extensively used for the suspension of insoluble substances in water, and for the formation of pills and troches. Two kinds of powdered acacia are used, one a coarse powder called *granulated*, the other *finely dusted*. The granulated dissolves more readily in water, because it has lost during desiccation only a part of its moisture, whilst in preparing the “finely dusted” powder the high heat necessarily used to dry it thoroughly, drives off nearly all the water. Its easy solubility and its absence of tendency to form “lumps” cause the coarse powder to be preferred for solutions, emulsions, etc.

Official Preparations.

- Mucilage Acaciae** . . . Made by dissolving 340 Gm. of acacia in 660 Gm. of cold water, preferably made by circulatory solution (see Fig. 302, page 253).
Mucilage of Acacia.
Syrupus Acaciae . . . Made by mixing 25 C.c. of mucilage of acacia with 75 C.c. of syrup (see page 300). The mucilage must be freshly made and free from acidity. The syrup does not keep well.
Syrup of Acacia.

TRAGACANTHA. U. S. Tragacanth.

A gummy exudation from *Astragalus gummifer* Labillardière, and from other species of *Astragalus* (nat. ord. *Leguminosæ*).

This gum upon analysis was found to consist of 33 per cent. of basorin, or insoluble gum, 53 per cent. of soluble gum (not arabin), 11 per cent. of water, and 3 per cent. of impurities.

Tragacanth is either in flaky, leaf-like pieces, or in tortuous vermicular filaments, of a whitish color, somewhat translucent, and resembling

horn in appearance. It is hard and more or less fragile, but difficult of pulverization, unless exposed to a freezing temperature, or thoroughly dried, and powdered in a heated mortar. Tragacanth has no smell, and very little taste. Its sp. gr. is 1.384. Introduced into water, it absorbs a certain proportion of that liquid, swells very much, and forms a soft adhesive paste, but does not dissolve. If agitated with an additional quantity of water, this paste forms a uniform mixture; but in the course of one or two days the greater part separates, and is deposited, leaving a portion dissolved in the supernatant fluid. The gelatinous mass is tinged blue by iodine T.S., and the fluid portion is not precipitated on the addition of alcohol. Tragacanth is wholly insoluble in alcohol. It appears to be composed of two different constituents, one soluble in water and resembling acacia, the other swelling in water, but not dissolving. The former differs from acacia in affording no precipitate with potassium silicate or ferric chloride.

Official Preparation.

Mucilage Tragacanthæ . . . Made by mixing 18 Gm. of glycerin with 75 C.c. of water, heating to boiling, adding 6 Gm. of tragacanth, macerating, making the weight up to 100 Gm., and then straining forcibly through muslin (see page 314).
Mucilage of Tragacanth.

ULMUS. U. S. Elm. [SLIPPERY ELM.]

The inner bark of *Ulmus fulva* Michaux (nat. ord. *Urticaceæ*).

This bark contains a mucilage which is capable of being precipitated by alcohol and lead acetate from its aqueous solution. It is much used as a demulcent.

Official Preparation.

Mucilage Ulmi . . . Made by digesting 6 Gm. of bruised elm in 100 C.c. of water (see page 315).
Mucilage of Elm.

SASSAFRAS MEDULLA. U. S. Sassafras Pith.

The pith of *Sassafras variifolium* (Salisbury) O. Kuntze (nat. ord. *Laurineæ*).

This pith contains a delicate mucilage, which is not precipitated from its aqueous solution by alcohol. It is used for making the official mucilage, which is principally employed as an eye-wash.

Official Preparation.

Mucilage Sassafras Medullæ . . . Made by macerating 2 Gm. of sassafras pith in 100 C.c. of water and straining (see page 314).
Mucilage of Sassafras Pith.

ALTHÆA. U. S. Althæa. [MARSHMALLOW.]

The root of *Althæa officinalis* Linné (nat. ord. *Malvaceæ*).

This root, which is generally imported from Europe, contains a large quantity of mucilage, $C_{12}H_{20}O_{10}$, associated with *asparagin*, sugar, and starch. It is used solely as a demulcent.

Official Preparation.

Syrupus Althææ. . This syrup is made by pouring 400 C.c. of cold water, previously mixed with 30 C.c. of alcohol, on 50 Gm. of cut althæa, macerating for one hour, then straining through flannel without expressing; 700 Gm. of sugar are added to the liquid and dissolved by agitation without heat; 100 C.c. of glycerin are then added, and enough water to make 1000 C.c. (see page 302).

Syrup of Althæa.

LINUM. U.S. Linseed. [FLAXSEED.]

The seed of *Linum usitatissimum* Linné (nat. ord. *Lineæ*).

Linseed contains 15 per cent. of mucilage, $C_{12}H_{22}O_{10}$, in the epithelium, and from 20 to 35 per cent. of fixed oil in the nucleus, besides resin, sugar, wax, etc. The mucilage is soluble in water, but more readily in hot water, forming a thick, viscid liquid. Alcohol and lead subacetate precipitate it from its aqueous solution. The mucilage is an important constituent; the seed is used in its unground state for making a demulcent infusion. Ground flaxseed is very useful to the pharmacist for making lutes, and, medicinally, it is used for making poultices. The fixed oil present is very valuable because of its drying properties. (See *Oleum Lini*.)

Unofficial Mucilaginous Substances.

Bael-fruit.	The dried, half-ripe fruit of <i>Egle Marmelos</i> . Nat. Ord. <i>Aurantiacææ</i> . Habitat, Himalaya Mountains. Used principally in dysentery. Dose of fluid extract, 1 to 2 fluidrachms.
Baobab.	From <i>Adansonia digitata</i> . Nat. Ord. <i>Sterculiacææ</i> . Habitat, Tropical Africa. Used as a tonic.
Benne Leaves.	From <i>Sesamum Indicum</i> . Nat. Ord. <i>Pedaliacææ</i> . Habitat, India. Used as a stimulant.
Blue-weed.	From <i>Echium vulgare</i> . Habitat, Europe. Used chiefly as an emollient and protective.
Borage.	From <i>Borago officinalis</i> . Nat. Ord. <i>Boraginacææ</i> . Habitat, Southern Europe. Used chiefly as an emollient and protective.
Cashew-nut.	From <i>Anacardium occidentale</i> . Nat. Ord. <i>Terebinthacææ</i> . Habitat, Tropical America. Used externally and as a vermifuge.
Comfrey-root.	The root of <i>Symphytum officinale</i> . Nat. Ord. <i>Boraginacææ</i> . Habitat, Europe. Used as a demulcent and astringent.
Cydonium, Quince Seed.	The seed of <i>Cydonia vulgaris</i> . Nat. Ord. <i>Rosacææ</i> . Used for <i>Mucilago Cydoniæ</i> , 2 per cent. quince seed, 98 per cent. water.
Evening Primrose.	From <i>Oenothera biennis</i> . Nat. Ord. <i>Onagracææ</i> . Habitat, North America.
Fenugreek.	The seeds of <i>Trigonella Fœnum-græcum</i> . Nat. Ord. <i>Leguminosææ</i> . Habitat, Western Asia. Used as an emollient.
Hog Gum.	From <i>Rhus metopium</i> . Habitat, South America. Used as a demulcent.
Hound's Tongue.	From <i>Cynoglossum officinale</i> . Habitat, Europe and United States. Used as an emollient and protective.
Jujube Berries.	The fruit of <i>Zizyphus vulgaris</i> . Nat. Ord. <i>Rhamnacææ</i> . Habitat, Asia Minor. Used as a laxative.
Laminaria.	From <i>Laminaria Cloustoni</i> . Nat. Ord. <i>Algææ</i> . Habitat, North Atlantic Ocean.
Lungwort.	From <i>Pulmonaria officinalis</i> . Habitat, Europe.
Maidenhair.	The fronds of <i>Adiantum Capillus-Veneris</i> . Nat. Ord. <i>Filices</i> . Used as a demulcent and stimulant.
Mesquite Gum.	From <i>Algarobia glandulosa</i> . Habitat, Texas.
Mullein.	The leaves and flowers of <i>Verbascum Thapsus</i> . Nat. Ord. <i>Scrophulariacææ</i> . Habitat, North America. Used as a demulcent.
Okra.	From <i>Hibiscus esculentus</i> . Habitat, Africa.
Salép.	From the tubers of <i>Orchis mascula</i> . Is very mucilaginous, only four grains being sufficient to make one fluidounce of water gelatinous.
Virginia Lungwort.	From <i>Pulmonaria Virginica</i> . Habitat, United States.
Willow Herb.	From <i>Epilobium angustifolium</i> . Nat. Ord. <i>Onagracææ</i> . Used as a tonic and demulcent.

QUESTIONS ON CHAPTER L.

AMYLACEOUS AND MUCILAGINOUS PRINCIPLES.

- What is starch? Give the Latin official name and description.
 What is its chemical composition?
 How is it made?
 What change takes place when starch is subjected to the action of diluted acids, diastase, or heat?
 Under what names is dextrin largely used in the arts? Describe its appearance.
 How may it be distinguished from gum arabic?
 In what solutions is starch soluble?
 What is the composition of inulin?
 Where is it found?
 In what particulars does it differ from starch?
 For what is starch used? Describe odor, taste, chemical reaction, and solubility.
 Give tests for identity.
 What are the official preparations of starch?
 Iceland moss—Give the Latin official name. Where is it found?
 What principles does it contain?
 What is its use?
 What official preparation of it is there?
 Irish moss—Give the Latin official name. Where does this alga come from?
 What principle does it contain?
 Wherein does this principle differ from gum?
 Wherein does this principle differ from starch?
 Wherein does this principle differ from pectin?
 For what is chondrus used?
 What is arabin?
 What three proximate principles are found in gums?
 In what gums are these principles found?
 Wherein do gums differ from starch or cellulin?
 Wherein do gums differ from sugars?
 Gum arabic—What is the Latin official name? Describe odor, taste, and chemical reaction. What is its specific gravity?
 Of what does this gum mainly consist?
 Does neutral lead acetate precipitate its aqueous solution?
 Does basic lead acetate precipitate its aqueous solution?
 What action is produced by soluble silicates on ferric salts?
 What are its uses in pharmacy?
 What are the official preparations of acacia?
 Tragacanth—What is the Latin official name? Whence obtained?
 What are its constituents? What is its specific gravity?
 What color is produced when iodine T.S. is added to mucilage of tragacanth?
 Wherein does the portion soluble in water differ from acacia?
 What official preparation is there of tragacanth?
 Slippery elm—What is the Latin official name? Of what tree is this the bark?
 What does the bark contain?
 For what is it used?
 What official preparation is there of it?
 Sassafras pith—What is the Latin official name? Whence obtained?
 What does it contain, and for what is it used?
 What official preparation is there of it?
 Marshmallow—What is the Latin official name? What part is official?
 Where does it come from?
 What does it contain, and for what is it used?
 What official preparation is there of it?
 Linseed—What is the Latin official name? Whence obtained?
 What does it contain?
 For what purposes is it used?
 Why is the fixed oil especially valuable?

CHAPTER LI.

SUGARS AND SACCHARINE SUBSTANCES.

SUGARS may be defined as organic bodies having a sweet taste, generally of vegetable origin and crystallizable, of a neutral reaction, soluble in water, their solutions being optically active to polarized light. The term sugar is popularly applied to but one product, saccharose, the sweet substance obtained from sugar-cane, beets, sorghum, etc. There are, however, many sugars varying not only in external appearance and properties, but also in chemical composition. They may be divided into two classes: 1. Fermentable sugars, and, 2. Non-fermentable sugars.

1. **Fermentable Sugars.**—This is by far the more important class, as it embraces the sugars which are largely consumed in food-products. It will be found convenient to divide this class into two subclasses: *Glucoses*, or sugars *directly* subject to vinous fermentation, and *Saccharoses*, sugars *indirectly* subject to vinous fermentation. The following table shows these in detail:

Glucoses, $C_6H_{12}O_6$.

Glucose (Dextro-glucose, or Dextrose).	Rotates the plane of polarization strongly to the right. Obtained by treating starch with diluted sulphuric acid, neutralising the acid with lime, separating the calcium sulphate, and evaporating the solution.
Grape-Sugar (Crystallized Glucose).	Obtained by crystallizing the above-named solution.
Levulose (Lævo-glucose).	Rotates the plane of polarisation strongly to the left. Found in the sugar-cane, and may be obtained from molasses, or by heating inulin under pressure with water.
Maltose, $C_{12}H_{22}O_{11} + H_2O$?	Made by the action of diastase on starch.
Dulcitol.	Obtained by oxidizing dulcite with nitric acid.
Mannitol.	Found in muscular flesh.
Galactose.	Made by treating milk-sugar with diluted sulphuric acid.

Saccharoses, $C_{12}H_{22}O_{11}$.

Fermentable only after being converted into a sugar belonging to the class of glucoses.

Cane-Sugar (Saccharose).	Obtained from sugar-cane, beets, etc. (see Saccharum).
Parasaccharose.	Produced by spontaneous fermentation of cane-sugar
Milk-Sugar (Lactose, Lactin).	Obtained from milk (see Saccharum Lactis).
Myose.	Obtained from ergot; identical with trehalose.
Melezitose.	Obtained from manna found in Tasmania and Persia.
Melitose.	Obtained from various species of Eucalyptus.
Trehalose.	Obtained from the cocoons of <i>Larinus maculatus</i> .

2. **Non-fermentable Sugars.**—These are sometimes termed *saccharoids*. Some of them have the chemical composition of glucose.

Mannite, $C_6H_{14}O_6$.	Obtained from Manna and many other plants.
Dulcite, $C_6H_{14}O_6$.	Also called Melampyrite. Obtained from <i>Melampyrum nemorosum</i> .
Eucalyn, $C_6H_{12}O_6$.	Produced in the fermentation of melitose.
Inosite, $C_6H_{12}O_6$.	Obtained from muscular flesh.
Quercitose, $C_6H_{12}O_6$.	By decomposing quercitrin with diluted sulphuric acid.
Sorbite, $C_6H_{12}O_6$.	From <i>Sorbus aucuparia</i> ,—mountain-ash berries.
Erythromannite, $C_{12}H_{20}O_{12}$.	Obtained from <i>Protococcus vulgaris</i> , also called <i>Phycite</i> .
Isodulcite, $C_6H_{14}O_6$.	From quercitrin.
Pinite, $C_6H_{12}O_6$.	From <i>Pinus Lambertiana</i> .
Quercite, $C_6H_{12}O_6$.	Obtained from acorns.

Glucose, $C_6H_{12}O_6$, may be obtained from candied honey, from grapes, and from many other sources, but it is prepared from starch upon an immense scale by the action of very weak sulphuric acid. The term glucose is applied to the syrupy product of this process, while the name *grape-sugar* is applied to the solid product from the same source. The process is as follows. The corn is first soaked in warm water, and is then ground on specially-prepared stones with a stream of water. The meal is next passed into a trough, the bottom of which is made of fine bolting-cloth. Here the starch is washed through and led to large tanks, where it is allowed to settle. It is next beaten up with caustic soda to separate the gluten, and the starch is again allowed to settle in long shallow troughs. The starch, washed from all adhering alkali, is next beaten up with water into a cream, and conducted into the converting-tubs. Here the starch cream is treated with dilute sulphuric acid, and steam is allowed to bubble up through the mixture. This process of conversion, which is called "open conversion," is completed in about two hours. Another method is called "close conversion." The substances are enclosed in stout copper cylinders and subjected to the action of superheated steam. This process occupies about fifteen minutes. After conversion, the liquid is treated with marble-dust and animal charcoal. After neutralization, the liquid is filtered through cloth and animal charcoal, and is then conveyed to the vacuum-pan. When glucose syrup alone is desired, the process of conversion is stopped when the starch has disappeared, so that the syrup contains both glucose and dextrin, while, when solid grape-sugar is desired, the conversion is carried further to the change of dextrin into dextrose. Glucose can be obtained as a hydrate in small and laminated crystals from aqueous solution, and anhydrous in hard crystalline masses either from alcoholic solution or from very concentrated aqueous solution. It is less sweet than cane-sugar. It is also less soluble in water, and much more soluble in alcohol. It has the sp. gr. 1.54–1.57 when anhydrous. Strong mineral acids hardly act on grape-sugar, but destroy cane-sugar with facility. On the other hand, grape-sugar is destroyed by alkalies, with which cane-sugar forms definite compounds. Dissolved in water and subjected to prolonged ebullition, grape-sugar undergoes very little alteration. Its solution rotates the plane of polarization of polarized light to the right, and is capable of undergoing the vinous fermentation directly, without passing through any intermediate state. It is characterized, also, in boiling solution, by reducing alkaline cupric tartrate (see Test-Solution of Alkaline Cupric Tartrate), producing a reddish precipitate. Manufactured glucose may sometimes contain calcium sulphate, which

may be detected by adding a solution of barium chloride, which produces a white precipitate of barium sulphate.

SACCHARUM. U. S. Sugar.

[CANE SUGAR.]

The refined sugar obtained from *Saccharum officinarum* Linné, and from various species or varieties of *Sorghum* (nat. ord. *Gramineæ*); also from one or more varieties of *Beta vulgaris* Linné (nat. ord. *Chenopodiaceæ*).

Preparation.—Sugar is prepared commercially from the sugar-cane, beet-root, and sorghum. Formerly, sugar-cane was the only source; but at present the root of *Beta vulgaris* is largely used in Europe for making cane-sugar, and from the rapid growth of this industry there is a prospect of its supplanting all others. To prepare sugar the sugar-cane is crushed, and the juice, amounting to about 80 per cent., is expressed; this is then heated, a little lime and calcium bisulphite added, strained, and the liquid quickly evaporated, cooled, and stirred. The thick liquid is transferred to casks perforated at the bottom, and the crystals drained. Sugar made in this way is called "open pan" sugar. It is now almost completely displaced by "vacuum-pan" sugar.

In the production of raw sugars by the vacuum-pan process, the juice, after "defecation" with lime and removal of excess of lime by carbonic acid gas, is run through large filters of bone-black, and then into the vacuum-pan for concentration. The vacuum-pan is a large evaporating-pan, closed above by a dome-like top, which connects with an exhausting steam-pump, so that the liquid can be concentrated under very reduced pressure (see page 140). The heat is supplied by coils of steam-pipes which run through the interior of the pan. The saccharine juice is evaporated in this until it begins to crystallize, and even after this fresh portions are added, so that the crystals already formed grow by accretion of fresh material. After the crystallization is complete, the warm mixture of crystals and syrup is run into "centrifugals," to which a rapid revolution is given, and the crystals thus drained and dried.

Beet-root sugar is made in a similar manner, but is more troublesome to purify than that made from sugar-cane. The best sugar for pharmaceutical uses is known technically as "granulated." Loaf-sugar is generally pure, but if kept in a damp atmosphere it is liable to absorb moisture, and if kept in a very dry air it will lose weight. For making troches, *lozenge-sugar*, a very pure, finely-powdered sugar, may be had through dealers in confectioners' supplies. "*Pulverized*" sugar, as it is called, is unfitted for such a purpose.

Saccharum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvent.
White, dry, hard, distinctly crystalline granules, permanent in the air. The aqueous solution, saturated at 15° C. (59° F.), has the sp. gr. 1.345, and is miscible with water in all proportions.	Odorless; purely sweet taste; neutral reaction.	At 15° C. (59° F.), 0.5 part. Boiling, 0.2 part.	At 15° C. (59° F.), 175 parts. Boiling, 28 parts.	Soluble in 80 parts of boiling absolute alcohol, but insoluble in ether, chloroform, or carbon disulphide.

IMPURITIES.	TESTS FOR IMPURITIES.
Insoluble Salts, Ultramarine, Prussian Blue, etc.	Neither an aqueous nor an alcoholic solution of Sugar, kept in large, well-closed and completely filled bottles, should deposit a sediment on prolonged standing.
Grape-Sugar, and more than a slight amount of Inverted Sugar.	If a portion or about 1 Gm. of Sugar be dissolved in 10 C.c. of boiling water, then mixed with 4 or 5 drops of silver nitrate T.S. and about 2 C.c. of ammonia water, and quickly heated until the liquid begins to boil, not more than a slight coloration, but no black precipitate, should appear in the liquid after standing at rest for five minutes.

When sugar is crystallized in regular large monoclinic prisms, it is called *rock-candy*, and has the sp. gr. 1.606. The official test excludes sugar which contains ultramarine; this is often added by refiners to save the expense of using bone-black: a sugar not entirely free from yellow color can be blued by ultramarine, and the fault thus covered up, so that most consumers remain ignorant of the deception; when solution is attempted, however, it is discovered, for the syrup is never colorless, and a sediment is deposited. Sugar in dilute aqueous solution is converted into alcohol, carbon dioxide, and eventually acetic acid, if exposed to warm air.

Cane-sugar may be distinguished from grape-sugar by Trommer's test, which consists in the use of copper sulphate and caustic potassa. If a solution of cane-sugar be mixed with a solution of copper sulphate, and potassa be added in excess, a deep blue liquid is obtained, which on being heated deposits, after a time, a little red powder. A solution of grape-sugar, similarly treated, yields, by heat, a copious greenish precipitate, which rapidly changes to scarlet, and eventually to dark red. When heated to 185° C. (365° F.), cane-sugar melts into a viscid, colorless liquid, which on being suddenly cooled forms a transparent amorphous mass, called *barley-sugar*. At a higher temperature (between 204.4° C. and 215.5° C. (400° F. and 420° F.) it loses two molecules of water, and is converted into a very thick, black liquid, called *caramel*, which is used largely for coloring aqueous or hydro-alcoholic liquids. At a still higher heat it yields combustible gases, carbonic acid, empyreumatic oil, and acetic acid, and there remains one-fourth of its weight of charcoal, which burns without residue.

Uses.—Sugar is used principally in pharmacy for making syrups, troches, masses, confections, etc., as already noted.

Saccharures are preparations made by saturating sugar with tinctures, drying it, and then reducing the mixture to a fine powder.

Oleo-saccharures (Elæosacchara) are similar preparations made by incorporating one drop of a volatile oil with thirty grains of sugar: they form convenient modes of administering remedies to children.

MEL. U.S. Honey.

A saccharine secretion deposited in the honey-comb by *Apis mellifica* Linné (Class, *Insecta*; Order, *Hymenoptera*).

It is not known whether honey is secreted by the bee, or whether it exists ready formed in plants. The nectaries of flowers contain a

sweet substance, which is extracted by the insect. Large quantities of honey are obtained from California, the Southern States, and the West Indies. A still larger amount, however, is manufactured by flavoring and coloring artificial glucose. The official test ingeniously detects this adulteration through the barium chloride test. Artificial glucose nearly always contains a trace of calcium sulphate, which produces a slight precipitate of barium sulphate (see below).

Mel. U.S.	ODOR AND TASTE.	SOLUBILITY.
A syrupy liquid of a light yellowish or pale brownish-yellow color, translucent when fresh, gradually becoming crystalline and opaque. When recent honey is diluted with 2 parts of water, the resulting liquid is almost clear, not stringy, and should have a specific gravity not lower than 1.100 (corresponding to a specific gravity of 1.375 for the original honey).	Characteristic aromatic odor; sweet, faintly acid taste; faintly acid reaction.	Miscible with water and alcohol.

IMPURITIES.	TESTS FOR IMPURITIES.
Limit of Chlorides.	If 1 part of Honey be dissolved in 4 parts of water, a clear or nearly clear solution should result, which should not be rendered more than faintly opalescent by a few drops of silver nitrate T.S.
Sulphate.	If 1 part of Honey be dissolved in 4 parts of water, a clear or nearly clear solution should result, which should not be rendered more than faintly opalescent by a few drops of barium chloride T.S.
Glucose and Foreign Inorganic Substances.	If 1 volume of Honey be diluted with 1 volume of water and a portion of this liquid gradually mixed with 5 volumes of absolute alcohol, it should not become more than faintly opalescent (as compared with the reserved portion of the solution), and should neither become opaque, nor deposit a slimy substance at the bottom and along the sides of the test-tube. When incinerated in small portions at a time, in a platinum crucible, it should not leave more than 0.2 per cent. of ash.
Starch.	Five parts of water boiled with 1 part of Honey, and allowed to cool, should not be rendered blue or green on the addition of iodine T.S.

Uses.—Honey is used pharmaceutically in the class Mellita (page 312), and as a vehicle and excipient. Owing to the difficulty of obtaining pure honey in large cities and towns, its place in many official preparations has been filled by substituting syrup or glycerin. Purified honey is official as Mel Despumatum (see page 313).

MANNA. U.S. Manna.

The concrete, saccharine exudation of *Frazinus Ornus* Linné (Nat. Ord. *Oleaceæ*).

This substance, which is found in commerce of varying quality, is of a yellowish-white color externally; internally, white, porous, and crystalline. Its sp. gr. is 0.834. When pure, it is soluble in three parts of cold water and in its own weight of boiling water. It separates in crystalline masses from a boiling, saturated, aqueous solution. It is soluble in alcohol; boiling alcohol will dissolve fifteen per cent. of it, and upon cooling deposit beautiful crystals of mannite.

The principal constituent of manna is *mannite*, a peculiar, sweet principle, which is also found in many other plants.

Mannite is white, inodorous, crystallizable in semi-transparent needles, of a sweetish taste, soluble in five parts of cold water, scarcely soluble in cold alcohol, but readily dissolved by that liquid when hot, and de-

posited when it cools. Its composition is $C_6H_{14}O_6$, and it is considered as belonging to the class of *hexatomic alcohols*. It may be obtained by boiling manna in alcohol, allowing the solution to cool, and redissolving the crystalline precipitate: pure mannite is then deposited.

Uses.—Manna is used as a laxative, and often added to senna leaves to make a cathartic infusion. The dose is from one to two ounces (31 to 62 Gm.).

GLYCYRRHIZA. U. S. Glycyrrhiza.

[LIQUORICE ROOT.]

The root of *Glycyrrhiza glabra* Linné, and of the variety *glandulifera* (Waldstein et Kittabel) Regel et Herder (nat. ord. *Leguminosae*).

This well-known root contains the sweet principle *glycyrrhizin*, or *glycyrrhizic acid*, $C_{44}H_{88}NO_{18}$. This was found by Roussin to exist in the root in combination with ammonium. There is also present an oleoresinous substance which communicates to the root a slight acidity.

Uses.—Glycyrrhiza is valuable in pharmacy solely on account of the sweet principle. It is one of the most efficient substances known for masking the taste of bitter substances, like quinine sulphate, etc.

Official Preparations.

- Extractum Glycyrrhizæ** The commercial extract of the root, prepared by evaporating an aqueous extract and forming it into cylindrical rolls about six inches long (see page 450).
 Extract of Glycyrrhiza.
- Extractum Glycyrrhizæ Purum** . . Made by percolating glycyrrhiza with dilute solution of ammonia and evaporating the percolate to a pilular consistence (see page 450).
 Pure Extract of Glycyrrhiza.
- Pulvis Glycyrrhizæ Compositus** . . Made by mixing together 180 Gm. senna, 236 Gm. glycyrrhiza, 4 Gm. oil of fennel, 80 Gm. washed sulphur, and 500 Gm. sugar, all in fine powder.
 Compound Powder of Glycyrrhiza.
- Extractum Glycyrrhizæ Fluidum** . Made of the strength of 1 C.c. representing 1 Gm., with a menstruum consisting of 50 C.c. ammonia water, 300 C.c. alcohol, and 650 C.c. water (see page 408).
 Fluid Extract of Glycyrrhiza.

GLYCYRRHIZINUM AMMONIATUM. U. S. Ammoniated Glycyrrhizin.

	Metric.	Old form.
Glycyrrhiza, in No. 20 powder	500 Gm.	25 oz. av.
Water,		
Ammonia Water,		
Sulphuric Acid, each, a sufficient quantity.		

Mix 475 C.c. [old form 11 fl. oz. 192 min.] of Water with 25 C.c. [old form 288 min.] of Ammonia Water, and, having moistened the powder with the mixture, macerate for twenty-four hours. Then pack it moderately in a conical glass percolator, and gradually pour Water upon it until 500 C.c. [old form 12 fl. oz.] of percolate are obtained. Add Sulphuric Acid slowly to the percolate, with constant stirring, so long as a precipitate is produced. Collect this on a strainer, wash it with cold Water until the washings no longer have an acid reaction, redissolve it in Water with the aid of Ammonia Water, filter, if necessary, and again add Sulphuric Acid so long as a precipitate is produced. Collect this, wash it, dissolve it in a sufficient quantity of Ammonia Water previously diluted with an equal volume of Water, and spread the clear solution upon plates of glass, so that, when dry, the product may be obtained in scales.

The introduction of this preparation is the result of the very important researches of Z. Roussin, who noticed that *glycyrrhizin*, the sweet principle of liquorice root, was insipid when compared with the root itself, and inferred that it existed in a modified form in the root. Experiment showed that alkalies developed the sweet taste, and he ultimately proved that the alkali with which it was combined in the root was ammonia, and that glycyrrhizin played the part of an acid. Liquorice root which has lost a portion of its sweetness through fermentation and the development of acetic acid and precipitation of insoluble glycyrrhizin can be restored to its former sweetness if allowed to remain a sufficient length of time in an ammoniacal atmosphere.

Uses.—This compound is useful when mixed with bitter or disagreeable powders to mask their taste.

TRITICUM. U. S. *Triticum*. [COUCH-GRASS.]

The rhizome of *Agropyrum repens* (Linné) Beauvois (nat. ord. *Gramineæ*), gathered in the spring and deprived of the roots.

Triticum is usually found in the market cut into small sections. It contains *triticin*, a principle resembling inulin, also glucose, lævulose, etc. It is used as a diuretic and for its special action on the urinary organs.

Official Preparation.

Extractum Tritici Fluidum. . . Made with boiling water, concentrated by evaporation, and preserved by the addition of a mixture of 1 volume of alcohol and 3 volumes of water (see page 426).
Fluid Extract of Triticum.

QUESTIONS ON CHAPTER LI.

SUGARS AND SACCHARINE SUBSTANCES.

What are sugars?

To what is the term sugar popularly applied?

Into what two classes may sugars be divided?

Into what two sub-classes may fermentable sugars be conveniently divided?

What are glucoses, and what are saccharoses?

What are the non-fermentable sugars sometimes called?

Glucose—What is its formula in symbols?

How is it obtained on the large scale?

Is glucose more or less sweet than cane-sugar?

What is its specific gravity when anhydrous?

Wherein does the action of strong mineral acids and of alkalies upon glucose differ from their action upon cane-sugar?

In what direction does its solution rotate the plane of polarization of polarized light?

Is it capable of direct fermentation?

What effect has it in boiling solution upon alkaline cupric tartrate?

What impurity does it almost always contain?

How may this be detected?

Sugar—What is the Latin name?

Give its formula in symbols and molecular weight.

How is it prepared commercially?

What is the difference between the "open pan process" and the "vacuum process"?

What is the best sugar for pharmaceutical purposes?

Describe odor, taste, chemical reaction, and solubility.

How may the following impurities be detected?—viz.: Insoluble salts, foreign matters, ultramarine, Prussian blue, etc.; grape-sugar, and of more than a slight amount of inverted sugar.

What is the specific gravity of rock-candy?

What is the object of adding ultramarine to sugar?

What change takes place when sugar in dilute solution is exposed to warm air?

When cane-sugar is heated to 185° C. (365° F.), what change takes place, and what is formed?

At a higher temperature, 204.4° to 215.5° C. (400° to 420° F.), what change takes place?

At a still higher temperature what occurs?

For what purposes in pharmacy is sugar used?

What are saccharures?

What are oleo-saccharures (elæosacchara)?

Honey—Whence is it obtained?

Describe odor, taste, chemical reaction, and solubility.

How may the following impurities be detected?—viz.: Chloride; sulphate; glucose or other foreign admixtures; starch.

For what is honey used in pharmacy?

In what form is it official?

What is manna? What is its specific gravity?

What is its solubility in water? In alcohol?

What is the principal constituent of manna?

What are the physical properties of mannite?

What is its chemical composition, and to what class is it considered to belong?

How may it be obtained?

For what is manna used, and what is the dose?

Liquorice root—What is the Latin official name? Whence obtained?

What sweet principle does glycyrrhiza contain?

What is its chemical composition, and in what combination does it exist in the root?

To what does the root owe its acidity?

What are the official preparations of glycyrrhiza?

Ammoniated glycyrrhizin—What is the Latin official name?

How is it made?

What amount is obtained from glycyrrhiza?

What effect do alkalies have upon glycyrrhizin?

For what is this compound useful?

What is triticum, and how is it found in commerce?

What principles does triticum contain?

For what is it used?

What official preparation of triticum is there?

CHAPTER LII.

DERIVATIVES OF SUGARS THROUGH THE ACTION OF FERMENTS.

Fermentation.—When certain organic bodies are subjected to the action of water, air, and a warm temperature, decomposition takes place. This is accompanied by the presence of microscopic organisms, and the result is the formation of new products. When decomposition is followed by the production of worthless or offensive substances, it is termed *putrefaction*; when useful products are formed, the process is called *fermentation*.

Two prominent theories accounting for the phenomena of fermentation have been advanced,—one, in which the action is regarded as a chemical process, the presence of the microscopic bodies being considered unimportant; the other (which is now universally accepted) that fermentation is caused by the presence of the organisms.

Ferments may be divided into two classes: 1. Organized or physiological ferments, as yeast, mycoderms, torulas, etc.; 2. Unorganized or soluble nitrogenous ferments, like diastase, synaptase, myrosin, etc. Fermentation which is produced by the latter class has been termed *false fermentation*, and the ferments themselves called *cryptolytes*.

Vinous Fermentation.—Cane-sugar, as before stated, is capable of being decomposed by this process and converted into alcohol and carbon dioxide, but it will not undergo the vinous fermentation by itself. It requires to be dissolved in water, subjected to the influence of a ferment, and kept at a certain temperature. Accordingly, sugar, water, the presence of a ferment, and the maintenance of an adequate temperature must be deemed the prerequisites of the vinous fermentation. The water acts by giving fluidity, and the ferment and temperature by commencing and maintaining the chemical changes. The precise manner in which the ferment operates has not been positively determined; but the fermentative change seems to be intimately connected with the multiplication of a microscopic plant, *Torula cerevisiae*.

Beginning with the simple substances cellulose and starch, it will be found that, through the action of dilute acids and ferments, they may be converted into alcohol or acetic acid:

then

then

And if the action is not arrested, the acetous fermentation begins, resulting in the conversion of the alcohol into acetic acid through oxidation:

The most important derivative of sugar through the action of a ferment is alcohol: this is usually obtained from whisky by distillation. The distilled product of vinous liquors forms the different ardent spirits of commerce. When obtained from wine, it is called *brandy*; from fermented molasses, *rum*; from cider, malted barley, or rye, *whiskey*; from malted barley and rye-meal with hops, and rectified from juniper berries, *Holland gin*; from malted barley, rye, or potatoes, and rectified from turpentine, *common gin*; and from fermented rice, *arrack*. These spirits are of different strengths,—that is, contain different proportions of alcohol,—and have various peculiarities by which they are distinguished by the taste.

The compounds derived from sugars will be considered under the following subheads: 1. Ethyl hydrate and oxide and their preparations. 2. Preparations of the compound ethers of the ethyl and amyl series. 3. Aldehyd, its derivatives and preparations.

Ethyl Hydrate and Oxide and their Preparations.

The compounds containing the radical ethyl are the most important of those derived from organic substances, alcohol being the source of all.

Alcohol is regarded chemically as the type of a class of carbon compounds called alcohols, of which there are many important members. *They are the hydrates of the alcohol radicals* (ethyl hydrate, alcohol; amyl hydrate, amylic alcohol), just as slaked lime, or calcium hydrate, is the hydrate of the metal calcium.

Ethers are the oxides of these radicals, just as lime, or calcium oxide, is the oxide of the metal calcium.

Compound ethers are analogous to the salts of the metals, being formed by the decomposition of their alcohols by acids,—*i.e.*, ethyl nitrite, ethyl acetate, amyl nitrite,—just as potassium nitrate, sodium acetate, and calcium sulphate may be produced by decomposing the hydrates of their respective metals with acids. In each case water is formed as one of the results of the decomposition.

This may be shown by the reactions

SPIRITUS FRUMENTI. U. S. Whiskey.

An alcoholic liquid, obtained by the distillation of the mash of fermented grain (usually of mixtures of corn, wheat, and rye), and at least two years old.

Owing to the immense production of grain in this country, the cheapest sources of starch (corn, wheat, and rye) are used in making alcoholic liquids. The operations by which whiskey is obtained from grain are technically termed,—1. *Mashing*, by which the starch is converted into sugar. 2. *Fermentation*, or the production of the alcohol. 3. *Distillation*, or the separation of the crude spirit.

The crushed grain, mixed with malt, is added to water at 15.4° C. (60° F.), and allowed to stand, to permit the conversion of the starch into maltose, through the action of the diastase. The liquid is now termed the *wort*. This is caused to ferment by the addition of yeast, and alcohol is gradually formed, carbon dioxide escaping: the liquor is then distilled, the distillate being termed *low wines*. This is again distilled, and *raw whiskey* is the product. This upon keeping, especially in a warm room, improves in quality through the formation of compound ethers, which are supposed to communicate an agreeable flavor to the liquid.

Spiritus Frument. U. S.	IMPURITIES.	TESTS FOR IMPURITIES.
Whiskey has an amber color, a distinctive taste and odor, slightly acid reaction, and a sp. gr. not above 0.930 nor below 0.917, corresponding approximately with an alcoholic strength of 44 to 50 per cent. by weight, or 50 to 58 per cent. by volume.	Limit of Free Acid.	To render 100 C.c. of Whiskey distinctly alkaline to litmus should not require more than 1.2 C.c. of potassium hydrate V.S. If 100 C.c. of Whiskey be very slowly evaporated in a tared capsule on a water-bath, the last portions volatilized should not have a harsh or disagreeable odor, And the residue, when dried at 100° C. (212° F.), should not weigh more than 0.25 Gm. This residue should have no sweet or distinctly spicy taste. It should almost completely dissolve in 10 C.c. of cold water, forming a solution which is colored not deeper than light green by a few drops of dilute ferric chloride T.S., made by mixing the latter with 10 volumes of water.
	More than traces of Fusel Oil from grain.	
	Added Sugar, Glycerin, or Aromatic Substances.	
	More than traces of Oak Tannin from casks.	

Uses.—Crude whiskey is used as the source of alcohol. When purified and mellowed by age, it is used as a stimulant.

ALCOHOL. U. S. Alcohol.

A liquid composed of about 91 per cent., by weight, or 94 per cent., by volume, of Ethyl Alcohol [$C_2H_5OH = 45.9$], and about 9 per cent., by weight, of Water.

ALCOHOL ABSOLUTUM. U. S. Absolute Alcohol.

Ethyl Alcohol, containing not more than 1 per cent., by weight, of Water. Absolute Alcohol should be kept in well-stoppered bottles or tin cans, in a cool place, remote from lights or fire.

ALCOHOL DEODORATUM. Deodorized Alcohol.

A liquid composed of about 92.5 per cent., by weight, or 95.1 per cent., by volume, of Ethyl Alcohol [$C_2H_5OH = 45.9$], and about 7.5 per cent., by weight, of Water.

Preparation.—The natural sources of alcohol are starch and sugar as they exist in various plants, and alcohol, if pure, is the same from whatever source it is derived. It is generally made by distilling whiskey, and redistilling and rectifying the distillate in an apparatus termed an alcohol column and still. The yield of alcohol, sp. gr. .835, obtained from good whiskey is about 58 per cent. by volume. The principal impurity is *fusel oil*, or amylic alcohol. Alcohol may be deprived of odor by treating it with potassium permanganate and redistilling. *Absolute alcohol* is the name given to the strongest alcohol which can be made, and which is intended to be absolutely free from water. This is a difficult preparation to make, owing to the very strong affinity existing between the two liquids. The strongest alcohol that can be made by simple distillation contains 11 per cent. of water, and in order to separate the latter from it, it is necessary to use some substance having a still stronger affinity for water. This is found in recently-burned lime, and the method employed is to percolate the strongest and purest alcohol attainable through the lime, out of contact with air, and then to redistil the percolate in vacuo. In this way alcohol may be obtained having a sp. gr. as low as 0.79355 at 15.6° C. (60° F.). (Squibb.) Absolute alcohol is a colorless, volatile liquid, of an agreeable odor and a burning taste. It boils at 78.4° C. (173.1° F.), and is not congealed by a cold of 202° F. below zero. Its freedom from water may be ascertained by dropping into it a piece of anhydrous baryta, which will remain unchanged if the alcohol be free from water, but otherwise will fall to powder; or (a more delicate test) by its forming a clear solution when mixed with an equal bulk of pure benzol. Absolute alcohol should be free from fusel oil.

Alcohol. U. S.	IMPURITIES.	TESTS FOR IMPURITIES.
A transparent, colorless, mobile, and volatile liquid, of a characteristic and agreeable odor, and a burning taste. It boils at 78° C. (172.4° F.), and is readily inflammable, giving a blue flame without smoke. It should not change the color of blue or red litmus paper previously moistened with water. Miscible with water in all proportions, and without any trace of cloudiness; also miscible with ether or chloroform.	Fixed Impurities, or Coloring-Matter.	If 50 C.c. of Alcohol be evaporated to dryness in a glass vessel, no weighable residue or color should appear. On allowing Alcohol, mixed with one-third of its volume of water, to evaporate spontaneously from clean, odorless blotting-paper saturated with it, no odor of fusel oil, nor other foreign odor, should become perceptible. If 20 C.c. of Alcohol be shaken in a clean, glass-stoppered vial with 1 C.c. of silver nitrate T.S., the mixture should not become more than faintly opalescent, or acquire more than a faint brownish tint, when standing during six hours in diffused daylight. If 10 C.c. of Alcohol be mixed in a test-tube with 5 C.c. of potassium hydrate T.S., there should not be an immediate darkening of the liquid.
	Fusel Oil, or other Foreign Odor.	
	Amylic Alcohol, Organic impurities.	
	Methyl Alcohol, Aldehyde, and Oak Tannin.	

It burns with a pale flame without residue, the products being carbonic acid and water. Absolute alcohol consists of two atoms of carbon, six of hydrogen, and one of oxygen. Its empirical formula is, therefore, C_2H_6O . It is, however, recognized as the hydrate of the radical ethyl (C_2H_5), so that its rational formula would be C_2H_5HO .

Alcohol is official in four forms: absolute alcohol, sp. gr. 0.797; deodorized alcohol, sp. gr. 0.816; alcohol, sp. gr. 0.820 at $15^\circ C$. ($59^\circ F.$), 0.812 at $25^\circ C$. ($77^\circ F.$); diluted alcohol, sp. gr. 0.936.

Deodorized alcohol is merely a stronger and higher grade of alcohol, and, according to the U. S. P. 1890, must stand the following tests: If 25 C.c. of Deodorized Alcohol be mixed with an equal volume of water and 5 C.c. of glycerin, and the mixture allowed to evaporate spontaneously from a piece of clean, odorless blotting paper, no foreign odor should become perceptible when the last traces of Alcohol leave the paper (absence of *fusel oil constituents*). If 25 C.c. be allowed to evaporate spontaneously in a porcelain capsule carefully protected from dust, until only a moisture is left, no red or brown color should be produced upon the addition of a few drops of colorless, concentrated sulphuric acid (absence of *amylic alcohol*, or *non-volatile, carbonizable, organic impurities*).

The official description and tests for Absolute Alcohol are as follows: A transparent, colorless, mobile, and volatile liquid, of a characteristic, rather agreeable odor, and a burning taste. Very hygroscopic. Specific gravity: not higher than 0.797 at $15^\circ C$. ($59^\circ F.$); or 0.789 at $25^\circ C$. ($77^\circ F.$). In other respects, Absolute Alcohol has the properties, and should respond to the reactions and tests, of Deodorized Alcohol (see *Alcohol Deodoratum*).

Uses.—Alcohol is used in pharmacy principally for its solvent powers (see pages 355, 356). It is used as the source of many important compounds, like ether, chloroform, iodoform, etc., and as an antiseptic. The cologne spirit is generally a purified product, and cleaner than ordinary alcohol. A specially fine brand of alcohol can now be had which is rectified particularly for perfumers' use: it is said to be made by diluting the cologne spirit with sufficient water to bring it to about the strength of diluted alcohol, passing this through bone-black, and then redistilling and concentrating it again to the proper strength in the rectifying column and still.

ALCOHOL DILUTUM. U. S. Diluted Alcohol.

A liquid composed of about 41 per cent., by weight, or about 48.6 per cent., by volume, of absolute Ethyl Alcohol [$C_2H_5OH = 45.9$], and about 59 per cent. of Water. It should be kept in well-closed vessels, in a cool place, remote from lights or fire.

	Metric.	Old form.
Alcohol	500 C.c.	1 pint.
Distilled Water	500 C.c.	1 pint.

Mix them. If the two liquids be measured at the temperature of $15.6^\circ C$. ($60^\circ F.$), the mixture, when cooled to the same temperature, will measure about 971 C.c.

Diluted Alcohol may also be prepared in the following manner :

	Metric.	Old form.
Alcohol	410 Gm.	41 oz. av.
Distilled Water	500 Gm.	50 oz. av.

Mix them.

Diluted Alcohol has a specific gravity of about 0.988 at 15° C. (59° F.), about 0.987 at 15.6° C. (60° F.), and about 0.980 at 25° C. (77° F.).

It should respond to the reactions and tests given under *Alcohol*.¹

When alcohol and water are mixed together, a rise in temperature and a contraction in volume take place. In small operations the contraction is generally disregarded; in larger operations the loss is very apparent. If 55 gallons of alcohol be mixed with 45 gallons of water, the product will not be 100 gallons of diluted alcohol, but only 96½ gallons, showing a loss of 3½ gallons. United States *Proof Spirit* differs from diluted alcohol in containing 50 per cent. by volume of absolute alcohol.

Uses.—Diluted alcohol is used as a menstruum in making tinctures, fluid extracts, extracts, etc. Its properties have been already fully described in connection with the various preparations. Its value consists not only in antiseptic properties, but also in its possessing the solvent powers of both water and alcohol.

¹ *Official Rules for making an Alcohol of any Required Lower Percentage from an Alcohol of any Given Higher Percentage.*—I. BY VOLUME: Designate the volume-percentage of the stronger alcohol by *V*, and that of the weaker alcohol by *v*. Rule: Mix *v* volumes of the stronger alcohol with pure water to make *V* volumes of product. Allow the mixture to stand until full contraction has taken place, and until it has cooled, then make up any deficiency in the "*V*" volumes by adding more water. Example: An alcohol of 30 per cent. by volume is to be made from an alcohol of 94 per cent. by volume.—Take 30 volumes of the 94 per cent. alcohol, and add enough pure water to produce 94 volumes.

II. BY WEIGHT: Designate the weight-percentage of the stronger alcohol by *W*, and that of the weaker by *w*. Rule: Mix *w* parts by weight of the stronger alcohol with pure water to make *W* parts by weight of product. Example: An alcohol of 50 per cent. by weight is to be made from an alcohol of 91 per cent. by weight.—Take 50 parts by weight of the 91 per cent. alcohol, and add enough pure water to produce 91 parts by weight.

It is evident that when percentage by volume is specified the liquids should be *measured*, and when percentage by weight is used the liquids in all cases should be *weighed*. The alcoholmetrical table gives the various percentages both by weight and volume, and an examination will show clearly that there is considerable difference between weight and volume percentage. When alcohol is sold by per cent. valuation, unscrupulous dealers sometimes take advantage of the unwary when the buyer does not specify whether he wants "per cent. by volume" or per cent. by weight. It is much more satisfactory in buying alcohol to indicate clearly the strength that is wanted by inserting the specific gravity at the official temperature: thus, an order for "Alcohol, sp. gr. 0.820 at 59° F.," cannot be susceptible of two meanings.

File's Rules for Diluting Alcohol.—1. To reduce alcohol to any required strength. To as many parts of the given alcohol as are indicated by the percentage required, add sufficient water to make the number of parts of the mixture equal to the percentage of the given alcohol. Example: It is desired to make an alcohol of 30 per cent. from one of 95 per cent. Take 30 fluidounces of the alcohol and add a sufficient amount of water to make 95 fluidounces.

2. To make any required quantity of any per cent. As the percentage of the alcohol given is to that of the alcohol required, so is the quantity desired to the quantity of the alcohol to be taken. And to this quantity of alcohol sufficient water must be added to make up the required quantity. Example: It is desired to make 80 fluidounces of 75 per cent. alcohol from that of 95 per cent. As 95:75::80:63½. This represents the number of fluidounces of 95 per cent. alcohol that is to be made up to 80 fluidounces by the addition of water.

By these rules no allowance is made for any subsequent contraction, and a mixture after being made should be allowed to stand for a short time for such contraction to take place, when a final amount of water is to be added to make up the full measure.

ALCOHOLMETRICAL TABLE.

Based on the Relation between Absolute Alcohol (Sp. Gr. 0.7938) and Pure Water at 15.6° C. (60° F.).—Abridged from Dr. E. R. Squibb's Table.

* Official alcohol.

† Official deodorized alcohol.

ÆTHER. U. S. Ether. [ÆTHER FORTIOR, PHARM. 1880.]

A liquid composed of about 96 per cent., by weight, of absolute Ether or Ethyl Oxide [$(C_2H_5)_2O = 78.84$], and about 4 per cent. of Alcohol containing a little Water.

But one ether is now official, in place of the two in the U. S. P. 1880, known as Æther and Æther Fortior; the old Æther, sp. gr. 0.750, was dropped altogether, the name Æther being now applied to what was formerly known as Æther Fortior, or stronger ether.

Preparation.—The Pharmacopœia of 1870 contained a process for the preparation of Ether. It was rarely or never used, because this is one of the liquids which cannot be safely or profitably made upon the small scale with the usual facilities afforded by the pharmacist's laboratory. Ether is made by acting on alcohol with sulphuric acid between the temperatures of $130^{\circ} C.$ ($266^{\circ} F.$) and $137.7^{\circ} C.$ ($280^{\circ} F.$). The sulphuric acid is not consumed in the process, but is regenerated, so that the making of ether is continuous. This will be understood when the reactions are explained. Ether is the oxide of the monad radical ethyl C_2H_5 . Alcohol, as has been already stated, is the hydrate C_2H_5HO : now,

then

Formerly it was believed that the sulphuric acid acted by catalysis, and that it dehydrated the alcohol through its affinity for water; but, the presence of ethyl-sulphuric acid, which was formed during the process, having been proved, this simple theory had to be abandoned.

Æther. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A thin and very diffusive, clear, and colorless liquid. It boils at $37^{\circ} C.$ ($98.6^{\circ} F.$). Stronger Ether is highly volatile and inflammable, and its vapor, when mixed with air and ignited, explodes violently. Sp. gr. 0.725 to 0.728.	Refreshing, characteristic odor; burning and sweetish taste, slightly bitter after-taste; neutral reaction.	Ten times its volume of water at $15^{\circ} C.$ ($59^{\circ} F.$).	All proportions.	All proportions of chloroform, benzol, benzin, fixed and volatile oils.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
It should boil actively, in a test-tube half filled with it and held a short time in the hand, on the addition of small pieces of broken glass. When 10 C.c. of Stronger Ether are agitated with an equal volume of glycerin in a graduated test-tube, the Ether layer, when fully separated, should not measure less than 8.6 C.c.	Acidity. Non-volatile Impurities and Foreign Odors. Undue amount of Alcohol or Water. Aldehyde.	<p>If a piece of pale blue litmus paper moistened with water be immersed ten minutes in a portion of the Ether, the color should not change. On evaporating at least 50 C.c. of Stronger Ether in a glass vessel, no fixed residue should appear, and, on evaporating a portion dropped upon blotting-paper, no foreign odor should be developed.</p> <p>When 20 C.c. of Ether are shaken in a graduated tube, with 20 C.c. of water just previously saturated with ether, the ethereal layer, upon separation, should not measure less than 19.8 C.c.</p> <p>If 10 C.c. of Ether be shaken occasionally, within one hour, with 1 C.c. of potassium hydrate T.S., no color should be developed in either liquid.</p>

Uses.—Ether is used principally as an anæsthetic, and, notwithstanding the many efforts made to supplant it, continues to be the best agent yet discovered for producing insensibility to pain in surgical operations. It is also used as a solvent. It dissolves iodine and bromine freely, and sulphur and phosphorus sparingly. Its power to dissolve corrosive sublimate makes it a useful agent in the manipulations for detecting that poison. It is also a solvent of volatile and fixed oils, many resins and balsams, tannic acid, caoutchouc, and most of the alkaloids.

Ether should be kept in well-stoppered bottles, or in soldered tins, in a cool place remote from lights and fire. Especial care should be observed in pouring ether from one vessel to another by gas-light: the vapor is heavy,—two and a half times as heavy as air,—and it will at once take fire with explosive force on contact with flame.

SPIRITUS ÆTHERIS. U. S. Spirit of Ether.

	Metric.	Old form.
Ether	325 C.c.	4 fl. oz.
Alcohol	675 C.c.	8½ fl. oz.
To make	1000 C.c.	12½ fl. oz.

Mix them.

Uses.—This simple mixture of ether and alcohol is used as a diffusible stimulant in doses of one to three fluidrachms (3.7 to 11.1 C.c.).

SPIRITUS ÆTHERIS COMPOSITUS. U. S. Compound Spirit of Ether.

[HOFFMANN'S ANODYNE.]

	Metric.	Old form.
Ether	325 C.c.	8 fl. oz.
Alcohol	650 C.c.	16 fl. oz.
Ethereal Oil	25 C.c.	5 fl. dr.
To make	1000 C.c.	24½ fl. oz.

Mix them.

Commercial Hoffmann's anodyne is usually bought by the pharmacist and substituted for this preparation. It differs from the official liquid in containing variable proportions of light and heavy oil of wine, ether, and alcohol: it is obtained as a supplementary product by the manufacturing chemist.

During the rectification of crude ether, the distillation is continued as long as the ether comes over of the proper specific gravity; after which the receiver is changed, and an additional distillate is obtained, consisting of ether and alcohol impregnated with a little ethereal oil. It is this second distillate, variously modified by the addition of alcohol, ether, or water, so as to make it conform in taste, smell, opalescence, etc., to a standard preparation kept by the manufacturer, that is sold as Hoffmann's anodyne.

The expensiveness of the ethereal oil is alleged to be the cause of this substitution. The cheap commercial liquid may be known by adding it to water; it usually mixes without causing milkiness. The

official compound spirit of ether produces a slight opalescence when forty drops are added to a pint of water, and the peculiar odor of ethereal oil is distinctly noticed; but castor oil is sometimes added by dishonest manufacturers to circumvent this test. This fraud may be detected by mixing equal parts of the suspected liquid and water, and collecting the oil which separates on a piece of filtering-paper and exposing it to heat: a permanent greasy stain indicates a fixed oil, an ethereal oil stain disappears on heating.

Uses.—Compound spirit of ether is used as an anodyne, in doses of thirty minims to two fluidrachms (1.9 to 7.4 C.c.). It is sometimes given in combination with laudanum.

Preparations of the Compound Ethers of the Ethyl and Amyl Series.

OLEUM ÆTHEREUM. U.S. Ethereal Oil.

A volatile liquid consisting of equal volumes of Heavy Oil of Wine and Ether.

	Metric.	Old form
Alcohol	1000 C.c.	2 pints.
Sulphuric Acid	1000 C.c.	2 pints.
Distilled Water	25 C.c.	384 min.
Ether, a sufficient quantity.		

Add the Acid slowly to the Alcohol, mix them thoroughly, and allow the mixture to stand, in a closed flask, for twenty-four hours, or until the liquid is clear; then pour the clear liquid into a tubulated retort of such capacity that the mixture shall nearly fill it. Insert a thermometer through the tubulure, so that the bulb shall be deeply immersed in the liquid, and, having connected the retort with a well-cooled condenser, and also having connected with the receiver a bent glass tube for conducting the uncondensed gases into water, distil, by means of a sand-bath, at a temperature between 150° and 160° C. (302°–320° F.), until oily drops cease to come over, or until a black froth, which forms on the surface, begins to rise in the retort. Separate the yellow, ethereal liquid from the distillate, and expose it to the air for twenty-four hours, in a shallow capsule. Then transfer it to a wet filter, and, when the watery portion has drained off, wash the oil which is left on the filter with the Distilled Water, which should be as cold as possible. When this also has drained off, transfer the oil to a graduated measure, and add to it an equal volume of Ether.

Keep the product in small, glass-stoppered vials, in a cool place.

Compound ethers, as already explained, are produced by the action of acids on alcohols (page 812). Ethereal oil is a mixture of compound ethers.

If alcohol is distilled with a large excess of sulphuric acid, there are formed towards the close of the distillation heavy oil of wine, sulphurous acid, olefiant gas, and empyreumatic products. The product of the distillation is generally in two layers, one consisting of water holding sulphurous acid in solution, and the other, of ether containing the heavy oil of wine. After separation, the latter liquid is exposed for twenty-four

hours to the air, in order to dissipate the ether by evaporation; and the oil which is left is washed with water to deprive it of all traces of sulphurous acid.

In the early stage of the distillation of a mixture of sulphuric acid and alcohol, ethyl-sulphuric acid, $C_2H_5HSO_4$, is formed. During its progress this is decomposed so as to yield ether. When, however, the alcohol is distilled with a large excess of sulphuric acid, the ethyl-sulphuric acid is decomposed so as to form a small quantity of the *heavy oil of wine*. This is a mixture of ethyl sulphate, $(C_2H_5)_2SO_4$, ethyl sulphite, $(C_2H_5)_2SO_3$ (the sulphurous acid having been formed by reduction of sulphuric acid), with polymeric forms of ethylene, C_2H_4 . Ethereal oil is a transparent, nearly colorless, volatile liquid, of a peculiar, aromatic, ethereal odor, a pungent, refreshing, bitterish taste, and a neutral reaction to dry litmus paper. Sp. gr. 0.910.

Uses.—Ethereal oil is used solely as an ingredient in compound spirit of ether.

SPIRITUS ÆTHERIS NITROSI. U.S. Spirit of Nitrous Ether.

An alcoholic solution of Ethyl Nitrite [C_2H_5NO , = 74.87], yielding, when freshly prepared, and tested in a nitrometer, not less than 11 times its own volume of Nitrogen Dioxide [NO = 29.97].

	Metric.	Old form.
Sodium Nitrite	635 Gm.*	4 oz. av. 210 gr.
Sulphuric Acid	520 Gm.	8 oz. av. 292 gr.
Sodium Carbonate	10 Gm.	81 grains.
Potassium Carbonate, completely deprived of water by drying	30 Gm.	98 grains.
Deodorized Alcohol,		
Water, each, a sufficient quantity.		

Dissolve the Sodium Nitrite in 1000 C.c. [old form 6 fl. oz. 6 fl. dr.] of Water, and put the solution into a suitable flask, connected with a condenser kept cold by ice-cold water; then add 550 C.c. [old form 3 fl. oz. 6 fl. dr.] of Deodorized Alcohol, and mix well. Through a cork fitted into the mouth of the flask insert a funnel-tube dipping below the surface of the liquid. With the condenser connect a receiver, and keep this surrounded by a mixture of common salt and crushed ice. Then gradually introduce into the flask, through the funnel-tube, the Sulphuric Acid, previously diluted with 1000 C.c. [old form 6 fl. oz. 6 fl. dr.] of Water. Distillation will usually commence before the whole of the Acid has been added. When all the Acid has been introduced, regulate the distillation by the application or withdrawal of a gentle heat until no more nitrous ether distils over. Wash the distillate, first, with 100 C.c. [old form $5\frac{1}{2}$ fl. dr.] of ice-cold Water to remove any Alcohol which may have passed over, and then remove any traces of Acid by washing the Ether with 100 C.c. [old form $5\frac{1}{2}$ fl. dr.] of ice-cold Water, in which the Sodium Carbonate had previously been dissolved. Carefully separate the Ether from the aqueous

* In the copies of the U. S. P. 1890 at first issued this quantity was given as 770 Gm. Experience has proved that there is an unnecessary excess of 135 Gm.

liquid, and agitate it, in a well-stoppered vial, with the Potassium Carbonate to remove traces of water. Then filter it through a pellet of cotton, in a covered funnel, into a tared bottle containing 2000 C.c. [old form 13½ fl. oz.] of Deodorized Alcohol. Ascertain the weight of the Nitrous Ether filtered into the Alcohol by noting the increase of weight of the tared bottle and contents, and then add enough Deodorized Alcohol to make the mixture weigh 22 times the weight of the Nitrous Ether added. This preparation is often termed *Sweet Spirit of Nitre*.

The object of this process is to form ethyl nitrite, a compound ether produced by substituting the acid radical for the hydrogen of the hydroxyl in the alcohol: this is then preserved from decomposition by the addition of sufficient alcohol.

The U. S. P. 1890 process differs from that formerly official in the method of obtaining the nitrous radical, the use of nitric acid having been abandoned; the object of using sodium nitrite is to avoid the production of aldehyde, and to furnish a more easily controlled process than the one previously employed. The sulphuric acid decomposes the sodium nitrite, the nitrous radical combining with the ethyl of the alcohol to form ethyl nitrite. The dilution of the sulphuric acid and the use of a solution of sodium nitrite prevent too rapid action. Experience with the new process has demonstrated its advantages.

Pure ethyl nitrite is pale yellow, has the smell of apples, boils at 18° C. (64.4° F.), and has the sp. gr. 0.900 at 15.5° C. (60° F.). The density of its vapor is 2.627. Litmus is not affected by it. It is soluble in forty-eight parts of water, and in all proportions in alcohol or rectified spirit. It is highly inflammable, and burns with a white flame without residue. Mixed with an alcoholic solution of potassa, it becomes dark brown, showing the presence of aldehyd. When kept, it becomes acid in a short time, as shown by litmus; and nitric oxide is given off, which often causes the bursting of the bottle. Its tendency to become acid is rendered greater by the action of the air, and depends on the absorption of oxygen by the aldehyd, which is converted into acetic acid. These facts show the necessity of preserving this ether in small, strong bottles, kept full and in a cool place, and, in warm weather, of cooling a bottle thoroughly before opening it.

Spiritus Ætheris Nitrosi. U. S.	ODOR AND TASTE.
<p>A clear, mobile, volatile, and inflammable liquid, of a pale straw-color, inclining slightly to green. Sp. gr. about 0.836 * to 0.842 at 15° C. (59° F.). When freshly prepared, or even after being kept for some time with but little exposure to light and air, it is neutral to litmus paper. When long kept, or after having been freely exposed to air and light, it acquires an acid reaction, but it should not effervesce when a crystal of potassium bicarbonate is dropped into it.</p>	<p>Fragrant, ethereal pungent odor, free from acidity; sharp, burning taste.</p>

* There are reasons for believing that this figure is too high, and that 0.820 is nearer the true specific gravity if U. S. P. deodorized alcohol (0.816) be used for dilution.

TESTS FOR IDENTITY.	QUANTITATIVE TEST.
<p>If a test-tube be half filled with the Spirit, and put into a water-bath heated to 65° C. (149° F.) until it has acquired this temperature, the Spirit should boil distinctly upon the addition of a few pieces of broken glass.</p> <p>If 10 C.c. of the Spirit be mixed with 5 C.c. of potassium hydrate T.S., previously diluted with 5 C.c. of water, the mixture will assume a yellow color which should not turn decidedly brown within twelve hours (limit of <i>aldehyde</i>.)</p>	<p>If 5 C.c. of recently prepared Spirit of Nitrous Ether be introduced into a nitrometer, and followed, first, by 10 C.c. of potassium iodide T.S., and then by 10 C.c. of normal sulphuric acid, the volume of nitrogen dioxide generated at the ordinary indoor temperature (assumed to be at or near 25° C. or 77° F.) should not be less than 55 C.c. (corresponding to about 4 per cent. of pure ethyl nitrite).</p>

Spirit of nitrous ether is never quite free from aldehyde; and, if the distillation is too long continued, it is apt to contain a good deal of this liquid, which afterwards becomes acetic acid by absorbing oxygen. The change goes on rapidly if the preparation be insecurely kept. Aldehyde, if in considerable proportion, may be detected by imparting a pungent odor and acrid flavor, and by the preparation assuming a brown tint on the addition of a weak solution of potassa, owing to the formation of aldehyde resin. The official potassa test, with the best specimens, produces a straw-yellow tint within twelve hours.

Specific gravity cannot be relied upon as a test of the quantity of ethyl nitrite present, because both it and water are heavier specifically than the diluting liquid, alcohol. The sp. gr. of deodorized alcohol being 0.816, and that of spirit of nitrous ether 0.836 to 0.842, it follows that the heavier specific gravity of the latter should be caused by the addition of ethyl nitrite (sp. gr. 0.900), but it may be increased by diluting it with water (sp. gr. 1.000), or by using alcohol of the sp. gr. 0.825, and this is a common practice.

The nitrometer test is regarded as the only reliable one to determine the quantity of ethyl nitrite in this spirit, and the very practical apparatus shown in Fig. 352 has been devised by Dr. Squibb for the use of pharmacists who do not possess a nitrometer. This consists of a small glass funnel, a section of rubber tubing, spring pinch-cock, straight glass tube, one tube bent twice at right angles, not over $\frac{1}{4}$ inch bore, a cork with two holes for the tubes, a two-ounce vial, and some wooden blocks. In using this for testing, the bottle is filled with mercury nearly to the edge, then 10 or 20 drops of water are added. The cork holding the tubes is then pushed into the bottle, which causes the water to flow into the tube, followed by a little mercury; the funnel is connected with the upright tube and the pinch-cock closed, then about 20 minims of mercury are poured into the funnel and cautiously allowed to flow into the vial by slowly opening the pinch-cock until the bent tube is entirely filled with mercury. There must, of course, be no leakage into the apparatus. 1 fl. dr. of spirit of nitrous ether is measured into the funnel and let into the vial, followed by 1 fl. dr. of solution of potassium iodide T.S. (see official test, above), and then 1 fl. dr. of the diluted sulphuric acid. This makes 3 fl. dr. of liquid to be deducted from the measure of mercury. The reaction soon sets in, and the amount of gas set free indicates the quantity of ethyl nitrite by dis-

placing the mercury. In ten minutes the reaction is over, and the receiving measure may be taken away and the quantity of mercury read off; the mercury remaining in the tube runs back into the bottle

FIG. 352.

Nitrometer for druggists' use (Squibb).

as it should. The measure of the spirit taken for assay, divided into the measure of mercury displaced by the gas, shows the number of times that the gas exceeds the spirit. If the mercury be 11 to 13 times the volume of the spirit, the latter will have contained about 5 p. c. ethyl nitrite. Each per cent. of indicated ethyl nitrite is about equal to 1.86 per cent. of the total complex ethereal liquid in the spirit.

Uses.—Spirit of nitrous ether is a valuable diaphoretic and diuretic. The dose is thirty minims to one fluidrachm (1.9 to 3.7 C.c.).

ÆTHER ACETICUS. U. S. Acetic Ether.

A liquid composed of about 98.5 per cent., by weight, of Ethyl Acetate [$C_4H_8O_2$, = 87.8] and about 1.5 per cent. of Alcohol containing a little water. Specific gravity 0.898 to 0.895 at 15° C. (59° F.). It should be kept in well-stoppered bottles, in a cool and dark place, remote from lights or fire.

Preparation.—Acetic ether may be made in several ways. The best method is probably that of distilling a mixture of sixteen parts of

dried sodium acetate, ten parts of alcohol, and twenty parts of sulphuric acid, shaking the distillate in a bottle with exsiccated sodium acetate, and subsequently redistilling it.

Ethyl sulphuric acid is formed through the action of the sulphuric acid and heat upon the alcohol. This is then decomposed by contact with sodium acetate, ethyl acetate and acid sodium sulphate being produced.

Ether Aceticus. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A transparent and colorless liquid. It boils at about 76° C. (168.8° F.). It is inflammable, burning with a bluish-yellow flame and acetous odor, and is readily volatilized, even at a low temperature.	Strong, fragrant, ethereal, refreshing, and somewhat acetous odor, and burning, acetous taste; neutral reaction.	At 15° C. (59° F.), 8 parts.	All proportions.	In all proportions of ether, fixed and volatile oils.

IMPURITIES.	TESTS FOR IMPURITIES.
Free Acid, fixed residue.	Acetic Ether should not change the color of blue litmus paper previously moistened with water, nor leave any fixed residue upon evaporation. When 25 C.c. of Acetic Ether are agitated with an equal volume of water, in a graduated test-tube, the upper, ethereal layer, after its separation, should not measure less than 24.5 C.c. If a portion be allowed to evaporate spontaneously from clean, odorless blotting-paper, the final odor should not resemble that of pine-apples. When a small portion of Ether is carefully poured upon some concentrated sulphuric acid, no dark ring should be developed at the point of contact of the two layers.
Alcohol or Water.	
Butyric and Amylic Derivatives.	
Readily Carbonizable, Organic Impurities.	

Uses.—Acetic ether is sometimes employed as an anæsthetic. Its odor is frequently noticed in old tinctures and extemporaneous mixtures which have once contained alcohol and acetic acid.

AMYL NITRIS. U. S. Amyl Nitrite.

A liquid containing about 80 per cent. of Amyl (principally Isoamyl) Nitrite [$\text{C}_5\text{H}_{11}\text{NO}_2 = 116.78$], together with variable quantities of undetermined compounds. It should be kept in small, dark-amber-colored and glase-stoppered vials, in a cool and dark place, remote from lights or fire.

Preparation.—This compound ether may be made by acting on amylic alcohol with nitric acid. The latter is deoxidized into nitrous acid, which acts on amylic alcohol, as shown in the reaction :

Amyl Nitrite. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvent.
A clear, pale yellowish liquid. In alcoholic solution it gradually decomposes, with formation of ethyl nitrite and amylic alcohol. It boils at about 96°-99° C. (204.8°-210.2° F.), giving an orange-colored vapor. It burns with a fawn-colored flame. Sp. gr. 0.870-0.880 at 15° C. (59° F.).	Ethereal, 'fruity' odor; pungent, aromatic taste; neutral or slightly acid reaction.	Almost insoluble.	In all proportions.	In all proportions of ether.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
If 0.26 Gm. of Amyl Nitrite, diluted with about 5 C.c. of alcohol, be introduced into a nitrometer, followed by 10 C.c. of potassium iodide T.S., and afterwards by 10 C.c. of normal sulphuric acid V.S., the volume of nitric oxide generated, measured at the ordinary indoor temperature (assumed to be at or near 25° C., or 77° F.), should be about 40 C.c. (each C.c. indicating about 2 per cent. of pure Amyl Nitrite).	Free Acid. Water. Aldehyde.	{ If 1 C.c. of normal potassium hydrate V.S. and 10 C.c. of water be mixed with a drop of phenolphthalein T.S., then 5 C.c. of Amyl Nitrite added, and the tube inverted a few times, the red tint of the alkaline layer should still be perceptible. { It should remain transparent, or nearly so, when exposed to the temperature of melting ice. { On shaking together equal volumes of Amyl Nitrite and potassium hydrate T.S., the aqueous layer should not acquire a deeper tint than pale yellow.

Tanner's process, which is adapted for small operations, is as follows: 10 fl. oz. of purified amylic alcohol is introduced into a large tubulated retort containing copper wire, 1 fl. oz. of strong sulphuric acid is now added, and then 1 fl. oz. of nitric acid, previously diluted with an equal bulk of water. It is gently heated to 63° C. (145.4° F.). At this temperature the reaction commences, and goes on very quietly until a bulk about equal to double the quantity of nitric acid collects in the receiver. The chemical movement now ceases, and the temperature, which has risen to near 100° C. (212° F.), begins to fall. More dilute nitric acid is added, and the process carried out as before. These additions are repeated until the amylic alcohol is exhausted, which is known by the appearance of red fumes in the retort. The whole product is washed with caustic soda, to remove hydrocyanic and other acids, and rectified over potassium carbonate, to get rid of moisture. The portion which distils over between 95° C. (203° F.) and 100° C. (212° F.) is medicinally pure amyl nitrite.

Difficulties are experienced in rectifying amyl nitrite on account of the number of products present having similar boiling points. If strong nitric acid is used instead of diluted acid, explosions are almost sure to occur.

Uses.—Amyl nitrite is a valuable remedy. It is exceedingly volatile, and is much used in asthma, angina pectoris, and similar complaints, by inhalation. It is a stimulant, producing an excessive action of the heart, and may be administered by dropping a small quantity on a handkerchief and inhaling the vapor, or by crushing a glass *pearl of amyl nitrite* in the handkerchief and inhaling.

QUESTIONS ON CHAPTER LII.

DERIVATIVES OF SUGARS THROUGH THE ACTION OF FERMENTS.

What is fermentation, and what is the difference between fermentation and putrefaction?

What are the two theories of fermentation?

Into what two classes may ferments be divided?

What are the necessary conditions to cause cane-sugar to undergo vinous fermentation?

What is the probable action of the ferment?

Explain the reactions which take place in the conversion of cellulin or starch, first, into maltose, then into glucose, then into alcohol, and finally into acetic acid.

What is the most important derivative of sugar by the action of a ferment?

What are the sources of the various ardent spirits of commerce? Of brandy? Rum? Whiskey? Holland gin? Common gin? Arrack?

Chemically considered, why are the carbon compounds called alcohols?

What are ethers? What are compound ethers?

Explain the reaction which occurs when alcohol is decomposed by acetic acid.

Whiskey—What is the Latin official name? What is its official definition?

How is it obtained, and what are the operations termed by which it is obtained from grain?

Describe it. What is its specific gravity?

What is its alcoholic strength?

How may the following impurities be detected?—viz.: More than traces of fusel oil from grain or potato spirit; an undue amount of solids; glycerin, added sugar, or spices; traces of oak tannin from casks; an undue amount of free acid.

What are its medicinal uses?

Alcohol—Describe it and give its specific gravity.

How much ethyl alcohol does it contain?

Give its formula in symbols and molecular weight.

What are the natural sources of alcohol, and how is it made?

How much alcohol, specific gravity .835, is obtained from good whiskey?

What is its principal impurity?

How may it be deprived of odor?

What is absolute alcohol?

What is the strongest alcohol which can be obtained by simple distillation?

How may it be freed from water?

Alcohol of what specific gravity may be obtained by the use of lime?

What is its boiling-point, and to what degree of cold may it be reduced without congealing?

How may its freedom from water be ascertained?

What is the empirical formula of alcohol?

What strengths of alcohol are official?

What are its uses?

What is the composition of diluted alcohol? What is its specific gravity?

How is it made?

How may it be made from alcohol of greater than the official strength?

If 55 gallons of alcohol be mixed with 45 gallons of water, how much will the mixture measure?

What is the difference between diluted alcohol and United States proof spirit?

What is the specific gravity of the latter?

What are the uses of diluted alcohol?

Ether—What is its composition? What is its specific gravity?

What is the formula in symbols of ethyl oxide?

How is stronger ether made?

Describe odor, taste, chemical reaction, and solubility.

How may the following impurities be detected?—viz.: Acidity, non-volatile impurities, and foreign odors.

What are its uses?

How is spirit of ether made? What is the Latin official name?

What is the dose?

Compound spirit of ether—What is the Latin name? Give the synonyme.

How is it made?

How may the cheap commercial article be known?

Where castor oil has been used to give it opalescence, how may the fraud be detected?

What is the dose?

What is ethereal oil? What is the Latin official name?

Give description and specific gravity.

How is it made?

What is ethyl-sulphuric acid?

If alcohol is distilled with a large excess of sulphuric acid, what is formed?

What are the physical properties of ethereal oil?

What is its use?

Spirit of nitrous ether—What is the Latin official name? What is its synonyme?

Give description and specific gravity.

How much ethyl nitrite does it contain?

Give formula in symbols and molecular weight.

How is it made?

Give rationale of process. What is the object of this process?

Pure ethyl nitrite—What is the specific gravity?

Give odor, taste, chemical reaction.

Spirit of nitrous ether—How may its quality be tested?

What impurity is always present, and what change results from its presence?

If in considerable proportion, how may it be detected?

Is its specific gravity a reliable test of the amount of ethyl nitrite present? Why?

Is there any reliable test to ascertain its quality?

What is the dose?

Acetic ether—What is the Latin official name?

Give the formula in symbols and molecular weight.

What is probably the best method of making it? Give rationale of process.

Describe odor, taste, chemical reaction, and solubility.

How may the following impurities be detected?—viz.: Free acid, fixed impurities; alcohol, ether.

What is the dose?

Amyl nitrite—What is the Latin official name?

Give formula in symbols and molecular weight.

Give description and specific gravity.

How may it be made? Describe rationale of process.

How may the following impurities be detected?—viz.: Free acid; water.

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

What is Tanner's process for preparing it?

If strong nitric acid is used, what occurs?

What is the dose?

CHAPTER LIII.

ALDEHYDE, ITS DERIVATIVES AND PREPARATIONS.

THE term *aldehyde*, like the terms *alcohol* and *ether*, was formerly applied to one compound. It is now used to define a class of organic bodies. The word is derived from the first syllables of the term *alcohol dehydrogenatum*, which means alcohol from which hydrogen has been abstracted.

Aldehyde has the composition C_2H_4O , and is made by depriving alcohol, C_2H_6O , of two hydrogen atoms. This abstraction of hydrogen may be effected by acting on alcohol with oxidizing agents, as in making ethyl nitrite, and in other ways. By the oxidation of aldehydes acids are formed, as in making acetic acid by the beech-wood shavings process (see page 776). The addition of $2H$ to aldehyde, C_2H_4O , reproduces alcohol, C_2H_6O , whilst the addition of O to aldehyde, C_2H_4O , produces acetic acid, $C_2H_4O_2$.

PARALDEHYDUM. U. S. Paraldehyde.

A polymeric form of Ethylic Aldehyde [$C_2H_4O = 48.9$]. Paraldehyde should be kept in well-stoppered, dark amber-colored bottles, in a cool place.

This new official liquid is a product of the condensation of three molecules of ethyl, or ordinary aldehyde; it may be made by treating ethyl aldehyde with small quantities of either sulphurous anhydride, hydrochloric acid, carbon oxychloride, or zinc chloride; almost complete conversion occurs, and by freezing the liquid and rectifying, pure paraldehyde is produced.

Paraldehydum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A colorless, transparent liquid. When cooled to near $0^{\circ} C.$ ($32^{\circ} F.$), Paraldehyde solidifies to a crystalline mass, which becomes liquid again at $10.5^{\circ} C.$ ($51^{\circ} F.$). It boils at 123° – $125^{\circ} C.$ (253.4° – $257^{\circ} F.$), giving off inflammable vapors.	Strong characteristic, but not unpleasant or pungent odor; burning and cooling taste; neutral or slightly acid reaction.	At $15^{\circ} C.$ ($59^{\circ} F.$), 8.5 parts. Boiling, 16.5 parts.	Miscible in all proportions.	Miscible in all proportions with ether and fixed and volatile oils.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
When distilled with a small portion of sulphuric acid, Paraldehyde is converted into ordinary aldehyde, boiling at about 21° C. (70° F.) On warming some silver ammonium nitrate T.S. saturated with Paraldehyde in a test-tube, a silver mirror will form on standing.	Aldehyde derived from Fusel Oil.	On heating some Paraldehyde on a water-bath, it should completely volatilize, without leaving any disagreeable odor. One C.c. of Paraldehyde should form, with 10 C.c. of water, a clear solution free from oily drops, And this solution, when acidulated with nitric acid, should not be affected by silver nitrate T.S. Or barium chloride T.S.
A mixture of 8 C.c. of Paraldehyde and 8 C.c. of alcohol with 1 drop of phenolphthalein T.S. should acquire a pink color upon the addition of 0.5 C.c. of normal potassium hydrate T.S. (limit of <i>free acid</i>).	Amylic Alcohol, etc.	
	Hydrochloric Acid.	
	Sulphuric Acid.	

Uses.—Paraldehyde is a hypnotic and sedative. Owing to its unpleasant taste, it is usually prescribed in combination with alcoholic liquids, elixirs, etc. The dose is from thirty minims to one fluidrachm (1.8 to 3.7 C.c.).

CHLORAL. U.S. Chloral.

A crystalline solid, composed of Trichloraldehyde or Chloral with one molecule of water. It should be kept in glass-stoppered bottles in a cool and dark place.

Preparation.—This valuable compound is made by passing dry chlorine gas, in a continuous stream, through absolute alcohol for six or eight weeks. The chlorine is led into cold alcohol at first, and when no more is absorbed, the alcohol is heated at first gently and then to 60° C. (140° F.). When saturated, the mixture formed is agitated with sulphuric acid at a temperature of 60° C. (140° F.) for several hours, during which time most of the hydrochloric acid escapes. The separated chloral is then rectified over calcium carbonate. This is anhydrous chloral, a colorless liquid, of a penetrating odor, of the sp. gr. 1.502. The pure chloral so obtained is then mixed in glass flasks with the necessary amount of water, and the resulting hydrate either cast into cakes or purified by crystallization. As solvents for this purpose, certain of the side-products of the chloral manufacture, after being purified and rectified, are used,—for instance, ethylen and ethylen chloride; or, in their absence, chloroform, petroleum benzin, or carbon disulphide may be employed. The name *chloral* is derived from the first two syllables of *chlorine* and *alcohol*.

The reaction may be thus expressed :

then

Chloral is thus seen to be aldehyde in which three of the atoms of hydrogen have been replaced by three atoms of chlorine: hence it is termed, in systematic nomenclature, *trichloraldehyde*.

Chloral. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Separate, rhomboidal, colorless and transparent crystals, slowly evaporating when exposed to air. It liquefies when triturated with about an equal quantity of camphor, menthol, thymol, or carbolic acid. Its aqueous solution soon acquires an acid reaction, but its alcoholic solution remains neutral. At about 58° C. (136.4° F.) it melts, forming a liquid having a specific gravity of about 1.575, which at a higher temperature should not evolve inflammable vapors. Liquefied chloral, at a temperature between 35° and 50° C. (95° and 122° F.), solidifies to a crystalline mass. At about 78° C. (172° F.) it begins to yield vapors of water and of anhydrous chloral, and it boils at 95° C. (203° F.).	Aromatic, penetrating, and slightly acrid odor; a bitterish, caustic taste; neutral reaction when fresh, but gradually acquiring an acid reaction.	Freely soluble.	Freely soluble.	Freely soluble in ether, also soluble in chloroform, benzol, benzoin, carbon disulphide, and fixed or volatile oils.
TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.		
When treated with alkalis, alkaline earths, or ammonia, chloroform is obtained, with a formate in solution. Chloral should be dry, and should not readily attract moisture in ordinarily dry air.	Hydrochloric Acid and Chlorides. Chloral Alcoholate.	When a Chloral solution (1 in 20) is dissolved in diluted alcohol it should not be precipitated upon addition of a few drops of nitric acid and silver nitrate T.S. If 1 Gm. of Chloral be dissolved in 2 C.c. of warm water and about 8 C.c. (or a slight excess) of solution of potassium hydrate T.S. added, the mixture filtered clear through wet filter paper, and the filtrate treated with iodine T.S. until it is yellowish, no yellow, crystalline precipitate (iodoform) should appear, even after standing half an hour.		

Uses.—Chloral hydrate is a hypnotic: it is generally administered in a flavored syrup. The dose is fifteen to thirty grains (0.9 to 1.9 Gm.).

CHLOROFORMUM. U. S. Chloroform.

[CHLOROFORMUM PURIFICATUM, PHARM. 1880.]

A liquid consisting of 99 to 99.4 per cent., by weight, of absolute Chloroform, and 1 to 0.6 per cent. of Alcohol. It should be kept in dark amber-colored, glass-stoppered bottles, in a cool and dark place.

Preparation.—Chloroform is made by mixing six parts of chlorinated lime with twenty-five parts of water, and, after transferring the mixture to a still, one part of alcohol is added. Heat is applied, and when the temperature of 40° C. (122° F.) is reached, chloroform containing some alcohol begins to distil over. This is washed with water to separate the alcohol, and the heavy liquid is further purified by redistillation.

Chloroform, CHCl_3 , is termed chemically *trichloro-methane*, because it can be produced by substituting three atoms of chlorine for three hydrogen atoms of *methane*, marsh-gas, CH_4 . It may also be produced

by acting on chloral hydrate with an alkali, and this process is sometimes used upon a commercial scale.

When made from alcohol and chlorinated lime, the reactions are more complicated. In the first place, aldehyd, calcium chloride, and water are formed, thus :

Then the aldehyde reacting with calcium hypochlorite is decomposed, chloral, calcium chloride, and calcium hydrate being produced.

Then chloral is decomposed by calcium hydrate, chloroform and calcium formate being produced.

Chloroform is now more profitably made by reacting on acetone with chlorinated lime; the liquid products (ketones) resulting from the decomposition of crude acetates at high temperatures may also be used. The acetone must be very pure; the yield is sometimes nearly 200 per cent. The reaction is as follows :

Chloroformum. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A heavy, clear, colorless, mobile and diffusible liquid. Sp. gr. not below 1.490 at 15° C. (59° F.), or 1.473 at 25° C. (77° F.). It boils at 60° to 61° C. (140° to 141.8° F.). Chloroform is volatile even at a low temperature; it is not inflammable, but its heated vapor burns with a green flame.	Characteristic, ethereal odor; burning, sweet taste; neutral reaction.	200 parts.	All proportions.	All proportions of ether, also benzol, benzin, fixed or volatile oils.

TESTS.	IMPURITIES.	TESTS FOR IMPURITIES.
If 20 C.c. of Chloroform be poured upon a clean, odorless filter laid flat upon a warmed porcelain or glass plate, and the plate be rocked from side to side until the liquid is all evaporated, no foreign odor should become perceptible as the last portions disappear from the paper, and the paper should be left nearly odorless when compared with a new, odorless filter.	Acids.	{ If 10 C.c. of Chloroform be thoroughly agitated with 20 C.c. of distilled water, the latter, when separated, should not affect blue litmus paper. If 10 C.c. of Chloroform be thoroughly agitated with 20 C.c. of distilled water, the latter, when separated, should not be affected by silver nitrate T.S. If 10 C.c. of Chloroform be thoroughly agitated with 20 C.c. of distilled water, the latter should not be affected by potassium iodide T.S.
	Chloride.	
	Free Chlorine.	

TESTS.—Continued.

TESTS.	IMPURITIES.	TESTS FOR IMPURITIES.
If 40 C.c. of Chloroform be shaken with 4 C.c. of colorless, concentrated sulphuric acid in a 50 C.c. glass-stoppered cylinder during 20 minutes, and the liquids be then allowed to separate completely so that both are transparent, the Chloroform should remain colorless, and the acid should appear colorless, or very nearly so, when seen in a stratum of not less than about 16 Mm. in thickness. (<i>Impurities decomposable by Sulphuric Acid.</i>)	Absence of products of decomposition in Chloroform which may otherwise be pure.	If to about 5 C.c. of Chloroform, contained in a dry test-tube of the capacity of about 10 C.c., about 4 C.c. of perfectly clear barium hydrate T.S. be added without agitation, and the test-tube be then corked and set aside in a dark place for six hours, no film should be visible at the line of contact of the two liquids. If 2 C.c. of the sulphuric acid, separated from the Chloroform, be diluted with 5 C.c. of distilled water, the liquid should become colorless and clear, and, while hot from the mixing, should be odorless, or give but a faint vinous or ethereal odor. When further diluted with 10 C.c. of distilled water, it should remain clear, and not be affected by silver nitrate T.S. If 10 C.c. of the Chloroform, separated from the acid, be well shaken with 20 C.c. of distilled water, and the liquid be allowed to separate completely, the watery portion should not be affected by silver nitrate T.S.
	Odorous Decomposition Products.	
	Chlorinated Compounds.	

Purification.—Chloroform which fails to respond to the above tests should be purified by the following process :

Chloroform, four hundred grammes	400 Gm.
Sulphuric Acid, eighty grammes	80 Gm.
Dried Sodium Carbonate, twenty grammes	20 Gm.
Deodorized Alcohol, four cubic centimeters	4 C.c.

Add the Sulphuric Acid to the Chloroform, contained in a glass-stoppered bottle, and shake them together occasionally during twenty-four hours, avoiding exposure to bright daylight. Separate the lighter Chloroform layer, add to it the Dried Sodium Carbonate, previously rendered anhydrous by heating it, in a porcelain capsule, on a sand-bath, until it ceases to give off aqueous vapor, and shake them together frequently and thoroughly during half an hour; then transfer the Chloroform to a dry retort, add to it the Alcohol, and distil, by means of a water-bath, at a temperature not exceeding 67.2° C. (153° F.), into a well-cooled, tared receiver, until the distillate measures two hundred and fifty-five (255) cubic centimeters.

Chloroform sometimes contains a chlorinated pyrogenous oil which renders it unfit for its most important use, that of an anæsthetic, and the object of the above process is to purify it. Sulphuric acid decomposes this contaminating oil, and in turn is blackened by it. The chloroform is separated from the sulphuric acid, agitated with solution of sodium carbonate to neutralize adhering acid, then mixed with alcohol, which acts as a preservative from decomposition, and redistilled (preferably from lime) to separate water.

Uses.—Purified chloroform is used as an anæsthetic by inhalation. Taken internally, in large doses, one to two fluidrachms (3.7 to 7.4 C.c.) it is narcotic; in small doses, ten to fifteen minims (0.6 to 0.9 C.c.) it is carminative and sedative. Externally it is irritant, and may produce blisters.

Unofficial Ethyl, Amyl, and Methyl Compounds, and Allied Products.

- Acetal,
 $C_6H_{14}O_2$, or $CH_3CH(OEt)_2$,
 Ethylidene Diethyl Ether.
 Narcotic. Dose, one drachm (3.8 Gm.).
- Aldehyde,
 C_2H_4O .
 By gently warming a mixture of alcohol, manganese dioxide, sulphuric acid, and water, and collecting the vapor which is formed by means of a condenser. If exposed, it will gradually be converted into acetic acid. It is a colorless, thin, and very inflammable liquid, having an ethereal odor, and the sp. gr. .805.
- Amyl Acetate,
 $C_8H_{18}O_2$.
 By distilling amyl alcohol with an acetate and sulphuric acid. It is when pure a colorless liquid having a very fragrant odor. Insoluble in water. Sp. gr. .876.
- Amyl Butyrate,
 $C_{11}H_{22}O_2$.
 Sp. gr. .852. Fragrant odor.
- Amyl Chloride,
 $C_5H_{11}Cl$.
 By the action of strong hydrochloric acid upon amyl alcohol. Sp. gr. .874.
- Amyl Iodide,
 $C_5H_{11}I$.
 By acting upon amyl alcohol with iodine and phosphorus. It is a colorless, transparent liquid, of a faint odor and a pungent taste. Sp. gr. 1.509.
- Amyl Valerianate,
 $C_8H_{16}O_2$.
 Sp. gr. .864. Odor of apples.
- Amylene (Valerene, Pentene),
 C_6H_{10} .
 A colorless liquid, having a peculiar, disagreeable smell; density, 0.655 at 10° C. (50° F.). Anæsthetic. Too dangerous for use.
- Amylene Hydrate.
 Used as a hypnotic. Dose, $\frac{f\text{ss}}$ (3.7 C.c.).
- Barium Sulphethylate,
 $Ba(C_2H_5SO_4)_2$.
 By neutralizing ethyl-sulphuric acid with barium carbonate, filtering off the insoluble barium sulphate, and evaporating the filtrate to crystallization.
- Bromal,
 $C_2H_5Br_2O$.
 Hypnotic. Dose, three grains (0.194 Gm.).
- Bromamide,
 $C_2H_5Br_2NH.HBr$.
 Antipyretic, analgesic, and antirheumatic. Dose, ten to fifteen grains (0.65 to 0.97 Gm.).
- Bromoform,
 $CHBr_3$.
 By acting simultaneously upon wood spirit with bromine and potassa. It is a limpid liquid, resembling chloroform, and has an agreeable odor and a saccharine taste. Local anæsthetic in whooping-cough. Dose, for a child two to four years old, four to five drops three or four times daily.
- Bromopyrin (Monobromantipyrin),
 $C_{11}H_{11}BrN_3O$.
 In white, crystalline needles. Soluble in alcohol and chloroform. Slightly soluble in hot water.
- Butyl Chloral,
 $C_4H_9Cl_3O$.
 By passing chlorine gas into aldehyde when it is formed in addition to chloral. It is a dense, oily liquid, of peculiar odor. It dissolves when treated with an excess of warm water, and on cooling deposits *Butyl chloral-hydrate*.
- Butyl Chloral-Hydrate,
 $C_4H_9Cl_3O.H_2O$.
 Used as a hypnotic in ten-grain (0.6 Gm.) doses.
- Calcium Sulphethylate,
 $Ca(C_2H_5SO_4)_2$.
 By neutralizing ethyl-sulphuric acid with calcium carbonate, filtering off the insoluble calcium sulphate, and evaporating the filtrate to crystallization.
- Carbonei Tetrachloridum,
 Carbon Tetrachloride,
 Tetrachlor-Methane,
 Chlorocarbon,
 Carboneum Chloratum,
 CCl_4 .
 Anæsthetic. A colorless liquid. Sp. gr. 1.599.
- Chloralamide,
 Chloral Formamide,
 $CCl_3CH \begin{cases} OH \\ CONH_2 \end{cases}$.
 Hypnotic. Dose, thirty to sixty grains (1.9 to 3.88 Gm.).
- Chloral-Ammonium,
 $CCl_3CH(NH_2)OH$.
 Used as a hypnotic and substitute for chloral and urethane. Dose, fifteen to thirty grains (0.9 to 1.9 Gm.). Called also tri-chlor-amido-ethyl alcohol.
- Chloral Carbamide.
 Chloral Carbol,
 Carbolated Chloral.
 Similar to chloral in its action, but slow and uncertain. Used locally as an anæsthetic and counter-irritant.
- Chloral Cyanhydrate,
 $CCl_3-CH- \begin{cases} OH \\ CN \end{cases}$.
 A substitute for hydrocyanic acid. $6\frac{1}{2}$ parts, by weight, correspond with 1 part of anhydrous hydrocyanic acid.
- Chloralimide,
 $CCl_3CH=NH$.
 Antipyretic and analgesic. Dose, three to seven grains (0.19 to 0.45 Gm.).

Unofficial Ethyl, Amyl, and Methyl Compounds, and Allied Products.—
Continued.

Chloral-Menthol, Mentholated Chloral.	An oily, colorless liquid, with a mint-like odor. Sp. gr. 1.984. Counter-irritant and local anæsthetic.
Chloralose, $C_6H_{11}Cl_3O_6$.	Hypnotic. Dose, twelve grains (0.775 Gm.).
Chloral-Urethane (Uralium), $CCl_3CH \begin{cases} OH \\ NHCO_2C_2H_5. \end{cases}$	Hypnotic. Dose, 15.5 grains (1 Gm.).
Copper Sulphethylate, $Cu(C_2H_5SO_4)_2$.	By mixing alcoholic solutions of ethyl sulphhydrate and copper acetate and collecting the gelatinous precipitate.
Croton Chloral-Hydrate.	The same as butyl chloral-hydrate (see above).
Ethyl Benzoate, $C_2H_5.C_7H_5O$.	By heating to 100° C. in a sealed glass tube a mixture of alcohol and benzoic acid. It is a colorless, oily liquid, with a pleasant aromatic smell and a pungent taste. Sp. gr. 1.051.
Ethyl Bromide, C_2H_5Br .	By mixing amorphous phosphorus with absolute alcohol, and adding bromine gradually, then distilling carefully, and washing with a small quantity of solution of soda to remove any free bromine. A transparent and colorless liquid. Sp. gr. 1.40. Very volatile. It has a strong ethereal odor and a pungent taste.
Ethyl Butyrate, $C_2H_5.C_4H_7O_2$.	By heating together a mixture of strong sulphuric acid, butyric acid, and strong alcohol. A transparent, colorless, very thin liquid. It has an odor resembling that of pineapple. Sp. gr. .902.
Ethyl Chloride, C_2H_5Cl .	By saturating absolute alcohol with hydrochloric acid gas, distilling in a water-bath, collecting the distillate in a bottle containing water, then immersing in water surrounded by ice, and, lastly, washing with water to remove free alcohol, then rectifying over magnesia. A thin, colorless liquid, having an ethereal odor, and a sweet, afterwards alliacious, taste. Very inflammable. Sp. gr. .920.
Ethyl Cyanide, Hydrocyanic Ether, Propionitrile, C_2H_5N , or $C_2H_5.CN$.	A colorless liquid. Sp. gr. 0.78. Very poisonous, but less so than hydrocyanic acid, with which it agrees in therapeutic action and dose.
Ethyl Disulphide, C_2H_5S .	By acting upon potassium disulphide in concentrated solution with potassium sulphethylate. A colorless, oily liquid, having a very strong odor and a sharp, sweetish taste.
Ethyl Iodide, C_2H_5I .	By acting upon alcohol with iodine and phosphorus. A colorless, volatile liquid, but gradually turning brown in the light. Slightly soluble in water. Sp. gr. 1.946. Anæsthetic, antispasmodic, and stimulant. Dose, fifteen drops three or four times a day, inhaled from a handkerchief.
Ethyl Pelargonate (Grape Oil), $C_2H_5.C_9H_{17}O_2$.	By adding sulphuric acid and water to wine lees, and distilling in a current of steam. A colorless, mobile liquid, of a strong vinous odor. Almost insoluble in water, but soluble in alcohol. Sp. gr. .860.
Ethyl Sulphhydrate (Mercaptan), $C_2H_5.HS$.	By distilling crystallized calcium sulphethylate with a solution of barium sulphhydrate, collecting the product in a well-cooled receiver, then decanting the aqueous portion, and purifying the mercaptan by distilling with mercury, and dehydrating by calcium chloride. A colorless, very mobile liquid, having an alliacious odor.
Ethylene Bromide, $C_2H_4Br_2$.	Contains 90.9 per cent. of bromine. Dose, six drops three times a day.
Ethylidene Chloride, Chlorinated Muriatic Ether, Ethylene-Chloride, CH_3CHCl_2 .	A colorless liquid, somewhat resembling chloroform. Sp. gr. 1.175 at 17° C.; boiling at 60° C. Anæsthetic.
Ethyl-Sulphuric Acid (Sulphovinic Acid), $C_2H_5.HSO_4$.	By reacting upon sulphuric acid with alcohol. It is found in the preparation of ether.
Ethyl Valerate, $C_2H_5.C_4H_9O_2$.	A colorless liquid, having a fruity odor, also like that of valerian. Sp. gr. .866. It is also called ethyl valerianate.
Euphorin, Phenyl Urethane, $CO < \begin{matrix} OC_2H_5 \\ NH(C_6H_5). \end{matrix}$	Antipyretic, antiseptic, antirheumatic, and analgesic. Dose, seven and a half grains (0.49 Gm.), equivalent to fifteen grains (0.972 Gm.) of antipyrin.

Unofficial Ethyl, Amyl, and Methyl Compounds, and Allied Products.—

- Pental** (Trimethylethylene
(β -iso-amylene),
 $(CH_3)_2C = CH.CH_3$, or C_5H_{10}).
- Pentane** (Amylhydride),
 $CH_3.CH_2.CH_2.CH_2.CH_3$.
- Phenocoll Hydrochloride,**
 $C_6H_4 \begin{cases} OC_2H_5 \\ NH.COCH_2NH_2.HCl \end{cases}$.
- Phenylurethan,**
Phenylcarbamate of Ethyl,
Euphorine,
 $C_6O_2H_{11}N \begin{pmatrix} OC_2H_5 \\ NH(C_2H_5) \end{pmatrix}$.
- Piperazine,**
Diethylendiamine,
 $N_2 \begin{pmatrix} H_2 \\ (C_2H_4)_2 \end{pmatrix}$.
- Antipyretic, analgesic, and antispasmodic. Dose, three to six grains (0.194 to 0.389 Gm.), not more than twelve grains being given in twenty-four hours.
- Antiseptic. Used for the preservation of beer, wine, etc.
- Made by the action of iodine on alcohol and nitric acid. It resembles chloral in its therapeutic action.
- Nearly insoluble in water, but soluble in alcohol, ether, chloroform, and fatty oils. Contains nearly 90 per cent. of iodine. Used as a substitute for iodoform. Dose, one to three grains.
- Prepared by carefully heating 4 parts of menthol in a capsule, adding 1 part of finely powdered iodal, and triturating into a homogeneous mass. Used as a local application in neuralgia.
- Antipyretic, analgesic, antirheumatic. Dose, seven and a half grains (0.49 Gm.).
- (Prepared by processes similar to those employed for obtaining ethyl acetate, *quod vide*.) It is present to some extent in crude wood naphtha. Sp. gr. .919. Readily soluble in water.
- By distilling together a mixture of methyl alcohol, sodium chloride, and sulphuric acid. It is a gas at ordinary temperatures, but may be condensed by pressure to a colorless, very mobile liquid. It has an ethereal smell and a sweet taste. Used chiefly as a refrigerating agent.
- By distilling 1 part phosphorus, 8 parts iodine, and 12 parts wood spirit, allowing the distillate to pass into a bottle containing water, then rectifying the product in a water-bath over calcium chloride and lead oxide. A colorless liquid. Sp. gr. 2.23. Vesicant. It is best applied on lint.
- A colorless liquid, easily soluble in water, in alcohol, in fatty and in ethereal oils. Used as a hypnotic. Dose, seventy-five to one hundred grains (4.9 to 6.4 Gm.).
- A colorless liquid (sp. gr. 1.344), having an odor analogous to that of chloroform. Anæsthetic. Given internally in the dose of ten to thirty minims (0.62 to 1.85 Gm.).
- Antipyretic. Isomeric with trimethylcarbinol.
- Narcotic, sedative, and anti-emetic.
- Anæsthetic.
- A colorless, inflammable liquid. Sp. gr. 0.678. Anæsthetic. Cardio depressant.
- A colorless, volatile liquid (sp. gr. 0.626), very inflammable. Proposed as an anæsthetic.
- Antipyretic, antirheumatic. Dose, eight to twelve grains (0.518 to 0.775 Gm.).
- Antipyretic, analgesic, and antirheumatic. Dose, seven to fifteen grains (0.454 to 0.972 Gm.). Used also as an antiseptic dressing.
- Antirheumatic and solvent of uric acid. Dose, fifteen grains (0.972 Gm.) during the day.

Unofficial Ethyl, Amyl, and Methyl Compounds, and Allied Products.—
Continued.

Potassium Ethylate, $\text{C}_2\text{H}_5\text{KO}$.	By treating absolute alcohol with potassium. It crystallizes in colorless crystals.
Potassium Sulphethylate, $\text{KC}_2\text{H}_5\text{SO}_4$.	By acting upon mercaptan with potassium. It is a dull white, granular mass, very soluble in water.
Silver Sulphethylate, $\text{AgC}_2\text{H}_5\text{SO}_4$.	By adding silver nitrate to an aqueous solution of mercaptan and collecting the white precipitate.
Sodium Ethylate, $\text{C}_2\text{H}_5\text{NaO}$.	By treating absolute alcohol with sodium. It crystallizes in broad laminae.
Somnal.	Said to be a solution of chloral hydrate and urethane in alcohol. Dose, from one-half to one drachm (1.94 to 3.88 Gm.).
Soxal, $(\text{C}_6\text{H}_4(\text{OH})\text{SO}_3)_2\text{Al}_2$, Aluminum Paraphenolsulphonate.	Antiseptic.
Sosiodol, Diiodoparaphenolsulphonic Acid, $\text{C}_6\text{H}_2\text{I}_2(\text{SO}_3\text{H})\text{OH}$.	Bactericide.
Sulphaminol, $\text{C}_6\text{H}_4(\text{OH})\text{NS}$, Thioxydiphenylamine.	Used as a substitute for iodoform. The dose is four or five grains. Externally it may be used in powder or in oily mixtures.
Sulphonal, $(\text{CH}_3)_2\text{C}(\text{C}_2\text{H}_5\text{SO}_2)_2$.	Not very soluble in water; soluble in alcohol and ether. Hypnotic dose, fifteen to thirty grains (0.9 to 1.9 Gm.). It is also called Diethylsulphondimethylmethane.
Thymacetin, $\text{C}_6\text{H}_5\text{CH}_2\text{C}_2\text{H}_5 \begin{cases} \text{OC}_2\text{H}_5 \\ \text{NH}(\text{C}_2\text{H}_5\text{O}) \end{cases}$.	Antiseptic, analgesic, and hypnotic. Dose, three to fifteen grains (0.19 to 0.9 Gm.).
Tri-methyl-amine, Propylamine.	The chloride is usually preferred for internal use. Dose, seven to twenty grains (0.4 to 1.3 Gm.).
Trional, Tetronal, $\text{C} \begin{cases} \text{SO}_2\text{C}_2\text{H}_5 \\ \text{SO}_2\text{C}_2\text{H}_5 \\ \text{CH}_2 \\ \text{C}_2\text{H}_5 \end{cases} \quad \text{C} \begin{cases} \text{SO}_2\text{C}_2\text{H}_5 \\ \text{C}_2\text{H}_5 \\ \text{C}_2\text{H}_5 \end{cases}$	Sedative hypnotics. Dose, fifteen to thirty grains (0.9 to 1.9 Gm.).
Urethane (Ethyl Carbonate), $\text{CO}(\text{NH}_2)\text{OC}_2\text{H}_5$.	Used as a hypnotic, in doses of forty to sixty grains (2.6 to 3.8 Gm.).

QUESTIONS ON CHAPTER LIII.

ALDEHYDE, ITS DERIVATIVES AND PREPARATIONS.

- What is meant by the term aldehyde? What is the derivation of the word?
 What is its chemical composition?
 What is produced when 2H is added to aldehyde? What is the dose?
 Paraldehyde—Give Latin name, formula in symbols, and molecular weight.
 How is it made? What are its uses and dose?
 Chloral—Give Latin name, formula in symbols, molecular weight, and synonyme.
 From what is the name derived?
 How is it made? Describe the rationale of the process.
 What is the difference in composition between chloral and aldehyde?
 Hence, what is its name in systematic nomenclature?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 How may the following impurities be detected?—viz.: Acids; hydrochloric acid;
 organic impurities; inorganic impurities; alcoholate of chloral. What is the dose?
 Chloroform—What is the Latin name?
 Give formula in symbols, and molecular weight. How is it made?
 What is the object of this process, and how does it act?
 What is it termed chemically, and why?
 What is the reaction when it is produced by acting on chloral hydrate with an alkali?

What are its official preparations?

Iodoform—What is the Latin name?

Give formula in symbols and molecular weight.

What is Filhol's process for making it? What is the rationale of the process?

Describe odor, taste, chemical reaction, and solubility. What are tests for its identity? What is the dose?

How may the following impurities be detected?—viz.: Iodine; foreign impurities.

CHAPTER LIV.

PRODUCTS OF THE ACTION OF FERMENTS UPON ACID SACCHARINE FRUITS.

THE acid saccharine fruits form an important class in medicine and pharmacy. Their principal constituent is usually a vegetable acid (in some fruits several acids are found); sugar and albuminous principles are present in small amount, and on account of their presence vinous fermentation may be induced in their juices, resulting in the production of important alcoholic liquids. The fruits of this class which contribute the most useful products to pharmacy are grapes, lemons, limes, oranges, apples, tamarinds, raspberries, mulberries, pineapples, strawberries, currants, blackberries, etc. Most of the juices of these fruits readily undergo fermentation: the clear alcoholic liquid left after decomposition has received various names according to the fruit from which it is derived,—viz., wine from grapes, cider from apples, perry from pears, etc.

The products from the grape will be considered first.

VINUM ALBUM. U. S. White Wine.

An alcoholic liquid, made by fermenting the juice of fresh grapes, the fruit of *Vitis vinifera* (nat. ord. *Vitaceæ*), freed from seeds, stems, and skins.

VINUM RUBRUM. U. S. Red Wine.

An alcoholic liquid, made by fermenting the juice of fresh colored grapes, the fruit of *Vitis vinifera* (nat. ord. *Vitaceæ*), in presence of their skins.

The grape is the fruit of *Vitis vinifera*; the juice contains grape-sugar, tannin, acid potassium tartrate, calcium tartrate, potassium sulphate, sodium chloride, pectin, albuminous principles, and water. It will be seen that grape-juice naturally contains all the substances essential to the production of vinous fermentation, a favorable temperature and the presence of the atmosphere being alone needed to convert it into wine.

Preparation.—The grape-juice is run into vats, and constitutes the *must*. The temperature of the air being about 15.6° C. (60° F.), fermentation gradually takes place in the must, which becomes sensibly warmer and emits a large quantity of carbonic acid. The liquor from being sweet becomes vinous, owing to the conversion of the grape-sugar into alcohol. When the liquor has acquired a strong vinous taste and become perfectly clear, the wine is considered formed, and is racked off into casks. But even after this stage of the process the fermentation continues for several months. During the whole of this period a frothy matter is formed, which for the first few days collects round the bung, but afterwards precipitates along with coloring-matter and tartar, forming a deposit which constitutes the wine-lees. Wines are sweet,

dry, light, sparkling, still, acid, or rough, according to the character of the grape-juice and the method employed in making the wine. When the quantity of sugar in the juice is large, and the amount of ferment insufficient to convert all the sugar into alcohol, a *sweet* wine is produced; if, on the other hand, the quantity of ferment is sufficient to convert all the sugar into alcohol, a *strong* or *generous* wine is formed. If only a moderate amount of sugar is present in the juice, with enough ferment to convert all of it into alcohol, the wine is termed *dry*. A small proportion of sugar results in the production of a *light* wine; if a large quantity of ferment is present, however, a *sour* wine is produced, because the fermentation has progressed until acetic acid is formed. Wines are *sparkling* or *still* according as they contain carbonic acid or not, and, if fermented in contact with the seeds which contain tannin, they are *rough* or astringent. Two kinds of wine are official,—*Vinum album*, white wine, and *Vinum rubrum*, red wine: any of the commercial brands of wine which fulfil the requirements of the Pharmacopœia may therefore be used. The official recommendation is as follows: "When White Wine is prescribed without further specification, it is recommended that a dry White Wine of domestic production (such as California Riesling, Ohio Catawba, etc.) be employed. When Red Wine is prescribed without further specification, it is recommended that a dry Red Wine of domestic production (such as a native Claret, Burgundy, etc.) be employed."

Vinum Album. U.S.	ODOR, TASTE, AND REACTION.	
A pale amber-colored or straw-colored liquid. White Wine should have a sp. gr. of not less than 0.990, nor more than 1.010, at 15.6° C. (60° F.).	A pleasant odor free from yeastiness; a fruity, agreeable, and slightly spirituous taste, without excessive acidity or sweetness.	
ALCOHOLMETRICAL TEST.	IMPURITIES.	TEST AND LIMITS FOR IMPURITIES.
<p>Tested by the following method, White Wine should be found to contain not less than 10 nor more than 14 per cent., by weight (equivalent to 12.4 to 17.3 per cent. by volume), of absolute alcohol:</p> <p>Take the specific gravity (to four decimals) of a sufficient portion of the White Wine carefully measured at the temperature of 15.6° C. (60° F.) (noting its weight also), evaporate the Wine in a tared capsule to one-third of its original weight, cool, and add water until the liquid measures its original volume at 15.6° C. (60° F.); then take the specific gravity (to four decimals) again. The difference between the two specific gravities deducted from 1.0000 corresponds to the specific gravity of an alcohol containing the same percentage of absolute alcohol, by weight or volume, as the Wine under examination, the corresponding percentage being ascertained by referring to the alcoholmetrical table.</p>	Tannic Acid.	If 10 C.c. of White Wine be diluted with an equal volume of water, and treated with 5 drops of ferric chloride T.S., only a faint greenish-brown color should make its appearance.
	Limit of Fixed Residue.	If a portion of White Wine be evaporated, the residue, when dried during twelve hours on a water-bath, should not amount to less than 1.5 nor more than 3 per cent.
	Limit of Free Acid.	To neutralize 50 C.c. of White Wine should require not less than 3 nor more than 5.2 C.c. of normal potassium hydrate V.S., phenolphthalein being used as indicator.

The explanation of the official quantitative test for the amount of alcohol in wine is based upon the assumption that when the alcohol

from a measured weight of wine at a given temperature is entirely evaporated without boiling or wasting it, and when the original volume has been exactly restored by the addition of pure water at the same temperature, the difference between the two specific gravities deducted from 1.0000 expresses the specific gravity of an alcoholic liquid of the same strength as that in the wine. By referring to the alcohol table the percentage of alcohol by weight corresponding to this specific gravity is ascertained, and thus the percentage of alcohol in the wine is obtained.

An example will illustrate this. If 6 fl. oz. of the wine, sp. gr. 0.9973, to be tested weigh 2727 grains, when it has been evaporated to 2 fl. oz. and the alcohol has all been driven off, and distilled water added to the residuary liquid until its original volume of 6 fl. oz. is restored, it weighs 2789 grains, and its sp. gr. is 1.0200. Then $1.0200 - 0.9973 = 0.0227$, and $1.0000 - 0.0227 = 0.9773$. Consulting the alcoholmetrical table, a mixture of alcohol and water of the sp. gr. 0.9773 is found to contain 15 per cent. of alcohol, which is the percentage by weight that the wine contains.

Vinum Rubrum. U.S.		ODOR AND TASTE.	
A deep red liquid. Red Wine should have a sp. gr. of not less than 0.989, nor more than 1.010, at 15.6° C. (60° F.). If a portion of Red Wine be evaporated, the residue, when dried during twelve hours on a water-bath, should not amount to less than 1.6 per cent., nor more than 3.5 per cent.		A pleasant odor free from yeastiness; a-fruity, moderately astringent, pleasant, and slightly acidulous taste, without excessive acidity or sweetness.	
QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.	
<p>With lead acetate T.S., Red Wine forms a heavy precipitate which may vary in color from bluish-green to green.</p> <p>Tested by the following method, Red Wine should be found to contain not less than 10 nor more than 14 per cent., by weight (equivalent to 12.4 to 17.3 per cent. by volume), of absolute alcohol: Take the specific gravity (to four decimals) of a sufficient portion of the Red Wine accurately measured at the temperature of 15.6° C. (60° F.), (noting its weight also), evaporate the Wine in a tared capsule to one-third of its original weight, cool, and add water until the liquid measures the original volume at 15.6° C. (60° F.); then take the specific gravity (to four decimals) again. The difference between the two specific gravities deducted from 1.0000 corresponds to the specific gravity of an alcohol containing the same percentage of absolute alcohol, by weight or volume, as the Wine under examination, the corresponding percentage being ascertained by referring to the alcoholmetrical table.</p>	Limit of Acidity.	<p>To neutralize 50 C.c. of Red Wine should require not less than 3 nor more than 5.2 C.c. of normal potassium hydrate V.S., eosin or fluorescein being used as indicator.</p> <p>If 2 C.c. of Red Wine be mixed, in a test-tube, with two drops of chloroform and 4 C.c. of normal potassium hydrate V.S., and the mixture carefully heated, the disagreeable odor of isonitril should not become perceptible.</p> <p>If 50 C.c. of Red Wine be treated with a slight excess of ammonia water, the liquid should acquire a green or brownish-green color; if it be then well shaken with 25 C.c. of ether, the greater portion of the ethereal layer removed, and evaporated in a porcelain capsule with an excess of acetic acid and a few fibres of uncolored silk, the latter should not acquire a crimson or violet color.</p> <p>If 25 C.c. of Red Wine, heated to about 45° C. (113° F.), be well agitated with 25 Gm. of manganese dioxide, the liquid filtered off and acidulated with hydrochloric acid, it should not acquire a red color.</p> <p>If 10 C.c. of Red Wine be diluted with an equal volume of water, and treated with 5 drops of ferric chloride T.S., the liquid should acquire a brownish-green color.</p>	
	Absence of Various Aniline Colors.		
	Absence of Fuch sine.		
	Absence of Sulpho-Fuch sine.		
	Due to Tannic Acid.		

The aroma of wines, termed their "bouquet," depends upon the formation of certain compound ethers during the fermentation, and also during the ageing or ripening process. These are said to be *cenanthic*, *caprylic*, *butyric*, *caproic*, *acetic*, and *pelargonic ethers*.

Argols.—During the fermentation of wines, especially those that are acid, a peculiar matter is deposited upon the sides and bottom of the casks, forming a crystalline crust, called *crude tartar*, or *argols*. That deposited from red wines is of a reddish color, and is called *red argols*; that derived from white wines is of a dirty-white color, and is denominated *white argols*. Both kinds consist of potassium acid tartrate rendered impure by calcium tartrate, more or less coloring-matter, and other matters which are deposited during the clarification of the wine. The deposition of the tartar is thus explained: the acid tartrate exists naturally in the juice of the grape, held in solution by the sweet aqueous liquid; when the juice is submitted to fermentation in the process for converting it into wine, the sugar disappears, and is replaced by alcohol, in which the salt is insoluble. It is from this substance that potassium acid tartrate is obtained by a process of purification (see Potassii Bitartras, page 532), and from the latter tartaric acid is produced.

Uses.—Wine is used, pharmaceutically, as a menstruum (see Vinum Album, page 381), the present requirements being that it shall contain at least 20 per cent., but not more than 25 per cent., by weight, of absolute alcohol. This insures greater stability in the medicated wines. Medicinally, wine is used as a stimulant.

SPIRITUS VINI GALLICI. U. S. Brandy.

An alcoholic liquid obtained by the distillation of fermented grapes, and at least four years old.

Brandy varies in quality according to the source from which it is obtained. The best brandy is obtained from French wines, and the kind called Cognac is most esteemed. Very large quantities of brandy are now made in California, but the taste is peculiar and easily distinguished from that of Cognac. The Pharmacopœia recognizes all spirits when obtained from the juice of grapes, if sufficiently strong and pure to meet the tests given below.

Spiritus Vini Gallici. U. S.	IMPURITIES.	TESTS FOR IMPURITIES.
Brandy has a pale amber color, a distinctive taste and odor, a slightly acid reaction, and a sp. gr. not above 0.941 nor below 0.925, corresponding approximately with an alcoholic strength of 39 to 47 per cent. by weight, or 46 to 55 per cent. by volume.	Fusel Oil from grain or potato spirit.	<p>If 100 C.c. of Brandy be very slowly evaporated in a tared capsule, on a water-bath, the last portions volatilized should have an agreeable odor, free from harshness.</p> <p>The residue, dried at 100° C. (212° F.), should weigh not more than 1.5 Gm. This residue should have no sweet or distinctly spicy taste.</p> <p>The residue should nearly all dissolve in 10 C.c. of cold water, forming a solution which is colored light green by a dilute ferric chloride T.S., made by mixing the latter with 10 volumes of water.</p> <p>100 C.c. of Brandy should be rendered distinctly alkaline to litmus by 1 C.c. of potassium hydrate V.S.</p>
	Added Sugar, Glycerin, or Aromatic Substances.	
	Traces of Oak Tannin from casks.	
	Limit of Free Acid.	

Brandy owes its aroma to cœnanthic and acetic ethers and other volatile products. (See Vinum Album.) Cœnanthic ether is known chemically as ethyl pelargonate, $C_{11}H_{22}O_2$, but in commerce it is called *oil of cognac*. It is a fragrant, ethereal oil, of a greenish color, and is largely used in making factitious brandy.

Uses.—Brandy is not used in any official preparation. It is employed as a stimulant, and often administered with milk, yolk of eggs, etc.

ACIDUM TARTARICUM. Tartaric Acid.

An organic acid usually prepared from argols.

Preparation.—This important acid may be prepared by saturating the excess of acid in acid potassium tartrate or cream of tartar with calcium carbonate, and decomposing the resulting insoluble calcium tartrate by sulphuric acid, which precipitates in combination with the lime as calcium sulphate, and liberates the tartaric acid. The process, when thus conducted, furnishes only one-half of the tartaric acid. The other half may be procured by decomposing the neutral potassium tartrate remaining in the solution after the precipitation of the calcium tartrate by calcium chloride in excess. By double decomposition, potassium chloride will be formed in solution, and a second portion of calcium tartrate will precipitate, which may be decomposed by sulphuric acid together with the first portion.

then

and

Calcium sulphate is sometimes substituted for calcium chloride in the second stage of the decomposition. Tartaric acid is a dibasic acid, one or two of its hydrogen atoms are capable of being replaced by metals; with monad metals, acid, neutral, and double tartrates may be formed, thus:

Tartaric acid contains no water of crystallization. The tartrates are important salts: six are official, four of them being double salts, viz., antimony and potassium tartrate, iron and potassium tartrate, iron and ammonium tartrate, potassium and sodium tartrate; the other two salts are potassium tartrate and potassium bitartrate. Tartrates may be recognized by becoming blackened on the addition of sulphuric acid,

evolving at the same time an empyreumatic odor: their solutions, if neutral, yield with calcium chloride white precipitates of calcium tartrate, which are soluble in solution of potassa. Tartaric acid is recognized by a strong solution producing with a solution of potassium hydrate a white crystalline precipitate of acid potassium tartrate.

Acidum Tartaricum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Nearly or entirely colorless, translucent, monoclinic prisms, or crystalline crusts, or a white powder, permanent in air. When heated for two hours at 100° C. (212° F.), the crystals do not lose more than a trace in weight. At 135° C. (275° F.) they melt; at higher temperatures they are gradually decomposed, emitting the odor of burning sugar, and are finally consumed without leaving more than 0.05 per cent. of ash.	Odorless; purely acid taste; acid reaction.	Cold, 0.8 part.	Cold, 2.5 parts.	250 parts of ether; nearly insoluble in chloroform, benzol, and benzin.
		Boiling, 0.5 part.	Boiling, 0.2 part.	

Taste.	IMPURITIES.	TESTS FOR IMPURITIES.
An aqueous solution (1 in 2) of the Acid mixed with a strong solution (1 in 3) of potassium acetate yields a white crystalline precipitate which is soluble in solutions of alkalies and in mineral acids, but insoluble in acetic acid. To neutralize 3.75 Gm. of Tartaric Acid should require 50 C.c. of potassium hydrate V.S. (each C.c. corresponding to 2 per cent. of the pure acid), phenolphthalein being used as indicator.	Lead and Copper.	<p>A concentrated aqueous solution of Tartaric Acid should not be blackened, at the line of contact, by the careful addition of test-solution of hydrogen sulphide.</p> <p>On supersaturating 10 C.c. of the aqueous solution (1 in 10) with ammonia water, no turbidity should be produced in the liquid by ammonium oxalate T.S.</p> <p>Nor should the further addition to the above solution of 1 drop of ammonium sulphide T.S. produce any dark coloration or precipitate.</p> <p>An aqueous solution (1 in 10) in which the free acid has been nearly, but not entirely, neutralised by ammonia, should not be affected by calcium sulphate T.S. (difference from oxalic and uric acids).</p> <p>The aqueous solution (1 in 10) of Tartaric Acid, acidulated with a few drops of hydrochloric acid, should show no precipitate after the addition of barium chloride T.S.</p>
	Calcium.	
	Lead, Copper, Iron, etc.	
	Oxalic and Uvic Acids.	
	Sulphuric Acid.	

Official Preparation containing Tartaric Acid.

Pulvis Effervesceus Compositus. Prepared by wrapping 35 grains (2.26 Gm.) of powdered tartaric acid in white paper, and 160 grains (10.3 Gm.) of Seidlitz mixture (composed of 40 grains (2.59 Gm.) of sodium bicarbonate and 120 grains (7.77 Gm.) of Rochelle salt in blue paper. (See Pulveres.)

LIMONIS SUCCUS. U. S. Lemon Juice.

The freshly expressed juice of the ripe fruit of *Citrus Limonum* Risso (nat. ord. *Rutaceæ*).

Lemon juice owes its acidity to citric acid (see Acidum Citricum). It is a yellowish, slightly turbid, acid liquid, having a slight odor of lemon, due to the presence of a trace of the volatile oil of the rind. Its specific gravity should be not less than 1.030, and it should contain about 7 per cent. of citric acid. Lemon juice can only with difficulty be preserved. It is generally heated so as to coagulate albuminous matter, and then a small quantity of alcohol is added as an antiseptic.

ACIDUM CITRICUM. U. S. Citric Acid.

Preparation.—Although this acid is found in many plants, it is obtained upon a commercial scale only from the juice of limes and lemons.¹ It is extracted from *lime-juice* by a very simple process, but one requiring some careful manipulation. The boiling juice is first completely saturated with calcium carbonate (chalk or whiting) in fine powder, and the calcium citrate formed is allowed to subside. This is then washed repeatedly with water, and decomposed by diluted sulphuric acid. An insoluble calcium sulphate is precipitated, and the disengaged citric acid remains in solution. This is carefully concentrated in leaden boilers until a pellicle begins to form, when it is transferred to other vessels to cool and crystallize.

then

Acidum Citricum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvent.
Colorless, translucent, right-rhombic prisms, not deliquescent except in moist air, efflorescent in warm air.	Odorless; agreeable acid taste; acid reaction.	Cold, 0.63 part. Boiling, 0.4 part.	Cold, 1.61 parts. Boiling, 1.43 parts.	Ether 18 parts.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
When heated to about 75° C. (167° F.), the Acid begins to lose its water of crystallization; at about 135° C. (275° F.) it becomes anhydrous, and melts between 135° and 152° C. (275° and 305.6° F.). When slowly ignited, it is gradually decomposed without emitting the odor of burning sugar (difference from <i>tartaric acid</i>), and is finally consumed without leaving more than 0.05 per cent. of ash. On adding 1 C.c. of an aqueous solution (1 in 10) of the Acid to 50 C.c. of calcium hydrate T.S. (or so much more of the latter that the mixture has an alkaline reaction), the liquid remains clear until boiled, when it becomes opaque through the precipitation of calcium citrate, which redissolves on cooling.	Tartaric or Oxalic Acid.	If 1 Gm. of the powdered Acid be dissolved in 5 C.c. of a cold solution (1 in 3) of potassium acetate, the liquid should remain clear even after the addition of an equal volume of alcohol. On mixing 10 C.c. of a 10-per-cent. aqueous solution of the Acid with a quantity of ammonia water insufficient to neutralize it completely, and adding to one-half of this liquid 1 C.c. of ammonium oxalate T.S., it should remain clear. The other half of the above solution, mixed with a few C.c. of hydrogen sulphide T.S., should not deposit a colored precipitate, nor acquire more than a faintly brownish-yellow tint. 10 C.c. of a 1-per-cent. aqueous solution of the Acid should show no turbidity within five minutes after the addition of 1 C.c. of barium chloride T.S. and a few drops of hydrochloric acid.
To neutralize 3.5 Gm. of the Acid should require 50 C.c. of potassium hydrate V.S. (each C.c. corresponding to 2 per cent. of the pure acid), phenolphthalein being used as indicator.	Calcium.	
	Metallic Impurities.	
	Sulphuric Acid.	

¹ Limes—the fruit of *Citrus acris*—are usually smaller than lemons, and abound in a very acid juice.

Citric acid contains one molecule of water of crystallization : it differs in this respect from tartaric acid, which contains none. It is a tribasic acid ; in other words, three atoms of hydrogen are replaceable by metals, three classes of citrates being formed according as one, two, or three hydrogen atoms are replaced.

The citrates are a valuable class of medicinal salts, ten being official,—six of which are simple salts and four are double,—as follows : effervescent lithium citrate, bismuth, iron, lithium, and potassium citrates, magnesium citrate, bismuth and ammonium citrate, iron and ammonium citrate, iron and quinine citrate, iron and strychnine citrate. It is used in three solutions,—solution of ferric citrate, solution of magnesium citrate, solution of potassium citrate.

Uses.—Citric acid in solution is used as a substitute for lemon juice. The dose is from five to thirty grains (0.3 to 1.9 Gm.). It is rarely given in its free state.

Official Preparation.

Syrupus Acidi Citrici. Made by mixing 10 C.c. of spirit of lemon with 980 C.c. of syrup, and adding gradually a solution of 10 Gm. of citric acid in 10 C.c. of water (see page 300).
Syrup of Citric Acid.

TAMARINDUS. U. S. Tamarind.

The preserved pulp of the fruit of *Tamarindus indica* Linné (nat. ord. *Leguminosæ*).

Among the constituents of the pulp of tamarinds are citric and tartaric acids : malic acid is present in small quantity.

Uses.—This pulp is one of the ingredients in confection of senna : it is purgative, and is often used to make laxative confections.

RHUS GLABRA. U. S. Rhus Glabra.

The fruit of *Rhus glabra* Linné (nat. ord. *Anacardiæ*).

This fruit owes its acidity to malic acid, which exists in it as calcium and potassium malate : this acid is found in unripe apples and in a great number of fruits, roots, leaves, stems, etc. *Rhus glabra* also contains tannin, gallic acid, and red coloring-matter.

Malic acid may be obtained from *rhus glabra* by exhausting the berries with water, evaporating, filtering, and crystallizing the acid calcium malate, which is then dissolved in boiling water, and treated with lead acetate, when lead malate is precipitated ; this is then suspended in water, hydrogen sulphide is passed through it, lead sulphide is precipitated, and the solution of malic acid is evaporated to permit crystallization. Malic acid is found in colorless shining needles having a sour taste and an acid reaction. It is soluble in alcohol and deliquescent in the air. It is dibasic.

Uses.—*Rhus glabra* is a useful refrigerant and astringent. The dose is thirty grains to two drachms (1.9 to 7.7 Gm.).

Official Preparation.

Extractum Rhois Glabræ Fluidum. Made with 10 per cent. of glycerin and a menstruum of diluted alcohol (see page 419).
Fluid Extract of Rhus Glabra.

Acid Saccharine Fruits containing Pectinous Bodies.

The pulpy constituents of fruits and fleshy roots undergo naturally certain changes when subjected to the influences of a ferment known as *pectase*: these changes can be closely imitated artificially when the pulp is treated with acids or alkalis in aqueous solution, by the aid of heat. According to Fremy, pectase exists in fruits in either a soluble or an insoluble condition. Green unripe fruits contain *pectose*, a substance which is supposed to be isomeric with cellulose, and which gives to such fruits their hardness. Pectose is insoluble in water, alcohol, or ether.

In the process of ripening fruits, the pectase slowly acts on the pectose, the hardness disappears, *pectin* is formed, and the fruit is soft and ripe. When it is overripe, *parapectin* and *metapectic acid* are produced. The moderate action of heat and water upon fruits is thus explained: the citric, tartaric, or malic acid in the fruit acts on the pectose, softening it, and converting it into pectin, and the pectin is then acted upon by the ferment pectase, which causes it to gelatinize, on cooling, through the production of pectosic acid: this is the cause of the formation of fruit jellies. The *rapid* application of strong heat to the pulp of fruits results in the coagulation and destruction of the ferment pectase, and the production of jelly is thus prevented.

Alkalies form soluble compounds with pectosic acid and pectin, and hence, when gelatinous precipitates are found in fluid extracts and tinctures, due to the formation of either of these substances, they may be dissolved by the application of an alkaline solution: the use of ammonia water in fluid extract of senega is an illustration of this.

RUBUS IDÆUS. U. S. Raspberry.

The fruit of *Rubus idæus* Linné (nat. ord. *Rosaceæ*).

This fruit contributes to pharmacy an agreeable juice, which is used in making the official syrup. The average constituents are 3 to 5 per cent. sugar, 1 per cent. free acid, 1 per cent. albuminous substances, and 2 to 5 per cent. pectinous bodies.

Official Preparation.

Syrupus Rubi Idæi. Express the juice from fresh ripe raspberries, allow it to stand until it ferments, then filter it, and add 60 parts of sugar to 40 parts of the filtered liquid, heat to boiling, and strain (see page 309).

Unofficial Fruits.

- Apple.** The fruit of *Pyrus malus*. The constituents are 7 to 10 per cent. sugar, $\frac{1}{2}$ to 1 per cent. free acid, and 5 per cent. each albuminous and pectinous substances. The fermented juice of the apple is termed *cider* or *vinegar*.
- Apriocot.** The fruit of *Prunus Armeniaca*. The average constituents are 1 to 2 per cent. sugar, $\frac{1}{2}$ to 1 per cent. free acid, $\frac{1}{2}$ to 1 per cent. albuminous substances, and 5 to 10 per cent. pectinous substances.
- Blackberry.** The fruit of *Rubus villosus*, *R. canadensis*, and *R. trivialis*. The average constituents are 4 per cent. sugar, 1 per cent. free acid, $\frac{1}{2}$ per cent. albuminous substances, and 1 to 1 $\frac{1}{2}$ per cent. pectinous substances.
- Bilberry.** The fruit of *Vaccinium resinorum*. The average constituents are 5 per cent. sugar, 1 per cent. free acid, 1 per cent. albuminous substances, and $\frac{1}{2}$ per cent. pectinous substances.
- Cherry.** The fruit of a species of *Prunus*. The average constituents are 8 to 13 per cent. sugar, 1 per cent. free acid, and $\frac{1}{2}$ to 3 per cent. each albuminous and pectinous substances.

Unofficial Fruits.—Continued.

Current.	The fruit of <i>Ribes rubrum</i> . The average constituents are 4 to 7 per cent. sugar, 1 to 2 per cent. free acid, $\frac{1}{2}$ to $\frac{1}{4}$ per cent. albuminous substances, and $\frac{1}{2}$ per cent. pectinous substances.
Gooseberry.	The fruit of <i>Ribes Grossularia</i> . The average constituents are 6 to 8 per cent. sugar, 1 to $1\frac{1}{2}$ per cent. free acid (chiefly citric), $\frac{1}{2}$ per cent. albuminous substances, and $\frac{1}{2}$ to 2 per cent. pectinous substances.
Peach.	The fruit of <i>Amygdalus Persica</i> . The average constituents are $1\frac{1}{2}$ per cent. sugar, $\frac{1}{2}$ per cent. free acid, $\frac{1}{2}$ per cent. albuminous substances, and 6 per cent. pectinous substances.
Pear.	The fruit of <i>Pyrus communis</i> . The average constituents are 7 per cent. sugar, 7 per cent. free acid, $\frac{1}{2}$ per cent. albuminous substances, and 3 per cent. pectinous substances.
Pineapple.	The fruit of <i>Ananas sativa</i> . The juice contains 2 per cent. sugar, 1 per cent. free acid, and 3 per cent. albuminous and pectinous substances.
Plum.	The fruit-trees belonging to the genus <i>Prunus</i> . The average constituents are about 1 to 2 per cent. sugar, $\frac{1}{2}$ to 1 per cent. free acid, $\frac{1}{2}$ per cent. albuminous substances, and 2 to 11 per cent. pectinous substances.
Strawberry.	The fruit of different species of <i>Fragaria</i> . The average constituents are 3 to 7 per cent. sugar, 1 per cent. free acid, $\frac{1}{2}$ per cent. albuminous substances, and 2 per cent. pectinous substances.

QUESTIONS ON CHAPTER LIV.

PRODUCTS OF THE ACTION OF FERMENTS UPON ACID SACCHARINE FRUITS.

What is white wine? Describe it and give its specific gravity.

What is red wine? Describe it and give its specific gravity. What is must?

How is wine made?

What is meant by the following terms as applied to wines?—viz.: Sweet, dry, light, generous, sparkling, still, sour, rough.

What kinds of wine are official?

Describe odor, taste, chemical reaction, and solubility. How may the alcoholic strength of wine be ascertained?

How much alcohol should wine contain?

White wine—How may the following impurities be detected?—viz.: Tannic acid; limit of fixed residue; limit of acidity.

Red wine—How may the following impurities be detected?—viz.: Limit of acidity; aniline coloring.

What is the aroma of wines termed, and upon what does it depend?

What ethers are said to be formed in wines?

What are argols?

What is the difference between red and white argols?

Why are argols deposited during the clarification of wine?

What salt is obtained from argols?

What are the uses of wine?

What alcoholic strength is required of wine for pharmaceutical purposes?

How is it obtained, and why is it required?

Brandy—What is the Latin official name? What is its official definition?

Describe the best kind.

What kind of brandy is recognized by the U. S. Pharmacopœia?

How much alcohol should brandy contain?

Give description and specific gravity. Describe odor, taste, and chemical reaction.

How may the following impurities be detected?—viz.: Fusel oil from grain or potato spirit; an undue amount of solids; added sugar, glycerin, or spices; traces of oak tannin from casks; an undue amount of free acid.

To what does brandy owe its aroma?

What is cœnanthic ether chemically, and what is its commercial name?

- Is any preparation of brandy official?
 What is its medicinal use?
 Tartaric acid—What is the Latin name? Give formula in symbols and molecular weight.
 How is it prepared? Describe rationale of process.
 What is its quantivalence?
 Does it contain water of crystallization?
 What tartrates are official?
 How may they be recognized?
 How may tartaric acid be recognized? Describe rationale of process.
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 How may the following impurities be detected?—viz.: Lead and copper; lead, copper, and iron; copper; sulphuric acid.
 What official preparation contains tartaric acid?
 To what does lemon juice owe its acidity?
 How much acid should it contain?
 What should be its specific gravity?
 What official preparations are made with lemon juice?
 Citric acid—What is the Latin name? Give formula in symbols and molecular weight.
 How is this acid obtained commercially? Describe rationale of process.
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 How may the following impurities be detected?—viz.: Tartaric and oxalic acids; 1 per cent. or more of tartaric acid; lead or copper; copper; lead, copper, and iron; sulphuric acid.
 How much water of crystallization does it contain?
 What is its quantivalence? What citrates are official?
 What is the dose? What official preparation is made with it?
 What is tamarind?
 What acids are contained in the pulp of tamarinds?
 For what is it used?
 Sumach—What is the Latin official name? What is it?
 To what does it owe its acidity?
 How may malic acid be obtained from it?
 What is the quantivalence of malic acid?
 For what is rhus glabra used, and what is the dose?
 What official preparation is there of it?
 What is pectase, and what is pectose?
 To what substance do green, unripe fruits owe their hardness?
 In the ripening of fruits, what change takes place whereby the fruits are rendered soft?
 When fruit is over-ripe, what substances are produced?
 How is the formation of fruit jellies explained?
 What action do alkalies have upon pectosic acid and pectin?
 Give an illustration of the application of this principle.
 Raspberry—What is the Latin official name? What part is official?
 Into what official preparation does it enter? How is this made?

CHAPTER LV.

VOLATILE OILS.

VOLATILE oils, or *essential oils*, are found in the various parts of plants. They usually constitute the odorous principles, and they either pre-exist in the plant, or are produced by the reaction of certain constituents when brought in contact with water. Volatile oils are sometimes formed through destructive distillation, as the oil of amber, and may also be obtained from the animal kingdom, as the oil from ambergris. They may be divided into four classes: 1. Terpenes. 2. Oxygenated oils. 3. Sulphurated oils. 4. Nitrogenated oils.

1. **Terpenes**, or hydrocarbons, consist of carbon and hydrogen, and mostly have the formula $C_{10}H_{16}$, oil of turpentine being the type.

2. **Oxygenated Oils**.—Hydrocarbons containing oxygen, like the oil of cinnamon.

3. **Sulphurated Oils**.—Containing sulphur, like the volatile oil from mustard.

4. **Nitrogenated Oils**.—A very small class containing hydrocyanic acid, like oil of bitter almond; otherwise, nitrogen is never one of the constituents of volatile oils.

Proximately, volatile oils consist of two principles, which differ in their point of volatilization or congelation, or in their composition. They are termed *stearopten* and *eleopten*. It is, however, impossible to separate these by distillation alone so as to obtain them entirely pure. When, as often happens, they congeal at different temperatures, they may be separated by compressing the frozen oil between folds of bibulous paper. The solid matter, *stearopten*, remains within the folds, and the fluid, *eleopten*, is absorbed by the paper, from which it may be separated by distillation with water. The solid crystalline substances deposited by volatile oils upon standing are also called *stearoptens*. Some of them are denominated *camphors*, from their resemblance to true camphor. Some are isomeric with the oils in which they are formed; others are oxides or hydrates, alcohol-like in character. Certain oils, under the influence of water, deposit crystalline hydrates of the respective oils.

Color of Volatile Oils.—Most oils are colorless when pure and fresh, or can be made colorless by redistillation. Upon exposure to the air they acquire various colors, becoming green, as in oil of wormwood, yellow, as in oil of peppermint, red, as in oil of origanum, brown, as in oil of cinnamon, or blue, as in oil of chamomile.

Odor.—The odor of volatile oils is very variable. It is their most characteristic feature. It is sensibly modified by the exposure of the

oils to the air. Oil of turpentine may be rectified by distillation in an atmosphere of carbonic acid, or *in vacuo*, so that it will be odorless, or have an agreeable fragrant odor. A very slight exposure to the air is sufficient, however, to restore the well-known unpleasant odor.

Taste.—Their taste is almost as variable as their odor. Some are sweet, others have a mild, pungent, hot, acrid, caustic, or burning taste.

Density.—The specific gravity of volatile oils also varies (from 0.847 to 1.17). They are mostly lighter than water (see table, page 88).

Boiling Point.—This is also variable. The oils volatilize to some extent at ordinary temperatures and diffuse their peculiar odors. Upon heating, however, they may be completely vaporized. When sufficiently heated, they take fire, and burn with a bright flame.

Solubilities.—Water is a poor solvent for volatile oils, although it acquires a decided odor and flavor when brought in contact with the oil in a finely-divided state, as has been shown in the medicated waters. Alcohol, ether, chloroform, naphtha, glacial acetic acid, benzin, and benzol are solvents for volatile oils. Alcohol is a better solvent for the oxygenated oils than for the terpenes. Volatile oils freely dissolve fixed oils, fats, resins, camphors, sulphur, phosphorus, and similar bodies.

Exposure to Light and Air injures the quality and destroys the fragrance of volatile oils. Ozone is developed, and they thicken and become resinified, or deposit crystalline compounds upon exposure. The whitening of corks which have been inserted in bottles containing volatile oils and kept a long time is due to the bleaching action of the ozone which is gradually produced during their decomposition. They should be kept in tightly-stoppered, amber-colored vials.

Action of Acids, Alkalies, etc.—Nitric acid, if strong, decomposes volatile oils with great rapidity. Iodine reacts with some oils with explosive violence. Alkalies have generally little effect on volatile oils, with the exception of a few with which it forms chemical compounds, like the oils from cloves, gaultheria, cinnamon, etc.

Adulterations.—The volatile oils are costly enough to tempt the cupidity of those who make a business of adulterating. A fixed oil is sometimes used to mix with the volatile oil. This mixture may be detected by dropping the suspected oil on a piece of filtering-paper. The stain of a pure volatile oil is not permanent. By slightly heating it the oil is vaporized; if fixed oil is present, the stain remains. Alcohol may be detected by shaking the mixed oil in a graduated tube with glycerin or water. The volume of the oil will be diminished, and that of the water or glycerin correspondingly increased, in proportion to the amount used. This test is not susceptible of fine determination, because of the slight solubility of volatile oils in water and in mixtures of alcohol and water. Metallic sodium, calcium chloride, aniline red, have all been used to show the presence of alcohol and traces of water in volatile oils. The adulteration of volatile oils by the addition of cheaper grades of the same oil, or by using a cheaper oil having a similar odor, is largely practised. The only reliable test here is the use of the olfactories. By practice the sense of smell can be highly educated by the analyst. The specific rotatory power, the index of refraction, the amount of iodine absorbed, and the saponification num-

ber, or the amount of potassium hydrate absorbed by the ester to form a potassium salt, have all been used with more or less success in detecting adulterations.

Preparation of Volatile Oils.

Volatile oils are generally obtained from plants by the following methods: 1. Distillation with water. 2. Distillation *per se*. 3. Expression. 4. Solution.

1. **Distillation with Water.**—This is the method most frequently employed. The general formula is as follows: Put the substance from which the Oil is to be extracted into a still (see Distillation, page 166), and add enough water to cover it; then distil by a regulated heat into a large refrigeratory. Separate the Distilled Oil from the water which comes over with it.

The substances from which the volatile oils are extracted may be employed in either the recent or the dried state. Certain flowers, however, such as orange flowers and roses, must be used fresh, or preserved with salt or by means of glycerin, as they afford little or no oil after desiccation. Dried substances, before being submitted to distillation, require to be macerated in water till they are thoroughly penetrated by this fluid; and, to facilitate the action of the water, it is necessary that, when of a hard or tough consistence, they should be properly comminuted.

The water which is put with the substance to be distilled into the still, answers the double purpose of preventing the decomposition of the vegetable matter by regulating the temperature, and of facilitating the volatilization of the oil, which, though in most instances it readily rises with the vapor of boiling water, requires, when distilled alone, a considerably higher temperature, and is at the same time liable to be partly decomposed. Some oils, however, will not ascend readily with steam at 100° C. (212° F.), and in the distillation of these it is customary to use water saturated with common salt, which does not boil under 118.4° C. (227.1° F.) (see page 120). Other oils, again, may be volatilized with water at a temperature below the boiling point; and, as heat exercises an injurious influence over the oils, it is desirable that the distillation should be effected at as low a temperature as possible. To prevent injury from heat, it has been recommended to suspend the substance containing the oil in a basket, or to place it upon a perforated shelf, in the upper part of the still, so that it may be penetrated by the steam without being in direct contact with the water. Another mode of effecting the same object is to distil it *in vacuo*. Steam can be very conveniently applied to this purpose by causing it to pass through a coil of tube, of an inch or three-quarters of an inch bore, placed in the bottom of a common still (see page 133). The end at which the steam is admitted enters the still at the upper part, and the other end, at which the steam and condensed water escape, passes out laterally below, being furnished with a stop-cock, by which the pressure of the steam may be regulated, and the water drawn off when necessary. In some instances it is desirable to conduct the steam immediately into the still near the bottom, by which the contents are kept in a state of brisk ebullition (see Fig. 102).

The quantity of water added is not a matter of indifference. An

amount above what is necessary acts injuriously, by holding the oil in solution, when the mixed vapors are condensed; and if the proportion be very large, it is possible that no oil whatever may be obtained separate. On the contrary, if the quantity be too small, the whole of the oil will not be distilled, and there will be danger of the substance in the still adhering to the sides of the vessel and thus becoming burnt. The case shown on page 168 will be found useful in this connection. Sometimes the quantity of oil is so small that it entirely dissolves in the water, and then the process of *cobobation* is applicable: this consists in repeatedly returning the distillate to a fresh portion of the plant, the water in this way becoming supersaturated, and then the oil can be separated.

2. *Distillation per se*.—By this is meant the distillation of certain bodies without the use of water (*per se*, “by itself”). This is done in the cases of certain oleoresins, oils, copaiba, etc., water not being required in the process, and always being difficult to separate from the distillate.

3. *Expression* (see page 246).—This method generally produces the most fragrant products, because there are very few volatile oils whose aroma is not injuriously affected by the action of heat. The volatile oils of the Rutaceæ are mostly made by expressing the rind of the fresh fruit (see page 857).

4. *Solution or Absorption*.—Some volatile oils are so susceptible to decomposition that they are dissociated by distillation, whilst they do not exist in sufficient quantity in the plant to pay for their extraction by expression: in such cases the odorous principle may be extracted by some form of solution or absorption. This may be effected by maceration, digestion, percolation with carbon bisulphide or similar solvent, enfleurage, or the pneumatic process.

Maceration.—In obtaining volatile oils by maceration, the odorous portions of the plant (generally fragrant flowers) are allowed to stand in contact with a bland inodorous fixed oil, like fine olive oil, oil of ben, or purified cotton-seed oil: the oil absorbs the odor, and after a certain length of time it is strained. The odorous fixed oil is generally used in perfumery.

Digestion.—This process is similar to maceration, except that a moderate heat is employed, by the use of a salt-bath, to aid in the extraction.

Enfleurage is largely used for extracting the odors of very delicate flowers. It is a cold process, and consists in spreading a thin layer of purified inodorous fat upon glass frames (*châssis*): these resemble an ordinary window-sash, with one pane of glass in each. The flowers are sprinkled on the fat, and the frames piled in a stack. The whole is left undisturbed for a time varying from twelve hours to four days. The fat absorbs the odor completely. When strong pomades are desired, fresh flowers are continually added as long as the absorption continues, and the pomades are known commercially as Nos. 6, 12, 18, and 24, the numbers indicating the strength. The volatile products may be obtained from the pomade by chopping the latter into small pieces and macerating them in pure alcohol. A small portion of the fat is apt to be dissolved by this treatment and give a fatty odor to the solution, but this may be separated by subjecting it to cold, when it can be filtered out.

The process of extracting odors from pomades by agitating them in contact with alcohol has been largely used in late years in the United States. The pomades are mostly imported from Grasse, France, and Fig. 354 illustrates Day's pomade washer, a machine constructed for agitating the mixture of pomade and alcohol in order to hasten the process of extraction.

Pneumatic Process.—This method is used only with very delicate volatile oils. It consists in forcing a current of air into a vessel filled with fresh flowers, and then conveying the perfumed air into another vessel containing purified fat which is kept melted. Circular plates, half immersed, revolve in the fat, and these, when coated, absorb the odor from the perfumed air.

Percolation.—This process consists in percolating odorous flowers with purified carbon disulphide: the latter is distilled, and the volatile oils are found in the residue.

FIG. 354.

Day's pomade washer.

Official Products from the Rutaceæ.

The natural order Rutaceæ furnishes valuable products to medicine and pharmacy, which are conveniently grouped together.

AURANTII DULCIS CORTEX. U.S. Sweet Orange Peel.

The rind of the fresh fruit of *Citrus Aurantium* Linné (nat. ord. Rutaceæ).

Sweet orange peel owes its virtues to the volatile oil found in the epidermis. It also communicates a yellowish color to the preparations made with it. It is used as a flavoring substance.

Official Preparations.

- | | |
|---|--|
| Syrupus Aurantii | Made by digesting grated fresh sweet orange peel with a little boiling alcohol, making a medicated water by the aid of precipitated calcium phosphate, and dissolving sugar in it by agitation (see page 302). |
| Syrup of Orange. | |
| Tinctura Aurantii Dulcis | Made by percolating 200 Gm. of sweet orange peel with sufficient alcohol to make 1000 C.c. (see page 361). |
| Tincture of Sweet Orange Peel. | Dose, one fluidrachm (3.7 C.c.). |

AURANTII AMARI CORTEX. U.S. Bitter Orange Peel.

The rind of the fruit of *Citrus vulgaris* Risso (nat. ord. Rutaceæ).

The peel from the bitter orange contains *hesperidin* and a small quantity of volatile oil. It is not used to communicate flavor, but as a bitter tonic. The dose is ten to forty grains (0.6 to 2.6 Gm.).

Official Preparations.

- Extractum Aurantii Amari Fluidum** . Made with a menstruum of 2 parts of alcohol and Fluid Extract of Bitter Orange Peel. 1 part of water (see page 396). Dose, half a fluidrachm (1.8 C.c.).
- Tinctura Aurantii Amari** Made by exhausting 200 Gm. of bitter orange peel with sufficient menstruum, made by mixing 3 parts of alcohol and 2 parts of water, to make 1000 C.c. (see page 361). Dose, one to two fluidrachms (3.7 to 7.4 C.c.).

OLEUM AURANTII CORTICIS. U.S. Oil of Orange Peel.

A volatile oil obtained by expression from the fresh peel of either the Bitter Orange, *Citrus vulgaris* Risso, or the Sweet Orange, *Citrus Aurantium* Linné (nat. ord. *Rutaceæ*).

This oil is of a pale yellowish color, and has the composition of the terpenes, $C_{10}H_{16}$. Its sp. gr. is 0.850. It is soluble in alcohol, and may be preserved by shaking it with one-fourth of its volume of water, separating, and mixing with five times its measure of alcohol. It is very prone to decomposition, and rapidly acquires a terebinthinate odor. It is used in making cologne water and bay rum, and to flavor elixirs.

Official Preparations.

- Spiritus Aurantii** Made by dissolving 50 C.c. of oil of orange peel in 950 C.c. of deodorized alcohol (see page 330). Dose, one fluidrachm (3.7 C.c.).
- Spiritus Aurantii Compositus** . Made by dissolving 200 C.c. oil of orange peel, 50 C.c. oil of lemon, 20 C.c. oil of coriander, and 5 C.c. oil of anise, in enough deodorized alcohol to make 1000 C.c. Used in making Aromatic Elixir, U.S.P.

OLEUM AURANTII FLORUM. U.S. Oil of Orange Flowers.

[OIL OF NEROLI.]

A volatile oil distilled from the fresh flowers of the Bitter Orange, *Citrus vulgaris* Risso (nat. ord. *Rutaceæ*).

This is a brownish-yellow, very fragrant terpene ($C_{10}H_{16}$). Sp. gr. 0.875 to 0.890. It is soluble in an equal volume of alcohol, and is well preserved by this addition. If a little alcohol be poured on the surface of the oil and the mixture gently undulated, a bright violet fluorescence will be observed. In contact with a saturated solution of sodium bisulphite, it assumes a handsome and permanent purplish-red color. This oil as found in the market is very variable in quality. The best comes from Nice, and is derived from the flowers of the *Citrus Aurantium*, or sweet orange, by distillation with water: this is called *néroli pétale*. The next quality is obtained in the same way, but by using the blossoms of the *Citrus Bigaradia*, or bitter orange: this is called *néroli bigarade*. An inferior sort, *essence de petit grain*, is made by distilling the leaves and unripe fruit.

Uses.—This oil is almost exclusively used in perfumery.

LIMONIS CORTEX. U.S. Lemon Peel.

The rind of the recent fruit of *Citrus Limonum* Risso (nat. ord. *Rutaceæ*).

Lemon peel is principally used to communicate flavor and color to spirit and syrup of lemon. It contains volatile oil and *hesperidin*.

OLEUM LIMONIS. U. S. Oil of Lemon.

A volatile oil obtained by expression from fresh Lemon Peel.

This important volatile oil is a terpene, $C_{10}H_{16}$: when fresh it has the fragrant odor of lemons. Sp. gr. 0.858. It is soluble in three parts of alcohol, in glacial acetic acid, and in all proportions in absolute alcohol. It may be preserved from the effects of oxidation by the addition of 5 per cent. of alcohol and separation from the sediment.

Official Preparation.

Spiritus Limonis . . . Made by dissolving 50 C.c. of oil of lemon in 950 C.c. of deodorized Spirit of Lemon. alcohol to which 50 Gm. of freshly grated lemon peel are added.
Essence of Lemon. This spirit is used in flavoring syrup of citric acid (see page 332).

OLEUM BERGAMOTTÆ. U. S. Oil of Bergamot.

[OLEUM BERGAMII, PHARM. 1880.]

A volatile oil obtained by expression from the rind of the fresh fruit of *Citrus Bergamia* Risso et Poiteau (nat. ord. *Rutaceæ*).

This is an important volatile oil commercially, although it is not used medicinally. It derives its name from Bergamo, a city of Italy, and is largely produced in that country. It is a terpene ($C_{10}H_{16}$). Sp. gr. from 0.880 to 0.885. It is soluble in all proportions in alcohol and glacial acetic acid. This oil is often prepared by expression, although the sponge process is at present largely used. The *ecuelle* (Fig. 355) is a convenient instrument for rapidly rupturing the oil-vesicles: it is held in one hand by the operator, whilst with the other hand the bergamot, lemon, or orange fruit is skilfully rotated on the sharp points: the oil flows into the gutter in the cup, and then through the hollow handle into a suitable

FIG. 355.

Ecuelle.

vessel. Oil of bergamot is used solely for its perfume.

Official Products from the Labiatæ.

The natural order of the mints is a strongly marked group, the members of it being remarkable for their botanical analogy with one another and for the similarity of their chemical constituents.

MENTHA PIPERITA. U. S. Peppermint.

The leaves and tops of *Mentha piperita* Smith (nat. ord. *Labiatæ*).

Its properties are due to the presence of about two per cent. of volatile oil. It is largely cultivated, and is a grateful aromatic stimulant.

OLEUM MENTHÆ PIPERITÆ. U. S. Oil of Peppermint.

A volatile oil distilled from Peppermint.

It is a colorless or yellowish liquid, having the characteristic strong odor of peppermint, a strongly aromatic taste, followed by a sensation of

cold when air is drawn into the mouth, and a neutral reaction. Sp. gr. about 0.900. It is soluble in an equal weight of alcohol.

Oleum Menthae Piperitae. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Alcohol.	Other Solvents.
A colorless, or yellowish, or greenish-yellow liquid, becoming darker and thicker by age and exposure to the air. Specific gravity 0.900 to 0.920 at 15° C. (59° F.). The Oil does not fulminate with iodine.	Characteristic strong odor of peppermint; strongly aromatic, pungent taste, followed by a sensation of cold when air is drawn into the mouth; neutral reaction.	Forms a clear solution with an equal volume, becoming turbid when somewhat further diluted.	Soluble in all proportions in carbon disulphide and in glacial acetic acid.
TESTS FOR IDENTITY.	IMPURITIES	TESTS FOR IMPURITIES.	
If 5 drops of the Oil be added to 1 C.c. of glacial acetic acid, and the mixture gently warmed, the liquid will assume a blue color, with a red fluorescence.	Oil of Camphor and Oil of Sassafras.	If to 5 C.c. of nitric acid 1 drop of the Oil be added, and the mixture gently agitated, and allowed to stand for about three hours, it should have a yellowish, but not a bright red, color. If a portion of the Oil, contained in a test-tube, be placed in a freezing mixture of snow (or pounded ice) and salt for fifteen minutes, it should become cloudy and thick, and after the addition of a few crystals of menthol, being still exposed to cold, it should soon form a crystalline mass.	
If 2 C.c. of the Oil be mixed with 1 C.c. of glacial acetic acid, and 1 drop of nitric acid be added, the liquid will soon acquire a green, greenish-blue, blue, or violet tint, with a copper-red fluorescence.			
If 1 C.c. of the Oil be dissolved in 5 C.c. of alcohol, 0.5 Gm. of sugar and 1 C.c. of hydrochloric acid added, and the mixture gently heated, a deep blue or violet color will gradually be produced.	Distinction from Dementholised Oil.	When heated on a water-bath, in a flask provided with a well-cooled condenser, the Oil should not yield a distillate having the characters of alcohol.	
	Alcohol.		

Official Preparations.

- Aqua Menthae Piperitae** . . . Made by adding 2 C.c. of oil of peppermint to 4 Gm. of precipitated calcium phosphate and filtering with distilled water until 1000 C.c. have been obtained (see page 291).
Peppermint Water.
- Spiritus Menthae Piperitae** . Made by dissolving 100 C.c. of oil of peppermint in 900 C.c. of alcohol in which 10 Gm. of peppermint have been macerated (see page 332). Dose, twenty minims (1.2 C.c.).
Spirit of Peppermint.
- Trochisci Menthae Piperitae** . Each troche contains $\frac{1}{2}$ minim of oil of peppermint (see Part V.).
Troches of Peppermint.

MENTHOL. U. S. Menthol.

A stearopten (having the character of a secondary alcohol), obtained from the official oil of peppermint (from *Mentha piperita* Smith), or from Japanese or Chinese oil of peppermint (from *Mentha arvensis* Linné, var. *piperascens* Holmes, and *Mentha canadensis* Linné, var. *glabrata* Holmes; nat. ord. *Labiatae*)

The oil of peppermint owes its odor to menthol ($\text{C}_{10}\text{H}_{18}\text{O}$), a stearopten obtained from it through fractional distillation, cooling, and crystallization.

Menthol. U.S.	ODOR AND TASTE.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Colorless, acicular or prismatic crystals. It melts at 43° C. (109.4° F.) to a colorless liquid; boils at 212° C. (413.6° F.), and volatilizes slowly at the ordinary temperature.	Strong and pure odor of peppermint; warm, aromatic taste, followed by a sensation of cold when air is drawn into the mouth.	Slightly soluble, imparting its odor and taste.	Freely soluble.	Freely soluble in ether, chloroform, carbon disulphide, or glacial acetic acid.
TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.		
When triturated with about an equal weight of camphor, thymol, or chloral hydrate, the mixture becomes liquid. Its alcoholic solution is neutral to litmus paper, and deviates polarized light to the left.	Wax, Paraffin, or Inorganic Substances. Thymol.	{ If a little Menthol be heated in an open capsule, on a water-bath, it should gradually volatilize without leaving any residue. { If a few crystals of Menthol be dissolved in 1 C.c. of glacial acetic acid, and then 3 drops of sulphuric acid and 1 drop of nitric acid added, no green color should be produced.		

Uses.—Menthol is largely used, compressed into cones, as a local remedy in neuralgia and headache.

MENTHA VIRIDIS. U.S. Spearmint.

The leaves and tops of *Mentha viridis* Linné (nat. ord. *Labiatae*).

The volatile oil is the only constituent of importance in this plant; the yield is from $\frac{1}{4}$ to 1 per cent.

OLEUM MENTHÆ VIRIDIS. U.S. Oil of Spearmint.

A volatile oil distilled from Spearmint.

It is a colorless or yellowish liquid, having the characteristic strong odor of spearmint, a hot, aromatic taste, and a neutral reaction. Sp. gr. 0.930 to 0.940. It is soluble in an equal volume of alcohol.

Oil of spearmint contains an oxygenated oil, $C_{10}H_{14}O$, which is the odorous portion, and a terpene, $C_{10}H_{16}$. It is used as a stimulant and carminative.

Official Preparations.

Aqua Menthæ Viridis . . . Made by adding 2 C.c. of oil of spearmint to 4 Gm. of precipitated calcium phosphate, and filtering with distilled water until 1000 C.c. have been obtained (see page 292).

Spiritus Menthæ Viridis . . Made by dissolving 100 C.c. of oil of spearmint in 900 C.c. of alcohol in which 10 Gm. of spearmint have been macerated (see page 332). Dose, twenty minims (1.2 C.c.).

OLEUM LAVANDULÆ FLORUM. U.S. Oil of Lavender Flowers.

A volatile oil distilled from the fresh flowers of *Lavandula officinalis* Chaix (nat. ord. *Labiatae*).

It is a colorless or yellowish liquid, having the fragrant odor of lavender flowers, a pungent and bitterish taste, and a neutral reaction while fresh. Sp. gr. 0.885 to 0.897. It is readily soluble in alcohol and in

acetic acid of 90 per cent. or over. "It is soluble in three times its volume of a mixture of three volumes of alcohol and one volume of water (distinction from, and absence of, oil of turpentine)."

When heated to about 80° C. (176° F.), it should not yield a colorless distillate having the characteristics of alcohol.

Oil of lavender flowers is most largely used in perfumery. The best quality is distilled at Mitcham, England. It has the same composition and properties as oil of lavender: it is more fragrant and more expensive.

Official Preparations.

Spiritus Lavandulæ	Made by dissolving 50 C.c. of oil of lavender flowers in 950 C.c. of deodorized alcohol (see page 332). Dose, one fluidrachm (3.7 C.c.).
Spirit of Lavender.	
Tinctura Lavandulæ Composita . .	Made by dissolving 8 C.c. of oil of lavender flowers and 2 C.c. of oil of rosemary in 700 C.c. of alcohol and 250 C.c. of water, percolating 5 Gm. of cloves, 20 Gm. of cinnamon, 10 Gm. of nutmeg, and 10 Gm. of red saunders with the liquid, and adding sufficient diluted alcohol to obtain 1000 C.c. (see page 371). Dose, one to two fluidrachms (3.7 to 7.4 C.c.).
Compound Tincture of Lavender.	

OLEUM ROSMARINI. U.S. Oil of Rosemary.

A volatile oil distilled from the leaves of *Rosmarinus officinalis* Linné (nat. ord. *Labiatae*).

It is a colorless or yellowish liquid, having the characteristic pungent odor of rosemary, a warm, somewhat camphoraceous taste, and a neutral or faintly acid reaction. Sp. gr. 0.895 to 0.915. It is soluble in alcohol and in an equal volume of glacial acetic acid.

This oil consists of a terpene, $C_{10}H_{16}$, and the oxygenated compounds $C_{10}H_{16}O$, $C_{10}H_{18}O$. It is used as an ingredient in soap liniment and compound tincture of lavender.

HEDEOMA. U.S. Hedeoma. [PENNYROYAL.]

The leaves and tops of *Hedeoma pulegioides* (Linné) Persoon (nat. ord. *Labiatae*).

This indigenous plant is frequently confounded with *Mentha pulegium*, or European pennyroyal, which yields an oil having a similar odor and properties. It is stimulant and aromatic.

OLEUM HEDEOMÆ. U.S. Oil of Hedeoma. [OIL OF PENNYROYAL.]

A volatile oil distilled from Hedeoma.

It is a colorless or yellowish liquid, of a pungent, mint-like odor and taste and a neutral reaction. Sp. gr. 0.930 to 0.940. It is readily soluble in glacial acetic acid. It should form a perfectly clear solution with twice its volume of a mixture of three volumes of alcohol and one volume of water.

This is an oxygenated oil, and is used principally to protect the exposed parts of the body from the bites of flies, mosquitoes, fleas, etc. It is employed sometimes in amenorrhœa, in doses of one or two minims (0.06 or 0.12 C.c.).

MARRUBIUM. U. S. Marrubium. [HOREHOUND.]

The leaves and tops of *Marrubium vulgare* Linné (nat. ord. *Labiatae*).

This plant contains a volatile oil associated with resin and a bitter principle, *marrubiin*. It is stimulant, tonic, and expectorant.

MELISSA. U. S. Melissa. [BALM.]

The leaves and tops of *Melissa officinalis* Linné (nat. ord. *Labiatae*).

This plant owes its properties of a stimulant and carminative to an oxygenated volatile oil.

OLEUM THYMI. U. S. Oil of Thyme.

A volatile oil distilled from the leaves and flowering tops of *Thymus vulgaris* Linné (nat. ord. *Labiatae*).

It is a colorless or pale yellow, thin liquid, having a strong odor of thyme, a warm, pungent, and afterwards cooling taste, and a neutral reaction. Sp. gr. 0.900 to 0.930. It is soluble in half its volume of alcohol.

The oil, as prepared in the south of France, is known commercially as *oil of origanum*. It is, after one distillation, of a reddish-brown color, and is called the *red oil*, but when again distilled is colorless, and in this condition is distinguished as the *white oil*. The sp. gr. of the red or common oil is stated at 0.905, but probably varies, as the oil is a complex body. The more volatile portion, that coming over below 180° C. (356° F.) in distillation, is a mixture of *cymene*, $C_{10}H_{16}$, boiling at 175° C. (347° F.), and *thymene*, $C_{10}H_{18}$, boiling at 165° C. (329° F.). The less volatile portion is chiefly *thymol*, $C_{10}H_{14}O$, a white, crystalline solid, melting at 44° C. (111.2° F.), and possessing a pungent taste. This substance is also found in oil of monarda (horsemint). (See Thymol.)

Uses.—Oil of origanum, as it is usually called, is largely used in liniments as a stimulant.

THYMOL. U. S. Thymol.

A phenol occurring in the volatile oils of *Thymus vulgaris* Linné, *Monarda punctata* Linné (nat. ord. *Labiatae*), and *Carum Ajowan* (Roxburgh) Benthham et Hooker (nat. ord. *Umbelliferae*).

Preparation.—Thymol is obtained from the volatile oils of several plants by fractional distillation, by which terpenes are separated. The portion distilling above 190° C. (374° F.) is collected, agitated with solution of soda to separate more of the terpenes, and cooled; the compound of thymol with soda is then decomposed by hydrochloric acid. Thymol is recrystallized from an alcoholic solution. It has been obtained from *Monarda didyma* Linn., *M. punctata*, *Ammi copticum*, and *Ptychotis ajowan*. The phenol of the oil of *Thymus serpyllum* Linn. closely resembles thymol, but differs from it in not congealing at 10° C.

(50° F.), in its solution in diluted alcohol turning green with ferric chloride, and in the potassium salt with its sulpho-acid being amorphous.

Thymol. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Large, colorless, translucent crystals of the hexagonal system. Its sp. gr. as a solid is 1.069 at 15° C. (59° F.); after fusion it is lighter than water. It melts at 50° to 51° C. (122° to 123.8° F.), remaining liquid at lower temperatures. When triturated with about equal quantities of camphor, menthol, or chloral, it liquefies.	Aromatic, thyme-like odor; pungent, aromatic taste, with a very slight caustic effect upon the lips; neutral reaction.	At 15° C. (59° F.), 1200 parts.	At 15° C. (59° F.), Less than its own weight.	Soluble in less than its own weight of ether or chloroform; also readily soluble in carbon disulphide, glacial acetic acid, and fixed or volatile oils.
TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.		
Its alcoholic solution is optically inactive. If a very small crystal of Thymol be dissolved in 1 C.c. of glacial acetic acid, and then 6 drops of sulphuric acid and 1 drop of nitric acid be added, the liquid will assume a deep bluish-green color.	Thymen or Lavogyrate Pinene (C ₁₀ H ₁₆). Paraffin, Spermaceti, etc.	If 1 Gm. of Thymol be heated in a test-tube, in a water-bath, with 5 C.c. of a 10-per-cent. solution of sodium hydrate, a clear, colorless, or very slightly reddish solution should be formed, which becomes darker on standing, but without the separation of oily drops. If to this solution a few drops of chloroform be added, and the mixture agitated, a violet color will be produced. When a crystal of Thymol is heated in an open capsule, or in a watch-glass, on a water-bath, it should gradually volatilize, leaving no residue.		

Uses.—Thymol is a valuable antiseptic, and may be used for the same purposes as carbolic acid.

SALVIA. U.S. *Salvia*. [SAGE.]

The leaves of *Salvia officinalis* Linné (nat. ord. *Labiatae*).

This useful plant contains a volatile oil, which consists of a terpene, C₁₀H₁₆, and an oxygenated portion, *salviol*, C₁₀H₁₂O. It also contains tannin and extractive. It is used largely as a condiment. Infusion of sage is a popular remedy in sore throat.

SCUTELLARIA. U.S. *Scutellaria*.

[SCULLCAP.]

The herb of *Scutellaria lateriflora* Linné (nat. ord. *Labiatae*).

This plant contains volatile oil, tannin, and a bitter principle. It is used as a tonic and antispasmodic.

Official Preparation.

Extractum Scutellarie Fluidum. Made with a menstruum of diluted alcohol by percolation (see page 423). Dose, one-half to one fluidrachm (1.9 to 3.7 C.c.).
Fluid Extract of Scutellaria.

Unofficial Plants of, and Substances from, the Labiatae.

Aristol, Dithymoldiodide, $C_{20}H_{34}O_2I_2$, or	$\left. \begin{array}{l} C_8H_7 \\ CH_3 \\ CH_3 \\ C_8H_7 \end{array} \right\} C_6H_5(OI).$	Anæsthetic, antiseptic.
Brunella.		The herb of <i>B. (Prunella) vulgaris</i> . Found in North America, Asia, and Europe.
Calamintha. Wild Basil.		The herb of <i>C. clinopodium</i> .
Cataria, Catnep.		Antispasmodic and emmenagogue. Dose, two drachms (7.77 Gm.) in infusion.
Collinsonia, Horsebalm.		The herb of <i>Collinsonia canadensis</i> , grown in North America.
Glechoma, Ground-Ivy.		From <i>G. hederacea</i> and others, grown in Europe. It contains volatile oil, resin, etc.
Hyssopus, Hyssop.		From <i>H. officinalis</i> , indigenous to Southern Europe. It contains about $\frac{1}{4}$ per cent. of volatile oil, etc.
Lavender.		The flowers of <i>Lavandula vera</i> . It was formerly official, and contains a volatile oil.
Leonurus, Motherwort.		The herb of <i>L. cardiaca</i> , grown in Europe. It contains volatile oil and a bitter principle.
Lycopus, Bugleweed.		The herb of <i>L. virginicus</i> , found in the United States. It contains a volatile oil, resin, etc.
Monarda. Horsemint.		The leaves and tops of <i>M. punctata</i> , indigenous to the United States. It contains a volatile oil, etc.
Rosemary.		The leaves of <i>Rosmarinus officinalis</i> . It was formerly official, and contains a volatile oil.

Official Products of the Aromatic Umbelliferæ.

The aromatic plants belonging to the natural order Umbelliferæ are all characterized by the very distinctive properties of the volatile oils obtained by distilling their fruits (sometimes called seeds) with water. These oils are oxygenated, and are soluble in alcohol. Cumin and dill belong to this class: they are not official.

CARUM. U. S. Caraway.

The fruit of *Carum Carvi* Linné (nat. ord. Umbelliferæ).

This fruit, commonly called caraway seed, contains about 5 per cent. of volatile oil, with a little fixed oil and other constituents. It is carminative and stimulant.

OLEUM CARI. U. S. Oil of Caraway.

A volatile oil distilled from Caraway.

It is a pale yellow liquid, having the odor of caraway, and a sp. gr. of 0.910 to 0.920. It is soluble in an equal weight of alcohol. It consists of a terpene, *carvene*, $C_{10}H_{16}$, and *carvol*, $C_{10}H_{14}$. It is a useful aromatic oil.

FENICULUM. U. S. Fennel.

The fruit of *Fœniculum capillaceum* Gilibert (nat. ord. Umbelliferæ).

This fruit contains about 5 per cent. of an oxygenated volatile oil, with 10 per cent. of fixed oil. It is used in compound infusion of senna.

OLEUM FENICULI. U. S. Oil of Fennel.

A volatile oil distilled from Fennel. It should be kept in well-stoppered bottles, in a cool place, and, if it has partly or wholly solidified, it should be completely liquefied by warming before being dispensed.

This is a pale yellow liquid, having the odor of fennel, and a sp. gr. of not less than 0.960. It sometimes congeals when cooled to $5^{\circ}C$.

(41° F.). It consists of a terpene, $C_{10}H_{16}$, and *anethol*, $C_{10}H_{12}O$. It is used in compound powder of glycyrrhiza.

Official Preparation.

Aqua Foeniculi. Made by adding 2 C.c. of oil of fennel to 4 Gm. of precipitated calcium phosphate, and filtering it with 1000 C.c. of distilled water (see page 290).

CORIANDRUM. U. S. Coriander.

The fruit of *Coriandrum sativum* Linné (nat. ord. *Umbelliferae*).

This fruit furnishes an agreeable aromatic oil. The yield is about 1 per cent. It also contains about 10 per cent. of fixed oil.

OLEUM CORIANDRI. U. S. Oil of Coriander.

A volatile oil distilled from Coriander.

It is a colorless or yellowish liquid, having the characteristic aromatic odor of coriander, a warm, spicy taste, and a neutral reaction. Sp. gr. 0.870 to 0.885. It is readily soluble in alcohol. 1 C.c. of the oil forms a perfectly clear solution with 3 C.c. of a mixture of three volumes of alcohol and one volume of water.

This oil is composed principally of $C_{10}H_{16}O$. It is officially used in confection of senna and syrup of senna.

SUMBUL. U. S. Sumbul.

The root of *Ferula Sumbul* (Kauffmann) Hooker filius (nat. ord. *Umbelliferae*).

This Asiatic root contains about $\frac{1}{2}$ per cent. of volatile oil and about 10 per cent. of a resinous compound having a musky odor. It is used as a stimulant and nervine.

Official Preparation.

Tinctura Sumbul. . . . Made by percolating 100 Gm. of sumbul with a menstruum composed of 650 C.c. of alcohol to 350 C.c. of water until 1000 C.c. are obtained (see page 379). Dose, one-half to one fluidrachm (1.9 to 3.7 C.c.).

ANISUM. U. S. Anise.

The fruit of *Pimpinella Anisum* Linné (nat. ord. *Umbelliferae*).

This fruit contains about 2 per cent. of volatile oil and 3 per cent. of fixed oil. It is a useful carminative and stimulant.

OLEUM ANISI. U. S. Oil of Anise.

A volatile oil distilled from Anise. It should be kept in well-stoppered bottles protected from light, and, if it has separated into a liquid and a solid portion, it should be completely liquefied by warming before being dispensed.

This oil is colorless or yellowish, with the peculiar odor and taste of the fruit. Its sp. gr. is about 0.980 to 0.990, increasing with age. At 10° to 15° C. (50° to 59° F.) it solidifies to a crystalline mass, which does not resume its fluidity until the temperature rises to about 17° C. (62.6° F.). The oil is soluble in nearly an equal weight of alcohol. *Oil of Illicium* (*Star Anise*) has the same properties, except that it congeals at about 2° C. (35.6° F.). It consists of a small quantity of a

hydrocarbon, $C_{10}H_{16}$, but mainly of anethol, $C_{10}H_{12}O$, which is present in two modifications, one solid at ordinary temperatures and heavier than water (*anise camphor, solid anethol*), the other liquid and more volatile (*liquid anethol*). *Anethol*, both in the liquid and in the solid form, is present, and is the chief constituent of the oils of *anise, star-aniseed, and fennel*.

Official Preparations.

Aqua Anisi Made by adding 2 C.c. of oil of anise to 4 Gm. of precipitated calcium phosphate and filtering with distilled water until 1000 C.c. are obtained (see page 287).
Anise Water.

Spiritus Anisi Made by mixing 100 C.c. of oil of anise with 900 C.c. of deodorized alcohol (see page 329). Dose, thirty minims to one fluidrachm (1.9 to 3.7 C.c.).
Spirit of Anise.

ILLICIUM. U. S. *Illicium*. [STAR-ANISE.]

The fruit of *Illicium verum* Hooker filius (nat. ord. *Magnoliaceæ*).

This fruit does not belong to the *Umbelliferae*, but, as it is the source of nearly all the commercial oil of anise, it must be considered here. Star-anise contains about 5 per cent. of volatile oil, nearly identical with the oil from *Pimpinella Anisum* (see *Oleum Anisi*): it also contains resin and fixed oil.

Unofficial Volatile Oils and Plants of the *Umbelliferae*.

<i>Anethum Graveolens</i> .	An umbelliferous fruit, indigenous to Southern Europe.
Dill.	
<i>Oleum Anethi</i> .	An oxygenated oil: the yield is about 4 per cent.
Oil of Dill.	
<i>Angelica</i> .	The root of several species of <i>Angelica</i> , grown in Europe and America.
<i>Angelica-root</i> .	
<i>Oleum Angelicæ</i> .	A yellowish, volatile oil: the yield is about $\frac{1}{2}$ per cent.
Oil of <i>Angelica</i> .	
<i>Carota</i> .	The fruit of <i>Daucus Carota</i> , indigenous to Northern Asia.
Carrot Fruit.	
Oil of Carrot.	An oxygenated oil.
<i>Cicuta</i> .	The herb of <i>Cicuta virosa</i> , found in Northern Canada.
Water-Hemlock.	
<i>Cuminum</i> .	The fruit of <i>Cuminum Cyminum</i> , indigenous to Egypt.
Cumin.	
Oil of Cumin.	Consists of several hydrocarbons: the yield is about $\frac{1}{2}$ per cent.
<i>Heracleum</i> .	From <i>Heracleum lanatum</i> , grown in the United States. It contains a volatile oil, resin, etc.
Cow-Parsnip (<i>Masterwort</i>).	
<i>Levisticum</i> .	The root of <i>Levisticum officinale</i> , indigenous to Southern Europe. It contains soft and pungent resins.
Lovage.	
<i>Petroselinum</i> .	The root of <i>P. sativum</i> , indigenous to Europe. It contains a volatile oil and apiin, $C_{24}H_{38}O_{13}$.
Parsley.	A colorless or yellowish, volatile oil, sp. gr. 1.01-1.14: the yield is about $\frac{1}{2}$ per cent.
Oil of Parsley.	
<i>Phellandrium</i> .	The fruit of <i>Oenanthe Phellandrium</i> , grown in Europe. It contains about $\frac{1}{2}$ per cent. of volatile oil and resins.
Water-Fennel.	

Official Aromatic Products, with their Volatile Oils.

CINNAMOMUM CASSIA. U. S. *Cassia Cinnamon*.

[CINNAMOMUM, PHARM. 1880. CASSIA BARK.]

The bark of the shoots of one or more undetermined species of *Cinnamomum* grown in China (Chinese Cinnamon) (nat. ord. *Laurinææ*).

CINNAMOMUM SAIGONICUM. U. S. *Saigon Cinnamon*.

The bark of an undetermined species of *Cinnamomum* (nat. ord. *Laurinææ*).

CINNAMOMUM ZEYLANICUM. U.S. Ceylon Cinnamon.

[CINNAMOMUM, PHARM. 1890.]

The inner bark of the shoots of *Cinnamomum zeylanicum* Breyne (nat. ord. *Laurinæ*).

Ceylon, Saigon, and Chinese cinnamon, or *cassia*, all owe their virtues to a volatile oil: there are also present tannin, mannite, mucilage, sugar, etc. The tannin present often causes fluid extract of cinnamon to gelatinize through its alteration. Nine official preparations contain cinnamon; in one it is the sole active ingredient.

Official Preparation.

Tinctura Cinnamomi. Made by percolating 100 Gm. of powdered Ceylon cinnamon with sufficient menstruum, composed of 750 C.c. of alcohol, 200 C.c. of water, and 50 C.c. of glycerin, to obtain 1000 C.c. (see page 365). Dose, one to two fluidrachms (1.9 to 3.7 C.c.).

OLEUM CINNAMOMI. U.S. Oil of Cinnamon.

[OIL OF CASSIA.]

A volatile oil distilled from Cassia Cinnamon.

There are two oils of cinnamon in commerce: one procured from the Ceylon cinnamon, the other from the Chinese cinnamon: the latter (*oil of cassia*) is now the only official one. There is no essential difference in the two oils; and that of the Chinese cinnamon, as much the cheaper and more abundant of the two, will probably continue to be generally employed, notwithstanding that the Ceylon product has the finer flavor. The quality of oil of cinnamon has been greatly improved through the publication by Schimmel & Co. of good tests for detecting adulterations.

Oleum Cinnamomi. U.S.	ODOR AND TASTE.	SOLUBILITY.	
		Alcohol.	Other Solvent.
A yellowish or brownish liquid, becoming darker and thicker by age and exposure to the air. Specific gravity, 1.055 to 1.065 at 15° C. (59° F.).	Characteristic odor of cinnamon; sweetish, spicy, and burning taste.	In an equal volume.	In an equal volume of glacial acetic acid.
TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.	
When shaken with a saturated solution of sodium bisulphite, it solidifies to a crystalline mass. If 4 drops of the Oil, contained in a test-tube, be cooled to 0° C. (32° F.), and then shaken with 4 drops of fuming nitric acid, crystalline needles or plates will be formed.	Oil of Cloves.	If a portion of the Oil be shaken with water, and the liquid passed through a wet filter, the clear filtrate should give, with a few drops of basic lead acetate T.S., a white turbidity, without a yellow color.	
	Oil of Cloves or of Carbolic Acid.	If 4 drops of the Oil be dissolved in 10 C.c. of alcohol, the subsequent addition of a drop of ferric chloride T.S. should produce a brown, but not a green or blue, color.	
	Petroleum or Colophony.	If 1 C.c. of the Oil be mixed with 3 C.c. of a mixture of 3 volumes of alcohol and 1 volume of water, a clear solution should result; and if to this solution there be gradually added 2 C.c. of a saturated solution of lead acetate in a mixture of 3 volumes of alcohol and 1 volume of water, no precipitate should be produced.	

Oil of Ceylon Cinnamon has a slightly acid reaction. Sp. gr. about 1.040. It is readily soluble in alcohol. When cooled to -10° C. (14° F.) it remains clear, but at a lower temperature a solid portion separates from it. *Oil of Chinese Cinnamon* (Oil of Cassia) has the same properties, except that its sp. gr. is about 1.060 and its odor and taste are not quite so agreeable.

With the exception of quite small quantities of hydrocarbons, oil of cinnamon consists of *cinnamic aldehyde*, C_9H_8O , which by moderate oxidation yields the corresponding cinnamic acid, $C_9H_8O_2$, but by more energetic oxidation yields benzoic acid, $C_7H_6O_2$.

Oil of Ceylon cinnamon when not very fresh contains cinnamic acid in sufficient quantity to give a permanent cloudiness to cinnamon water made from it.

Official Preparations.

- Aqua Cinnamomi** . . . Made by adding 2 C.c. of oil of cinnamon to 4 Gm. of precipitated Cinnamon Water. calcium phosphate, and filtering with distilled water until 1000 C.c. are obtained (see page 289).
Spiritus Cinnamomi . Made by mixing 10 parts of oil of cinnamon with 90 parts of alcohol Spirit of Cinnamon. (see page 330). Dose, ten to twenty minims (0.6 to 1.2 C.c.).

CARYOPHYLLUS. U. S. Cloves.

The unexpanded flowers of *Eugenia aromatica* (Linné) O. Kuntze (nat. ord. *Myrtaceae*).

Cloves contain about 16 per cent. of volatile oil, 10 per cent. of tannin, *caryophyllin*, $C_{10}H_{16}O$, a crystalline principle, and *eugenin*, $C_{10}H_{12}O_2$, also crystalline. It is used as an aromatic in three official preparations.

OLEUM CARYOPHYLLI. U. S. Oil of Cloves.

A volatile oil distilled from Cloves.

Oil of cloves, when recently distilled, is very fluid, clear, and colorless, but becomes yellowish by exposure, and ultimately reddish-brown. The oil of cloves consists of two distinct oils, one lighter (a terpene) and the other heavier than water. They may be separated by distilling the oil from a solution of potassa. The lighter comes over, the heavier remains combined with the potassa, from which it may be separated by adding sulphuric acid and again distilling. *Light oil of cloves* is colorless, is of the sp. gr. 0.918, and has the formula $C_{10}H_{16}$. It is said not to possess active properties. *Heavy oil of cloves* is colorless at first, but darkens with age, has the odor and taste of cloves, is of the sp. gr. 1.079, boils at 243.3° C. (470° F.), and forms soluble and crystallizable salts with the alkalies. It consists of a phenol-like compound, *eugenol* (eugenic acid), $C_{10}H_{12}O_2$, which has been found capable of conversion into *vanillin*.

Oleum Caryophylli. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Alcohol.	Other Solvent.
A pale yellow, thin liquid, becoming darker and thicker by age and exposure to the air. Specific gravity 1.060 to 1.067 at 15° C. (59° F.).	Strongly aromatic odor of cloves; pungent and spicy taste; slightly acid reaction.	Soluble in an equal volume.	Soluble in an equal volume of glacial acetic acid.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>When shaken with an equal volume of a concentrated solution of potassium hydrate, or of stronger ammonia water, it forms a semi-solid, yellowish mass.</p> <p>If 2 drops of the Oil be dissolved in 4 C.c. of alcohol, and a drop of ferric chloride T.S. added, a bright green color will be produced; and if the same test be made with a drop of dilute ferric chloride T.S., prepared by diluting the test-solution with four times its volume of water, a blue color will be produced, which soon changes to yellow.</p>	<p>Petroleum, most Fatty Oils, Oil of Turpentine, and Similar Oils.</p> <p>Phenol or Carbolic Acid.</p>	<p>If 1 C.c. of the Oil be mixed with 2 C.c. of a mixture of 2 volumes of alcohol and 1 volume of water, it should form a clear and perfect solution.</p> <p>If, after cooling, the aqueous layer be passed through a wet filter, the clear filtrate should yield, with a drop of ferric chloride T.S., only a transient grayish-green, but not a violet or blue color.</p>

Oil of cloves is largely used as a remedy for toothache. It produces relief if the pain is caused by an exposed nerve, and may be used by applying a little upon cotton to the affected nerve.

PIMENTA. U. S. Pimenta. [ALLSPICE.]

The nearly ripe fruit of *Pimenta officinalis* Lindley (nat. ord. *Myrtaceæ*).

This aromatic fruit contains about 3 per cent. of volatile oil, with tannin, fat, resin, gum, sugar, etc.

OLEUM PIMENTÆ. U. S. Oil of Pimenta. [OIL OF ALLSPICE.]

A volatile oil distilled from Pimenta.

It is a colorless or pale yellow liquid, becoming darker and thicker by age and exposure to air, having a strong, aromatic, clove-like odor, a pungent, spicy taste, and a slightly acid reaction. Sp. gr. 1.045 to 1.055. It is readily soluble in alcohol. With an equal volume of a concentrated solution of sodium hydrate it forms a semi-solid mass.

It contains a terpene, $C_{10}H_{16}$, and *eugenol*, $C_{10}H_{12}O_2$. It is used as an ingredient in spirit of myrcia.

OLEUM MYRCIÆ. U. S. Oil of Myrcia. [OIL OF BAY.]

A volatile oil distilled from the leaves of *Myrcia acris* De Candolle (nat. ord. *Myrtaceæ*).

This oil is used almost exclusively in making artificial bay rum: it is very apt to be adulterated. Sp. gr. 0.975 to 0.990.

Oleum Myrciæ. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Alcohol.	Other Solvents.
A yellow or brownish-yellow liquid. When mixed with an equal volume of a concentrated solution of sodium hydrate, it forms a semi-solid mass.	Aromatic, somewhat clove-like odor; pungent spicy taste; scarcely perceptible acid reaction.	With an equal volume it yields slightly turbid solutions.	With equal volumes of glacial acetic acid or carbon disulphide it yields slightly turbid solutions.

TESTS FOR IDENTITY.	IMPURITY. TESTS FOR IMPURITY.
<p>If 2 drops of the Oil be dissolved in 4 C.c. of alcohol and a drop of ferric chloride T.S. be added, a light green color will be produced; and if the same test be made with a drop of diluted ferric chloride T.S., prepared by diluting the test-solution with four times its volume of water, a light bluish coloration will be produced, which soon disappears.</p>	<p>Carbolic Acid. { If 1 C.c. be shaken with 20 C.c. of hot water, the water should not give more than a scarcely perceptible acid reaction. If, after cooling, the liquid be passed through a wet filter, the clear filtrate should produce, with a drop of ferric chloride T.S., only a transient grayish-green, but not a blue or violet color.</p>
<p>If to 3 drops of the Oil, contained in a small test-tube, 3 drops of concentrated sulphuric acid be added, and, after the tube has been corked, the mixture be allowed to stand for half an hour, a resinous mass will be obtained. On adding to this mass 4 C.c. of diluted alcohol, vigorously shaking the mixture, and gradually heating to the boiling point, the liquid should remain nearly colorless, and should not acquire a red or purplish-red color (distinction from oil of pimenta and oil of cloves).</p>	

This oil, like the oil of cloves and the oil of pimenta, consists of two portions, a terpene, $C_{10}H_{16}$, and *eugenol*, $C_{10}H_{12}O_2$.

Official Preparation.

Spiritus Myrciæ Made by mixing 16 C.c. of oil of myrcia, 1 C.c. of oil of pimenta, and 1 C.c. of oil of orange peel, with alcohol and water to make 2000 C.c. (see page 333). Used externally.

Spirit of Myrcia (Bay Rum).

VANILLA. U.S. Vanilla.

The fruit of *Vanilla planifolia* Andrews (nat. ord. *Orchidæ*).

This valuable drug contains a trace of a volatile oil, 10 per cent. of fixed oil, resin, sugar, etc., and *vanillin*, $C_8H_8O_3$. This is the aldehyde of methyl-protocatechuic acid, and is now largely prepared from eugenol, coniferin, phenol, and benzoin.

Artificial vanillin has been used as a substitute for vanilla in flavoring; but, owing to the presence of the odorous oil in "vanilla bean," it is not identical.

Official Preparation.

Tinctura Vanillæ Made by macerating 100 Gm. of vanilla with 500 C.c. of a mixture of 65 parts of alcohol and 35 parts of water, draining and reserving the macerate, beating the residue with 200 Gm. of sugar, and percolating with the reserved liquid and sufficient menstruum to make 1000 C.c. (see page 380).

Tincture of Vanilla.

OLEUM CAJUPUTI. U.S. Oil of Cajuput.

A volatile oil distilled from the leaves of *Melaleuca Leucadendron* Linné (nat. ord. *Myrtacæ*).

This aromatic oil is very fluid, transparent, of a green color, a penetrating odor, analogous to that of cardamom, and a warm, pungent taste. Its composition is $C_{10}H_{16}H_2O$. It is termed chemically *cajuputene hydrate*, or *cajuputol*. It boils at $175^{\circ} C.$ ($347^{\circ} F.$), and is freely soluble in alcohol. Sp. gr. 0.922 to 0.929. On shaking 5 C.c. of the Oil with 5 C.c. of water containing a drop of diluted hydrochloric acid, the Oil loses its green tint and becomes nearly colorless. If to this acid liquid, separated from the Oil, a drop of potassium ferrocyanide T.S. be added, a reddish-brown color will usually be produced

(presence of traces of *copper*). If 5 parts of the Oil be heated to 50° C. (122° F.), and 1 part of powdered iodine gradually added, with avoidance of any further rise of temperature, the mixture, on cooling, will deposit a mass of crystals. When it is distilled, a light, colorless liquid first comes over, and afterwards a green and denser one. The green color has been ascribed to a salt of copper derived from the vessels in which the distillation is performed; and various investigators have found traces of copper present in it. Others, again, have carefully tested the green oil and proved its absence. A fair inference is that the oil of cajuput is naturally green, but that as found in commerce it sometimes contains copper, either accidentally present, or added with a view of imitating or maintaining the fine color of the oil.

EUCALYPTUS. U. S. Eucalyptus.

The leaves of *Eucalyptus globulus* Labillardière (nat. ord. *Myrtaceæ*), collected from the older parts of the tree.

The virtues of eucalyptus leaves depend upon a volatile oil: there are also present resin, tannin, chlorophyll, fatty acid, etc. The leaves are used as a stimulant, febrifuge, or astringent.

Official Preparation.

Extractum Eucalypti Fluidum. Made by percolating Eucalyptus with 3 parts of alcohol and 1 part of water (see page 405). Dose, ten to forty minims (0.6 to 2.4 C.c.).

OLEUM EUCALYPTI. U. S. Oil of Eucalyptus.

A volatile oil distilled from the fresh leaves of *Eucalyptus globulus* Labillardière, *Eucalyptus oleosa* F. v. Mueller, and some other species of *Eucalyptus* (nat. ord. *Myrtaceæ*).

It is a colorless or very pale yellowish liquid, having a characteristic aromatic odor, a pungent, spicy, and cooling taste, and a neutral reaction. Sp. gr. 0.915 to 0.925. It is soluble in all proportions of alcohol, carbon disulphide, and glacial acetic acid. If 1 C.c. of the Oil be mixed with 2 C.c. of glacial acetic acid, and 1 or 2 C.c. of a saturated, aqueous solution of sodium nitrite be gradually added, the mixture, when gently stirred, should not form a crystalline mass (distinction from oils of *Eucalyptus* containing a considerable proportion of phellandrene).

The larger portion of the oil consists of *eucalyptol*, $C_{10}H_{16}O$, which is very soluble in alcohol; there are also present two terpenes, $C_{10}H_{16}$, $C_{10}H_{18}$.

EUCALYPTOL. U. S. Eucalyptol.

A neutral body obtained from the volatile oil of *Eucalyptus globulus* Labillardière, and of some other species of *Eucalyptus* (nat. ord. *Myrtaceæ*).

Eucalyptol. U. S.	ODOR AND TASTE.	SOLUBILITY.	
		Alcohol.	Other Solvents.
A colorless liquid. Specific gravity, 0.930 at 15° C. (59° F.). Boiling point, 176° to 177° C. (348.8° to 350.6° F.). It is optically inactive (distinction from the oil of <i>Eucalyptus</i> and many other volatile oils).	Characteristic aromatic and distinctly camphoraceous odor; pungent, spicy, and cooling taste.	In all proportions.	In all proportions in carbon disulphide and glacial acetic acid.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
When exposed to a temperature some degrees below 0° C. (32° F.), or placed in a freezing mixture, it solidifies to a mass of colorless, needle-shaped crystals, which liquefy at -1° C. (30.2° F.). If a portion of Eucalyptol be shaken with an equal volume of sodium hydrate T.S., it should not diminish in volume.	Phenols.	{ Its alcoholic solution should be neutral to litmus-paper, and should not assume a brownish or violet color on the addition of a drop of ferric chloride T.S.

MYRISTICA. U. S. Nutmeg.

The seed of *Myristica fragrans* Houttuyn (nat. ord. *Myristicaceæ*), deprived of its testa.

This valuable spice owes its activity to the presence of an oxygenated volatile oil. Nutmeg contains about 25 per cent. of fixed oil, together with proteids, starch, etc. It forms one of the ingredients in at least seven official preparations.

OLEUM MYRISTICÆ. U. S. Oil of Nutmeg.

A volatile oil distilled from Nutmeg.

It is a colorless or pale yellowish liquid, having the characteristic odor of nutmeg, a hot, spicy taste, and a neutral reaction. Sp. gr. 0.870 to 0.900. It is readily soluble in alcohol.

This oil consists of a terpene called *myristicene*, $C_{10}H_{16}$, and an oxygenated portion, $C_{10}H_{14}O$, *myristicol*. It is used in aromatic spirit of ammonia.

Expressed oil of nutmeg, or *oil of mace*, is made by expressing nutmegs between hot plates, or macerating them in carbon disulphide, and distilling the macerate. It is a fat, having the composition $C_5H_8(C_{14}H_{22}O_2)_3$, *myristicin*.

Official Preparation.

Spiritus Myristicæ. Made by mixing 50 C.c. of oil of nutmeg with 950 C.c. of alcohol (see Spirit of Nutmeg. page 333).

MACIS. U. S. Mace.

The arillode of the seed of *Myristica fragrans* Houttuyn (nat. ord. *Myristicaceæ*).

This aromatic contains about 10 per cent. of a light, volatile oil, chiefly a terpene, $C_{10}H_{16}$ (*macene*). A fixed oil is obtained from mace: it is not a solid, and is not identical with the expressed oil of nutmeg, erroneously called *oil of mace*.

CASCARILLA. U. S. Cascarilla.

The bark of *Croton Eluteria* Bennett (nat. ord. *Euphorbiaceæ*).

Cascarilla contains about 2 per cent. of an oxygenated volatile oil, a crystalline principle, *cascarillin*, $C_{12}H_{18}O_4$, 15 per cent. of resin, also tannin, gum, pectin, etc. It is used as a stimulant and tonic. Dose, twenty grains (1.3 Gm.).

SASSAFRAS. U. S. Sassafras.

The bark of the root of *Sassafras variifolium* (Salisbury) O. Kuntze (nat. ord. *Laurineæ*).

This well-known bark contains volatile oil, sassafrid, tannin, starch,

resin, etc. It is principally used on account of its aromatic oil. It enters into two official preparations of sarsaparilla.

OLEUM SASSAFRAS. U. S. Oil of Sassafras.

[A volatile oil distilled from Sassafras.

It is a colorless or yellowish liquid, becoming darker and somewhat thicker by age and exposure to air, having the characteristic odor of sassafras, a warm, aromatic taste, and a neutral reaction. Sp. gr. 1.070 to 1.090. It is readily soluble in alcohol. When treated with cold nitric acid, it becomes dark red, and is finally converted into a red resin. If to a few drops of the oil a drop of sulphuric acid be added, a deep red color will be produced at first, which soon becomes blackish.

This oil is largely produced in New Jersey and Maryland from the wood and bark of the sassafras: the yield is about 2 per cent. It consists of a terpene, $C_{10}H_{16}$ (*safrene*), and an oxygenated portion, $C_{10}H_{10}O_2$ (*safrol*), now also obtained on an immense scale from oil of camphor.

OLEUM GAULTHERIÆ. U. S. Oil of Gaultheria.

[OIL OF WINTERGREEN.]

A volatile oil distilled from the leaves of *Gaultheria procumbens* Linné (Wintergreen; nat. ord. *Ericaceæ*), consisting almost entirely of Methyl Salicylate [$CH_3C_7H_5O_2 = 151.64$], and nearly identical with Volatile Oil of Betula.

This oil consists of a terpene, $C_{10}H_{16}$, termed *gaultherilene*, and methyl salicylate, $CH_3C_7H_5O_2$. It is the heaviest of all the volatile oils, having the sp. gr. 1.175 to 1.185. When mixed with concentrated solution of soda or potassa it becomes a solid crystalline mass, and the odor of the oil is lost. It is a colorless or yellow or reddish liquid, of a peculiar, strong, and aromatic odor, a sweetish, warm, and aromatic taste, and a slightly acid reaction. It is readily soluble in alcohol. The reddish color is due to a trace of iron. Boiling point, 218° to 221° C. (424.4° to 429.2° F.). It deviates polarized light slightly to the left: in other respects it has the same properties and conforms to the same reactions and tests as methyl salicylate (see Methyl Salicylas and Oleum Betulæ Volatile).

The adulteration with chloroform or alcohol is shown by heating it to about 80° C. (176° F.), when the oil should not yield a colorless distillate having the characteristics of chloroform or of alcohol; and that of oil of sassafras by mixing 5 drops of the oil with 5 drops of nitric acid, when the mixture should not acquire a deep red color and should not solidify to a dark red, resinous mass.

Uses.—Oil of gaultheria is used in place of salicylic acid in neuralgia and kindred diseases, in doses of ten to twenty minims (0.6 to 1.2 C.c.).

Official Preparation.

Spiritus Gaultheriæ. Made by mixing 50 C.c. of oil of gaultheria with 950 C.c. of alcohol Spirit of Gaultheria. (see page 331). Dose, ten to twenty minims (0.6 to 1.2 C.c.).

OLEUM BETULÆ VOLATILE. U. S. Volatile Oil of Betula.

[OIL OF SWEET BIRCH.]

A volatile oil obtained by distillation from the bark of *Betula lenta* Linné (Sweet Birch; nat. ord. *Betulaceæ*). It is identical with Methyl Salicylate [$CH_3C_7H_5O_2$], and nearly identical with Oil of Gaultheria.

METHYL SALICYLAS. U. S. Methyl Salicylate.

[ARTIFICIAL (OR SYNTHETIC) OIL OF WINTERGREEN.]

This may be made by distilling salicylic acid or a salicylate with methyl alcohol and strong sulphuric acid.

Methyl Salicylas. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.
A colorless or slightly yellowish liquid. Is identical with the essential constituent of oil of gaultheria. Is wholly identical with the volatile oil of betula. Sp. gr. 1.183-1.185 at 15° C. (59° F.). Boiling point, 219°-221° C. (426.2°-429.8° F.). It is optically inactive.	It has the strongly aromatic odor and sweetish, warm, and aromatic taste of oil of gaultheria; neutral or slightly acid reaction.	In all proportions in alcohol, glacial acetic acid, or carbon disulphide.
TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>If a drop of Methyl Salicylate be shaken with a little water, and a drop of ferric chloride T.S. subsequently added, a deep violet color will be produced.</p> <p>When heated on a water-bath, in a flask provided with a suitable condenser, it should yield no distillate having the characteristics of alcohol or chloroform.</p>	<p>Other Volatile Oils or Petroleum.</p> <p>Methyl Benzoate, etc.</p>	<p>If to 1 C.c. of Methyl Salicylate, contained in a capacious test-tube, 10 C.c. of sodium hydrate T.S. be added, and the mixture agitated, a bulky, white crystalline precipitate will be produced; then, if the test-tube, loosely corked, be allowed to stand in boiling water for about five minutes, with occasional agitation, the precipitate should dissolve, and form a clear, colorless, or faintly yellowish solution, without the separation of any oily drops, either on the surface or at the bottom of the liquid.</p> <p>If the alkaline liquid thus obtained be subsequently diluted with about three times its volume of water, and a slight excess of hydrochloric acid added, a white, crystalline precipitate will be produced, which, when collected on a filter, washed with a little water, and recrystallized from hot water, should respond to the tests of identity and purity described under <i>Acidum Salicylicum</i>.</p>

Uses.—Methyl salicylate is asserted to be identical in medical properties with oil of wintergreen and oil of sweet birch.

CALAMUS. U. S. Calamus. [SWEET FLAG.]

The rhizome of *Acorus Calamus* Linné (nat. ord. *Aroideæ*).

Calamus contains a volatile oil having the composition of a terpene, $\text{C}_{10}\text{H}_{16}$, soft resin, a bitter principle, acorin, starch, and mucilage. It is esteemed solely on account of its aromatic properties, which are due to the volatile oil.

Official Preparation.

Extractum Calami Fluidum. Made with a menstruum of alcohol (see page 397). Dose, Fluid Extract of Calamus. one-half to one fluidrachm (1.8 to 3.7 C.c.).

CARDAMOMUM. U. S. Cardamom.

The fruit of *Elettaria repens* (Sonnerat) Baillon (nat. ord. *Scitamineæ*).

This valuable aromatic is imported from India. The seeds contain 5 per cent. of an oxygenated volatile oil, of the sp. gr. 0.943, 10 per cent.

of fixed oil, starch, mucilage, etc. Owing to the presence of the fixed oil, they are very difficult to powder alone: hence the practice in compound powders containing cardamom of mixing the other ingredients with it, so that they may absorb the oil. The oil of cardamom is usually made by percolation with ether, and is a mixture of both volatile and fixed oils. Cardamom enters into a number of official preparations, in two of which it is the principal ingredient.

Official Preparations.

- Tinctura Cardamomi** Made by percolating 100 Gm. of cardamom with sufficient diluted alcohol to make 1000 C.c. (see page 363). Dose, one fluidrachm (3.7 C.c.).
Tincture of Cardamom.
Tinctura Cardamomi Composita . Made by percolating 20 Gm. each of cardamom and cinnamon, 10 Gm. of caraway, and 5 Gm. of cochineal with sufficient diluted alcohol to obtain 950 C.c., and adding 50 C.c. of glycerin to the percolate (see page 364). Dose, one fluidrachm (3.7 C.c.).
Compound Tincture of Cardamom.

ZINGIBER. *U. S.* Ginger.

The rhizome of *Zingiber officinale* Roscoe (nat. ord. *Scitamineæ*).

This well-known and largely used rhizome owes its virtues to about 4 per cent. of volatile oil, having the composition $C_{10}H_{16}$, and therefore a terpene, and a soft, pungent, aromatic resin, which is soluble in alcohol and ether. It is used in a number of official preparations, in three of which it is the sole medicinal ingredient.

Official Preparations.

- Extractum Zingiberis Fluidum** . Made with a menstruum of alcohol (see page 429). Dose, ten to thirty minims (0.6 to 1.8 C.c.).
Fluid Extract of Ginger.
Oleoresina Zingiberis Made by percolating powdered ginger with ether (see page 435). The yield is 6 to 8 per cent. Dose, one minim (0.06 C.c.).
Oleoresin of Ginger.
Syrupus Zingiberis Made from 30 C.c. fluid extract of ginger, 850 Gm. sugar, and sufficient water to make 1000 C.c. (see page 312).
Syrup of Ginger.
Tinctura Zingiberis Made by percolating 200 Gm. powdered ginger with sufficient alcohol to make 1000 C.c. (see page 380). Dose, one fluidrachm (3.7 C.c.).
Tincture of Ginger.
Trochisci Zingiberis Each troche contains 2 grains of tincture of ginger (see Trochisci).

Unofficial Terpenes.

- Oil of Burgundy Pitch.** From *Abies excelsa*. Nat. Ord. Coniferae. Habitat, Europe.
Calamus. From the rhizome of *Acorus Calamus*. Nat. Ord. Araceae. Habitat, North America. The yield is about $1\frac{1}{2}$ to 2 per cent.
Canada Turpentine. From the oleoresin of *Abies balsamea*. Nat. Ord. Coniferae.
Cedrat. From *Citrus medica*. Nat. Ord. Aurantiaceae. Used in perfumery.
Elemi. From *Canarium commune*. Nat. Ord. Burseraceae. Habitat, Philippine Islands. The yield is about 10 per cent.
Gurjun Balsam. From *Dipterocarpus turbinatus*. Nat. Ord. Dipterocarpaceae. Habitat, India. The yield is about from 40 to 70 per cent.
Hemlock Spruce. From *Abies canadensis*. Nat. Ord. Coniferae. Habitat, Canada.
Hungarian Turpentine. From *Pinus Pumilio*. Nat. Ord. Coniferae.
Jaborandi. From the leaflets of *Pilocarpus pennatifolius*. Nat. Ord. Rutaceae. Habitat, Brazil.
Myrtle. From *Myrtus communis*. Nat. Ord. Myrtaceae.
Sage. From the leaves of *Salvia officinalis*. Nat. Ord. Labiatae. The yield is about $\frac{1}{2}$ per cent.
Strassburg Turpentine. From *Abies pectinata*. Nat. Ord. Coniferae.
Templin. From the shoots of *Pinus Pumilio*. It is a colorless or yellowish-green oil, of an agreeable, somewhat terebinthinate odor.
Venice Turpentine. From *Larix europæa*. Nat. Ord. Coniferae.

Unofficial Oxygenated Oils.

Oil of Absinthium.	From <i>Artemisia Absinthium</i> . Nat. Ord. Compositæ.
Angustura.	From the bark of <i>Galipea Cusparia</i> . Nat. Ord. Rutacææ. Habitat, South America. Yield about $\frac{1}{4}$ per cent. Composition, $C_{15}H_{24}O$.
Anthemis.	From the flower-heads of <i>Anthemis nobilis</i> . Nat. Ord. Compositæ. Habitat, Europe.
Arnica.	From the root and flowers of <i>Arnica montana</i> . Nat. Ord. Compositæ. Habitat, Europe. Yield about $\frac{1}{4}$ to 1 per cent.
Asarum.	From the rhizome of <i>Asarum canadense</i> . It is used to give permanence to the odors of cologne waters.
Buchu.	From the leaves of <i>Barosma betulina</i> , <i>B. crenulata</i> , and <i>B. serratifolia</i> . Nat. Ord. Rutacææ. Habitat, Southern Africa. The yield is from $\frac{1}{4}$ to $1\frac{1}{2}$ per cent.
Camphor.	From the preparation of crude camphor. Nat. Ord. Laurinææ. Habitat, Asia.
Canella.	From the bark of <i>Canella alba</i> . Nat. Ord. Canellacææ. Habitat, Southern United States. The yield is about from $\frac{1}{4}$ to 1 per cent.
Capsicum.	From the fruit of <i>Capsicum fastigiatum</i> . Nat. Ord. Solanacææ. Habitat, Southern and Central America. The yield is very small.
Cardamom.	From the fruit of <i>Elettaria repens</i> . Nat. Ord. Scitaminææ. Habitat, Hindostan. The yield is about 4 per cent.
Carrot.	From the fruit of <i>Daucus Carota</i> . Nat. Ord. Umbelliferææ. Indigenous to Northern Asia. The yield is very small.
Cascarilla.	From the bark of <i>Croton Eluteria</i> . Nat. Ord. Euphorbiacææ. Indigenous to the Bahama Islands. The yield of oil is about $1\frac{1}{2}$ per cent.
Catnep.	From the leaves and tops of <i>Nepeta Cataria</i> . Nat. Ord. Labiatææ. Habitat, Europe. The yield is small.
Celery.	From the fruit of <i>Apium graveolens</i> . Nat. Ord. Umbelliferææ. Habitat, Europe.
Citronella.	From the leaves of <i>Andropogon Nardus</i> . Habitat, Ceylon. Contains a terpene, citronellol, and a heptoic aldehyde. Used in perfumery.
Clove Cinnamon.	From <i>Persea caryophyllata</i> .
Curcuma.	From the rhizome of <i>Curcuma longa</i> . Nat. Ord. Zingiberacææ. Habitat, India. The yield is about 1 per cent.
Cyna.	From the flowers of <i>Artemisia maritima</i> . Nat. Ord. Compositæ. Habitat, Asia. A pale yellow oil. The yield is about 2 per cent.
Dahlia.	From the tubers of <i>Dahlia pinnata</i> .
Elder (European).	From the flowers of <i>Sambucus nigra</i> . Nat. Ord. Caprifoliacææ. Habitat, Europe. The yield is about from $\frac{1}{4}$ to $\frac{1}{2}$ per cent.
Feverfew.	From <i>Pyrethrum Parthenium</i> . Nat. Ord. Compositæ. Habitat, Europe.
Galangal.	From the rhizome of <i>Alpinia officinarum</i> . Nat. Ord. Zingiberacææ. Habitat, China. The yield of oil is about $\frac{1}{4}$ per cent.
Ginger.	From the rhizome of <i>Zingiber officinale</i> . Nat. Ord. Scitaminææ. Habitat, Jamaica. The yield is about from 1 to 2 per cent.
Ginger Grass.	From the flowers of <i>Andropogon Schænanthus</i> .
Golden Rod.	From the leaves of <i>Solidago odora</i> .
Heliotrope.	From the flowers of <i>Heliotropium peruvianum</i> and <i>H. grandiflorum</i> .
Hop.	From the strobiles of <i>Humulus Lupulus</i> . Nat. Ord. Urticacææ. Habitat, North America. The yield is about 0.8 per cent.
Horsemint.	From the leaves and flowers of <i>Monarda punctata</i> . Nat. Ord. Labiatææ. Habitat, United States.
Hyssop.	From the herb of <i>Hyssopus officinalis</i> . Nat. Ord. Labiatææ. Habitat, Southern Europe. The yield is about from $\frac{1}{4}$ to $\frac{1}{2}$ per cent.
Ihlang-Ihlang.	From <i>Unona odoratissima</i> .
Indian Cannabis.	From <i>Cannabis sativa</i> . Nat. Ord. Urticacææ. Habitat, Asia.
Inula.	From the root of <i>Inula Helenium</i> . Nat. Ord. Compositæ. Habitat, Europe. The yield is very small.
Jessamine.	From the flowers of <i>Jasminum grandiflorum</i> and <i>J. fragrans</i> . Nat. Ord. Jasminææ. The yield is very small. Used in perfumery.
Laurel.	From <i>Laurus nobilis</i> . Nat. Ord. Lauracææ. Habitat, Southern Europe. The yield of oil is about 20 per cent.
Lilac.	From the flowers of <i>Syringa vulgaris</i> . Nat. Ord. Oleacææ. Used in perfumery.
Lily of the Valley.	From the flowers of <i>Convallaria majalis</i> . Nat. Ord. Liliacææ. The yield is very small. Used in perfumery.

Unofficial Oxygenated Oils.—Continued.

Oil of Linden.	From the inflorescence of different species of <i>Tilia</i> . Nat. Ord. Tiliaceæ. Habitat, Europe and America. The yield is about from $\frac{1}{10}$ to $\frac{1}{5}$ per cent.
Lovage.	From the root of <i>Levisticum officinale</i> . Nat. Ord. Umbelliferae. Habitat, Europe.
Mace.	From the arilode of <i>Myristica fragrans</i> . Nat. Ord. Myristicaceæ. Habitat, Molucca Islands. The yield is about 8 per cent.
Marrubium.	From <i>Marrubium vulgare</i> . Nat. Ord. Labiatae. Habitat, Europe and Asia. The yield is small.
Marsh Tea.	From the leaves of <i>Ledum palustre</i> . Nat. Ord. Ericaceæ. Habitat, Europe and Asia. The yield is variable, but about from $\frac{1}{2}$ to $1\frac{1}{2}$ per cent.
Masterwort.	From <i>Heracleum lanatum</i> . Nat. Ord. Umbelliferae. Habitat, United States. The yield is small.
Matico.	From the leaves of <i>Piper angustifolium</i> . Nat. Ord. Piperaceæ. Habitat, tropical America. The yield is about $1\frac{1}{2}$ per cent.
Matricaria.	From the flowers of <i>Matricaria Chamomilla</i> . Nat. Ord. Compositæ. Habitat, Europe and United States. The yield is about $\frac{1}{2}$ per cent.
Melissa.	From the leaves and tops of <i>Melissa officinalis</i> . Nat. Ord. Labiatae. Habitat, Europe and United States. The yield is about from $\frac{1}{2}$ to $\frac{1}{2}$ per cent.
Mignonette.	From the flowers of <i>Roseda odorata</i> . Nat. Ord. Resedaceæ. Habitat, Southern France. The yield is very small. Used in perfumery.
Mountain Balm.	From the leaves of <i>Eriodictyon californicum</i> . Nat. Ord. Hydrophyllaceæ. Habitat, California.
Myrrh.	From the gum-resin of <i>Commiphora Myrrha</i> . Nat. Ord. Burseraceæ. Habitat, Arabia. The yield is about from 2 to $2\frac{1}{2}$ per cent.
Olibanum.	From <i>Bonellia Carterii</i> . Nat. Ord. Burseraceæ. Habitat, Arabia. The yield is about from 4 to 8 per cent.
Parsley.	From the fruit of <i>Petroselinum sativum</i> . Nat. Ord. Umbelliferae. Habitat, Southern Europe. The yield is about $1\frac{1}{2}$ per cent.
Patchouly.	From <i>Pogostemon Patchouly</i> . Nat. Ord. Labiatae. Habitat, East India.
Phellandrium.	From the fruit of <i>Ænanthe Phellandrium</i> . Nat. Ord. Umbelliferae. The yield is about $1\frac{1}{2}$ per cent.
Red Cedar.	From <i>Juniperus virginiana</i> . Nat. Ord. Coniferae. Habitat, Canada and United States.
Rhodium.	From the root of <i>Convolvulus Scoparius</i> . Habitat, Canary Islands. The oil of rhodium sold in pharmacy is usually a feitious article, made by mixing 1 part of oil of rose with 20 parts of oil of copaiba. It is used as a lure for rats.
Saffron.	From <i>Crocus sativus</i> . Nat. Ord. Iridææ. Habitat, Europe. The yield is about 1 per cent.
Serpentaria.	From the rhizome and roots of <i>Aristolochia Serpentaria</i> and <i>A. reticulata</i> . Nat. Ord. Aristolochiaceæ. Habitat, Virginia. The yield is about $\frac{1}{2}$ per cent.
Summer Savory.	From the herb of <i>Satureja hortensis</i> . Nat. Ord. Labiatae.
Sweet Basil.	From <i>Ocimum Basilicum</i> . Nat. Ord. Labiatae. Habitat, Asia and Africa.
Sweet Cicely.	From <i>Osmorhiza longistylis</i> . Nat. Ord. Umbelliferae.
Sweet Marjoram.	From <i>Origanum majorana</i> . Nat. Ord. Labiatae.
Sweet Violet.	From the flowers of <i>Viola odorata</i> . Nat. Ord. Violaceæ.
Tansy.	From the leaves of <i>Tanacetum vulgare</i> . Nat. Ord. Compositæ. Habitat, Europe and North America. The yield is variable, but about $\frac{1}{2}$ to $\frac{1}{2}$ per cent.
Tea.	From the leaves of <i>Thea sinensis</i> . Nat. Ord. Ternstroemiaceæ. Habitat, China. The yield is about from $\frac{1}{2}$ to 1 per cent.
Thuja.	From the branches of <i>Thuja occidentalis</i> . Nat. Ord. Coniferae. Habitat, Canada and United States. The yield is variable, but about 1 per cent.
Tuberose.	From the flowers of <i>Polianthes tuberosa</i> . Nat. Ord. Amaryllidaceæ.
Verbena (Lemon-grass).	From <i>Andropogon Citratis</i> . A grass cultivated in Ceylon and Singapore.
Wormwood.	From the herb of <i>Artemisia Absinthium</i> . Nat. Ord. Compositæ. Habitat, Europe. The yield is about $\frac{1}{2}$ per cent.
Zedoary.	From the rhizome of <i>Curcuma Zedoaria</i> . Nat. Ord. Zingiberaceæ. Habitat, East India Islands.

Stearoptens from Volatile Oils.

CAMPHORA. U. S. Camphor.

A stearopten (having the nature of a ketone) obtained from *Cinnamomum Camphora* (Linné) Nees et Ebermaier (nat. ord. *Laurineæ*), and purified by sublimation.

Camphor is sometimes sublimed in powder by conducting the vapor into a large chamber (see Sublimation, page 171). This powder is often compressed into oblong cakes, forming *compressed camphor*.

It is in white, translucent masses of a tough consistence and crystalline structure, readily pulverizable in the presence of a little alcohol, ether, or chloroform. It has the sp. gr. 0.995, melts at 175° C. (347° F.), boils at 204° C. (399.2° F.), sublimes without residue, and burns with a luminous, smoky flame. It has a penetrating odor and a pungent taste, dissolves readily in alcohol, ether, chloroform, carbon disulphide, benzin, and fixed and volatile oils, and is sparingly soluble in water. It has the property of softening resins, and liquefies when triturated with such substances as menthol, thymol, phenol, or chloral hydrate.

Preparation.—Refined camphor is usually made by subliming in circular cakes the crude granular camphor imported from China and Japan. The vessels in which the camphor is put are of cast iron, circular, from twelve to fifteen inches or more in diameter, and four inches deep, with perpendicular sides, and a ledge at top, on which the cover rests. This consists of sheet-iron, with a hole through the centre about an inch in diameter, over which a small hollow cone of sheet-iron is placed loosely. The crude camphor, mixed with lime,—the object of which is said to be to combine with the moisture present, which would interfere with the due solidification of the camphor vapor,—is placed in the iron vessels described, of which from twenty to fifty are arranged in a long sand-bath. Heat is then applied until the camphor melts, after which the heat is kept as nearly uniform as possible, so that the vaporization may take place regularly, without violent ebullition. The camphor sublimes on the lower surface of the lid in a solid circular cake, care being taken, by the occasional removal of the iron cone and clearing of the opening by means of a knife, to allow the escape of any excess of the vapor: the round hole in the cakes is thus accounted for.

Uses.—Camphor is a stimulant. It is given in doses of five to ten grains (0.3 to 0.6 Gm.). There are three official preparations in which camphor is used, and it is an ingredient in six others,—soap liniment, camphorated tincture of opium, belladonna liniment, compound liniment of mustard, compound powder of morphine, and camphor cerate.

Official Preparations.

Aqua Camphoræ	Made by dissolving 8 Gm. of camphor in 5 C.c. of alcohol, triturating with 5 Gm. of precipitated calcium phosphate, and filtering this with distilled water until 1000 C.c. have been obtained (see page 288).
Camphor Water.	
Ceratum Camphoræ	Made by mixing 100 Gm. of camphor liniment, 300 Gm. of white wax, and 600 Gm. of lard.
Camphor Cerate.	
Linimentum Camphoræ . .	Made by dissolving 200 Gm. of camphor in 800 Gm. of cotton-seed oil (see page 340).
Camphor Liniment.	
Spiritus Camphoræ	Made by dissolving 100 Gm. of camphor in alcohol sufficient to make 1000 C.c. (see page 230). Dose, five to forty minims (0.3 to 2.4 C.c.).
Spirit of Camphor.	

CAMPHORA MONOBROMATA. U. S. Monobromated Camphor.

Preparation.—This compound of camphor may be made by Prof. Maisch's process, as follows. Four ounces of bromine are introduced gradually into a retort in which thirteen ounces of camphor have been previously placed. In fifteen or twenty minutes a brisk reaction will commence. When this subsides, eight or nine ounces more of bromine are to be poured in, in four portions, waiting after each addition until the reaction ceases. The liquid in the retort is now to be heated to about 132° C. (270° F.), then cooled, and sufficient petroleum benzin added to dissolve the crystalline mass. The crystals which are formed on cooling may be purified by recrystallization from benzin or hot alcohol.

Camphora Monobromata. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Colorless, prismatic needles or scales, permanent in the air, and unaffected by light. At 76° C. (168.8° F.) it melts, and it may be sublimed at a slightly higher temperature. At 274° C. (525.2° F.) it boils without decomposition, and is finally volatilized without leaving a residue.	Mild, camphoraceous odor and taste; neutral reaction.	Almost insoluble.	Freely soluble.	Freely soluble in ether, chloroform, hot benzin, and fixed and volatile oils; slightly soluble in glycerin.

TESTS FOR IDENTITY.

It is soluble, without decomposition, in cold, concentrated sulphuric acid, and will again separate unaltered if the solution be poured into water.

Uses.—Monobromated camphor is given as a nervous sedative, in doses of five grains (0.3 Gm.).

Official Substances containing Nitrogenated and Sulphurated Oils with Allied Products.**AMYGDALA AMARA. U. S. Bitter Almond.**

The seed of *Prunus Amygdalus*, var. *amara* De Candolle (nat. ord. *Rosaceæ*).

Bitter almond contains *amygdalin*, $\text{C}_{20}\text{H}_{27}\text{NO}_{11}$, a glucoside which splits into benzyl-aldehyd, or oil of bitter almond, hydrocyanic acid, and glucose, under the influence of emulsin, or synaptase, a ferment which becomes active in the presence of water.

It also contains about 35 per cent. of fixed oil, mucilage, sugar, etc., with a trace of tannin in the testa. Bitter almond is used in making the volatile oil, and in syrup of almond.

OLEUM AMYGDALÆ AMARÆ. U. S. Oil of Bitter Almond.

A volatile oil obtained from Bitter Almond by maceration with water, and subsequent distillation.

Preparation.—As stated above, oil of bitter almond, or benzyl-aldehyd, is produced as the result of the reaction of emulsin on amygd-

dalin in aqueous mixture: it therefore does not pre-exist in the almond, and cannot be obtained from sweet almond, because amygdalin is not present in the latter.

The process is simply to make a mixture of the bitter almond cake (obtained after the fixed oil has been extracted) with water, and distil it by passing a current of steam through it. Artificial benzyl-aldehyd, which is identical with the product obtained from the almond, is now made from toluol, C_6H_6 . By the action of chlorine upon the hot toluol, benzyl chloride, $\text{C}_6\text{H}_5\text{CH}_2\text{Cl}$, results, and this yields benzyl-aldehyd on distillation with lead nitrate and water in an atmosphere of carbon dioxide. Artificial benzyl-aldehyd is free from hydrocyanic acid, but is liable to retain traces of chlorine compounds. This artificial product must not be confounded with nitrobenzol, or *oil of myrbane*, which is made by reacting on benzol with nitric acid. Nitrobenzol is made in large quantities for perfuming soap: its odor is similar to, but by no means identical with, that of oil of bitter almond.

Uses.—Oil of bitter almond is sedative and poisonous if it contains hydrocyanic acid. The dose is from one-half to one minim (0.03 to 0.06 C.c.). It is used for flavoring.

Oleum Amygdale Amara. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A clear, colorless or yellowish, thin, and strongly refractive liquid. Sp. gr. 1.060 to 1.070 at 15° C. (59° F.). Boiling point, about 180° C. (356° F.). Optically inactive.	Peculiar aromatic odor; bitter and burning taste; neutral reaction; but when kept for some time it assumes an acid reaction, due to the formation of benzoic acid.	At 15° C. (59° F.), 300 parts.	Soluble in all proportions.	Soluble in all proportions of ether, also in nitric acid, at the ordinary temperature, without evolution of nitrous vapors.

TESTS FOR IDENTITY.	IMPURITIES.	TEST FOR IMPURITY.
<p>The presence of artificial oil containing chlorinated products may be detected in the following manner. Fold a small strip of filter paper in the form of a taper, saturate it with the Oil, and lay it into a small porcelain capsule. Set this capsule into a larger one, and provide a large beaker to be inverted over the capsule containing the taper. Then, having moistened the inner surface of the beaker with distilled water, ignite the taper, immediately invert the beaker over the capsule, and allow the products of combustion to be absorbed by the water in the beaker. If the beaker be now rinsed with a little distilled water, and the liquid filtered, the filtrate should yield no turbidity with silver nitrate T.S.</p> <p>If 5 C.c. of the Oil be vigorously shaken, in a flask, with 50 C.c. of a cold, saturated solution of sodium bisulphite, and the mixture heated for a few minutes on a water-bath, the odor of the Oil should disappear, and a nearly clear solution be formed, without the separation of any oily drops on the surface of the liquid (absence of most other volatile oils and of nitrobenzol).</p>	<p>Presence of Hydrocyanic Acid.</p>	<p>If 10 drops of the Oil, dissolved in a little alcohol, be shaken with a few drops of a strong solution of sodium hydrate, then with a little ferrous sulphate T.S., and finally mixed with a slight excess of hydrochloric acid, a blue precipitate will be produced.</p>

Official Preparation.

Aqua Amygdalæ Amara. Made by dissolving 1 C.c. of oil of bitter almond in 999 C.c. of distilled water (see page 287). Dose, one to two fluidrachms (3.7 to 7.4 C.c.).
Bitter Almond Water.

PRUNUS VIRGINIANA. U. S. Wild Cherry.

The bark of *Prunus serotina* Ehrhart (nat. ord. *Rosaceæ*), collected in autumn.

This bark contains amygdalin, emulsin, tannin, bitter principle, starch, resin, etc. As with bitter almond, contact with water results in the production of oil of bitter almond and hydrocyanic acid: as both of the latter principles are volatile and active, all the preparations of wild cherry should be made without heat. An insoluble precipitate of altered tannin is often noticed in old fluid extract of wild cherry. Wild cherry bark is sedative and tonic.

Official Preparations.

Infusum Pruni Virginianæ Made with 40 Gm. of wild cherry and sufficient water to make 1000 C.c. (see page 349). Dose, two fluidounces (59 C.c.).
Infusion of Wild Cherry.
Syrupus Pruni Virginianæ Made with 150 Gm. of wild cherry, 700 Gm. of sugar, 150 C.c. of glycerin, and water to make 1000 C.c. (see page 308). Dose, a tablespoonful (14.7 C.c.).
Syrup of Wild Cherry.
Extractum Pruni Virginianæ Fluidum . Made with a menstruum of water, glycerin, and alcohol (see page 417). Dose, one fluidrachm (3.7 C.c.).
Fluid Extract of Wild Cherry.

ACIDUM HYDROCYANICUM DILUTUM. U. S. Diluted Hydrocyanic Acid.

[PRUSSIC ACID.]

A liquid composed of 2 per cent., by weight, of absolute Hydrocyanic Acid [$\text{HCN} = 26.98$], and 98 per cent. of water.

	Metric.	Old form.
Potassium Ferrocyanide, in coarse powder	20 Gm.	4 oz. av.
Sulphuric Acid	8 C.c.	1½ fl. oz.
Water	65 C.c.	12½ fl. oz.
Distilled Water, a sufficient quantity.		

Place the Potassium Ferrocyanide in a tubulated retort, and add to it 40 C.c. [old form 7½ fl. oz.] of Water. Connect the neck of the retort (which is to be directed upward), by means of a bent tube, with a well-cooled condenser, the delivery tube of which terminates in a receiver surrounded with ice-cold water, and containing 65 C.c. [old form 12½ fl. oz.] of Distilled Water. All the joints of the apparatus, except the neck of the receiver, having been made air-tight by means of well-fitting corks, pour into the retort, through the tubulure, the Sulphuric Acid, previously diluted with 25 C.c. [old form 5 fl. oz.] of Water. Gently mix the contents of the retort, and then heat it, in a sand-bath, so as to keep the liquid in brisk ebullition, until about one-half of its volume has passed over into the receiver. Detach the receiver, and assay a small portion of the contents by the method given below. Then add to the remainder so much Distilled Water as may be required to bring the product to the strength of two per cent., by weight, of absolute Hydrocyanic Acid.

If to 1 C.c. of the Acid, rendered alkaline by potassium hydrate T.S., a few drops, each, of ferrous sulphate T.S. and ferric chloride T.S. be added, and the mixture then acidulated with hydrochloric acid, a blue precipitate will be formed.

To ascertain the percentage strength, mix in a flask (of the capacity of about 100 C.c.) 0.27 Gm. of Hydrocyanic Acid (obtained by distillation as above directed) with sufficient water and magnesia to make an opaque mixture of about 10 C.c. Add to this 2 or 3 drops of potassium chromate T.S., and then, from a burette, decinormal silver nitrate V.S., until a red tint is produced which does not again disappear by shaking. Each C.c. of silver nitrate V.S. used indicates 1 per cent. of absolute Hydrocyanic Acid. After ascertaining the strength of the distillate, dilute it with Distilled Water so as to bring it to the strength of 2 per cent. of absolute acid. Lastly, test the finished product again, when 1.35 Gm. of it should require, for complete precipitation, 10 C.c. of decinormal silver nitrate V.S.

Diluted Hydrocyanic Acid may also be prepared, extemporaneously, in the following manner:

	Metric.	Old form.
Silver Cyanide	6 Gm.	50½ grains.
Hydrochloric Acid	5 C.c.	48 minims.
Distilled Water	55 C.c.	1 fl. oz.

Mix the Hydrochloric Acid with the Distilled Water, add the Silver Cyanide, and shake the whole together in a glass-stoppered bottle. When the precipitate has subsided, pour off the clear liquid.

Diluted Hydrocyanic Acid should be kept in small, dark amber-colored, cork-stoppered vials, in a cool place.

Diluted Hydrocyanic Acid is a colorless liquid, of a characteristic odor and taste resembling those of bitter almond, and having a slightly acid reaction. On being heated, it is completely volatilized. If to the Acid, rendered alkaline by potassa, a little ferrous sulphate and ferric chloride be added, and the mixture be acidulated with hydrochloric acid, a blue precipitate will make its appearance.

It is a solution of the very poisonous compound HCN in water. *Cyanogen*, CN or Cy, does not exist ready-formed in nature, but compounds of it are found in plants and animal fluids. It is generally the product of chemical reaction, and was the first compound radical discovered. It is more closely related to the halogens in the character of its combinations than any other class of bodies. It unites with hydrogen to form hydrocyanic acid, HCN, and the compounds with metals and bases are termed cyanides. These have been considered in the previous chapters.

Scheele's hydrocyanic acid is a stronger solution, containing about 5 per cent. of anhydrous acid. Its use should be discouraged as unnecessary, tending to create confusion, and dangerous. Diluted hydrocyanic acid frequently becomes decomposed upon keeping, a black insoluble precipitate which contains paracyanogen forming in the bottle. This

decomposition may be prevented by the addition of a small quantity of sulphuric or hydrochloric acid. The use of cork-stoppered vials is said to be an advantage. Alcohol has not proved a good preservative, and hence was not adopted in the U. S. P. 1890 formula.

Uses.—Diluted hydrocyanic acid is sedative in doses of one to three minims (0.06 to 0.18 C.c.). Potassium cyanide is often prescribed in combination with an acid and syrup, so that hydrocyanic acid may be generated and dissolved.

SINAPIS ALBA. U. S. White Mustard.

The seed of *Brassica alba* (Linné) Hooker filius et Thompson (nat. ord. *Cruciferae*).

White mustard seed contains *sinalbin*, $C_{30}H_{44}N_2O_{16}S_2$, a crystalline glucoside, which, under the influence of a peculiar ferment, *myrosin*, and water, is split into *acrinyl thiocyanate*, C_8H_7NOS , which is a pungent, volatile oil (this is not the official oil of mustard), *sinapine sulphate*, $C_{16}H_{23}NO_5H_2SO_4$, and glucose. The seed contains in addition 20 per cent. of fixed oil, mucilage, gum, etc., but no starch. It is used as a stimulant, condiment, and emetic; externally, it is rubefacient.

SINAPIS NIGRA. U. S. Black Mustard.

The seed of *Brassica nigra* (Linné) Koch (nat. ord. *Cruciferae*).

Black mustard contains potassium myronate ($KC_{10}H_{13}NS_2O_{10}$), *myrosin*, a ferment, 25 per cent. of fixed oil, mucilage, etc. Under the influence of the myrosin and water the potassium myronate is converted into allyl iso-thiocyanate, or volatile oil of mustard. This action takes place at ordinary temperatures, and explains the pungency of aqueous mixtures of ground mustard.

Official Preparation.

Charta Sinapis. . . Made by first depriving the ground black mustard of fixed oil by percolation with benzin, drying, mixing with solution of india-rubber, and spreading on paper. It must be kept excluded from moisture, to prevent the generation of the volatile oil before it is needed (see Part V.).

OLEUM SINAPIS VOLATILE. U. S. Volatile Oil of Mustard.

A volatile oil obtained from Black Mustard by maceration with water, and subsequent distillation.

Chemically, this oil is *allyl iso-thiocyanate*; it is also called *allyl sulphocyanide*: its production is explained in the preceding article. It is prepared artificially by distilling *allyl sulphate* with *potassium thiocyanate*.

Oleum Sinapis Volatile. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Alcohol.	Other Solvents.
A colorless or pale yellow, limpid, and strongly refractive liquid. Specific gravity, 1.018 to 1.029 at 15° C. (59° F.). Boiling point, 148° to 150° C. (298.4° to 302° F.).	Pungent and acid odor and taste; neutral reaction.	Freely soluble.	Freely soluble in ether or in carbon disulphide.

Unofficial Volatile Oils and Allied Products.—Continued.

Cress.	The seed of <i>Lepidium sativum</i> . Nat. Ord. Cruciferae. Contains a sulphurated volatile oil.
Garlic.	From the bulb of <i>Allium sativum</i> . Nat. Ord. Liliaceae. Habitat, Europe and Asia. The yield of oil is about $\frac{1}{2}$ per cent.
Hedge Garlic.	<i>Alliaria officinalis</i> . Nat. Ord. Cruciferae. Contains a sulphurated oil.
Horseradish.	From the root of <i>Cochlearia Armoracia</i> . Nat. Ord. Cruciferae. Habitat, Europe. The yield is about $\frac{1}{10}$ per cent.
Radish.	<i>Raphanus sativa</i> contains a sulphurated volatile oil.
Sagapenum.	From <i>Ferula persica</i> . The yield of volatile oil is small.
Shepherd's Purse.	The seeds of <i>Capsella bursa-pastoris</i> contain a sulphurated volatile oil.
Wallflower.	The seed of <i>Cheiranthus annuus</i> contains a sulphurated volatile oil.
Wild Mustard.	The seed of <i>Sisymbrium nasturtium</i> contains a sulphurated volatile oil.
Wild Radish.	The seed of <i>Raphanus Raphanistrum</i> contains a sulphurated volatile oil.
Allyl Tri-bromide, $C_3H_5Br_3$.	A slightly yellowish liquid, identical with <i>Tri-brom-hydrin</i> ; sedative and anodyne in its action. Dose, five or six drops.
Apiol.	A yellowish, oily liquid, obtained from <i>Apium petroselinum</i> . Dose, fifteen grains, as an emmenagogue.
Apiol Camphor (crystallized), $C_{15}H_{14}O_4$.	Dose, fifteen grains.
Thiocinamin, Allyl-sulpho-urea, Allyl-sulpho-carbamide, $CS \begin{cases} NH_2 \\ NH(C_6H_5) \end{cases}$.	Used in tuberculous diseases, by subcutaneous injection, of 4½ to 7 grains (0.3 to 0.45 Gm.), in 15-per-cent. alcoholic solution.

QUESTIONS ON CHAPTER LV.

VOLATILE OILS.

- What are volatile oils, and whence are they obtained?
 Into what four classes may they be divided?
 What is the characteristic of each of these divisions?
 Of what two principles do volatile oils proximately consist?
 How may they be separated?
 Why are some stearoptens called camphors?
 What is the color of most volatile oils when pure?
 What is the most characteristic feature of volatile oils?
 What variation exists in the specific gravity of volatile oils?
 What are good solvents of volatile oils, and of what substances are they solvents?
 What effect does exposure to light and air have on them?
 How should they be kept?
 What effect does strong nitric acid have upon them?
 What effect does strong iodine have upon them?
 How are they affected by alkalies?
 How may their adulteration with fixed oils be detected?
 How may the presence of alcohol be detected?
 How may the presence of inferior qualities of the same kind of oil be detected?
 In what ways are volatile oils obtained from plants?
 What is the method most frequently employed?
 What is the general formula for this process?
 How should dried substances be treated before being subjected to distillation?
 What purposes does water serve in distilling vegetable substances along with it?
 When vegetable substances contain volatile oils which do not readily distil at the temperature of boiling water, how are they treated?
 Where oils are injured by heat, and it is desirable to distil them at as low a temperature as possible, how may the distillation be accomplished?
 What will be the effect where too much water is used?
 What will be the effect where not enough water is used?

- What is the process known as cohobation ?
 How may oils be freed from the disagreeable odor which they are apt to have when first procured ?
 When altered by exposure to air, how may they be partially restored to their former quality ?
 What is meant by distillation "per se" ?
 In what cases and for what reason is this used ?
 Expression—Is this a good method of obtaining oils ?
 What is the principal objection to it ?
 What is meant by the process of solution or absorption ?
 How is the process of maceration conducted ?
 How is the process of digestion conducted ?
 What is the process known as enfleurage ?
 How is the "pneumatic process" conducted ?
 How are oils prepared by the "percolation process" ?
 Sweet orange peel—Give the Latin name. Whence is it obtained ?
 To what does it owe its virtues, and for what is it used ?
 What are the official preparations of it ?
 Bitter orange peel—Give the Latin official name. Whence is it obtained ?
 What principles does it contain ? What is the dose ?
 What are official preparations of it ?
 Oil of orange peel—Give the Latin official name. How is it obtained ?
 What is its composition ? Give description, specific gravity, and solubility.
 For what is it used ?
 What are official preparations of it ?
 Orange flowers—What is the Latin official name ? From what plants is it obtained ?
 For what are they used ?
 How may fresh orange flowers be preserved ?
 What official preparation is there of them ?
 Oil of orange flowers—What is its synonyme ?
 How is it obtained, and where does it come from ?
 What is its composition ? Describe it and give its specific gravity.
 What is the best quality called ?
 What is "neroli bigarade" ?
 What is "essence de petit grain" ?
 For what is this oil used ?
 What is lemon peel, and for what is it used ?
 What does it contain ?
 Oil of lemon—What is the Latin official name ? How is it obtained ?
 What is its chemical composition ? Give description, specific gravity, and solubility.
 How may it be preserved from the effects of oxidation ?
 What official preparation is there of it ?
 Oil of bergamot—How and whence is it obtained ?
 From what does it derive its name ? Give description, specific gravity, and solubility.
 What is an "ecuelle," and how is it used ?
 For what is this oil used ?
 Peppermint—What is the Latin official name ? What part of the plant is official ?
 To what are its properties due ?
 Oil of peppermint—Give Latin name, description, specific gravity, and solubility.
 To what does oil of peppermint owe its odor ?
 Menthol—Describe odor, taste, chemical reaction, and solubility. What is its melting-point ?
 What is its boiling-point ?
 For what is it used ?
 What are the official preparations of oil of peppermint ?
 Spearmint—What is the Latin official name ? To what does it owe its properties ?
 What is the yield of volatile oil ?
 Oil of spearmint—Describe odor, taste, chemical reaction, and solubility.
 Give its specific gravity.
 What does it contain ? For what is it used ?
 What are the official preparations of it ?

Oil of lavender flowers—What is the Latin name? Describe odor, taste, chemical reaction, and solubility.

What is its specific gravity?

What kind of an oil is it, and what does it contain?

What preparations of it are official?

How may the presence of alcohol be detected?

Where does the best quality come from?

Oil of rosemary—What is the Latin name? Give description and specific gravity.

How is it obtained?

Of what does it consist?

In what preparations is it used?

Hedeoma—What is its synonyme? Where does it come from?

To what does it owe its virtues?

What are its medicinal properties?

Oil of pennyroyal—What is the Latin name? Give description and specific gravity. What is its solubility? What is the dose?

Marrubium—What is its synonyme? What part of the plant is official?

What does it contain?

What are its medicinal properties?

Melissa—What is its synonyme? What part of the plant is official?

To what does it owe its properties, and what are they?

Oil of thyme—What is the name of the herb?

Give description and specific gravity. Describe the odor, taste, chemical reaction, and solubility.

By what name is this oil known commercially?

What is the difference between the red oil and the white oil?

Does this oil vary in composition?

Of what does the more volatile portion consist? What is the less volatile portion?

What is the formula in symbols of the latter? Describe the odor, taste, and chemical reaction.

In what other oil is this substance found?

For what purpose is oil of thyme used?

Salvia—What is its synonyme? What part of the plant is official?

Of what does its volatile oil consist?

For what is it used?

Scutellaria—What is the name of the plant from which it is derived?

What is its synonyme? What does it contain? For what is it used?

What official preparation is made of it?

Caraway—From what plant is it derived?

What does it contain? What are its medicinal properties?

Oil of caraway—What is its specific gravity. Describe the odor, taste, chemical reaction, and solubility. Of what does it consist?

Fennel—What is the Latin name? From what plant is it derived?

What does it contain? For what is it used?

Oil of fennel—What is its specific gravity? Describe odor, taste, chemical reaction, and solubility. Of what does it consist?

What official preparation is made of it?

Coriander—Whence is it derived?

How much volatile oil does it yield?

How much fixed oil does it yield?

Into what official preparation does it enter?

Oil of coriander—What is its specific gravity?

Describe odor, taste, chemical reaction, and solubility.

What is its chemical composition?

For what is it used?

Sumbul—From what plant is it derived?

What does it contain, and for what is it used?

What official preparation is made of it?

Anise—From what plant is it derived?

What does it contain? For what is it used?

Oil of anise—From what plants is it obtained?

Are these products identical? What is its specific gravity?

Describe odor, taste, chemical reaction, and solubility.

Of what does it consist?

What preparations of it are official?

- Illicium—What is its synonyme?
 What is the name of the plant from which this is derived?
 How much volatile oil does it contain?
 What other constituents has it?
 Cinnamon—Give the Latin official name. What is cinnamon defined to be?
 To what does cinnamon owe its virtues?
 What other constituents are present?
 Into how many official preparations does it enter?
 In what one is it the sole active ingredient?
 Oil of cinnamon—What is known as oil of cinnamon in commerce?
 Are these two oils identical?
 What is the difference in their specific gravities and other properties?
 Of what does oil of cinnamon consist?
 When slightly oxidized what is produced?
 Upon further oxidation what is produced?
 Why is cinnamon water made from Ceylon cinnamon cloudy?
 What official preparations are made from it?
 Cloves—What is the Latin name? What are cloves?
 What two crystallizable principles do they contain?
 What other constituents do they contain?
 For what is it used?
 Oil of cloves—Give description and specific gravity. What is the Latin name?
 Describe odor, taste, chemical reaction, and solubility.
 Of what does the oil of cloves consist?
 How may these oils be separated?
 What combination is formed when oil of cloves is mixed with concentrated solution of potassa?
 What is the composition and specific gravity of light oil of cloves?
 Heavy oil of cloves—Give description and specific gravity.
 What is its boiling-point?
 Of what does it consist, and what effect does it have on alkalies?
 Into what principle may eugenic acid be converted?
 What is its use?
 Allspice—What is the Latin official name? What is it?
 How much volatile oil does it contain? What else does it contain?
 Oil of pimenta—What is its specific gravity?
 Describe odor, taste, chemical reaction, and solubility.
 What action does solution of potassa have upon it?
 Of what does it consist?
 For what is it used?
 Oil of myrcia.—What is its synonyme? Whence is it obtained?
 What action does solution of potassa have upon it?
 Of what does it consist?
 What official preparation is made from it?
 Vanilla—Whence is it obtained?
 What are its constituents?
 Considered chemically, what is vanillin?
 From what is artificial vanillin made?
 Are the flavors of vanilla and artificial vanillin identical?
 What causes the difference?
 What official preparation is made from vanilla?
 Oil of cajuput—From what is it obtained?
 Describe odor, taste, and chemical reaction.
 What is its composition, and what is it termed chemically?
 What is its boiling-point? Its solubility? Its specific gravity?
 To what is its green color owing?
 Eucalyptus—From what tree is it obtained?
 What are its constituents?
 Upon which of these do the virtues depend?
 What are its properties?
 What official preparation is made from it?
 Oil of eucalyptus—Whence is it obtained? What is its specific gravity?
 Describe odor, taste, chemical reaction, and solubility.
 Of what does it consist?
 Myristica—What is it? What is the common name?

- To what does it owe its activity?
 How much fixed oil does it contain?
 In how many official preparations is it found?
 Oil of nutmeg—What is the Latin name?
 Describe odor, taste, chemical reaction, and solubility.
 Of what does it consist?
 Expressed oil of nutmeg—What is this usually called?
 How is it made? What is its chemical composition?
 What official preparation is made from it?
 Mace—What is the Latin name? What is mace?
 What does it contain?
 Is the fixed oil identical with the expressed oil of nutmeg?
 Is this the commercial oil of mace?
 Cascarilla—From what shrub or tree is it obtained?
 What are its constituents? What is the dose?
 Sassafras—What are its constituents?
 For what is it used, and into what preparations does it enter?
 Oil of sassafras—Describe it. What is its specific gravity?
 Describe odor, taste, chemical reaction, and solubility.
 What action does nitric acid have upon it?
 Where is it largely produced, and what is the yield?
 Of what does it consist?
 How much saffrol does it contain?
 Wintergreen—What is the Latin name? Whence is it obtained?
 What are its constituents?
 What are its properties and use?
 Oil of wintergreen—What is the Latin name?
 Describe it and give specific gravity.
 Of what does it consist?
 What action does concentrated solution of soda or of potassa have upon it?
 Describe odor, taste, chemical reaction, and solubility.
 To what is its reddish color due?
 How may its adulteration with chloroform or alcohol be detected?
 How may the presence of oil of sassafras be detected?
 What official preparation is made from it?
 Calamus—What is its synonyme? What are its constituents?
 What are its properties and use?
 What official preparation is made from it?
 Cardamom—Give the Latin name.
 Whence is it obtained, and where does it come from?
 What do the seeds contain? What is the specific gravity of the volatile oil?
 How is it usually made?
 When made in this way, is it pure?
 Of what two preparations is it the principal ingredient?
 Ginger—To what does it owe its virtues?
 How much volatile oil does it contain?
 What are the official preparations of it?
 Camphor—What is the Latin name? Give the symbol and atomic weight.
 What is camphor?
 What is compressed camphor? What is its specific gravity?
 Describe odor, taste, chemical reaction, and solubility.
 What are its melting- and boiling-points?
 How is refined camphor usually made?
 What is the dose?
 What are the official preparations of camphor?
 Monobromated camphor—Give Latin name, formula in symbols, and molecular weight.
 Describe a process for making this.
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 What is the dose?
 Thymol—What is the formula in symbols? How is it obtained?
 From what different plants has it been obtained?
 In what respects does the phenol of the oil of *Thymus serpyllum* (Linn.) differ from thymol?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

- How may the impurity of carbolic acid be detected?
 What are its properties and uses?
 Bitter almond—What is the Latin name? What does it contain?
 Into what is amygdalin decomposed in the presence of water? Describe rationale of process.
 For what is bitter almond used?
 Oil of bitter almond—Give Latin official name.
 Does this oil pre-exist in the almond?
 Why can it not be obtained from sweet almond?
 How is it made? Describe rationale of process. What is the dose?
 Is artificial benzyl-aldehyd identical with the product obtained from almond?
 How is it made? Does it contain hydrocyanic acid?
 What impurities is it likely to contain?
 Is this artificial product identical with the oil of myrbane?
 How is this latter substance made, and for what is it used?
 Oil of bitter almond—Describe odor, taste, chemical reaction, and solubility.
 How may the following impurities be detected?—viz.: Chloroform or alcohol; nitrobenzol.
 What official preparation is made from it?
 Wild cherry—What is the Latin name? Of what tree is this the bark?
 When should it be collected?
 What does it contain?
 Why should the preparations of wild cherry be made without heat?
 What are its properties?
 What official preparations are made from it?
 Diluted hydrocyanic acid—What is the Latin name? What is its synonyme?
 How much absolute hydrocyanic acid does it contain?
 How is it made? How may its strength of 2 per cent. be tested?
 How may it be prepared extemporaneously? Give rationale of process.
 How may it be identified?
 What is cyanogen? Does it exist ready formed in nature?
 Combined with hydrogen, what does it form?
 Combined with metals and bases, what are formed?
 What is Scheele's hydrocyanic acid?
 When hydrocyanic acid is decomposed upon keeping what substance is formed?
 How may its decomposition be prevented or lessened? What is the dose?
 What is the effect of prescribing cyanide of potassium in combination with an acid?
 White mustard—What is the Latin name? What does it contain?
 Under the influence of myrosin and water, into what substances is sinalbin decomposed?
 Is this volatile oil the official oil of mustard?
 What are the other constituents of white mustard?
 Does it contain starch? For what is it used?
 Black mustard—What is the Latin name? What does it contain?
 Under the influence of myrosin and water, into what is potassium myronate converted?
 Does this action take place at ordinary temperatures?
 What official preparation is made from black mustard?
 Volatile oil of mustard—What is the Latin name? How is it obtained?
 What is this oil chemically considered?
 How is it prepared artificially? Give description and specific gravity.
 Describe odor, taste, chemical reaction, and solubility.
 At what temperature does it boil?
 What action does sulphuric acid have upon it?
 How may the presence of carbon disulphide be detected?
 What is its use?
 What official preparation contains it?
 Garlic—What is the Latin official name? What does it contain?
 What is the active principle?
 How may it be obtained artificially?
 What are the medicinal properties of garlic?
 What official preparation is made from it?

CHAPTER LVI

OFFICIAL DRUGS AND PRODUCTS CONTAINING VOLATILE OIL WITH SOFT RESIN.

PIPER. U. S. Pepper. [BLACK PEPPER.]

The unripe fruit of *Piper nigrum* Linné (nat. ord. *Piperaceæ*).

Black pepper contains piperin, a neutral principle, 2 per cent. of volatile oil, a pungent resin, soluble in alcohol, ether, and alkaline solutions.

The volatile oil is a terpene, $C_{10}H_{16}$. Its principal use is as a condiment.

Official Preparation.

Oleoresina Piperis . . . Made by percolating pepper with ether and evaporating the ether (see page 435). The yield is about 5 per cent. Dose, one to two minims (0.06 to 0.12 C.c.).
Oleoresin of Pepper.

PIPERINUM. U. S. Piperin.

A neutral principle obtained from pepper, and obtainable also from other plants of the natural order *Piperaceæ*.

Preparation.—Piperin is obtained by treating pepper with alcohol, evaporating the tincture to the consistence of an extract, submitting the extract to the action of an alkaline solution, by which the oleaginous matter is converted into soap, washing the undissolved portion with cold water, separating the liquid by filtration, treating the matter left on the filter with alcohol, and allowing the solution thus obtained to evaporate spontaneously, or by a gentle heat. Crystals of piperin are deposited, and may be purified by alternate solution in alcohol or ether, and crystallization.

Piperin is decomposed by alkalies in alcoholic solution into *piperic acid*, $C_{12}H_{10}O_4$, and *piperidine*, $C_5H_{11}N$. It was formerly considered to be an alkaloid of feeble power.

Piperinum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Colorless, or pale yellowish, shining, four-sided prisms, permanent in the air. When heated to 130° C. (266° F.), Piperin melts. Upon ignition it emits alkaline vapors, and is consumed, leaving no residue.	Odorless; almost tasteless when first put in the mouth, but on prolonged contact producing a sharp and biting sensation; neutral reaction.	Almost insoluble.	At 16° C. (60° F.), Cold, 30 parts. Boiling, 1 part.	Very soluble in hot acetic acid; slightly soluble in ether.

TESTS FOR IDENTITY.

Concentrated sulphuric acid dissolves Piperin with a dark, blood-red color, which disappears on dilution with water. When treated with nitric acid, Piperin turns rapidly first orange, then red, and the acid acquires a yellow color, deepening to reddish as the crystals dissolve. On adding to this solution an excess of potassium hydrate T.S., the color is at first yellow, but upon boiling it deepens to blood-red.

Uses.—Piperin has been used as a stimulant and an antiperiodic. Its virtues, however, in this connection depend principally upon its impurities,—i.e., adhering resin and oil. When absolutely pure and colorless it has but little medicinal action.

MATICO. U. S. Matico.

The leaves of *Piper angustifolium* Ruiz et Pavon (nat. ord. *Piperaceæ*).

Matico leaves contain about 2 per cent. of volatile oil, a pungent resin, a crystalline principle, *artanthic acid*, and tannin. Matico is stimulant and hæmostatic.

Official Preparations.

- Extractum Matico Fluidum** . Made with a menstruum consisting of 3 parts of alcohol and 1 part of water (see page 414). Dose, one-half to one fluidrachm (1.8 to 3.7 C.c.).
 Fluid Extract of Matico.
Tinctura Matico Made by percolating 100 Gm. of powdered matico with diluted alcohol to make 1000 C.c. (see page 372). Dose, one fluidrachm (3.7 C.c.).
 Tincture of Matico.

CUBEBA. U. S. Cubeb.

The unripe fruit of *Piper Cubeba* Linné filius (nat. ord. *Piperaceæ*).

This useful fruit, or berry as it is commonly called, contains about 10 per cent. of volatile oil, 3 per cent. of resin, cubebin, *cubebic acid*, wax, fat, etc. The virtues of cubeb reside in the cubebic acid, resin, and oil, cubebin when pure being destitute of activity. Cubebic acid, cubebic resin, and cubebin are all colored red by strong sulphuric acid. Cubeb is used as a diuretic, stimulant, and expectorant.

Official Preparations.

- Extractum Cubebe Fluidum** . Made with a menstruum of alcohol (see page 403). Dose, one-half to one fluidrachm (1.8 to 3.7 C.c.).
 Fluid Extract of Cubeb.
Oleoresina Cubebe Made by percolating cubeb with ether, distilling off, and evaporating the ether (see page 434). The yield is 18 to 25 per cent. Dose, five to fifteen minims (0.3 to 0.9 C.c.).
 Oleoresin of Cubeb.
Trochisci Cubebe Each troche contains about $\frac{1}{4}$ grain of oleoresin of cubeb (see Trochisci, Part V.).
 Troches of Cubeb.
Tinctura Cubebe Made by percolating 200 Gm. of cubeb with sufficient diluted alcohol to make 1000 C.c. (see page 366). Dose, one to two fluidrachms (3.7 to 7.4 C.c.).
 Tincture of Cubeb.

OLEUM CUBEBAE. U. S. Oil of Cubeb.

A volatile oil distilled from Cubeb.

It is a colorless, or pale greenish, or yellowish liquid, having the characteristic odor of cubeb, a warm, camphoraceous, aromatic taste, and a neutral reaction. Sp. gr. about 0.920. It is soluble in an equal weight of alcohol.

The oil contains a small amount of a hydrocarbon, $C_{10}H_{16}$, boiling at 158° – 163° C. (316.4° – 325.4° F.), and two oils of the formula $C_{15}H_{24}$, boiling at 262° – 265° C. (503.6° – 509° F.), one of which unites with

HCl, while the other does not. Upon standing, it sometimes deposits rhomboidal prismatic crystals of a stearopten. The crystals have the formula $C_{30}H_{48} + 2H_2O$, are fusible at 67° – 68° C. (152.6° – 154.4° F.), and volatilize without change at 148° – 150° C. (298.4° – 302° F.). Oil of cubeb is an aromatic stimulant and carminative.

CAPSICUM. U. S. Capsicum. [CAYENNE PEPPER. AFRICAN PEPPER.]

The fruit of *Capsicum fastigiatum* Blume (Nat. Ord. *Solanaceæ*).

The principal constituents of capsicum are capsaicin, $C_{15}H_{14}O_2$, traces of a volatile alkaloid and a volatile oil, fixed oil, resin, coloring-matter, etc. *Capsaicin* is in colorless crystals, volatile, intensely acrid, and soluble in alcohol, ether, and fixed oils. Capsicum is stimulant and rubefacient.

Official Preparations.

- Emplastrum Capsici** Made by spreading resin plaster upon muslin, cooling, and applying a thin coating of oleoresin of capsicum.
Capsicum Plaster.
Extractum Capsici Fluidum . Made with alcohol (see page 399). Dose, one-half to one minim (0.03 to 0.06 C.c.).
Fluid Extract of Capsicum.
Oleoresina Capsici Made by percolating powdered capsicum with ether, distilling, and evaporating (see page 434). Yield, 5 per cent. Dose, one-fourth to one minim (0.015 to 0.06 C.c.).
Oleoresin of Capsicum.
Tinctura Capsici Made by percolating 50 Gm. of powdered capsicum with a menstruum of 19 parts of alcohol and 1 part of water until 1000 C.c. are obtained (see page 363). Dose, one-half to one fluidrachm (1.8 to 3.7 C.c.).
Tincture of Capsicum.

COPAIBA. U. S. Copaiba. [BALSAM OF COPAIBA.]

The oleoresin of *Copaiba Langsdorffii* (Desfontaines) O. Kuntze, and of other species of *Copaifera* (nat. ord. *Leguminosæ*).

Copaiba is mostly imported from Pará, in Brazil, Maracaibo, in Venezuela, and other South American ports. It contains *copaivic acid*, volatile oil, and a bitter principle. Copaivic acid, $C_{20}H_{30}O_2$, the resinous mass left after distilling the oil, forms a series of amorphous salts. (See *Massa Copaibæ*.) It may be obtained pure by exposing a mixture of nine parts of copaiba and two parts of aqueous ammonia (sp. gr. 0.95) to a temperature of 10° C. (50° F.). Copaiba is often adulterated.

Copaiba. U. S.	ODOR AND TASTE.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A transparent or translucent, more or less viscid liquid, of a color varying from pale yellow to brownish-yellow. Sp. gr. 0.940 to 0.990 at 15° C. (59° F.).	Peculiar aromatic odor; persistently bitter and acrid taste.	Insoluble.	Absolute, Readily soluble.	Soluble in ether, chloroform, carbon disulphide, benzoin, and fixed and volatile oils.
TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.		
It is not fluorescent, and when heated to 130° C. (266° F.) does not become gelatinous. It yields a transparent mixture with one-third of its volume of ammonia water.	Fixed Oils. Gurjun Balsam.	When subject to heat, it does not evolve the odor of turpentine, and, after distilling off the volatile oil, the residue, when cool, should be amorphous, transparent, and friable. On adding 1 drop of Copaiba to 19 drops of carbon disulphide and shaking the mixture with 1 drop of a cold mixture of equal parts of sulphuric and nitric acids, it should not acquire a purplish-red or violet color.		

Uses.—Copaiba is stimulant and diuretic, and has a special irritant action upon the mucous membranes of the urinary passages. Dose, from twenty minims to one fluidrachm (1.2 to 3.7 C.c.).

Official Preparations.

- Massa Copaibæ** . . . This is a magnesium copaivate, and is made by mixing 6 parts of Magnesia with 94 parts of copaiba: the solidification takes place better if the magnesia be hydrated. Dose, five to ten grains (0.3 to 0.6 Gm.). (See Part V.)
Mass of Copaiba.
Resina Copaibæ . . . The residue left after distilling copaiba (copaivic acid) (see page 461).
Resin of Copaiba. Dose, five to ten grains (0.3 to 0.6 Gm.).

OLEUM COPAIBÆ. U. S. Oil of Copaiba.

A volatile oil distilled from Copaiba.

It is a colorless or pale yellowish liquid, having the characteristic odor of copaiba, a pungent, bitterish taste, and a neutral reaction. Sp. gr. 0.890 to 0.910. It is soluble in ten times its volume of alcohol, forming a slightly turbid liquid.

This oil is a hydrocarbon, consisting of $C_{10}H_{16}$ and $C_{15}H_{24}$. It is used as a stimulant, and for the same purposes as copaiba. Dose, five to ten minims (0.3 to 0.6 C.c.).

OLEUM SANTALI. U. S. Oil of Santal. [OIL OF SANDAL-WOOD.]

A volatile oil distilled from the wood of *Santalum album* Linné (nat. ord. *Santalaceæ*).

It is a pale yellowish or yellow liquid, of a peculiar, strongly aromatic odor, a pungent and spicy taste, and a slightly acid reaction. Sp. gr. 0.970 to 0.978. It is readily soluble in alcohol, and is liable to be grossly adulterated. If to 1 C.c. of the oil at 20° C. (68° F.) there be added 10 C.c. of a mixture of 3 volumes of alcohol and 1 volume of water, a perfectly clear solution should be obtained (test for cedarwood oil, castor oil, and other fatty oils).

This is an oxygenated oil, consisting of $C_{15}H_{24}O$ and $C_{15}H_{22}O$. It is used as a stimulant to the mucous membranes, especially in the treatment of gonorrhœa. It is generally administered in capsules. Dose, five to fifteen minims (0.3 to 0.9 C.c.).

BUCHU. U. S. Buchu.

The leaves of *Barosma betulina* (Thunberg) Bartling et Wendland, and *Barosma crenulata* (Linné) Hooker (nat. ord. *Rutaceæ*).

This drug owes its valuable properties to the presence of a volatile oil and resin: it also contains a bitter principle, mucilage, etc. The stearopten *diosphenol* is colored dark green by ferric chloride. Buchu is used as a diuretic and stimulant.

Official Preparation.

- Extractum Buchu Fluidum** . Made with a menstruum of alcohol (see page 397). Dose, one fluid Extract of Buchu. fluidrachm (3.7 C.c.).

SERPENTARIA. U. S. Serpentina. [VIRGINIA SNAKEROOT.]

The rhizome and roots of *Aristolochia Serpentina* Linné, and of *Aristolochia reticulata* Nuttall (nat. ord. *Aristolochiaceæ*).

This rhizome, when fresh, contains 1 per cent. of volatile oil, a bitter principle, starch, sugar, etc. It yields its virtues to alcohol and diluted alcohol. It is one of the ingredients in compound tincture of cinchona.

Official Preparations.

- Extractum Serpentariae Fluidum** . Made with a menstruum of 4 parts of alcohol and 1 part of water (see page 424). Dose, twenty to thirty minims (1.2 to 1.8 C.c.).
Fluid Extract of Serpentaria.
Tinctura Serpentariae Made by percolating 100 Gm. of powdered serpentaria with sufficient menstruum (65 alcohol and 35 water) to make 1000 C.c. (see page 378). Dose, one fluidrachm (3.7 C.c.).
Tincture of Serpentaria.

HUMULUS. U. S. Hops.

The strobiles of *Humulus Lupulus* Linné (nat. ord. *Urticaceae*).

Hops owe their sedative virtues to a small quantity of volatile oil; their bitterness is due to the resin and lupulin present.

Official Preparation.

- Tinctura Humuli** . Made by percolating 200 Gm. of hops with sufficient diluted alcohol to make 1000 C.c. (see page 369). Dose, one fluidrachm (3.7 C.c.).
Tincture of Hops.

LUPULINUM. U. S. Lupulin. [LUPULINA, PHARM. 1870.]

The glandular powder separated from the strobiles of *Humulus Lupulus* Linné (nat. ord. *Urticaceae*).

Lupulin contains 10 per cent. of volatile oil, which, on exposure, yields valeric acid, trymethyamine, a bitter principle (lupamaric acid), $C_{32}H_{50}O_7$, resin, wax, and an alkaline liquid termed *lupuline*. Alcohol and ether are the best solvents.

Official Preparations.

- Extractum Lupulini Fluidum** . Made with a menstruum of alcohol (see page 413). Dose, ten to fifteen minims (0.6 to 0.9 C.c.).
Fluid Extract of Lupulin.
Oleo-resina Lupulini Made by percolating lupulin with ether, distilling, and evaporating the ether. The yield is about 50 per cent. (see page 435). Dose, three to ten minims (0.18 to 0.6 C.c.).
Oleo-resin of Lupulin.

CANNABIS INDICA. U. S. Indian Cannabis. [INDIAN HEMP.]

The flowering tops of the female plant of *Cannabis sativa* Linné (nat. ord. *Urticaceae*), grown in the East Indies.

Indian cannabis contains a resinous substance, *cannabinine*, volatile oil, and tetanocannabinine. Alcohol is the best solvent for the active principles. It is used as an anodyne and nervous stimulant.

Official Preparations.

- Extractum Cannabis Indiciæ** Made by percolating Indian cannabis with alcohol, distilling the alcohol from the percolate, and evaporating to a pilular consistence (see page 446). Dose, one-fourth grain to two grains (0.016 to 0.13 Gm.).
Extract of Indian Cannabis.
Extractum Cannabis Indiciæ Fluidum . Made with alcohol (see page 398). Dose, one-half to one minim (0.03 to 0.06 C.c.).
Fluid Extract of Indian Cannabis.
Tinctura Cannabis Indiciæ Made by percolating 150 Gm. of Indian cannabis with sufficient alcohol to make 1000 C.c. (see page 363). Dose, thirty minims (1.8 C.c.).
Tincture of Indian Cannabis.

VALERIANA. U. S. Valerian.

The rhizome and roots of *Valeriana officinalis* Linné (nat. ord. *Valerianææ*).

Valerian contains about 1 per cent. of volatile oil, valerianic acid, resin, starch, tannin, etc.; there are also present some acetic and formic acids. Alcohol and ether are good solvents for the active principles. It is used as a nervine.

Official Preparations.

- Extractum Valerianæ Fluidum** . Made with a menstruum of 3 parts of alcohol and 1 part of water (see page 427). Dose, one fluidrachm (3.7 C.c.).
Fluid Extract of Valerian.
Tinctura Valerianæ Made by percolating 200 Gm. of powdered valerian with a mixture of 3 parts of alcohol and 1 part of water until 1000 C.c. of tincture have been obtained (see page 379).
Tincture of Valerian. Dose, two fluidrachms (7.4 C.c.).
Tinctura Valerianæ Ammoniata . Made by percolating 200 Gm. of powdered valerian with aromatic spirit of ammonia until 1000 C.c. of tincture have been obtained (see page 379). Dose, two fluidrachms (7.4 C.c.).
Ammoniated Tincture of Valerian.

VIBURNUM OPULUS. U. S. Viburnum Opulus. [CRAMP BARK.]

The bark of *Viburnum Opulus* Linné (nat. ord. *Caprifoliaceæ*).

See next article.

Official Preparation.

- Extractum Viburni Opuli Fluidum** . . . Made with a menstruum of 3 parts of alcohol and 1 part of water (see page 428). Dose, one-half to one fluidrachm (1.9 to 3.7 C.c.).
Fluid Extract of Viburnum Opulus.

VIBURNUM PRUNIFOLIUM. U. S. Black Haw.

[VIBURNUM, PHARM. 1880.]

The bark of *Viburnum prunifolium* Linné (nat. ord. *Caprifoliaceæ*).

Viburnum contains valerianic acid, a bitter, resinous principle, *viburnin*, tannin, sugar, etc. Alcohol is the best solvent for its active principles. It is used like valerian, as a nervine and tonic; it has also diuretic properties.

Official Preparation.

- Extractum Viburni Prunifolii Fluidum** . Made with a menstruum of 3 parts of alcohol and 1 part of water (see page 428). Dose, one-half to one fluidrachm (1.9 to 3.7 C.c.).
Fluid Extract of Viburnum Prunifolium.

SAMBUCUS. U. S. Sambucus. [ELDER.]

The flowers of *Sambucus canadensis* Linné (nat. ord. *Caprifoliaceæ*).

Elder flowers contain a little volatile oil and resin, sugar, mucilage, etc. Water and diluted alcohol are capable of extracting all the virtues that they possess.

CHENOPODIUM. U. S. Chenopodium. [AMERICAN WORMSEED.]

The fruit of *Chenopodium ambrosioides* Linné, and variety *anthelminticum* Gray (nat. ord. *Chenopodiaceæ*).

Chenopodium contains a volatile oil, a small quantity of resin, and bitter extractive. Alcohol and ether are good solvents for its active principles. It is used as an anthelmintic.

OLEUM CHENOPODII. U. S. Oil of Chenopodium. [OIL OF AMERICAN WORMSEED.]

A volatile oil distilled from *Chenopodium*.

It is a thin, colorless, or yellowish liquid, of a peculiar aromatic odor, a pungent and bitterish taste, and a neutral reaction. Sp. gr. about 0.970, increasing by age. It is readily soluble in alcohol.

This oil consists of a terpene, $C_{10}H_{16}$, and an oxygenated portion, $C_{10}H_{16}O$. It is used as an anthelmintic. It is best administered as an emulsion, first mixing the oil with twice its volume of olive oil.

OLEUM JUNIPERI. U. S. Oil of Juniper.

A volatile oil distilled from the fruit of *Juniperus communis* Linné (nat. ord. *Coniferae*).

It is a colorless or faintly greenish-yellow liquid, becoming darker and thicker by age and exposure to air; having the characteristic odor of juniper, a warm, aromatic, somewhat terebinthinate and sweetish taste, and a neutral reaction. Sp. gr. 0.850 to 0.890. It is soluble in about four times its volume of alcohol, forming a turbid liquid.

Oil of juniper (berries) is a terpene, $C_{10}H_{16}$. It has diuretic and stimulant properties.

Official Preparations.

- Spiritus Juniperi** Made by mixing 50 C.c. of oil of juniper with 950 C.c. of alcohol (see page 331). Dose, one to four fluidrachms (3.7 to 14.7 C.c.).
- Spiritus Juniperi Compositus** . Made by mixing 8 C.c. of oil of juniper and 1 C.c. each of oils of fennel and caraway with 1400 C.c. of alcohol and sufficient water to make 2000 C.c. (see page 332). Dose, one to four fluidrachms (3.7 to 14.7 C.c.).

SABINA. U. S. Savine.

The tops of *Juniperus Sabina* Linné (nat. ord. *Coniferae*).

Savine contains a terpene, $C_{10}H_{16}$, and resin, with a trace of tannin. Alcohol is the best menstruum.

Official Preparation.

- Extractum Sabinae Fluidum** . Made with a menstruum of alcohol (see page 420). Dose, three to eight minims (0.18 to 0.49 C.c.).
- Fluid Extract of Savine.

OLEUM SABINÆ. U. S. Oil of Savine.

A volatile oil distilled from Savine.

It is a colorless or yellowish liquid, becoming darker and thicker by age and exposure to air, having a peculiar, terebinthinate odor, a pungent, bitterish, and camphoraceous taste, and a neutral reaction. Sp. gr. 0.910 to 0.940.

This oil is a terpene, $C_{10}H_{16}$. It is used as a stimulant and emmenagogue. Owing to its having been frequently used to produce abortion, it should not be dispensed except upon the order of a physician. Dose, two to five minims (0.12 to 0.3 C.c.).

Unofficial Substances containing Volatile Oil and Resin.

Agaricus Albus.	A fungus from <i>Polyporus officinalis</i> , which grows on the trunks of old trees.
White Agaric.	
Alisma.	From <i>Alisma Plantago</i> , indigenous to Europe. Contains an acrid resin.
Water Plantain.	
Oil of Water Plantain.	A pungent oil.
Aralia Racemosa.	The rhizome of <i>A. racemosa</i> , found in North America. It contains volatile oil, resin, etc.
American Spikenard.	From <i>C. Mariana</i> , found in the United States. It contains volatile oil and resin.
Cunila.	
Dittany.	The rhizome of <i>Alpinia officinarum</i> , grown in China. It contains $\frac{1}{2}$ per cent. of volatile oil, and a pungent, soft resin, etc.
Galanga.	
Galangal.	A pale yellow or brownish-yellow volatile oil.
Oil of Galangal, $C_{20}H_{32}O$.	The rhizome of different species of <i>Iris</i> , grown in Europe. It contains a volatile oil, soft, acrid resin, etc.
Iris Florentina.	The fruit of <i>J. communis</i> (nat. ord. <i>Coniferae</i>).
Florentine Orris.	The tops of <i>J. virginiana</i> , grown in Canada and the United States. It contains volatile oil, resin, etc.
Juniperus.	Distilled from the wood of <i>Juniperus virginiana</i> .
Juniperus Virginiana.	From <i>L. latifolium</i> , found in Europe. It contains volatile oil and a bitter principle.
Red Cedar.	From <i>Prunus Laurocerasus</i> , found in Western Asia. It contains volatile oil, resin, etc.
Oil of Red Cedar.	The leaves and fruit of <i>L. nobilis</i> , indigenous to the Levant. It contains volatile and fixed oils, also resin, etc.
Laserpitium.	A pale yellow oxygenated oil, sp. gr. 91. The yield is about 2 per cent.
White Gentian.	From <i>L. officinale</i> , found in Europe. It contains volatile oil, resins, etc.
Laurocerasus.	From different species of <i>Liatris</i> , indigenous to North America.
Cherry Laurel.	
Laurus.	The leaves of <i>M. cerifera</i> , found near Lake Erie and the Atlantic coast. It contains volatile oil, resin, etc.
Laurel.	From <i>M. communis</i> , found along the Mediterranean. It contains a volatile oil, resin, etc.
Oil of Laurel.	The root of <i>P. Methysticum</i> , indigenous to the Sandwich Islands. It contains a volatile oil and acrid resin.
Levisticum.	An intoxicating liquor, made from the root of <i>Piper Methysticum</i> .
Lovage.	From different species of <i>Psoralea</i> , found in the United States. It contains a volatile oil and resin.
Liatris.	From <i>P. trifoliata</i> , found in North America. It contains a volatile oil and pungent resin.
Liatris.	The herb of <i>R. graveolens</i> .
Myrica.	
Bayberry.	A volatile oil from <i>Ruta graveolens</i> , sp. gr. 0.880, more soluble in water than most volatile oils. It is methyl-nonyl-ketone, $CH_3.CO.C_9H_{19}$.
Myrtus.	The wood of <i>S. album</i> . It contains an oxygenated volatile oil and resin. (See Oleum Santali.)
Myrtle.	The fresh tops of <i>Thuja occidentalis</i> Linné (nat. ord. <i>Coniferae</i>).
Piper Methysticum.	
Kava-Kava.	
Ava-Kava.	
Psoralea.	
Pseoralea.	
Ptelea.	
Shrubby Trefoil.	
Ruta Graveolens.	
Rue.	
Oleum Rutæ.	
Oil of Rue.	
Santalum Album.	
Sandal-wood.	
Thuja.	
Arbor Vitæ.	
Winters.	
Winter's Bark.	
Oil of Winter's Bark.	

Official Drugs and Products containing Volatile Oil associated with Bitter Principle or Extractive.

ABSINTHIUM. U. S. Absinthium. [WORMWOOD.]

The leaves and tops of *Artemisia Absinthium* Linné (nat. ord. *Compositæ*).

This drug contains 1 per cent. of an oxygenated volatile oil, which is chiefly absinthol, $C_{10}H_{16}O$; the bitter principle is *absinthin*, $C_{40}H_{58}O_7$. It also contains tannin, resin, and succinic acid. It is one of the ingredients in aromatic wine.

TANACETUM. U.S. Tansy.

The leaves and tops of *Tanacetum vulgare* Linné (nat. ord. *Compositæ*)

Tansy contains a small quantity of volatile oil, which is freely soluble in alcohol; the bitter principle is *tanacetin*. It also contains tannin, fat, resin, etc.

ARNICÆ FLORES. U.S. Arnica Flowers.

The flower-heads of *Arnica montana* Linné (nat. ord. *Compositæ*.)

Arnica flowers contain a trace of volatile oil, and a bitter principle, *arnicin*, with resin, coloring-matter, etc. Alcohol and water extract their virtues.

Official Preparation.

Tinctura Arnicæ Florum . . . Made by percolating 200 Gm. of powdered arnica flowers with Tincture of Arnica Flowers. sufficient diluted alcohol to make 1000 C.c. (see page 360).

ARNICÆ RADIX. U.S. Arnica Root.

The rhizome and roots of *Arnica montana* Linné (nat. ord. *Compositæ*).

This rhizome contains about 1 per cent. of volatile oil, the bitter principle *arnicin*, acrid resin, tannin, etc.

Official Preparations.

Extractum Arnicæ Radicis Made by percolating powdered arnica root with diluted alcohol, and evaporating the percolate to a pilular consistence (see page 445). Dose, three to five grains (0.19 to 0.3 Gm.).

Emplastrum Arnicæ Made by mixing 330 Gm. of extract of arnica root with 670 Gm. of melted resin plaster. (See Emplastra.)

Extractum Arnicæ Radicis Fluidum . Made with a menstruum of 3 parts of alcohol to 1 part of water (see page 395). Dose, five to ten minims (0.3 to 0.6 C.c.).

Tinctura Arnicæ Radicis Made by percolating 100 Gm. of arnica root with sufficient menstruum (650 alcohol, 350 water) to make 1000 C.c. (see page 360). Dose, twenty minims to half a fluidrachm (1.2 to 1.8 C.c.).

CALENDULA. U.S. Calendula. [MARIGOLD.]

The florets of *Calendula officinalis* Linné (nat. ord. *Compositæ*).

Calendula contains a small quantity of a volatile oil, a bitter principle, gum, sugar, etc. *Calendulin* is not the active principle, having very little taste.

Official Preparation.

Tinctura Calendulæ . . . Made by percolating 200 Gm. of powdered calendula with sufficient Tincture of Calendula. alcohol to make 1000 C.c. (see page 362). Used externally.

OLEUM ERIGERONTIS. U.S. Oil of Erigeron. [OIL OF FLEABANE.]

A volatile oil distilled from the fresh, flowering herb of *Erigeron canadense* Linné (nat. ord. *Compositæ*).

It is a pale yellow liquid, becoming darker and thicker by age and exposure to air, having a peculiar, aromatic, persistent odor, an aromatic, slightly pungent taste, and a neutral reaction. Sp. gr. about 0.850. It is readily soluble in alcohol.

This oil consists of a terpene, $C_{10}H_{16}$, and an oxygenated portion. It is used in uterine hemorrhage as a hæmostatic. It is best administered in capsules.

INULA. U.S. Inula. [ELECAMPANE.]

The root of *Inula Helenium* Linné (nat. ord. *Compositæ*).

This root contains acrid resin and a volatile oil, which are the active principles. Helenin, C_6H_8O , is inert. *Inulin*, a kind of starch, is abundant (see page 796). Alcohol and water extract its virtues.

ANTHEMIS. U.S. Anthemis. [CHAMOMILE.]

The flower-heads of *Anthemis nobilis* Linné (nat. ord. *Compositæ*), collected from cultivated plants.

Anthemis owes its virtues to a volatile oil, and a bitter principle which has been called *anthemic acid*. The volatile oil is frequently blue in color. It is used as a tonic, often in infusion.

MATRICARIA. U.S. Matricaria. [GERMAN CHAMOMILE.]

The flower-heads of *Matricaria Chamomilla* Linné (nat. ord. *Compositæ*).

Matricaria contains a dark blue volatile oil, which is soluble in alcohol; the bitter principle is termed *anthemic acid*. It is used as a tonic and stimulant.

EUPATORIUM. U.S. Eupatorium. [THOROUGHWORT.]

The leaves and flowering tops of *Eupatorium perfoliatum* Linné (nat. ord. *Compositæ*).

This plant, known also as *boneset*, contains a volatile oil and resin, *eupatorin*, gum, tannin, sugar, etc. Alcohol, diluted alcohol, and water extract its virtues. It is tonic and laxative.

Official Preparation.

Extractum Eupatorii Fluidum. Made with a menstruum of diluted alcohol (see page 406).
Fluid Extract of Eupatorium. Dose, one to two fluidrachms (3.7 to 7.4 C.c.).

GRINDELIA. U.S. Grindelia.

The leaves and flowering tops of *Grindelia robusta* Nuttall, and of *Grindelia squarrosa* Dunal (nat. ord. *Compositæ*).

Grindelia contains a volatile oil and a bitter and resinous principle. Alcohol is the best menstruum.

Official Preparation.

Extractum Grindeliæ Fluidum. Made with alcohol (see page 409). Dose, one-half to one
Fluid Extract of Grindelia. fluidrachm (1.8 to 3.7 C.c.).

ERIODICTYON. U.S. Eriodictyon.

The leaves of *Eriodictyon glutinosum* Benthham (nat. ord. *Hydrophyllaceæ*).

Eriodictyon is known as *Yerba Santa*, or *mountain balm*; it contains a bitter resin, volatile oil, and extractive. It is given in doses of twenty to sixty grains (1.3 to 3.8 Gm.) as a stimulating tonic. Its preparations are often used to disguise the taste of quinine.

Extractum Eriodictyi Fluidum. Made with a menstruum of 4 parts of alcohol to 1 part of
Fluid Extract of Eriodictyon. water (see page 405). Dose, one-half to one fluidrachm
(1.8 to 3.7 C.c.).

MEZEREUM. U. S. Mezerium.

The bark of *Daphne Mezereum* Linné, and of other species of *Daphne* (nat. ord. *Thymelæaceæ*).

Mezerium contains *daphnin*, $C_{31}H_{34}O_{19}$, a glucoside, associated with an acrid soft resin and oil. Alcohol is the best menstruum for extracting the activity. It is rarely given internally alone, being usually combined with sarsaparilla and other drugs. The dose is five grains (0.3 Gm.).

Official Preparation.

Extractum Mezerei Fluidum. Made with alcohol (see page 414). Dose, one minim (0.06 C.c.).
Fluid Extract of Mezerium. Used externally.

ASPIDIUM. U. S. Aspidium. [MALE FERN.]

The rhizome of *Dryopteris Filix-mas* Schott, and of *Dryopteris marginalis* Asa Gray (nat. ord. *Filices*).

Aspidium contains *filixic acid*, $C_{14}H_{18}O_6$, filix red, filitannic acid, fixed oil, etc. It is used as a tæniifuge in the form of oleoresin. The green portions of the rhizome alone are active.

Official Preparation.

Oleoresina Aspidii. . . . Made by exhausting aspidium with ether, distilling, and evaporating (see page 434). Yield, 10 to 15 per cent. Dose, one-half to one fluidrachm (1.8 to 3.7 C.c.).
Oleoresin of Aspidium.

CYPRIPEDIUM. U. S. Cypripedium. [LADIES' SLIPPER.]

The rhizome and roots of *Cypripedium pubescens* Swartz, and of *Cypripedium parviflorum* Salisbury (nat. ord. *Orchideæ*).

This rhizome contains resins, an acid principle, volatile oil, tannin, starch, etc. Alcohol extracts its virtues. It is stimulant and diaphoretic, in doses of fifteen grains (0.9 Gm.)

Official Preparation.

Extractum Cypripedii Fluidum. Made with diluted alcohol (see page 403). Dose, fifteen minims (0.9 C.c.).
Fluid Extract of Cypripedium.

PHYTOLACCÆ RADIX. U. S. Phytolacca Root. [POKE ROOT.]

The root of *Phytolacca decandra* Linné (nat. ord. *Phytolaccææ*).

This root contains an acrid resin, tannin, mucilage, etc. It is used as an alterative, in doses of twenty grains (1.3 Gm.).

Official Preparation.

Extractum Phytolacæ Radicis Fluidum. Made with a menstruum of 2 parts of alcohol and 1 part of water (see page 416). Dose, five to thirty minims (0.3 to 1.8 C.c.).
Fluid Extract of Phytolacca Root.

PHYTOLACCÆ FRUCTUS. U. S. Phytolacca Fruit. [POKE BERRY.]

The fruit of *Phytolacca decandra* Linné (nat. ord. *Phytolaccææ*).

This fruit contains reddish-purple coloring-matter, sugar, gum, etc. It is very little used in medicine, although said to be alterative and laxative.

ZEA. U.S. Zea. [CORN-SILK.]

The styles and stigmas of *Zea Mays* Linné (nat. ord. *Gramineæ*).

Corn-silk when dried contains *maizenic acid*, fixed oil, resin, chlorophyll, sugar, gum, extractive, etc. It is a mild diuretic, in doses of one to two drachms (3.8 to 7.4 Gm.).

STILLINGIA. U.S. Stillingia. [QUEEN'S ROOT.]

The root of *Stillingia sylvatica* Linné (nat. ord. *Euphorbiaceæ*).

Stillingia contains an acrid resin, starch, fixed oil, gum, etc. It is used as an alterative, in doses of twenty grains (1.3 Gm.).

Official Preparation.

Extractum Stillingiæ Fluidum. Made with diluted alcohol (see page 425). Dose, fifteen Fluid Extract of *Stillingia*. to forty minims (0.9 to 2.5 C.c.).

PYRETHRUM. U.S. Pyrethrum. [PELLITORY.]

The root of *Anacyclus Pyrethrum* (Linné) De Candolle (nat. ord. *Compositæ*)

This root contains an acrid brown resin and fixed oils, inulin, mucilage, etc. It is used as a sialagogue and stimulant, in doses of fifteen to forty grains (0.9 to 2.6 Gm.).

Official Preparation.

Tinctura Pyrethri. . . . Made by percolating 200 Gm. of pyrethrum with sufficient alcohol to make 1000 C.c. (see page 375). It is used externally, and in tooth-washes.
Tincture of Pyrethrum.

XANTHOXYLUM. U.S. Xanthoxylum. [PRICKLY ASH.]

The bark of *Xanthoxylum americanum* Miller, and of *Xanthoxylum Clava-Herculis* Linné (nat. ord. *Rutaceæ*).

Xanthoxylum owes its virtues to a soft resin, a crystalline resin, a bitter principle, and an acrid green oil. There are also present sugar, tannin, gum, etc. It is a sialagogue, stimulant, and alterative. Dose, fifteen grains (0.9 Gm.).

Official Preparation.

Extractum Xanthoxyli Fluidum. Made with alcohol (see page 429). Dose, one-half to one fluidrachm (1.8 to 3.7 C.c.).
Fluid Extract of *Xanthoxylum*.

IRIS. U.S. Iris. [BLUE FLAG.]

The rhizome and roots of *Iris versicolor* Linné (nat. ord. *Irideæ*).

The acidity of iris is due to the presence of a bitter resin. There are also present sugar, gum, tannin, and fatty matter. Iris is an alterative and emetic. Dose, fifteen grains (0.9 Gm.).

Official Preparations.

Extractum Iridis Fluidum. Made with a menstruum of alcohol (see page 411). Dose, five to ten minims (0.3 to 0.6 C.c.).
Fluid Extract of Iris.
Extractum Iridis Made with a menstruum of alcohol (see page 451). Dose, one to two grains (0.06 to 0.13 Gm.).
Extract of Iris.

CIMICIFUGA. U. S. Cimicifuga. [BLACK SNAKERROOT.]

The rhizome and roots of *Cimicifuga racemosa* (Linné) Nuttall (nat. ord. *Ranunculaceæ*).

Cimicifuga contains resin, an acrid principle (possibly an alkaloid), starch, tannin, gum, etc. It is used as a sedative and alterative, in doses of thirty grains (1.8 Gm.).

Official Preparations.

- Extractum Cimicifugæ** Made with a menstruum of alcohol (see page 446). Dose, three to ten grains (0.19 to 0.6 Gm.).
Extract of Cimicifuga.
Extractum Cimicifugæ Fluidum Made with a menstruum of alcohol (see page 400). Dose, thirty to sixty minims (1.8 to 3.7 C.c.).
Fluid Extract of Cimicifuga.
Tinctura Cimicifugæ Made by percolating 200 Gm. of cimicifuga with sufficient alcohol to make 1000 C.c. (see page 364). Dose, one to four fluidrachms (3.7 to 14.7 C.c.).
Tincture of Cimicifuga.

PULSATILLA. U. S. Pulsatilla.

The herb of *Anemone Pulsatilla* and *Anemone pratensis* Linné (nat. ord. *Ranunculaceæ*), collected soon after flowering.

It should be carefully preserved, and not be kept longer than one year. *Pulsatilla* contains an acrid, odorous, resinous substance, coloring-matter, gum, etc. The acrid principle may be converted into *anemonin*, $C_{15}H_{12}O_6$, which, through the action of alkalies, becomes anemonic acid. Alcohol is the best menstruum to extract its virtues. It is irritant and diaphoretic, in doses of thirty to fifty grains (1.9 to 3.2 Gm.).

APOCYNUM. U. S. Apocynum. [CANADIAN HEMP.]

The root of *Apocynum cannabinum* Linné (nat. ord. *Apocynaceæ*).

Apocynum contains resin, *apocynin*, *apocymein*, bitter extractive, tannin, etc. Alcohol is a good menstruum for it. It is emetic and antiperiodic. Dose, five to twenty grains (0.3 to 1.3 Gm.).

Official Preparation.

- Extractum Apocyni Fluidum** Made with a menstruum of 65 parts of alcohol, 25 parts of water, and 10 parts of glycerin (see page 394). Dose, five to twenty minims (0.3 to 1.2 C.c.).
Fluid Extract of Apocynum.

ASCLEPIAS. U. S. Asclepias. [PLEURISY ROOT.]

The root of *Asclepias tuberosa* Linné (nat. ord. *Asclepiadaceæ*).

This root contains resins, volatile principle, tannin, mucilage, etc. Diluted alcohol extracts its virtues. It is used as an expectorant and anodyne, in doses of thirty grains (1.9 Gm.).

Official Preparation.

- Extractum Asclepiadis Fluidum** Made with diluted alcohol (see page 395). Dose, twenty minims to one fluidrachm (1.2 to 3.7 C.c.).
Fluid Extract of Asclepias.

LACTUCARIUM. U. S. Lactucarium.

The concrete milk-juice of *Lactuca virosa* Linné (nat. ord. *Compositæ*).

Lactucarium is a complex substance. It contains a bitter resinous principle, *lactucin*, $C_{11}H_{12}O_5 \cdot H_2O$, *lactucic acid* (bitter and crystalline), *lactucopierin* (bitter and amorphous), *lactucerin* in large quantity, nearly 60 per cent. (this principle is inert and crystallizable), caoutchouc, resin, asparagin, volatile oil, mucilage, etc. It is used as a sedative, in doses of three grains (0.19 Gm.).

Official Preparations.

- Tinctura Lactucarii** . . . Made by treating 500 Gm. lactucarium with benzoin to extract the Tincture of Lactucarium. inert resinous lactucerin, then mixing with sand, and percolating with a mixture of alcohol, water, and glycerin until 1000 C.c. are obtained (see page 371).
- Syrupus Lactucarii** . . . Made by mixing 100 C.c. of tincture of lactucarium with precipitated calcium phosphate, sugar, and water, dissolving the remainder of the sugar in the filtrate, filtering, and adding enough water to make 1000 C.c. (see page 307). Dose, a fluidrachm (3.7 C.c.).

Unofficial Volatile Oils and Products containing Volatile Oil, Bitter Principle, and Extractive.

- Achillea.**
Yarrow.
Oleum Achilleæ.
Oil of Yarrow.
Angustura.
Angustura Bark.
Oil of Angustura, $C_{12}H_{24}O$.

Linden Flowers.
Trillium.
Beth Root.
Turnera.
Damiana.
Verbascum.
Mullein.
- A perennial herb of the order Compositæ, *Achillea Millefolium*, growing in America and Europe. It contains achilleine.
A blue or dark-green volatile oil. The yield is about $\frac{1}{10}$ per cent.
The bark of *Galipea Oseparia*, from the mountains near the Orinoco River.
The yield of oil is about $\frac{1}{4}$ per cent.
A root which grows in New England and Canada.
From *Artemisia vulgaris*. It contains volatile oil, bitter principle, etc.
From *Egle Marmelos*, grown in the Himalaya Mountains. It contains tannin, bitter principle, and volatile oil.
From *Boldus fragrans*, grown in Chili. It contains volatile oil, glucoside, etc.
Used in infusion. Made in the proportion of two drachms to a pint of boiling water.
The leaves of *Eugenia Chekan*, grown in Chili. It contains volatile oil, bitter principle, chekenon, chekenin, chekenetin, and cheken-bitter. Dose of the fluid extract, one to three fluidrachms (3.7 to 11 C.c.).
The herb from different species of *Clematis*.
A bark belonging to the Lauraceæ. It contains cotoin ($C_{22}H_{38}O_6$) and paracotoin.
A pale yellow oil of a peppery taste.
The leaves and tops of *Erigeron canadense*. Diuretic, tonic, astringent. Dose, in substance, a drachm (3.88 Gm.).
Euphrasia officinalis, indigenous to Europe.
The young branches of *Genista tinctoria*, indigenous to Asia and Europe. It contains a yellowish-green volatile oil.
The rhizome of *Geum rivale*, grown in America and Europe. It contains volatile oil and bitter principle.
From different species of *Gnaphalium*, grown in North America. It contains volatile oil and bitter principle.
The herb of *Helianthemum canadense*, indigenous to Canada. It contains a bitter principle.
From *Hypericum perforatum*, grown in Europe. It contains hypericum red, volatile oil, etc.
The flowering herb of *Pyrethrum Parthenium*, growing in waste places in Europe. It contains volatile oil and bitter principle.
From *Primula officinalis*, indigenous to Europe and Asia. It contains a volatile oil and primulin.
From *Ranunculus bulbosus*, found in North America. It contains a golden-yellow volatile oil and a bitter principle.
From *Senecio aureus*, grown in Europe. It contains bitter principle, etc.
From *Teucrium Marum*, indigenous to Europe. It contains volatile oil and bitter principle.
From *Tilia americana*. It contains volatile oil, bitter principle, etc.
The rhizome of *Trillium erectum*. It contains resinous, fatty, and acrid principles, etc.
The leaves of *Turnera microphylla*. It contains volatile oil, resin, etc.
The flowers of *Verbascum phlomoides*, found in Europe. It contains volatile oil, etc.

QUESTIONS ON CHAPTER LVI.

DRUGS AND PRODUCTS CONTAINING VOLATILE OIL WITH SOFT RESIN.

- Pepper—Give the Latin name. What is its synonyme? What does it contain? How much volatile oil, and what is its composition? What is its principal use? What official preparation is made from it?
- Piperin—Give the Latin name and formula in symbols. What is piperin? How is it prepared? What effect is produced upon it by alkalies in alcoholic solution? Describe odor, taste, chemical reaction, and solubility. Give tests for identity. What are its properties, and upon what do its virtues depend?
- Matico—Whence is it obtained? What do the leaves contain? What are its properties? What official preparations are made from it?
- Cubeb—What is the Latin official name? Whence is it obtained? What does it contain? Upon what do its virtues depend? Is cubebin active? What effect does strong sulphuric acid have upon cubebic acid, cubebic resin, and cubebin? What are its medicinal properties? What official preparations are made from it?
- Oil of cubeb—What is the Latin name? What is the specific gravity? Describe odor, taste, chemical reaction, and solubility. What are the constituents of this oil? What is sometimes deposited upon standing? What are the medicinal properties of the oil?
- Capsicum—What is its synonyme? What is capsicum? What are its principal constituents? What are the properties of capsaicin? What are the medicinal properties of capsicum? What official preparations are made from it?
- Copaiba—What is its synonyme? What is copaiba? Where does it come from? What are its constituents? What is the composition of copaivic acid? How may it be obtained pure? Give description and specific gravity. Describe odor, taste, chemical reaction, and solubility. Give tests for identity. How may the following impurities be detected?—viz.: Fixed oils; admixture of foreign volatile oil; gurjun balsam.
- What is the dose? What official preparations are made from it?
- Oil of copaiba—How is it obtained? What is its specific gravity? Describe odor, taste, chemical reaction, and solubility. Of what does it consist? What is the dose?
- Oil of santal—What is its synonyme? How is it obtained? What is its specific gravity? Describe odor, taste, chemical reaction, and solubility. What is its chemical composition? What is the dose?
- Broom—What is the Latin name? What is it defined to be? What are its constituents? How may its virtues be extracted? What is the dose?
- Buchu—Whence derived? What are its constituents, and to what does it owe its valuable properties? What stearopten does it contain, and how is this acted upon by ferric chloride? What are its medicinal properties? Name the official preparations.
- Serpentaria—What is its synonyme? What is this defined to be? What are its constituents? How may its virtues be extracted? Into what official preparations does it enter?
- Hops—What is the Latin name? What are hops? To what do they owe their virtues? Name the official preparations.
- Lupulin—What is the Latin name? What is lupulin? What are the constituents of lupulin?

- What change takes place in the volatile oil on exposure?
 What is the bitter principle and its chemical composition?
 What are the best solvents for lupulin? Name the official preparations.
 Indian cannabis—What is the Latin name? What is its synonyme?
 What is its definition? What are its constituents? What is its best solvent?
 What are its properties? What are its official preparations?
 Valerian—What are its constituents?
 What are good solvents for its active principles?
 For what is it used? What are its official preparations?
 Oil of valerian—Give description, specific gravity, and solubility.
 Of what does it consist?
 What change is produced by the action of chromic acid?
 Does the same change occur in *old* valerian root? Why?
 What crystallizable compound is found in the oil?
 Viburnum prunifolium—What is its synonyme? What part of the plant is used?
 What are its constituents?
 What is the best solvent for its active principles?
 What are its properties and uses? Name the official preparation.
 Viburnum opulus—What is the synonyme?
 What is its official preparation?
 Elder—Give Latin official name. What do the flowers contain?
 What are good solvents?
 Chenopodium—What is its synonyme? Whence derived?
 What does it contain? What are good solvents?
 What is its use?
 Oil of chenopodium—What is its synonyme?
 Describe odor, taste, chemical reaction, and solubility.
 What is its specific gravity?
 Of what does it consist? For what and how is it used?
 Juniper—Whence is it derived?
 To what does it owe its properties?
 What other constituents are present?
 What is a good solvent? For what is it used?
 Oil of juniper—What is its synonyme?
 Describe odor, taste, chemical reaction, and solubility.
 What is its chemical composition?
 What are its medicinal properties?
 What are its official preparations?
 Savine—What is the Latin name? What is its definition?
 What does it contain? What is its best solvent?
 What are its official preparations?
 Oil of savine—What is the Latin name?
 What is its composition? What is the dose? Should it be dispensed cautiously?
 Thuja—What is its synonyme? What is its definition?
 What are its constituents? What is its best solvent?
 What are its medicinal properties?
 Absinthium—What is its synonyme? What is its definition?
 What are its constituents?
 What is the chemical composition of absinthol?
 What is the bitter principle, and what is its composition?
 Of what official preparation is it an ingredient?
 Tansy—What is the Latin name? What is its definition?
 What are its constituents? What is the bitter principle?
 Arnica flowers—What do these flowers contain?
 What is the bitter principle? What are good solvents?
 What are its official preparations?
 Arnica root—What is its definition?
 What does it contain? What are its official preparations?
 Calendula—What is its synonyme? What is its definition?
 What does it contain? Is calendulin the active principle?
 What are the official preparations?
 Oil of erigeron—What is the Latin name? What is the synonyme?
 Whence is it obtained? What is the specific gravity?
 Describe odor, taste, chemical reaction, and solubility.

Of what does it consist? What is its use, and how is it best administered?

Inula—What is its synonyme? Whence is it obtained?

What are its constituents?

Which of these are the active principles? What are good solvents?

Anthemis—What is its synonyme? What is its definition?

To what does it owe its virtues?

What is the name of the bitter principle?

For what and how is it generally used?

What is the color of the volatile oil?

Matricaria—What is its synonyme? Whence is it derived?

What are its constituents? What is the name of the bitter principle?

What are its medicinal properties?

Eupatorium—What is its synonyme? What is its definition?

What are its constituents? What are good solvents?

What are its medicinal properties? What are the official preparations?

Grindelia—What is its definition?

What does it contain? What is its best solvent?

What are its official preparations?

Mezereum—What is its definition?

What does it contain? What is its best solvent?

How is it generally used medicinally? What is the dose?

What are its official preparations?

Aspidium—What is its synonyme? What is its definition?

What are its constituents? For what is it used?

What part of the rhizome is active? What are its official preparations?

Cypripedium—What is its synonyme? What is its definition?

What are its constituents? What is a good solvent?

What is the dose? What are the official preparations?

Phytolacca root—What is the Latin name? What is its synonyme?

Whence is it derived?

What are its constituents? What is the dose?

Phytolacca berry—What does it contain? What are its properties?

Stillingia—What is its synonyme? Whence is it derived? What does it contain?

What is the dose? What are its official preparations?

Magnolia—Whence is it derived? What does it contain?

What is the dose?

Pyrethrum—What is its synonyme? Whence is it derived?

What does it contain? What is the dose? What are the official preparations?

Xanthoxylum—What is its synonyme? Whence is it derived?

What are its constituents, and to what does it owe its virtues?

What is the dose? What are the official preparations?

Iris—What is its synonyme? What is its definition?

What are its constituents?

To what is its acidity due? What is the dose?

What are the official preparations?

Cimicifuga—What is its synonyme? What is its definition?

What does it contain? What is the dose? What are the official preparations?

Pulsatilla—What is its definition?

What does it contain? Into what may the acrid principle be converted, and what does this become through the action of alkalis?

What is its best solvent? What is the dose?

Apocynum—What is the synonyme? Whence is it derived?

What does it contain? What is a good solvent? What is the dose?

Asclepias—What is the synonyme? Whence is it derived?

What does it contain? What is a good solvent? What is the dose?

Lactucarium—What is it? What does it contain?

What is the chemical composition of the bitter resinous principle?

What are the properties of lactucic acid?

What are the properties of lactucopicroin?

What are the properties of lactucerin?

Which of these principles is in the largest proportion?

What is the dose? What are its official preparations?

CHAPTER LVII

RESINS, OLEORESINS, GUM-RESINS, AND BALSAMS.

RESINS are natural or induced solid or semi-solid exudations from plants, characterized by being insoluble in water, mostly soluble in alcohol, uncrystallizable, and softening or melting at a moderate heat. They are usually the *oxidized terpenes* of plants, and, owing to their insolubility in water, have little taste; they are, chemically, mixed products; some of them are acids, and combine with alkalies, forming soaps, as in the case of common rosin.

Resins, when pure, are usually transparent; when they contain water, they are opaque, and no longer hard and brittle.

Natural Oleoresins are mixtures of oils and resin, generally obtained by incising the trunks of the trees from which they are obtained: as turpentine, copaiba, etc.

Gum-resins are natural mixtures of gum and resin, usually obtained as exudations from plants: as myrrh, asafetida, etc.

Balsams are resinous substances which contain benzoic, cinnamic, or an analogous acid: as balsam of tolu, etc.

The official resins, oleoresins, gum-resins, and balsams will now be considered, followed by a condensed table of unofficial allied products.

TEREBINTHINA. U. S. Turpentine.

A concrete oleoresin obtained from *Pinus palustris* Miller, and from other species of *Pinus* (nat. ord. *Coniferae*).

White turpentine contains abietic anhydride, which may be converted into abietic acid, $C_{44}H_{64}O_8$, a bitter principle, and 25 per cent. of volatile oil. It is used as an ingredient in plasters (see *Emplastrum Galbani*), and is sometimes administered in pill form. Dose, fifteen to thirty grains (0.9 to 1.9 Gm.).

OLEUM TEREBINTHINÆ. U. S. Oil of Turpentine.

A volatile oil distilled from Turpentine.

This important oil has the composition $C_{10}H_{16}$, and, as has been already stated, is the type of the terpenes.

It is a thin, colorless liquid, of a characteristic odor and taste, becoming stronger and less pleasant by age and exposure to air, and of a neutral or faintly acid reaction. Sp. gr. 0.855 to 0.870. It is soluble in three times its volume of alcohol. Bromine and powdered iodine act violently upon it. Brought in contact with a mixture of nitric and sulphuric acids, it takes fire. It is used as a solvent for resins, etc.

Official Preparation.

Linimentum Terebinthinæ. Made by mixing 650 Gm. of resin cerate with 350 Gm. of oil of turpentine (see page 341).

OLEUM TEREBINTHINÆ RECTIFICATUM. U. S. Rectified Oil of Turpentine.

Oil of Turpentine, a convenient quantity.

Lime Water, a sufficient quantity.

Shake the Oil thoroughly with six times its volume of Lime Water, and introduce the mixture into a copper still connected with a well-cooled condenser. Then distil, until about three-fourths of the Oil have passed over, and separate the clear Oil from the water. Keep the product in well-stoppered bottles, in a cool place, protected from light. Rectified Oil of Turpentine should always be dispensed when Oil of Turpentine is required for internal use. The object of this preparation is merely to provide a purer form of oil for internal use.

TEREBENUM. U. S. Terebene.

$$C_{10}H_{16} = 185.7.$$

A liquid consisting chiefly of Pinene, and containing not more than very small proportions of Terpinene and Dipentene. Terebene should be kept in well-stoppered bottles, in a cool place, protected from light.

Terebene is made by acting on oil of turpentine with sulphuric acid.

Terebenum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A colorless or slightly yellowish, thin liquid. Specific gravity about 0.862 at 15° C. (59° F.). Boils at 156° to 160° C. (312.8° to 320° F.). On exposure to light and air, Terebene gradually becomes resinified, and acquires an acid reaction.	Rather agreeable thymelike odor; aromatic, somewhat terebinthinate taste.	Slightly soluble.	Soluble in an equal volume.	Soluble in an equal volume of glacial acetic acid or carbon disulphide.

IMPURITIES.

TESTS FOR IMPURITIES.

Acids.	{	In its chemical properties it resembles oil of turpentine. Terebene should possess its characteristic agreeable odor, and should not redden moistened blue litmus paper,
Unaltered Oil of Turpentine.		And should not have more than a very slight action on polarized light.
More than traces of Resinous Matter.		When evaporated, it should not leave more than a very slight residue.

Uses.—Terebene is a valuable stimulating expectorant, given in capsules or emulsion in doses of twenty to sixty minims (1.2 to 3.7 C.c.) during the day.

TERPINI HYDRAS. U. S. Terpin Hydrate.

The hydrate of the diatomic alcohol Terpin. Terpin hydrate should be kept in well-stoppered bottles.

Terpin hydrate is made by acting on a mixture of oil of turpentine

and alcohol with nitric acid ; after standing three or four days the crystals which form are purified by recrystallization.

<i>Terpin Hydras. U. S.</i>	ODOR AND TASTE.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Colorless, lustrous, rhombic prisms, permanent in the air. Terpin Hydrate melts at 116° to 117° C. (240.8° to 242.6° F.), with the loss of water, and, at the temperature of boiling water, sublimes in fine needles. When heated in a flask adapted for distillation, it first loses water. At 258° C. (496.4° F.) anhydrous terpin distils over without decomposition, soon solidifying to a crystalline, hygroscopic mass, which melts at 102° to 105° C. (215.6° to 221° F.). When strongly heated on platinum foil, it burns with a bright, smoky flame, leaving no residue.	Nearly odorless; slightly aromatic, somewhat bitter taste.	At 15° C. (59° F.), 250 parts. Boiling, 32 parts.	At 15° C. (59° F.), 10 parts. Boiling, 2 parts.	Soluble in 100 parts of ether, 200 parts of chloroform, and 1 part of boiling glacial acetic acid.
TESTS FOR IDENTITY.		IMPURITY. TESTS FOR IMPURITY.		
Terpin Hydrate is dissolved by sulphuric acid with an orange-yellow color. If to its hot, aqueous solution a few drops of sulphuric acid be added, the liquid will become turbid and develop a strongly aromatic odor.		Adhering Acid.	{ Terpin Hydrate should not have the odor of turpentine, and its hot, aqueous solution should not reddens blue litmus paper.	

Uses.—Terpin hydrate is used in bronchitis, in doses of two or three grains (0.13 to 0.19 Gm.).

RESINA. U. S. Resin. [COLOPHONY.]

The residue left after distilling off the volatile oil from Turpentine.

Resin consists of abietic anhydride, which passes into abietic acid when treated with diluted alcohol. It is a transparent, amber-colored substance, hard, brittle, with a glossy and shallow conchoidal fracture, and having a faintly terebinthinate odor and taste. Sp. gr. 1.070 to 1.080. It melts at about 135° C. (275° F.), and is soluble in alcohol, ether, and fixed and volatile oils. It is used to give adhesiveness to plasters, and in cerates and ointments, as in cantharides cerate, and mercurial plaster.

Official Preparations.

Ceratum Resinæ. . . . Made by melting together 350 Gm. of resin, 150 Gm. of yellow wax, Resin Cerate. and 500 Gm. of lard. (See Cerata.)
Emplastum Resinæ. . . . Made by melting together 140 Gm. of resin, 800 Gm. of lead plaster, Resin Plaster. and 60 Gm. of yellow wax. (See Emplastra.)

TEREBINTHINA CANADENSIS. U. S. Canada Turpentine.

[CANADA BALSAM. BALSAM OF FIR.]

A liquid oleoresin obtained from *Abies balsamea* (Linné) Miller (nat. ord. *Coniferae*).

Canada turpentine contains resin, associated with a terpene, $C_{10}H_{16}$, and a small quantity of a bitter principle. It is a yellowish or faintly

greenish, transparent, viscid liquid, of an agreeable terebinthinate odor, and a bitterish, slightly acrid taste; slowly drying on exposure, and then forming a transparent mass; completely soluble in ether, chloroform, or benzol. It is used principally as an external application and for mounting microscopic objects.

MASTICHE. U. S. Mastic.

A concrete resinous exudation from *Pistacia Lentiscus* Linné (nat. ord. *Anacardiæ*).

Mastic contains a resin (mastichic acid, $C_{30}H_{32}O_2$), which is soluble in strong alcohol; also masticin, a resinous principle which is insoluble in alcohol; a small quantity of volatile oil is likewise present. It is used in pills of aloes and mastic to modify the action of the aloes; in the arts it is employed to form a varnish.

PIX BURGUNDICA. U. S. Burgundy Pitch.

The prepared, resinous exudation of *Abies excelsa* Poirét (nat. ord. *Coniferae*).

Burgundy pitch contains resin, a small quantity of a terpene, $C_{10}H_{16}$, and water. It is almost entirely soluble in glacial acetic acid. It is used as a basis for plasters.

Official Preparations.

- Emplastrum Picis Burgundicæ** . . . Made with 800 Gm. of Burgundy pitch, 50 Gm. of Burgundy Pitch Plaster. olive oil, and 150 Gm. of yellow wax.
Emplastrum Picis Cantharidatum . Made by melting together 920 Gm. of Burgundy pitch and 80 Gm. of cerate of cantharides. Cantharidal Pitch Plaster.

AMMONIACUM. U. S. Ammoniac.

A gum-resin obtained from *Dorema Ammoniacum* Don (nat. ord. *Umbelliferae*).

Ammoniac is a gum-resin. It contains about 25 per cent. of gum, 70 per cent. of resin, and about 3 per cent. of volatile oil. The resin is remarkable for yielding resorcin when fused with potassa. With water it forms an emulsion. It is partially soluble in acetic acid. It is used as an expectorant and stimulant. Dose, fifteen grains (0.9 Gm.).

Official Preparations.

- Emulsum Ammoniaci** Made by rubbing 40 Gm. of ammoniac with 1000 C.c. of water (see page 315). Dose, half a fluidounce (14.7 C.c.).
Emplastrum Ammoniaci cum Hydrargyro . 720 Gm. ammoniac; 180 Gm. mercury; 8 Gm. oleate of mercury; diluted acetic acid, and lead plaster to make 1000 Gm. (See Emplastra.)
 Ammoniac Plaster with Mercury.

ASAFETIDA. U. S. Asafetida.

A gum-resin obtained from the root of *Ferula fetida* (Bunge) Regal (nat. ord. *Umbelliferae*).

This gum-resin contains a sulphurated volatile oil (ferulyl sulphide), about 20 per cent. of gum, and 70 per cent. of resin. The gum is partially soluble in water; the resin is soluble in alcohol, and yields resorcin by treatment with potassa, and umbelliferone by dry distillation. The valuable principles in asafetida are soluble in alcohol; with water

an emulsion may be formed, which possesses its virtues. It is used as an antispasmodic. Dose, ten grains (0.6 Gm.).

Official Preparations.

- Emulsum Asafetidæ** . . . Made by rubbing 40 Gm. of asafetida with 1000 C.c. of water (see page 316). Dose, half a fluidounce (14.7 C.c.).
Tinctura Asafetidæ . . . Made by macerating 200 Gm. of asafetida with 800 C.c. of alcohol, and adding sufficient alcohol to make 1000 C.c. (see page 360).
Pilulæ Asafetidæ . . . Each pill contains about 3 grains of asafetida and 1 grain of soap.
 Pills of Asafetida.

MYRRHA. U. S. Myrrh.

A gum-resin obtained from *Commiphora Myrrha* (Nees) Engler (nat. ord. *Burseraceæ*).

Myrrh is a gum-resin, and contains 3 per cent. of an oxygenated volatile oil, a bitter principle, and about 30 per cent. of gum and 60 per cent. of resin. Alcohol is the best solvent for the oil and resin, which are its active principles. The gum left after macerating myrrh in alcohol may be used for making a good mucilage. Myrrh is stimulant, tonic, and vulnerary. Dose, twenty grains (1.3 Gm.). It is used in compound myrrh mixture, pills, etc. (See Condensed Chart at the end of this part.)

Official Preparation.

- Tinctura Myrrhæ** . . . Made by macerating 200 Gm. of myrrh with alcohol to obtain 1000 Tincture of Myrrh. C.c. (see page 372). Used externally.

ELASTICA. U. S. India-Rubber. [CAOUTCHOUC.]

The prepared milk-juice of various species of *Hevea* (nat. ord. *Euphorbiaceæ*), known in commerce as Para Rubber.

India-rubber was introduced into the U. S. P. 1890. Its solution is used in making mustard-paper. It is soluble in chloroform, carbon disulphide, oil of turpentine, benzin, and benzole. The milky juice of the plants by combination with sulphur furnishes ordinary soft rubber; this, upon heating, becomes hard rubber.

GUAIACI LIGNUM. U. S. Guaiacum Wood.

The heart-wood of *Guaiacum officinale* Linné, and of *Guaiacum sanctum* Linné (nat. ord. *Zygophyllæ*).

This wood owes its virtues to resin, which is present usually to the amount of 25 per cent. It is regarded as an alterative, antirheumatic, and diaphoretic. Dose, thirty to sixty grains (1.9 to 3.8 Gm.). It is an ingredient in both the compound decoction and the compound syrup of sarsaparilla.

GUAIACI RESINA. U. S. Guaiac.

The resin of the wood of *Guaiacum officinale* Linné (nat. ord. *Zygophyllæ*).

This resin is usually prepared by boiling guaiac chips in salt water: the resinous scum is collected, melted, and strained. It consists of *guaiacic acid* ($C_{12}H_{16}O_6$), *guaiaconic acid* ($C_{19}H_{20}O_5$), *guaiaretic acid* ($C_{20}H_{26}O_4$), beta resin, gum, etc. Alcohol and alkaline solutions are the best solvents for guaiac. A solution of guaiac resin is colored blue by oxidizing agents, due to the presence of guaiaconic acid. Guaiac is one of the ingredients in compound pills of antimony. This resin is antirheumatic, in doses of fifteen grains (0.9 Gm.).

Official Preparations.

- Tinctura Guaiaci** Made by macerating 200 Gm. of guaiac in alcohol, filtering, and adding sufficient alcohol to make 1000 C.c. The official direction to macerate *seven days* is unnecessary; it should be macerated until dissolved; twenty-four hours is often sufficient time (see page 368). Dose, one to two fluidrachms (3.7 to 7.4 C.c.).
- Tincture of Guaiac.**
- Tinctura Guaiaci Ammoniata** Made by macerating 200 Gm. of guaiac in aromatic spirit of ammonia to obtain 1000 C.c. (see page 369). Dose, one to two fluidrachms (3.7 to 7.4 C.c.).
- Ammoniated Tincture of Guaiac.**

BALSAMUM TOLUTANUM. U. S. Balsam of Tolu.

A balsam obtained from *Toluifera Balsamum* Linné (nat. ord. *Leguminosæ*).

Balsam of tolu contains *cinnamic* and *benzoic acids*, resins, a volatile oil called *benzyl benzoate*, $C_7H_5(C_7H_7)O_2$, *benzyl cinnamate*, a terpene, $C_{10}H_{16}$, termed *tolene*, and other, unimportant constituents. It is used as a stimulant and expectorant. Alcohol is the best solvent; it is almost insoluble in benzin. Warm carbon disulphide removes from the balsam scarcely anything but cinnamic and benzoic acids. On evaporating the disulphide, no substance having the properties of resin should remain.

Balsamum Tolutanum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A yellowish-brown, semi-fluid or nearly solid mass, becoming more brittle when exposed to cold, transparent in thin layers. Carbon disulphide, aided by a gentle heat, removes from the Balsam scarcely anything but some of its cinnamic and benzoic acids. On decanting and evaporating the disulphide, no substance having the properties of resin should remain.	Agreeable odor, recalling that of vanilla, but distinct from it; mild, aromatic taste; acid reaction.	Nearly insoluble.	Readily and completely soluble in alcohol.	Completely soluble in chloroform; solutions of fixed alkalies; almost completely soluble in ether; nearly insoluble in benzin or carbon disulphide.

Official Preparations.

- Tinctura Tolutana** . Made by dissolving 100 Gm. of balsam of tolu in enough alcohol to make 1000 C.c. (see page 379). Dose, one fluidrachm (3.7 C.c.).
- Tincture of Tolu.**
- Syrupus Tolutanus** . Made by making a medicated water from the balsam of tolu with water, dissolving in this the sugar, straining, and making up to 1000 C.c. with water (see page 311).
- Syrup of Tolu.**

BALSAMUM PERUVIANUM. U. S. Balsam of Peru.

A balsam obtained from *Toluifera Pereiræ* (Royle) Baillon (nat. ord. *Leguminosæ*).

Balsam of Peru contains *cinnamic* and *benzoic acids*, *benzyl cinnamate*, $C_7H_5(C_7H_7)O_2$, resin, *benzyl benzoate*, stilbene, etc.

Balsamum Peruvianum. U. S.	ODOR AND TASTE.	SOLUBILITY.	
		Alcohol.	Other Solvents.
A liquid having a syrupy consistence, free from stringiness or stickiness, of a brownish-black color in bulk, reddish-brown and transparent in thin layers. On exposure to air it does not become hard. Sp. gr. 1.135 to 1.150.	Somewhat smoky, but agreeable and vanilla-like odor; bitter taste, leaving a persistent after-taste; acid reaction.	5 parts.	Miscible, in all proportions, with absolute alcohol, chloroform, or glacial acetic acid. Partially soluble in ether or benzin.

TEST FOR IDENT- TITY.	IMPURITIES.	TESTS FOR IMPURITIES.
On distilling water with a portion of the Balsam, no essential oil should pass over.	Gurjun Bal- sam.	<p>If 1 C.c. of carbon disulphide be mixed with 3 C.c. of the Balsam, contained in a dry test-tube, a clear liquid will result. On now adding 8 more C.c. of carbon disulphide and agitating, the resinous constituent of the Balsam (amounting to about 15 per cent.) will adhere to the walls of the tube, and the liquid portion will be clear, of a tint not deeper than light brownish, and not more than faintly fluorescent.</p> <p>If 10 drops of the Balsam be triturated, in a small mortar, with 20 drops of sulphuric acid, a tough, homogeneous, brownish-red mass will result, which, when washed with cold water, should, after a few minutes, be converted into a brittle, resinous mass.</p> <p>If 2 C.c. of the Balsam be vigorously shaken, in a dry test-tube, with 8 C.c. of benzin, so that the Balsam may be spread over the walls of the tube and the liquid then immediately poured off, the Balsam should remain adherent to the walls for some minutes and subside slowly, while the liquid (which should be filtered, if turbid) should be colorless or only faintly yellow, and should deposit no sediment on standing.</p>
	Fixed Oils.	
	Storax, Tur- pentine, Co- palba, etc.	

Uses.—Balsam of Peru is very apt to be adulterated. It is used as a preservative for fats, ointments, etc.; internally, it is stimulant and aromatic.

BENZOINUM. U. S. Benzoin.

A balsamic resin obtained from *Styrax Benzoin* Dryander (nat. ord. *Styracæ*).

Benzoin contains benzoic acid, cinnamic acid ($C_9H_7O_2$), a fragrant volatile oil, and resins: in some varieties vanillin is found. Alcohol is the best solvent for its active principles. It is a valuable stimulant and expectorant. Dose, thirty grains (1.9 Gm.).

Official Preparations.

Adeps Benzoïnatus	Made by digesting 20 Gm. of benzoin tied in a piece of coarse muslin in 1000 Gm. of melted lard.
Tinctura Benzoini	Made by macerating 200 Gm. of benzoin in alcohol to obtain 1000 C.c. (see page 361). Dose, thirty minims (1.8 C.c.).
Tinctura Benzoini Composita . .	Made by macerating 120 Gm. benzoin, 20 Gm. purified aloes, 80 Gm. storax, and 40 Gm. balsam of tolu in alcohol to obtain 1000 C.c. (see page 362). Dose, thirty minims.
Compound Tincture of Benzoin.	

STYRAX. U. S. Storax.

A balsam prepared from the inner bark of *Liquidambar orientalis* Miller (nat. ord. *Hamamelacæ*).

Storax contains cinnamic acid, benzoic acid, *styracin*, $C_9H_7(C_2H_5)O_2$, *storexin*, $C_{36}H_{58}O_8$, *ethyl cinnamate*, $C_9H_7(C_2H_5)O_2$, *phenyl-propyl cinnamate*, $C_9H_7(C_9H_{17})O_2$, *styrol*, C_8H_8 , a fragrant hydrocarbon, and a resinous substance not yet investigated. A large quantity of water is usually present. It is insoluble in water, but completely soluble (with the exception of accidental impurities) in an equal weight of warm alcohol. If the alcoholic solution, which has an acid reaction, be cooled, filtered, and evaporated, it should leave not less than 70 per cent. of the original weight of the balsam, in the form of a brown, semi-liquid residue, almost completely soluble in ether and in carbon disulphide, but insoluble in benzin. When heated on a water-bath, Storax becomes more fluid, and if it be then agitated with warm benzin, the supernatant liquid, on being decanted and allowed to cool, will

be colorless, and will deposit white crystals of cinnamic acid and cinnamic ethers. Storax is used in compound tincture of benzoin. It is stimulant and expectorant. It may be used, like benzoin, to protect fatty substances from rancidity.

ACIDUM BENZOICUM. U. S. Benzoic Acid.

Preparation.—Benzoic acid is found naturally in benzoin, balsam of tolu, balsam of Peru, gum acroides, storax, and other resinous substances. It may be obtained from these by the process described on page 171; but, owing to the small yield afforded in this way, commercial benzoic acid is now largely made artificially in several ways:

1. From the urine of cattle, by mixing it with lime in excess, evaporating and decomposing the lime hippurate with hydrochloric acid. The separated hippuric acid, after purification with animal charcoal, is treated with hydrochloric acid, when benzoic acid and *glycocine* are produced, the hydrochloric acid not being decomposed.

The benzoic acid is sometimes sublimed with benzoin to mask its disagreeable odor and imitate the acid sublimed from benzoin.

2. Benzoic acid is made from *naphthalin*, C_{10}H_8 , which, on treatment with nitric acid, yields *phthalic acid*; this, when heated with excess of calcium hydrate, yields calcium benzoate and carbonate.

3. Benzoic acid is also made from trichlormethyl-benzol, a compound obtained from toluol, C_7H_8 , a coal-tar hydrocarbon. By heating it with zinc chloride and acetic acid, benzoic acid is formed, hydrochloric acid being liberated at the same time.

Acidum Benzoicum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
White, or yellowish-white, lustrous scales or friable needles, permanent in air; somewhat volatile at a moderately warm temperature; volatilizes freely with the vapor of water; it begins to sublime at 100° C. (212° F.); it melts at 121.4° C. (250.5° F.), and at a higher temperature it is consumed without leaving a residue. The acid sublimed from benzoin has a lower melting point, and a greater solubility in water. It is rendered darker by exposure to light. If gradually heated in a retort with 8 parts of freshly slaked lime, benzol is evolved.	Slight aromatic odor of benzoin; a warm, acid taste; acid reaction.	Cold, 500 parts. Boiling, 15 parts.	Cold, 2 parts. Boiling, 1 part.	In 3 parts of ether, 7 parts of chloroform, and readily soluble in carbon disulphide, benzol, and fixed or volatile oils, but sparingly soluble in benzoin; freely soluble in solutions of potassa, soda, and ammonia.

TEST FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
On carefully neutralising any of the solutions of benzoic acid in alkaline liquids, and adding ferric chloride T.S., previously diluted with 2 volumes of water, and neutralized by ammonia, if necessary, a flesh-colored precipitate of ferric benzoate is produced.	Readily Carbonisable, Organic Matters.	The solution of the Acid in pure, cold sulphuric acid, when gently warmed, should not turn darker than light brown; if now poured into water, the Benzoic Acid should separate as a white precipitate, and the liquid should be colorless.
	Chlorine.	If 0.5 Gm. of the Acid and 0.8 Gm. of calcium carbonate be mixed with a little water in a crucible, the mixture dried, gently ignited, and then dissolved in water, with the aid of nitric acid in slight excess so as to obtain 20 C.c. of filtrate, the addition of silver nitrate T.S. to the latter should not produce much more opalescence (if at all) than is produced by the same reagent in a solution measuring 20 C.c. prepared by dissolving 0.8 Gm. of the same calcium carbonate in water with the aid of nitric acid.
	Cinnamic Acid.	On warming 0.5 Gm. of the Acid with 5 C.c. of water and 0.5 Gm. of potassium permanganate in a test-tube stoppered loosely and placed in a water-bath heated to about 45° C. (113° F.), then tightly stoppering, and cooling the test-tube with cold water, upon removing the stopper the odor of oil of bitter almond should not be evolved.

Uses.—This acid is useful in forming *benzoates*, a class of salts which have been employed frequently during the last few years. It is stimulant, expectorant, and irritant to the mucous membranes. Dose, ten grains (0.64 Gm.), administered in thick mucilage or syrup.

Unofficial Products from Oils and Substances containing Resins.

Alkanet.	The root of <i>Anchusa tinctoria</i> . Used exclusively for coloring oils, ointments, and plasters, which are beautifully reddened by $\frac{1}{16}$ of their weight of the root.
Annatto.	A coloring substance, consisting of the pulp which surrounds the seeds in the fruit of <i>Bixa Orellana</i> . Used for coloring cheese and butter, and for dyeing silk and cotton, orange-yellow.
Bdellium.	From <i>Balsamodendron Mukul</i> , grown in India. It contains volatile oil and resin.
Benzoyl Glycooll, $\text{CH}_2 < \begin{matrix} \text{NH.C}_6\text{H}_5\text{O} \\ \text{COOH.} \end{matrix}$	The dose of sodium hippurate is ten grains (0.6 Gm.) three times a day.
Copal.	A resinous substance, brought principally from the East Indies. Used for making varnish.
Doundaké.	An astringent and tonic febrifuge.
Elemi.	From <i>Canarium commune</i> , grown in the Philippine Islands. It contains 10 per cent. of volatile oil, $\text{C}_{10}\text{H}_{16}$, and 25 per cent. of resin.
Euphorbium.	From <i>Euphorbium resinifera</i> , found in Morocco. It contains 18 per cent. of gum and 38 per cent. of resin, etc.
Galbanum.	From <i>Ferula galbaniflua</i> . It contains 8 per cent. of volatile oil and 85 per cent. of resin. Dose, fifteen grains (0.972 Gm.).
Galbanum.	From <i>Dipterocarpus turbinatus</i> . It contains about 40 per cent. of volatile oil and resin.
Gurjun.	From <i>Leonandra Gutta</i> . Its solution in chloroform was formerly official.
Wood Oil.	Suggested as a remedy in the uric acid diathesis.
Gutta-Percha.	
Gutta-Percha.	
Hippuric Acid, ($\text{C}_9\text{H}_9\text{NO}_5$).	
Labdanum.	A stimulant expectorant. At present used only in plasters.
Labdanum.	
Lac.	A reddish-brown resin. Formerly used in medicine, but at present chiefly for making varnish; also in making sealing-wax.
Lacca.	Stimulant and expectorant. The bark of the tree is astringent, and is used in diarrhoea and dysentery, especially in children, given in the form of a syrup.
Liquidambar.	
Styraciflua.	
(Copalm Balsam.)	

Unofficial Products from Oils and Substances containing Resins.—Continued.

Olibanum.	From several species of <i>Boswellia</i> , found in Africa. It contains 6 per cent. of volatile oil and 56 per cent. of resin.
Frankincense.	
Pix Canadensis.	From <i>Abies canadensis</i> . Used in making plasters.
Canada Pitch.	
Resina Draconis.	The resin from the fruit of <i>Calamus Draco</i> . It contains a peculiar resin, $C_{20}H_{30}O_2$, etc.
Dragon's Blood.	
Retinol.	A yellowish oil, boiling at 280° C. Mildly antiseptic. Good solvent of phosphorus.
Sagapenum.	Stimulant, antispasmodic. Dose, ten to thirty grains (0.6 to 1.9 Gm.). Used also externally in plasters as a discutient.
Sandarach.	Used chiefly as a varnish and as incense. Formerly given internally, and used in ointments and plasters.
Gum Juniper.	
Succinum.	Contains succinic acid, and a volatile oil which is stimulant and antispasmodic, or rubefacient when applied externally.
Amber.	
Terpinol.	Derivative of oil of turpentine. In colorless crystals. Dose, three to four grains (0.194 to 0.259 Gm.).
$(C_{10}H_{16})_2H_2O$.	
Viscum Album.	Oxytoxic. Dose, a fluidrachm (3.7 C.c.) of the fluid extract.
Mistletoe.	

Eclectic Resinoids.

These so-called active principles are made by adding a concentrated alcoholic fluid extract of the drug to a large quantity of water, and collecting the precipitate: they are largely used by the eclectic practitioners, and vary greatly in properties and effects. *They must not be confounded with true active principles*, although the names are often exactly the same: this fact often leads to annoyance in dispensing, and has been the cause of dangerous mistakes. A list of the *resinoids* most frequently used is appended.

Alnuin.	From the bark of <i>Alnus rubra</i> . The dose is about one to three grains (0.065 to 0.194 Gm.).
Ampelopsin.	From the branches and bark of <i>Ampelopsis quinquefolia</i> . The dose is from two to eight grains (0.130 to 0.518 Gm.).
Apocynin.	From the root of <i>Apocynum androsaemifolium</i> . It yields about one ounce of apocynin from two pounds of drug. The dose is from one-half to two grains (0.032 to 0.130 Gm.).
Asclepidin.	From the root of <i>Asclepias tuberosa</i> . The dose is from one to five grains (0.065 to 0.324 Gm.).
Baptisin.	From the root of <i>Baptisia tinctoria</i> . It is of a yellowish-brown color. The dose is from one-third to one grain (0.022 to 0.065 Gm.).
Barosmin.	From the leaves of <i>Barosma betulina</i> and other species. The dose is from one to four grains (0.065 to 0.259 Gm.).
Caulophyllin.	From the root of <i>Caulophyllum thalictroides</i> . It yields about 12 per cent. of caulophyllin. The dose is from one-quarter to one grain (0.016 to 0.065 Gm.).
Ceanothin.	From the root of <i>Ceanothus americanus</i> .
Cerasein.	From the bark of <i>Cerasus virginiana</i> . The dose is from five to ten grains (0.324 to 0.648 Gm.).
Chelonin.	From the herb of <i>Chelone glabra</i> . The dose is from one to two grains (0.065 to 0.130 Gm.).
Chimaphilin.	From the leaves of <i>Chimaphila umbellata</i> . The dose is from one to four grains (0.065 to 0.259 Gm.).
Cimicifugin.	From the rhizome of <i>Cimicifuga racemosa</i> . It yields about 5 per cent. It is also called Macrotin. The dose is from one to six grains (0.065 to 0.389 Gm.).
Collinsonin.	From the herb of <i>Collinsonia canadensis</i> . The dose is about three grains (0.194 Gm.).
Cornin.	From the bark of the root of <i>Cornus florida</i> . The dose is about five grains (0.324 Gm.).
Corydalin.	From the tubers of <i>Dicentra canadensis</i> . It yields about one-half ounce of corydaline from two pounds of the tubers. The dose is from one-half to two grains (0.032 to 0.130 Gm.).
Cypripedin.	From the rhizome of <i>Cypripedium pubescens</i> . The dose is about two grains (0.130 Gm.).
Dioscorein.	From the root of <i>Dioscorea villosa</i> . The dose is from two to five grains (0.130 to 0.324 Gm.).
Euonymin.	From the bark of <i>Euonymus atropurpureus</i> . The dose is from one-fourth to four grains (0.016 to 0.259 Gm.).

Eclectic Resinoids.—Continued.

Eupatorium.	From the leaves and flowering tops of <i>Eupatorium perfoliatum</i> . The dose is from two to four grains (0.130 to 0.259 Gm.).
Euphorbin.	From the root of <i>Euphorbia corollata</i> . The dose is from one-half to two grains (0.032 to 0.130 Gm.).
Fraserin.	From the root of <i>Fraxina Walteri</i> . The dose is from one to five grains (0.065 to 0.324 Gm.).
Gelsemin.	From the rhizome of <i>Gelsemium sempervirens</i> . The dose is from one-half to two grains (0.032 to 0.130 Gm.).
Hamamelin.	From the root of <i>Hamamelis virginica</i> . The dose is about five grains (0.324 Gm.).
Helonin.	From the root of <i>Helonias dioica</i> . The dose is from one-half to two grains (0.032 to 0.130 Gm.).
Hydrastin.	From the rhizome of <i>Hydrastis canadensis</i> . The dose is from three to five grains (0.194 to 0.324 Gm.).
Juglandin.	From the bark of the root of <i>Juglans cinerea</i> . The dose is from two to five grains (0.130 to 0.324 Gm.).
Leptandrin.	From the root of <i>Leptandra virginica</i> . The dose is from two to four grains (0.130 to 0.259 Gm.).
Lupulin.	From the strobiles of <i>Humulus Lupulus</i> . The dose is from five to ten grains (0.324 to 0.648 Gm.).
Lycopin.	From <i>Lycopus virginicus</i> . The dose is from three to five grains (0.194 to 0.324 Gm.).
Macrotin.	See Cimicifugin.
Menispermmin.	From <i>Menispermum canadense</i> . The dose is about two grains (0.130 Gm.).
Myricin.	From <i>Myrica cerifera</i> . The dose is from two to eight grains (0.130 to 0.518 Gm.).
Phytolaccin.	From <i>Phytolacca decandra</i> . The dose is from one-quarter to one grain (0.016 to 0.065 Gm.).
Populhn.	From the bark of <i>Populus tremuloides</i> . The dose is from two to five grains (0.130 to 0.324 Gm.).
Prunin.	From <i>Cerasus serotina</i> . The dose is about two grains (0.130 Gm.).
Ptelein.	From the root of <i>Ptelea trifoliata</i> .
Rhein.	From different species of <i>Rheum</i> . The dose is from two to four grains (0.130 to 0.259 Gm.).
Rhusin.	From the leaves of <i>Rhus glabra</i> . It is said to be a light brown powder.
Rumin.	From <i>Rumex crispus</i> . The dose is about two grains (0.130 Gm.).
Sanguinarin.	From <i>Sanguinaria canadensis</i> . The dose is from one-half to two grains (0.032 to 0.130 Gm.).
Scutellarin.	From the herb of <i>Scutellaria lateriflora</i> . The dose is from three to six grains (0.194 to 0.389 Gm.).
Senecin.	From <i>Senecio gracilis</i> . The dose is from three to five grains (0.194 to 0.324 Gm.).
Senecionin.	From <i>Senecio gracilis</i> . The dose is from one to five grains (0.065 to 0.324 Gm.).
Smilacin.	From different species of <i>Smilax</i> . The dose is from two to five grains (0.130 to 0.324 Gm.).
Stillingin.	From <i>Stillingia sylvatica</i> . The dose is one-half to one grain (0.032 to 0.065 Gm.).
Trillin.	From <i>Trillium pendulum</i> . The dose is from three to six grains (0.194 to 0.389 Gm.).
Viburnin.	From <i>Viburnum Opulus</i> . The dose is about two grains (0.130 Gm.).

QUESTIONS ON CHAPTER LVII.

RESINS, OLEORESINS, GUM-RESINS, AND BALSAMS.

What are resins, and how are they characterized? What are they chemically?
 What are natural oleoresins? What are gum-resins? What are balsams?
 Terebinthina—What is its synonyme? What is its definition?
 What does it contain? What is the dose?
 Oil of turpentine—What is its synonyme? What is the Latin name?
 What is its chemical composition? What is its specific gravity?
 Describe odor, taste, chemical reaction, and solubility.
 What action does a mixture of nitric and sulphuric acids have upon it?
 For what substances is it a solvent? What are its official preparations?
 Resin—What is its synonyme? Whence obtained?
 Of what does resin consist?
 What change takes place in it when treated with diluted alcohol?
 What is its specific gravity?

- Describe odor, taste, chemical reaction, solubility, and melting-point.
 For what is it used? What are its official preparations?
 Canada turpentine—Give Latin official name. What is its synonyme?
 What is it? What does it contain?
 Describe odor, taste, chemical reaction, and solubility.
 For what purposes is it used?
 Mastic—What is the Latin name? Whence is it derived?
 What does it contain? For what purposes is it used?
 Burgundy pitch—What is the Latin name? Whence is it derived?
 What does it contain? In what acid is it almost entirely soluble?
 For what is it used? What are its official preparations?
 Canada pitch—Whence is it derived?
 What does it contain? For what is it used? What are its official preparations?
 Gutta-percha—Whence is it derived?
 Of what does it consist? Describe its solubility.
 What are its official preparations?
 Ammoniac—What is the Latin official name? What is ammoniac?
 What does it contain?
 For what is the resin remarkable? Describe its solubility.
 What is the dose? What are its official preparations?
 Asafetida—What is the Latin official name? What is its definition?
 What does it contain?
 Chemically considered, what is the volatile oil?
 What does the resin yield by treatment with potassa?
 What does it yield by dry distillation?
 What is the best solvent for its valuable principles?
 Will water extract its virtues? How? What is the dose?
 What are its official preparations?
 Myrrh—Whence is it obtained?
 What does it contain? What are its active principles?
 What is its best solvent? For what can the gum left after macerating myrrh in alcohol be used? What is the dose? What are its official preparations?
 Guaiacum wood—What is the Latin name? What is its definition?
 To what does this owe its virtues? How much resin does it usually contain?
 What is the dose? Of what official preparations is it an ingredient?
 Guaiac—What is the Latin name? How is this resin prepared?
 Of what does it consist? What are the best solvents for guaiac?
 Why is a solution of guaiac colored blue by oxidizing agents?
 What is the dose? What are the official preparations?
 Balsam of tolu—What is the Latin name? Whence is it obtained?
 What does it contain? What is its best solvent? What portions of it are soluble in carbon disulphide? How may the presence of resin be detected?
 What are its medicinal properties? What are its official preparations?
 Balsam of Peru—What is the Latin name? Whence is it obtained?
 What does it contain?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 How may the following impurities be detected?—viz.: Gurjun balsam; fixed oils and alcohol. For what purposes is it used?
 Benzoin—What is the Latin name? Whence is it obtained?
 What does it contain? What is its best solvent?
 What is the dose? What are the official preparations?
 Storax—What is the Latin name? Whence is it obtained?
 What does it contain? Into what preparations does it enter?
 What are its medicinal properties? For what is it used?
 Benzoic acid—Give formula in symbols, molecular weight, and Latin name.
 Where is it found, and how may it be obtained?
 How is it prepared artificially from urine? What is the rationale of the process?
 How is this acid sometimes treated to disguise its odor?
 How is it made from naphtalin? What is the rationale of the process?
 How is it made from trichlormethyl-benzol?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 How may the following impurities be detected?—viz.: Organic impurities; chloro-benzoic acid; cinnamic acid. What is the dose?
 What are eclectic resinoids, and how are they usually prepared?
 Are they the active principles of the drugs from which they are prepared?

CHAPTER LVIII

FIXED OILS, FATS, AND SOAPS.

FIXED oils and fats are obtained from both the vegetable and the animal kingdom. They are greasy to the touch, and leave a permanent oily stain on paper; they are insoluble in water, but dissolve in ether, chloroform, carbon disulphide, benzol, benzin, turpentine, and volatile oils; they usually mix with one another without separating.

When pure, they are generally colorless or have a pale yellow color; they have a distinctive odor and taste, which is often caused by impurities with which they are associated, as the process of refining deprives them of odor and taste.

When heated moderately, if solid they melt, or if liquid they become thinner; if heated strongly in air they are decomposed, evolve offensive vapors, and then burn with a sooty flame, much heat being generated. Their specific gravity varies from 0.870 to 0.985, thus being lighter than water. By exposure to air they acquire an acrid, disagreeable taste and become acid to litmus paper. This change, termed *rancidity*, is believed to be due to the presence of impurities (like albuminous substances), which act as ferments, induce decomposition, liberate the fatty acids, and produce volatile, odorous acids, like caproic, caprylic, butyric, and valerianic acids. Oils which have become rancid may often be purified by shaking them thoroughly with hot water and then with a cold solution of sodium carbonate, and subsequently washing them with cold water.

Chemically, the fixed oils and fats are compound ethers of higher members of the fatty acids, the alcohol being glycerin and the radical glyceryl. In most cases they consist of two or three proximate principles,—olein, palmitin, or stearin. These are sometimes termed the glycerides of oleic, palmitic, and stearic acids. Olein is liquid, and palmitin and stearin are both solid: hence the consistence of fixed oils and fats is due to the relative proportion of these principles: thus, almond oil, being composed principally of olein, is always liquid at ordinary temperatures, whilst tallow, being largely stearin, is solid.

Olein, $C_3H_5(C_{15}H_{31}O_2)_3$, is the oleate of the triad radical glyceryl, and constitutes the liquid principle of oils. It is extremely difficult to obtain it pure. Being in most oils associated with the solids stearin and palmitin, it has to be separated by pressure and other mechanical means, and this is not easily effected. As ordinarily procured, therefore, olein contains more or less of palmitin or stearin, or both. It is obtained either by the agency of alcohol or by expression. When one of the oils, olive oil, for example, is dissolved in boiling alcohol, the solution, on cooling, deposits the concrete principles, retaining the olein, which it yields upon evaporation. The other method consists in compressing one of the solid fats, or of the liquid oils rendered concrete by cold, between folds of bibulous paper, which absorb the olein, and give it up after-

wards by compression under water. Olein is a liquid of oily consistence, congealing at -6°C . (21.2°F .), colorless when pure, with little odor and a sweetish taste, insoluble in water, soluble in boiling alcohol and ether.

Palmitin.—Palmitic acid occurs in the more liquid fats, such as palm oil and coco-nut oil, as glyceride; while in spermaceti and some forms of wax it is combined with monatomic alcohol radicals. Palmitin is the glyceride of palmitic acid or tripalmitate of glyceryl.

Stearin.—This exists abundantly in tallow and other animal fats, and it is made on an immense scale for use in candles by cooling lard and tallow, and separating the olein by hydraulic pressure. It may be obtained pure by dissolving suet in hot oil of turpentine, allowing the solution to cool, submitting the solid matter to expression in unsized paper, repeating the treatment several times, and finally dissolving in hot ether, which deposits the stearin on cooling. This is white, opaque in mass, but of a pearly appearance as crystallized from ether, pulverizable, fusible at 66.5°C . (152°F .), soluble in boiling alcohol and ether, but nearly insoluble in those liquids cold, and quite insoluble in water. It consists of glyceryl and stearic acid, as a glyceride, $\text{C}_3\text{H}_5(\text{C}_{18}\text{H}_{35}\text{O}_2)_3$, and has been formed synthetically by heating a mixture of these two materials to 280° – 300°C .

Margarin.—What was long known under this name was shown by Heintz, in 1852, to be a mixture of stearin and palmitin. The true margaric acid, $\text{C}_{17}\text{H}_{34}\text{O}_2$, has been obtained by synthesis, and according to Ebert is found in *adipocere*, a waxy substance formed in the tissues of dead animals.

Stearic acid, $\text{C}_{18}\text{H}_{36}\text{O}_2$, is a firm white solid, like wax, fusible at 69.2°C . (157°F .), greasy to the touch, pulverizable, soluble in alcohol, very soluble in ether, but insoluble in water. In the impure state it is used as a substitute for wax in making wax candles. (See Acidum Stearicum). **Palmitic acid**, $\text{C}_{16}\text{H}_{32}\text{O}_2$, forms a white scaly mass, and melts at 62°C . (143.6°F .). **Oleic acid**, $\text{C}_{18}\text{H}_{34}\text{O}_2$, is an oily liquid, insoluble in water, soluble in alcohol and ether, lighter than water, crystallizable in needles a little below 0°C . (32°F .), and having a slight smell and a pungent taste. (See Acidum Oleicum.) **Glycerin** is described under a separate head. (See Glycerina.)

AMYGDALA DULCIS. U. S. Sweet Almond.

The seed of *Prunus Amygdalus* var. *dulcis* De Candolle (nat. ord. *Rosaceæ*).

Sweet almond contains about 40 per cent. of fixed oils, protein compounds (*conglutin* and *amandin*), sugar, mucilage, etc. Tannin is present in the integuments.

The protein compounds aid in emulsionizing the fixed oil which is present, and simple trituration is all that is necessary to form a mixture.

Official Preparations.

Emulsum Amygdalæ . . Made by blanching 60 Gm. of sweet almond, adding 10 Gm. of acacia and 30 Gm. of sugar, and triturating with 1000 C.c. of distilled water (see page 316). Dose, two to eight fluidounces (59 to 236 C.c.).

Syrupus Amygdalæ . . Made from 140 Gm. of sweet almond, 40 Gm. of bitter almond, 200 Gm. of sugar, 100 C.c. of orange flower water, and water and syrup to make 1000 C.c. (see page 302). Dose, one to two fluidounces (29 to 59 C.c.).

OLEUM AMYGDALÆ EXPRESSUM. U.S. Expressed Oil of Almond.

A fixed oil expressed from Bitter or Sweet Almond.

Preparation.—This oil is obtained equally pure from sweet and bitter almonds. The almonds, having been deprived of a reddish-brown powder adhering to their surface, by being rubbed together in a piece of coarse linen, are ground in a mill, and then pressed in canvas sacks between plates of steel slightly heated. The oil, which is at first turbid, is clarified by rest and filtration. Sweet almond yields about 40 per cent. and bitter almond 35 per cent. of fixed oil.

A colorless oil may be obtained by expressing almonds which have been *blanched*,—i.e., deprived of their testa by soaking them in hot water and slightly pressing them, and afterwards drying in a stove to evaporate the water.

Oleum Amygdalæ Expressum. U.S.	ODOR AND TASTE.	SOLUBILITY.	
		Alcohol.	Other Solvents.
A clear, pale straw-colored, or colorless, oily liquid. Sp. gr. 0.915 to 0.920 at 15° C. (59° F.). It remains clear at -10° C. (14° F.), and does not congeal until cooled to near -20° C. (-4° F.).	Almost inodorous; mild, nutty taste.	Slightly.	In all proportions in ether and chloroform.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
If 10 C.c. of the Oil be mixed with 15 C.c. of a 15-per-cent. solution of sodium hydrate and 10 C.c. of alcohol, the mixture allowed to stand at a temperature of 35° to 40° C. (95° to 104° F.), with occasional agitation, until it becomes clear, and then be diluted with 100 C.c. of water, the clear solution thus obtained, upon the subsequent addition of an excess of hydrochloric acid, will set free a layer of oleic acid. This, when separated from the aqueous liquid, washed with warm water, and clarified in a water-bath, will remain liquid at 15° C. (59° F.), although sometimes depositing particles of solid matter and becoming turbid.	Fixed Oils of Apricot and Peach Kernels, and Sesamum, Cotton Seed, and Poppy Seed Oils. Olive, Arachis, Cotton Seed, Sesamum, and other Fixed Oils.	If 2 C.c. of the Oil be vigorously shaken with 1 C.c. of fuming nitric acid and 1 C.c. of water, a whitish, not red or brownish, mixture should be formed, which, after standing for some hours at about 10° C. (50° F.), should separate into a solid, white mass, and a scarcely colored liquid. One part of this oleic acid, when mixed with 1 volume of alcohol, should give a clear solution, which at 15° C. (59° F.) should not deposit any fatty acids, nor become turbid on the further addition of 1 volume of alcohol.

Uses.—Expressed oil of almond, or *oil of sweet almonds*, as it is usually called, is used as an emollient, and an ingredient in "cold cream" and phosphorated oil.

OLEUM OLIVÆ. U.S. Olive Oil.

A fixed oil expressed from the ripe fruit of *Olea europæa* Linné (nat. ord. *Oleaceæ*).

Preparation.—Although pure olive oil is still found occasionally, there is good reason to believe that the so-called olive oil is mainly cotton seed oil, or other similar substitution, judiciously flavored. Pure

olive oil is made by expressing olives and clarifying the oil by subsidence; but the detection of admixtures of other fixed oils is attended with discouraging results. The exportation of over six million gallons of cotton seed oil annually to Mediterranean ports contiguous to the olive oil industry is a significant fact. The Pharmacopœia furnishes the following tests. It is difficult to detect an admixture of a similar vegetable oil of less than 20 per cent. by any published test.

Oleum Olivæ. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Alcohol.	Other Solvents.
A pale yellow, or light greenish-yellow, oily liquid. When cooled to about 10° C. (50° F.), it begins to be somewhat cloudy from the separation of crystalline particles, and at 0° C. (32° F.) it forms a whitish, granular mass. Sp. gr. 0.915 to 0.918 at 15° C. (59° F.).	Slight, peculiar odor; nutty, oleaginous taste, with a faintly acid after-taste; neutral reaction.	Very sparingly soluble.	Readily soluble in ether, chloroform, and carbon disulphide.
Tests.	IMPURITIES.	TESTS FOR IMPURITIES.	
<p>If 10 C.c. of the Oil be shaken frequently, during two hours, with a freshly prepared solution of 1 Gm. of mercury in 3 C.c. of nitric acid, a perfectly solid mass of a pale straw color will be obtained.</p> <p>If 30 C.c. of the Oil be saponified by heating with 20 C.c. of alcohol and 5 Gm. of potassa, the liquid then diluted with 200 C.c. of water, and freed from alcohol by boiling, on supersaturating the solution with diluted sulphuric acid the fatty acids will form a layer on the surface. If these be separated as far as possible, free from water, and filtered, 5 C.c. of the clear filtrate, when shaken in a test-tube with 5 C.c. of concentrated hydrochloric acid, should not color the latter green, and, on the subsequent addition of about 0.5 Gm. of sugar, and again shaking the mixture, no violet or crimson tint should be produced in the acid layer within fifteen minutes (absence of <i>sesamum oil</i>).</p>	<p>Appreciable quantities of Cotton Seed Oil and most other Seed Oils.</p> <p>More than 5 per cent. of Cotton Seed Oil and many other Foreign Oils.</p>	<p>If 6 Gm. of the Oil be thoroughly shaken, in a test-tube, for about two minutes, with a mixture of 1.5 Gm. of nitric acid and 0.5 Gm. of water, then heated in a bath of boiling water for not more than fifteen minutes, the Oil should retain a light yellow color, not becoming orange or reddish-brown, and, after standing at the ordinary temperature for about twelve hours, it should form a perfectly solid, light yellowish mass.</p> <p>If 5 C.c. of the Oil be thoroughly shaken, in a test-tube, with 5 C.c. of an alcoholic solution of silver nitrate (prepared by dissolving 0.1 Gm. of silver nitrate in 10 C.c. of deodorized alcohol, and adding 2 drops of nitric acid), and the mixture heated for about five minutes in a water-bath, the Oil should retain its original pale yellow color, not becoming reddish or brown, nor should any dark color be produced at the line of contact of the two liquids.</p>	

Uses.—Olive oil is used in making cerates, ointments, liniments, and plasters. It is a bland, agreeable oil, well suited for emollient purposes.

OLEUM GOSSYPII SEMINIS. U.S. Cotton Seed Oil.

A fixed oil expressed from the seed of *Gossypium herbaceum* Linné, and of other species of *Gossypium* (nat. ord. *Malvaceæ*), and subsequently purified.

Preparation.—This oil is made commercially in the southern part of the United States upon a very large scale. The seeds contain 15 per cent. of oil.

The testa of the seeds is first separated, and the kernels are exposed to powerful expression in hydraulic presses.

Oleum Gossypii Semina. U.S.	ODOR AND TASTE.	SOLUBILITY.	
		Alcohol.	Other Solvents.
A pale yellow, oily liquid. Specific gravity 0.920 to 0.930 at 15° C. (59° F.). On cooling the Oil to a temperature below 12° C. (53.6° F.), particles of solid fat will separate. At about 0° to -5° C. (32° to 23° F.), the Oil solidifies.	Odorless; bland, nut-like taste.	Very sparingly.	Readily soluble in ether, chloroform, or carbon disulphide.

TESTS FOR IDENTITY.

When the Oil is brought in contact with concentrated sulphuric acid, a dark reddish-brown color is instantly produced.

If 6 Gm. of the Oil be thoroughly shaken, in a test-tube, for about two minutes, with a mixture of 1.5 Gm. of nitric acid and 0.5 Gm. of water, then heated in a bath of boiling water for not more than fifteen minutes, the Oil will assume an orange or reddish-brown color, and, after standing for twelve hours at the ordinary temperature, will form a semi-solid mass.

If 5 C.c. of the Oil be thoroughly shaken in a test-tube, with 5 C.c. of an alcoholic solution of silver nitrate (made by dissolving 0.1 Gm. of silver nitrate in 10 C.c. of deodorized alcohol and adding 2 drops of nitric acid), and the mixture heated for about five minutes in a water-bath, the Oil will assume a red or reddish-brown color.

OLEUM SESAMI. U.S. Oil of Sesamum.

[SESAME OIL. TEEL OIL. BENNÉ OIL.]

A fixed oil expressed from the seed of *Sesamum indicum* Linné (nat. ord. *Pedaliaceæ*).

This oil consists of olein (70 per cent.), palmitin, stearin, and myristicin. It is inodorous, of a bland, sweetish taste and a neutral reaction, and will keep long without becoming rancid. It is not a drying oil. At 15° C. (59° F.) it has the sp. gr. 0.919 to 0.923; and its point of congelation is -5° C. (23° F.). Concentrated sulphuric acid converts it into a brownish-red jelly. If 5 C.c. of the oil be shaken with an equal volume of concentrated hydrochloric acid, the latter will usually assume a bright emerald-green color, especially if the oil has been exposed for some time to the action of air and light; and, on the subsequent addition of about 0.5 Gm. of sugar, and again shaking the mixture, a blue color, changing to violet, and finally to deep crimson, will be produced.

OLEUM LINI. U.S. Linseed Oil. [OIL OF FLAXSEED.]

A fixed oil expressed from Linseed without the use of heat.

Preparation.—It will be noticed that the official description specifies an oil made without the use of heat: this would reject all the oil made on the large scale for use in the arts.

Linseed oil is a drying oil, and consists mainly of *linolein*, which, by exposure, becomes *linoxyn*, $C_{23}H_{34}O_{11}$; *myristin* and *palmitin* are also present.

Oleum Lini. U.S.	ODOR AND TASTE.	SOLUBILITY.	
		Alcohol.	Other Solvents.
A yellowish or yellow, oily liquid. When exposed to the air it gradually thickens, and acquires a strong odor and taste; and if spread, in a thin layer, on a glass plate and allowed to stand in a warm place, it is gradually converted into a hard, transparent, resin-like mass (absence of non-drying oils). Specific gravity, 0.930 to 0.940 at 15° C. (59° F.). It does not congeal above -20° C. (-4° F.).	A slight, peculiar odor and a bland taste.	Absolute, 10 parts.	In all proportions in ether, chloroform, benzine, carbon disulphide, or oil of turpentine.
TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.	
It should not more than slightly redden blue litmus paper, previously moistened with alcohol (limit of free acid). If 10 C.c. of the Oil, contained in a small flask, be mixed with a solution of 3 Gm. of potassium hydrate in 5 C.c. of water, then 5 C.c. of alcohol added, and the mixture heated for about five minutes on a water-bath, with occasional agitation, a dark-colored but clear and complete solution should be obtained.	Non-Drying Oils.	{ If 2 C.c. of the Oil be shaken with 1 C.c. of fuming nitric acid and 1 C.c. of water, it should neither completely nor partially solidify, even after standing for one or two days.	
	Paraffin Oils.	{ If the dark-colored, clear solution be diluted with water to the measure of 50 C.c., then cooled and shaken with 50 C.c. of ether, the clear, ethereal layer, after having separated, should not show a bluish fluorescence, and, when carefully decanted, and allowed to evaporate spontaneously, should leave not more than a slight, and not oily, residue.	

Uses.—Linseed oil is used as a laxative, in doses of one to two fluidounces (29 to 58 C.c.).

PEPO. U.S. Pumpkin Seed.

The seed of *Cucurbita Pepo* Linné (nat. ord. *Cucurbitaceæ*).

This seed contains about 40 per cent. of fixed oil, starch, protein compounds, a little acrid resin, sugar, etc. Pumpkin seed is used as a tæniifuge by beating the kernels with water so as to make a mixture like almond mixture: a more elegant method, however, is to emulsify the fixed oil, which is now an article of commerce, and made by percolating the ground seeds with ether.

OLEUM RICINI. U.S. Castor Oil.

A fixed oil expressed from the seed of *Ricinus communis* Linné (nat. ord. *Euphorbiaceæ*).

Preparation.—Castor oil has been obtained from the seed in four ways: 1. By cold expression. 2. By expression with heat. 3. By percolation with alcohol. 4. By decoction. The first method produces the best oil: a powerful hydraulic press (see page 251) is generally used, and the oil clarified by subsidence. It is an almost colorless, transparent, viscid liquid, of a faint, mild odor, a bland, afterwards slightly acrid and generally offensive taste, and a neutral reaction. Sp. gr. 0.950 to 0.970. It is soluble in an equal volume of alcohol, and, in all proportions, in absolute alcohol, or in glacial acetic acid; also soluble, at

15° C. (59° F.), in 3 times its volume of a mixture of 19 volumes of alcohol and 1 volume of water (absence of more than about 5 per cent. of *most other fixed oils*). With an equal volume of benzin, it forms, at 15° C. (59° F.), a turbid mixture, but at 17° C. (62.6° F.) it yields a clear solution. When exposed to the air in a thin layer, it slowly dries to a varnish-like film. When cooled to 0° C. (32° F.), it becomes turbid, with the separation of crystalline flakes, and at about -18° C. (-0.4° F.) it congeals to a yellowish mass. If 3 C.c. of the Oil be shaken for a few minutes with 3 C.c. of carbon disulphide and 1 C.c. of sulphuric acid, the mixture should not acquire a blackish-brown color (absence of *many foreign oils*). It contains *ricinolein* and *palmitin*. The purgative action is due to the presence of an acrid principle, which has not yet been isolated: a given weight of the seeds is more active than the same quantity of oil. Castor oil is used as a purgative, in doses of one-half to one fluidounce (14.5 to 29 C.c.).

OLEUM TIGLII. U. S. Croton Oil.

A fixed oil expressed from the seed of *Croton Tiglium* Linné (nat. ord. *Euphorbiaceæ*).

Preparation.—Croton oil is prepared by expression or by percolating the ground seeds with carbon disulphide and distilling the percolate. It is a pale yellow or brownish-yellow, somewhat viscid and slightly fluorescent liquid, having a slight fatty odor, a mild, oily, afterwards acrid, burning taste, and a slightly acid reaction. When applied to the skin, it produces rubefaction or a pustular eruption. Sp. gr. 0.940 to 0.960 at 15° C. (59° F.). It reddens blue litmus paper moistened with alcohol. When fresh, it is soluble in about 60 parts of alcohol, the solubility increasing by age. It is freely soluble in ether, chloroform, carbon disulphide, and fixed or volatile oils. When gently heated with twice its volume of absolute alcohol, it forms a clear solution, from which the Oil usually separates on cooling. If to 2 C.c. of the Oil 1 C.c. of fuming nitric acid and 1 C.c. of water be added, and the mixture vigorously shaken, it should not solidify, either completely or partially, after standing for one or two days (absence of other *non-drying oils*). Neither the purgative principle nor the vesicating principle has been isolated: by the decomposition of the fatty substances present, tiglinic, valerianic, formic, acetic, myristic, stearic, isobutyric, lauric, and palmitic acids have been detected; crotonol, $C_{18}H_{36}O_6$, is said to be present. Internally, in doses of one minim (0.06 C.c.), croton oil is a powerful purgative; externally, when applied to the skin, it is rubefacient and vesicant.

OLEUM THEOBROMATIS. U. S. Oil of Theobroma.

[OLEUM THEOBROMÆ, PHARM. 1880. BUTTER OF CACAO.]

A fixed oil expressed from the seed of *Theobroma Cacao* Linné (nat. ord. *Sterculiaceæ*).

Preparation.—This is made by expressing the kernels of the "chocolate nut" between hot iron plates, and running the product into moulds. The yield is about 40 per cent. It is a yellowish-white solid, having a faint, agreeable odor, a bland, chocolate-like taste, and a neutral reaction.

Sp. gr. 0.970 to 0.980 at 15° C. (59° F.). Readily soluble in ether or chloroform; also soluble in 100 parts of cold and in 20 parts of boiling absolute alcohol, all these solutions being neutral to litmus paper. It is brittle at 15° C. (59° F.), and melts at 30° to 33° C. (86° to 91.4° F.) to a clear liquid. If 1 Gm. of Oil of Theobroma be dissolved in 3 C.c. of ether, in a test-tube, at a temperature of 17° C. (63° F.), and the tube subsequently plunged into water at 0° C. (32° F.), the liquid should not become turbid, nor deposit a granular mass in less than three minutes; and if the mixture, after congealing, be exposed to a temperature of 15° C. (59° F.), it should gradually form a perfectly clear liquid (absence of *paraffin, wax, stearin, tallow*, etc.).

Chemically, it is a mixture of stearin, palmitin, olein, arachin, and laurin, and, owing to its low fusing-point, and its property of becoming solid at a temperature just below the fusing-point, it is valuable in pharmacy in making suppositories. (See Suppositoria.)

LYCOPODIUM. U. S. *Lycopodium*.

The spores of *Lycopodium clavatum* Linné, and of other species of *Lycopodium* (nat. ord. *Lycopodiaceæ*).

Lycopodium contains 47 per cent. of fixed oil, with minute quantities of volatile bases. It is used as a dusting powder and to allay irritation of the skin through chafing, and for similar purposes.

Oils, and Substances containing Unofficial Fixed Oils.

Oil of Bassia.	From <i>Bassia longifolia</i> . Nat. Ord. Sapotacæ. A greenish oil is expressed from the seeds.
Bayberry.	From <i>Myrica cerifera</i> . Nat. Ord. Myricacæ. Habitat, North America. The oil and wax are prepared by boiling the fruit with water until the oil collects on the surface. The yield of oil is about 30 per cent.
Beech.	From the fruit of <i>Fagus sylvatica</i> . Nat. Ord. Cupulifæræ. Habitat, Europe. It is of a yellow color and mild odor and taste. The yield of oil is about 20 per cent.
Behen.	From the fruit of <i>Moringa aptera</i> . Used in ointments and pomades.
Ben.	A fixed oil from the seeds of <i>Moringa pterygosperma</i> . Used for the same purposes as olive oil.
Black Mustard.	From the seed of <i>Brassica nigra</i> (Linné) Koch. Nat. Ord. Crucifæræ. Habitat, Europe. A yellow or brownish-yellow fixed oil. Sp. gr. 0.916. The yield of oil is about 20 per cent.
Brazil Nut.	From the seed of <i>Bertholletia excelsa</i> . Nat. Ord. Lecythidacæ. Habitat, Brazil. It is a pale yellow, bland oil. The yield of oil is about 50 per cent.
Candle Nut.	From <i>Aleurites triloba</i> . Habitat, islands of the Pacific Ocean. The yield of oil is about 60 per cent.
Cardamom.	From the fruit of <i>Elettaria repens</i> . Nat. Ord. Scitamineæ. The yield of oil is about 10 per cent.
Chaulmugra.	From the seed of <i>Gynocardia odorata</i> . Nat. Ord. Bixacæ. Habitat, Malayan Peninsula. Prepared by subjecting the seeds to pressure and collecting the oil.
Coco-nut.	From <i>Cocos nucifera</i> . Nat. Ord. Palmæ. Habitat, tropical countries. Prepared by boiling the seeds with water and expressing. It is of a butyroseous consistence, white, and has a peculiar odor and a bland taste.
Crab.	From <i>Carapa guianensis</i> . Prepared by expressing the seed.
Cucumber Seed.	From the seed of <i>Cucumis sativus</i> . Nat. Ord. Cucurbitacæ. Habitat, Central Asia.
Ergot.	From <i>Claviceps purpurea</i> . The yield of oil is about 25 per cent.
Ground-nut.	From the kernels of the fruit of <i>Arachis hypogæa</i> . Prepared by expression.
Hazel-nut.	From <i>Corylus avellana</i> . Nat. Ord. Cupulifæræ. Habitat, Europe. The yield of oil is about 50 per cent.
Hemp Seed.	From the seed of <i>Cannabis sativa</i> . Nat. Ord. Urticacæ. Habitat, Europe and North America. The yield of oil is about 30 per cent.
Horsechestnut.	From the kernels of the fruit of <i>Æsculus Hippocastanum</i> . Nat. Ord. Sapindacæ. The yield of oil is about $\frac{1}{10}$ per cent.

Oils, and Substances containing Unofficial Fixed Oils.—Continued.

Oil of Hydrastis.	From <i>Hydrastis canadensis</i> . Nat. Ord. Ranunculaceæ. Habitat, United States.
Hyoscyamus Seed.	From the seed of <i>Hyoscyamus niger</i> . Nat. Ord. Solanaceæ. Habitat, Europe. The yield of oil is about 25 per cent.
Juglans.	From <i>Juglans cinerea</i> . Nat. Ord. Juglandaceæ. Habitat, United States. The yield of oil is about 15 per cent.
Kurung.	From <i>Pongamia glabra</i> . Nat. Ord. Leguminosæ. Habitat, India. It is a thickish, yellow oil, of sp. gr. 0.945.
Larkspur Seed.	From the seed of <i>Delphinium Consolida</i> . Nat. Ord. Ranunculaceæ. Habitat, Central Europe.
Laurel.	From <i>Laurus nobilis</i> . Nat. Ord. Lauraceæ. Habitat, Europe. Prepared by steeping the fruit in hot water and expressing.
Mace.	From the arillus of the fruit of <i>Myristica fragrans</i> . Nat. Ord. Myristicaceæ. Habitat, Molucca Islands.
Madia.	From <i>Madia sativa</i> . Nat. Ord. Compositæ. Habitat, Europe. The yield of oil is about 40 per cent.
Mangosteen.	From <i>Garcinia indica</i> . Nat. Ord. Guttiferæ. Habitat, India. The yield of oil is about 30 per cent.
Melon Seed.	From <i>Cucumis Melo</i> . Nat. Ord. Cucurbitaceæ. Habitat, Central Asia.
Nicker Seed	From <i>Cesalpinia Bunducella</i> . Nat. Ord. Leguminosæ.
Nigella.	From the seed of <i>Nigella sativa</i> . Nat. Ord. Ranunculaceæ. Habitat, Southern Europe. The yield of oil is about 35 per cent.
Niger Seed	From <i>Gnietia oleifera</i> . Nat. Ord. Compositæ. Habitat, India. The yield of oil is about 40 per cent.
Nutmeg.	From the kernel of the seed of <i>Myristica fragrans</i> . Nat. Ord. Myristicaceæ. Habitat, Molucca Islands. The yield of oil is about 22 per cent.
Palm.	From the fruit of <i>Elais guineensis</i> . Nat. Ord. Palmæ. Habitat, West Africa. Sp. gr. 0.945.
Peach.	From <i>Perrica vulgaris</i> . Nat. Ord. Rosaceæ. The oil resembles expressed oil of almond.
Poppy Seed.	From the seed of <i>Papaver somniferum</i> . Nat. Ord. Papaveraceæ. Habitat, Asia and Europe. It is of a yellow color, bland, and limpid. The yield is about 45 to 50 per cent.
Pumpkin Seed.	From the seed of <i>Cucurbita Pepo</i> . Nat. Ord. Cucurbitaceæ. Habitat, Asia and Europe. The yield of oil is about 45 per cent.
Purging Nut.	From the seed of <i>Curcas purgans</i> . Nat. Ord. Euphorbiaceæ. Habitat, West Indies. The yield is about 35 per cent.
Rape Seed.	From <i>Brassica campestris</i> . A fixed oil used for making green soft soap.
Staphisagria.	From the seed of <i>Delphinium Staphisagria</i> . Nat. Ord. Ranunculaceæ. Habitat, Europe. The yield of oil is about 30 per cent.
Stramonium Seed.	From the seed of <i>Datura Stramonium</i> . Nat. Ord. Solanaceæ. Habitat, United States. The yield of oil is about 25 per cent.
Tonka.	From the seed of <i>Dipterix odorata</i> . Nat. Ord. Leguminosæ. Habitat, Guiana. An odorous fixed oil.
Tonka Bean.	Contains coumarin. Used for flavoring. Narcotic. Used in whooping-cough, in doses of five to eight grains (0.3 to 0.5 Gm.), given in the form of fluid extract.
Tucom.	From the fruit of <i>Astrocaryum vulgare</i> . Habitat, South America. It has a bright red color and an agreeable odor.
Watermelon Seed.	From the seed of <i>Cucurbita Citrullus</i> . Nat. Ord. Cucurbitaceæ. Habitat, Southern Asia. The yield is about 30 per cent.
White Mustard.	From the seed of <i>Sinapis alba</i> . Nat. Ord. Crucifereæ. Habitat, Asia. The yield of oil is about 20 per cent.

ACIDUM OLEICUM. U. S. Oleic Acid.

An organic acid, prepared in a sufficiently pure condition by cooling commercial Oleic Acid to about 5° C. (41° F.), then separating and preserving the liquid portion.

Preparation.—Oleic acid is generally obtained as a by-product in the manufacture of candles from fats, stearic and palmitic acids being the fatty substances sought for by the makers. The crude oleic acid is known as "red oil," the stearic and palmitic acids being separated by cooling the mixture and filtering.

Acidum Oleicum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A yellowish, oily liquid, gradually becoming brown, rancid, and acid when exposed to the air. Sp. gr. 0.900. At 14° C. (57.2° F.) it becomes semi-solid, and remains so until cooled to 4° C. (39° F.), at which temperature it becomes a whitish mass of crystals. When heated to a temperature of about 95° C. (203° F.), the Acid begins to be decomposed, giving off acrid vapors; at a higher temperature it is completely dissipated.	Lard-like odor and taste; when pure, of a neutral reaction; feebly acid reaction in alcoholic solution.	Insoluble.	Completely soluble.	Completely soluble in chloroform, benzol, bensin, oil of turpentine, and fixed and volatile oils.

IMPURITIES.

TESTS FOR IMPURITIES.

More than traces of Palmitic and Stearic Acids.	{	If 1 Gm. of the Acid be heated with 20 C.c. of alcohol, 2 drops of phenolphthalein T.S. added, and then a strong solution (1 in 4) of sodium hydrate, drop by drop, until the liquid has acquired a permanent red tint and the Acid is saponified; next acetic acid added until the red color of the liquid is just discharged, and the liquid filtered,—10 C.c. of the filtrate mixed with 10 C.c. of ether should not be rendered more than slightly turbid by the addition of 1 C.c. of lead acetate T.S.
Fixed Oils.		Equal volumes of the Acid and of alcohol, mixed at the ordinary temperature, should give a clear solution without separating oily drops upon the surface.

Uses.—Oleic acid is used as the basis for the oleates, three of which—oleates of mercury, veratrine, and zinc—are official (see page 341). The oleates are very useful external remedies; they are used in various skin diseases, and also for communicating the constitutional effects of numerous remedies. Oleic acid is more quickly absorbed by the skin than any other similar base.

Unofficial Oleates.

Aluminum Oleate, $Al_2(C_{18}H_{35}O_2)_6$.	By decomposing sodium oleate with aluminum sulphate. It is a semi-solid, of a dark brown color, and has a decidedly astringent action. Used in treating burns, scalds, foul ulcers, etc.
Silver Oleate, $AgC_{18}H_{35}O_2$.	By precipitating sodium oleate with a saturated solution of silver nitrate, washing the precipitate with boiling water, drying it, and reducing to a fine powder. It is of a brownish-yellow color. Used externally.
Arsenic Oleate, $As_2(C_{18}H_{35}O_2)_3$.	By first preparing arsenious chloride by treating metallic arsenic with hydrochloric acid, and then adding sodium oleate and collecting the precipitate. It is of a yellowish color, and has the consistence of butter.
Bismuth Oleate, $Bi(C_{18}H_{35}O_2)_3$.	By dissolving crystallised bismuth nitrate in glycerin, then diluting sodium oleate with water and adding the bismuth solution to the sodium mixture, warming, rejecting the aqueous layer, and, lastly, washing several times with warm water. It is of a white or a yellowish-white color, and has about the consistence of an ointment.
Copper Oleate, $Cu(C_{18}H_{35}O_2)_2$.	By adding sodium oleate to a saturated solution of copper sulphate, then washing the precipitate. It is a handsome, dark green, waxy solid. Used chiefly in the treatment for ringworm.
Iron Oleate (Ferrio), $Fe_2(C_{18}H_{35}O_2)_6$.	By adding sodium oleate to a solution of ferrous sulphate and boiling. It is a dark red, soft, solid oleate. Used locally.
Manganese Oleate.	By adding to a solution of sodium oleate a solution of manganese sulphate, heating gently, and collecting the precipitate. It is of a light gray, slightly pinkish color, having a peculiar odor.
Mercury and Morphine Oleate.	By combining with a gentle heat 40 parts mercuric oleate, 3 parts morphine, and 13 parts oleic acid. It forms a very dark brown, soft solid.
Nickel Oleate.	By adding sodium oleate to a solution of nickel sulphate and collecting the precipitate. It is a green, amorphous, waxy substance. Used locally as an astringent.

Unofficial Oleates.—Continued.

Lead Oleate, $\text{Pb}(\text{C}_{18}\text{H}_{33}\text{O}_2)_2$.	By adding a clear solution of lead acetate to a solution of sodium oleate, boiling and washing the precipitate several times. It has the appearance of lead plaster (somewhat lighter in color).
Sodium Oleate.	By dissolving 1 part of pure Castile soap in 8 parts of hot water, cooling, and filtering from deposited sodium palmitate: the filtrate contains sodium oleate.
Tin Oleate.	By adding a solution of tin chloride to a solution of sodium oleate and collecting the precipitate. It has a grayish-yellow color, a soft consistence, and a decided metallic taste.

ACIDUM STEARICUM. U. S. Stearic Acid.

An organic acid, in its commercial, more or less impure form, usually obtained from the more solid fats, chiefly tallow.

This has been introduced in the U. S. P. 1890 solely because of its usefulness in making glycerin suppositories. It is a hard, white, somewhat glossy solid, odorless and tasteless, and permanent in the air. Insoluble in water; soluble in about 45 parts of alcohol at 15° C. (59° F.); readily soluble in boiling alcohol, and in ether. Stearic Acid, when pure, melts at 69.2° C. (156.6° F.). The commercial acid should have a melting point not lower than 56° C. (132.8° F.), and the melted acid should not become opaque and begin to congeal at a temperature lower than 54° C. (129.2° F.). If 1 Gm. of Stearic Acid and 1 Gm. of sodium carbonate be boiled with 30 C.c. of water, in a capacious flask, the resulting solution, while hot, should not be more than opalescent (limit of *undecomposed fat*).

Uses.—See Suppositoria Glycerini, Part VI.

GLYCERINUM. U. S. Glycerin.

A liquid obtained by the decomposition of vegetable or animal fats or fixed oils, and containing not less than 95 per cent. of absolute Glycerin $[\text{C}_3\text{H}_5(\text{OH})_3]$; 91.79].

Preparation.—This valuable liquid has been made in several ways. It is usually obtained—1. Through the saponification of fats and oils in making soap or lead plaster. 2. By the decomposition of fats and oils through pressure and superheated steam. Glycerin came into use in medicine and pharmacy about 1846, and it was first obtained on a commercial scale from the washings of lead plaster by Robert Shoemaker, of Philadelphia. In making the plaster, litharge, olive oil, and water are boiled together, when the olein of the oil is decomposed by the lead oxide, according to the following reaction :

The plaster, while still hot and in the liquid state, contains glycerin diffused through it. When the liquid plaster is mixed with an equal measure of boiling water, and the mixture stirred briskly, a solution of glycerin is obtained, which, after having been decanted, and evaporated to a limited extent, is freed from lead by hydrosulphuric acid. The liquid is then filtered to separate lead sulphide, heated to free it from hydrosulphuric acid, and finally evaporated to expel the water.

The process most frequently used for making glycerin originated with R. A. Tilghman, of this city, and consists in subjecting fatty bodies to the action of water at a high temperature under pressure, whereby the fats, which are *glycerides* or ethers of the fatty acids, are broken up into glycerin and fatty acids, the water supplying the elements of hydrogen and oxygen necessary for that change. The reaction is as follows in the case of a fat like stearin :

Glycerinum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A clear, colorless liquid, of syrupy consistence, oily to the touch. When exposed to the air it slowly abstracts moisture. Its sp. gr. should not be less than 1.250 at 15° C. (59° F.).	Odorless; very sweet and slightly warm to the taste; neutral action.	In all proportions.	In all proportions.	Soluble in a mixture of 3 parts of alcohol and 1 part of ether; insoluble in ether, chloroform, benzol, fixed oils, volatile oils, carbon disulphide, and benzin.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
In solution with water it is slowly vaporized, with steam, at 100° C. (212° F.); exposed alone to higher temperature, it yields acrid decomposition products of a characteristic odor, and at 165° C. (329° F.) it boils and is decomposed. If a fused bead of borax, on a loop of platinum wire, be moistened with Glycerin and held in the non-luminous flame, the latter will be transiently tinted deep green.	<p>Sugars and Dextrin, which leave a porous coal.</p> <p>Sugars.</p> <p>Fixed Impurities.</p> <p>Metals, Sulphuric or Oxalic Acid, or Calcium Salts.</p> <p>Readily Carbonisable Impurities.</p> <p>Fatty Acids, etc.</p> <p>Chlorides, and Impurities having Reducing Properties.</p>	<p>A small portion of Glycerin, when heated in a small, open porcelain or platinum capsule, upon a sand-bath, until it boils, and then gently ignited, should burn and vaporize so as to leave not more than a dark stain.</p> <p>If 5 C.c. of Glycerin be mixed with 50 C.c. of water and 10 drops of hydrochloric acid, in a small flask, and heated for half an hour on a boiling water-bath, then 10 C.c. of the hot liquid mixed with 2 C.c. of sodium hydrate T.S. and 1 C.c. of alkaline cupric tartrate V.S., no yellowish-red cloudiness or precipitate should appear within six hours.</p> <p>After full combustion of Glycerin no residue should be left.</p> <p>If Glycerin is diluted with 10 times its volume of distilled water, portions should give no precipitates or colors when treated with hydrogen sulphide or ammonium sulphide T.S., barium chloride T.S., calcium chloride T.S., or ammonium oxalate T.S.</p> <p>On gently warming a mixture of equal volumes of Glycerin and of concentrated sulphuric acid, in a test-tube, the liquid should not acquire a dark color.</p> <p>On gradually heating 5 C.c. of Glycerin with 3 C.c. of diluted sulphuric acid, in a test-tube, short of boiling, no offensive or acidulous odor should be evolved.</p> <p>If a mixture of 2 C.c. of Glycerin with 10 C.c. of water, contained in a perfectly clean, glass-stoppered cylinder, be heated for five minutes in a water-bath at a temperature of 60°-65° C. (140°-149° F.), then mixed with 10 drops of silver nitrate T.S., and the cylinder set aside, well stoppered, in diffused daylight, no change of transparency or color should occur in the mixture within five minutes.</p>

Chemically, glycerin belongs to the class of alcohols, and is sometimes termed *glycerol*, or *glyceric alcohol*. It is the hydrate of the radical glyceryl C_3H_5 , is triatomic, and one, two, or three of the hydrogen atoms may be replaced by monad radicals. When glycerin is acted on by nitric acid, *nitro-glycerin*, a powerful explosive, is formed. This has been used medicinally in small doses. It is sometimes called *glonoin* and *trinitrine*. (See *Spiritus Glonoini*.)

Uses.—Glycerin is one of the most valuable liquids known to pharmacy. It is a solvent and antiseptic, scarcely inferior to alcohol. It is useful in keeping substances moist, owing to its tendency to absorb water from the air. Its agreeable taste and non-poisonous properties adapt it for many purposes. Its varied uses have been constantly referred to in the preceding pages.

SAPO. U. S. Soap. [WHITE CASTILE SOAP.]

Soap prepared from soda and olive oil.

Preparation.—Soap is made by boiling fats or oils with a solution of caustic alkali until a thick mass is formed. Then, by evaporating the water, or by adding solution of common salt, the soap is separated and caused to rise to the surface: when it has ceased to froth in boiling, it is

Soap-cutter.

ladled out into wooden frames to congeal, after which it is cut into bars by means of a wire. The soap, as first separated, is called *grain soap*. Fig. 356 shows a useful soap-cutter made by the Woodward Lock Company, Clinton, Wisconsin. The "soap-dust" and chip-pings from Castile soap are a very convenient form for use in making soap liniment, etc. Toilet soap is made by *milling* grain soap, or cutting it into small pieces; perfume is then added, thoroughly mixed, and the mixture forced by a plotting-machine through an aperture,

which forms it into rolls and cuts it into pieces. These are then moulded.

The officinal soap is known as Castile soap. The soaps in general use are made from animal fat, chiefly tallow. Soaps are made hard by using a fat containing much stearin, like tallow, and soda for the alkali; they are made soft by using fats containing a large proportion of olein, and potassa for the alkali. When fats and oils undergo *saponification* by reaction with a salifiable base, the olein, palmitin, and stearin present are decomposed into stearic, palmitic, and oleic acids, which unite with the base to form the soap, and into glycerin, which is set free.

Soaps are divided into two classes, soluble and insoluble. The soluble soaps are combinations of the fatty acids with soda, potassa, and ammonia; those which are insoluble consist of the same acids united with earths and metallic oxides. The soluble soaps only are detergent, and to these the name *soap* is usually applied. Several of the insolu-

ble soaps are employed in pharmacy : as, for example, the soap of lead monoxide (litharge), or lead plaster, and the soap of lime, or lime liniment. (See *Emplastrum Plumbi* and *Linimentum Calcis*.) The two official soaps are of the soluble kind. One is a soda soap, made with olive oil (*Castile soap*), the other a potassa soap (*Sapo Viridis*). The soap of ammonia is noticed elsewhere. (See *Linimentum Ammoniae*.)

Sapo. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
A white or whitish solid, hard, yet easily cut when fresh.	Slight, peculiar odor, free from rancidity; disagreeable, alkaline taste; alkaline reaction.	Readily soluble.	Readily soluble.
		More readily with the aid of heat.	

IMPURITIES.	TESTS FOR IMPURITIES.
An undue amount of Water.	<p>On placing a small, weighed portion of Soap, together with about 10 C.c. of alcohol, in a tared beaker containing sand, evaporating the resulting solution of the Soap to dryness, and drying the residue at 110° C. (230° F.), the loss of weight should not exceed 36 per cent.</p> <p>The aqueous solution of Soap should remain unaffected on the addition of hydrogen sulphide or ammonium sulphide T.S.</p> <p>If a solution of 5 Gm. of Soap in 50 C.c. of water be mixed with 3 C.c. of decinormal oxalic acid V.S., the subsequent addition of a few drops of phenolphthalein T.S. should produce no pink or red tint.</p> <p>On dissolving 20 Gm. of Soap in alcohol, with the aid of heat, transferring the undissolved residue, if any, to a filter, and washing it thoroughly with boiling alcohol, it should, after drying, weigh not more than 0.6 Gm.</p> <p>And at least 0.4 Gm. of the residue should be soluble in water.</p> <p>A hot four-per-cent. alcoholic solution of soap should not gelatinize on cooling.</p>
Metals.	
Alkalinity.	
Sodium Carbonate, etc.	
Silica and other Accidental Impurities.	
Animal Fats.	

Uses.—Soap is a laxative and antacid ; it is used in pill masses, in combination with resins, to render them soluble and to modify their harsh action. It is also used in liniments, plasters, cerates, etc.

Official Preparations.

- Emplastrum Saponis** . . . Made by rubbing 100 Gm. of powdered soap with water until semi-liquid, and then incorporating with 900 Gm. of melted lead plaster. (See *Emplastra*.)
- Linimentum Saponis** . . . Dissolve 45 Gm. of camphor in 750 C.c. of alcohol, then add 70 Gm. of powdered soap and 10 C.c. of oil of rosemary, shake well, and add sufficient water to make 1000 C.c. (see page 340).

SAPO MOLLIS. U. S. Soft Soap.

[SAPO VIRIDIS, PHARM. 1890. GREEN SOAP.]

	Metric.	Old form.
Linseed Oil	400 Gm.	40 oz. av.
Potassa	90 Gm.	9 oz. av.
Alcohol	40 C.c.	4 fl. oz.
Water, a sufficient quantity.		

Heat the Linseed Oil in a deep, capacious vessel, on a water-bath or steam-bath, to a temperature of about 60° C. (140° F.). Dissolve the

Potassa in 450 C.c. [old form 3 pints] of Water, add the Alcohol, and then gradually add the mixture, constantly stirring, to the Oil, continuing the heat until a small portion of the mixture is found to be soluble in boiling Water without the separation of oily drops. Then allow the mixture to cool, and transfer it to suitable vessels.

The Potassa used in this process should be of the full strength directed by the Pharmacopœia (90 per cent.). Potassa of any other strength, however, may be used, if a proportionately larger or smaller quantity be taken, the proper amount for the above formula being ascertained by dividing 8100 by the percentage of absolute Potassa (potassium hydrate) contained therein.

This is a soft soap, and is generally imported from Germany: it is made from various oils which contain but little stearin. It is a soft, unctuous mass, of a yellowish-brown or brownish-yellow color. It is soluble in about 5 parts of hot water to a nearly clear liquid; also in 2 parts of hot alcohol without leaving more than 3 per cent. of insoluble residue.

Uses.—Green soap is used in skin diseases, chiefly in eczema.

Official Preparation.

Linimentum Saponis Mollis. Made by dissolving 650 Gm. of soft soap and 20 C.c. of oil of lavender flowers in sufficient alcohol to make 1000 Cc. (see page 341). Used externally.

Unsaponifiable Fats and Petroleum Products.

Under this head will be found two official products which cannot be classed properly with either the fixed or the volatile oils, yet which in some respects partake of the properties of both. Petrolatum, paraffin, and benzin are products from petroleum, and are hydrocarbons belonging to the marsh-gas series.

PETROLATUM LIQUIDUM. U.S. Liquid Petrolatum.

A mixture of hydrocarbons, chiefly of the marsh-gas series, obtained by distilling off the lighter and more volatile portions from petroleum, and purifying the residue when it has the desired consistence.

Liquid Petrolatum is a purified residual liquid obtained in distilling petroleum (see *Petrolatum Molle*).

Petrolatum Liquidum. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A colorless, or more or less yellowish, oily, transparent liquid, giving off, when heated, a faint odor of petroleum. Specific gravity about 0.875 to 0.945 at 15° C. (59° F.). When heated on platinum, Liquid Petrolatum is completely volatilized without emitting any acrid vapors.	Odorless and tasteless; neutral reaction.	Insoluble.	Cold, Scarcely. Hot, Scarcely.	Readily in ether, chloroform, carbon disulphide, oil of turpentine, benzin, benzol, and fixed and volatile oils.

TEST.	IMPURITY.	TEST FOR IMPURITY.
If 2 volumes of concentrated sulphuric acid be added to 1 volume of Liquid Petrolatum, in a test-tube placed in hot water, and the contents occasionally agitated during fifteen minutes, the acid should not acquire a deeper tint than brown, nor lose its transparency (limit of readily carbonisable organic impurities).	Fixed Oils or Fats of Animal or Vegetable Origin, or Resin.	If 5 Gm. of Liquid Petrolatum be digested, for half an hour, with 5 Gm. of sodium hydrate and 25 C.c. of water, and the aqueous layer separated, and supersaturated with sulphuric acid, no oily substance should separate.

Uses.—Liquid petrolatum is used as a basis for medicinal unctuous preparations.

PETROLATUM MOLLE. U. S. Soft Petrolatum.

[PETROLATUM, PHARM. 1880. SOFT PETROLEUM OINTMENT.]

A mixture of hydrocarbons, chiefly of the marsh-gas series, obtained by distilling off the lighter and more volatile portions from petroleum, and purifying the residue when it has the desired melting point. When Petrolatum is prescribed or ordered without further specification, Soft Petrolatum (*Petrolatum Molle*) is to be dispensed.

Preparation.—The “residuums,” as they are termed technically, which are obtained in the distillation of petroleum, are purified by first melting and then percolating them through recently burned bone-black; this abstracts the odor and the color. The consistency is varied by mixing them with certain portions of the harder paraffins and stirring them until a homogeneous mixture is made.

It is a fat-like mass, of about the consistence of an ointment, varying from white to yellowish or yellow, more or less fluorescent when yellow, especially after being melted, transparent in thin layers, completely amorphous, and without odor or taste, or giving off, when heated, a faint odor of petroleum. If a portion of Soft Petrolatum be liquefied, and brought to a temperature of 60° C. (140° F.), it will have a specific gravity of about 0.820 to 0.840. The melting point of Soft Petrolatum ranges between about 40° and 45° C. (104° and 113° F.). In other respects Soft Petrolatum has the characteristics of, and should respond to the tests given under, Liquid Petrolatum (see *Petrolatum Liquidum*).

Uses.—Petrolatum is used as a basis for ointments, for which it is well adapted. It is known commercially as *cosmoline*, *vaseline*, *petrolina*, *deodorolina*, etc.

PETROLATUM SPISSUM. U. S. Hard Petrolatum.

[PETROLATUM, PHARM. 1880. HARD PETROLEUM OINTMENT.]

A mixture of hydrocarbons, chiefly of the marsh-gas series, obtained by distilling off the lighter and more volatile portions from petroleum, and purifying the residue when it has the desired melting point.

Hard petroleum has been introduced into the U. S. P. 1890 with a view of furnishing a petroleum of firmer consistence than can be had in liquid or soft petroleum. It is a fat-like mass, of about the consistence of a cerate, varying from white to yellowish or yellow, more or less fluorescent when yellow, especially after being melted, transparent in thin layers, completely amorphous, and without odor or taste,

or giving off, when heated, a faint odor of petroleum. If a portion of Hard Petrolatum be liquefied, and brought to a temperature of 60° C. (140° F.), it will have a specific gravity of about 0.820 to 0.850. The melting point of Hard Petrolatum ranges between about 45° and 51° C. (113° and 125° F.). In other respects Hard Petrolatum has the characteristics of, and should respond to the tests given under, Liquid Petrolatum (see *Petrolatum Liquidum*).

Hard *paraffin*, or *paraffin wax*, is a solid, white, diaphanous substance resembling white wax, which is made by distilling the residuum obtained from the refiners of petroleum and collecting and purifying the distillate.

Paraffin, in its pure condition, is a white, waxy, inodorous, tasteless substance, harder than tallow, softer than wax, with a specific gravity of 0.877. Its melting point is variable, depending somewhat upon its origin. It ranges between 43° C. and 65° C. (109° F. and 151° F.). It is insoluble in water, is indifferent to the most powerful acids, alkalies, and chlorine, and can be distilled unchanged with strong oil of vitriol. Warm alcohol, ether, oil of turpentine, olive oil, benzol, chloroform, and carbon disulphide dissolve it readily. It can be mixed in all proportions with wax, stearin, palmitin, and resin, but it is difficult to prevent the mixtures from "granulating," even after prolonged stirring.

BENZINUM. U. S. Benzin.

[PETROLEUM BENZIN. PETROLEUM ETHER.]

A purified distillate from American petroleum, consisting of hydrocarbons, chiefly of the marsh-gas series [C_5H_{12} , C_6H_{14}], and homologous compounds. Benzin should be carefully kept in well-stoppered bottles or tin cans, in a cool place, remote from lights or fire.

Benzinum. U. S.	ODOR AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A transparent, colorless, diffusive liquid. It is highly inflammable, and its vapor, when mixed with air and ignited, explodes violently. Sp. gr. 0.670 to 0.675.	Strong, characteristic odor, slightly resembling that of petroleum, but much less disagreeable; neutral reaction.	Insoluble.	6 parts.	Readily soluble in ether, chloroform, benzol, and fixed and volatile oils.

TEST FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
It should require 6 parts of official alcohol to dissolve Benzin (difference from benzol).	Heavy Hydrocarbons.	Benzin, when evaporated upon the hand, should leave no odor, and, when evaporated in a warmed dish, should leave no residue. When Benzin is boiled a few minutes with one-fourth its volume of spirit of ammonia and a few drops of silver nitrate T.S., the ammoniacal liquid should not turn brown. If 5 drops of Benzin be added to a mixture of 40 drops of sulphuric acid with 10 drops of nitric acid, in a test-tube, the liquid warmed for about ten minutes and set aside for half an hour, and then diluted, in a shallow dish, with water, it should not evolve the bitter-almond like odor of nitro-benzol.
	Pyrogenous Products and Sulphur Compounds.	
	Benzol.	

Uses.—Benzin is a useful solvent for fats, resins, oils, caoutchouc, and similar bodies. It is not identical with benzol, the product obtained in the destructive distillation of coal (see page 789).

Unofficial Petroleum Products.

Ceresin. (Ozokerite.) (Earth-wax.)	A natural mineral product introduced into commerce as a substitute for wax. Sp. gr. 0.753 at 98° C.
Kandol. Canadol.	A very volatile fraction of petroleum. Used for rapidly freezing skin and subdermal tissues.
Ligroïne. Ligroïne.	A petroleum product, boiling between 80° C. and 120° C. Chiefly used as a solvent.
Rhigolène.	A very light, inflammable liquid, boiling at about 18° C. (64.4° F.). Used for producing cold by evaporation.

QUESTIONS ON CHAPTER LVIII.

FIXED OILS, FATS, AND SOAPS.

- Fixed oils and fats—Whence are they obtained?
 What are their general properties, solubilities, etc.?
 What is their specific gravity?
 What change takes place upon exposure to air?
 How may oils which have become rancid often be purified?
 What are fixed oils and fats, chemically?
 In most cases, of what do they consist?
 What are these proximate principles sometimes termed?
 To what is the consistence of fixed oils and fats due?
 Why is almond oil liquid and tallow solid at ordinary temperatures?
 Chemically considered, what is olein? What is its formula in symbols?
 How may it be obtained?
 What are the physical properties of olein?
 How does palmitic acid occur?
 Chemically, what is palmitin?
 Stearin—Where is it found, and how is it made?
 How may it be obtained pure? Describe odor, taste, and chemical reaction.
 What is its melting-point?
 Of what does it consist, and how has it been formed synthetically?
 Margarin—What has the substance long known under this name been shown to be?
 How has margaric acid been obtained?
 Stearic acid—What is the formula in symbols?
 Describe odor, taste, and chemical reaction. For what is it used?
 Palmitic acid—What is the formula in symbols?
 What is its form? Its melting-point?
 Oleic acid—What is the formula in symbols?
 Describe odor, taste, and chemical reaction.
 At what temperature does it crystallize?
 Sweet almond—What is the Latin name? What does it contain?
 How does the fixed oil form an emulsion by simple trituration of the almond with water? What are its official preparations?
 Expressed oil of almond—What is the Latin name?
 Whence and how is this oil obtained?
 How much oil does sweet almond yield?
 How much oil does bitter almond yield?
 How may a colorless oil be obtained?
 What is its specific gravity? Describe odor, taste, chemical reaction, and solubility. Of what does it principally consist?
 At what temperature does it congeal?

- How may it be distinguished from most other fixed oils?
 For what is it used?
 Olive oil—Whence is it obtained?
 Is commercial olive oil believed to be usually pure?
 Can its purity be ascertained easily? What is its specific gravity?
 Describe odor, taste, chemical reaction, and solubility.
 How may impurities of other fixed oils of similar physical properties be detected?
 What are its uses?
 Cotton seed oil—Whence is it obtained, and where is it made?
 How much oil does cotton seed contain? What is its specific gravity?
 Describe odor, taste, chemical reaction, and solubility.
 At what temperature does it begin to congeal?
 What effect does concentrated sulphuric acid have upon it?
 For what is it used?
 Oil of sesamum—What is its synonyme? Whence is it obtained?
 What are its constituents? What is its specific gravity?
 Describe odor, taste, chemical reaction, and solubility.
 At what temperature does it congeal?
 What effect does concentrated sulphuric acid have upon it?
 What are its uses?
 Oil of linseed—What is the Latin name? What is its synonyme?
 How is it prepared?
 Of what does it consist?
 To what does it owe its drying property? What is its specific gravity?
 Describe odor, taste, chemical reaction, and solubility.
 At how low a temperature does it remain liquid?
 What is the dose?
 Pumpkin seed—What is the Latin official name? Whence is it derived?
 What are its constituents?
 For what is it used, and in what form?
 How is the fixed oil obtained?
 Castor oil—Whence is it derived?
 In what four ways has castor oil been obtained?
 Which method produces the best oil?
 What is the specific gravity?
 Describe odor, taste, chemical reaction, and solubility.
 At what temperature does it congeal?
 What does it contain?
 To what is the purgative action due? How is this shown?
 What is the dose?
 Croton oil—What is the Latin official name? Whence is it derived?
 How is it prepared? What is the specific gravity?
 Describe odor, taste, chemical reaction, and solubility.
 What effect does it produce when applied to the skin?
 Have the active principles been isolated?
 What acids have been detected as having been formed by the decomposition of the fatty substances present?
 What is the chemical composition of crotonol?
 What is the dose?
 Oil of theobroma—What is the Latin name? What is its synonyme?
 Whence is it derived? How is it made? What is the yield of oil?
 Describe odor, taste, and chemical reaction. What is its melting-point?
 How may its purity be tested?
 What are its chemical constituents?
 For what is it used?
 Lycopodium—What is lycopodium?
 What does it contain? What are its uses?
 Oleic acid—What is the Latin name?
 Give the formula in symbols and molecular weight.
 How is it obtained?
 What is "red oil"? What is the specific gravity?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 How may the following impurities be detected?—viz.: More than traces of palmitic and stearic acids; fixed oils.
 What are its uses? Why is it especially useful?

Glycerin—What is its percentage of absolute glycerin?

What is the chemical composition of absolute glycerin?

How is glycerin obtained?

Explain the reaction which takes place in making lead plaster.

What is Tilghman's process for making it?

Explain the reaction which takes place in making glycerin by this process from stearin.

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Butyric acid; cane-sugar; sugars and dextrin, which leave a porous coal; sugars; metallic salts; acrylic, hydrochloric, sulphuric, or oxalic acid, iron, or calcium salts.

Chemically, to what class does glycerin belong, and what is it sometimes called?

What is its atomicity? What are its uses?

Soap—What is the Latin name? What is its synonyme?

What is its definition?

How is it made? What is grain soap?

How may it be purified?

How is toilet soap made?

What is the difference between hard soaps and soft soaps?

What change takes place when fats and oils undergo saponification?

What is the difference between soluble and insoluble soaps?

What are the two official soaps, and to which class do they belong?

What insoluble soaps are employed in pharmacy?

Describe its odor, taste, chemical reaction, and solubility.

How may the following impurities be detected?—viz.: An undue amount of water; animal fat; sodium carbonate; silica and other accidental impurities; metals.

What are its medicinal properties?

What are its uses? What are its official preparations?

Soft soap—What is the Latin official name? What was its name in the U. S. P. 1880 in Latin? in English?

How and where is it usually made?

Describe its odor, taste, chemical reaction, and solubility.

How may the following impurities be detected?—viz.: An undue amount of water; free fats; insoluble carbonates; starch.

For what is it used? What is its official preparation?

Petrolatum—What is petrolatum? How many kinds of petrolatum are official?

How are they prepared? What are their melting-points?

When petrolatum is ordered, its melting-point not being specified, which variety is to be dispensed?

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Fixed oils or fats of vegetable or animal origin, or resin; readily carbonized organic impurities.

What is its use? By what names is it known commercially?

What is paraffin? What is its specific gravity?

Describe odor, taste, chemical reaction, and solubility.

What effect has strong sulphuric acid upon it?

Can it be mixed readily with wax, resin, stearin, etc.?

Does it make a smooth mixture?

Benzin—Give the Latin name and synonyme. What is benzin?

What is its specific gravity? What is its boiling-point?

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—Heavy hydrocarbons; pyrogenous products and sulphur compounds; benzol.

For what is it used?

Is it identical with benzol?

CHAPTER LIX.

DRUGS CONTAINING GLUCOSIDES OR NEUTRAL PRINCIPLES, WITH THEIR PREPARATIONS.

GLUCOSIDES are bodies mostly found in plants, yielding glucose, $C_6H_{12}O_6$, as one of their products of decomposition when heated in contact with a diluted mineral acid and water. The other product which is formed at the same time differs in character from the original glucoside. Thus, *Salicin*, if boiled with diluted sulphuric acid, yields dextro-glucose and *saligenin*, or *saligenol*.

Glucosides may sometimes be split into glucose and the derived product by heating them with baryta water or alkaline solutions, by nitrogenous principles, which act as ferments, like *emulsin* or *synaptase*, or by treatment with yeast ferment or *ptyalin* found in saliva.

Glucosides are sometimes the active principles of the plants in which they are found, but they are more frequently associated with resins, oils, alkaloids, and bitter principles, and for this reason they have not been used to form a separate group for classification in this work: frequent mention, however, will be made of them when the occasion arises, in connection with the drug containing them, and the official drugs containing neutral principles have been classed with them.

The following list gives a view of some of the glucosides, with their derivatives:

Glucosides.

GLUCOSIDE.	SOURCE.	DERIVATIVE.
<i>Æsculin</i> , $C_{21}H_{32}O_{12}$.	From <i>Æsculus Hippocastanum</i> .	<i>Æsculetin</i> .
<i>Amygdalin</i> , $C_{20}NH_{27}O_{11}$.	From <i>Amygdalus communis</i> .	Oil of bitter almond and hydrocyanic acid.
<i>Arbutin</i> , $C_{12}H_{16}O_7$.	From <i>Uva Ursi</i> and other <i>Ericaceæ</i> .	Hydrokinone and methylhydrokinone.
<i>Bryonin</i> , $C_{48}H_{80}O_{18}$.	From <i>Bryonia alba</i> and <i>B. dioica</i> .	<i>Bryoretin</i> and hydrobryoretin.
<i>Colocyntin</i> , $C_{46}H_{80}O_{22}$.	From <i>Citrullus colocynthis</i> .	<i>Colocynthein</i> .

Jalapin, $C_{20}H_{112}O_{22}$.	From <i>Ipomoea Jalapa</i> .	Jalapinol.
Ononin, $C_{20}H_{34}O_{12}$.	From <i>Ononis spinosa</i> .	Formonetin.
Phillyrin, $C_{27}H_{34}O_{11}$.	From <i>Phillyria latifolia</i> .	Phillygenin.
Phlorizin, $C_{21}H_{34}O_{10}$.	From the bark of the pear, apple, cherry, and plum tree.	Phloretin.
Pinipterin, $C_{22}H_{36}O_{11}$.	From <i>Thuja occidentalis</i> .	Ericinol.
Populin, $C_{20}H_{32}O_7$.	From different species of <i>Populus</i> .	Benzoic acid, saliretin.
Prophetin, $C_{22}H_{36}O_7$.	From <i>Cucumis prophetarum</i> .	Propheretin.
Queroitrin, $C_{26}H_{38}O_{20}$.	From <i>Quercus tinctoria</i> .	Quercetin.
Quinovin, $C_{30}H_{48}O_8$.	From the bark of Cinchonas.	Quinovic acid.
Salicin, $C_{13}H_{18}O_7$.	From different species of <i>Salix</i> and <i>Populus</i> .	Saligenin.
Santonin, $C_{15}H_{18}O_2$.	From <i>Artemisia maritima</i> .	Santoniretin.
Saponin, $C_{27}H_{54}O_{18}$.	From <i>Saponaria officinalis</i> .	Saponetin.
Thujin, $C_{20}H_{32}O_{12}$.	From <i>Thuja occidentalis</i> .	Thujigenin and thuje-
Xanthorhamnin, $C_{23}H_{32}O_{14}$.	From <i>Rhamnus amygdalinus</i> .	tin. Rhamnetin.

GENTIANA. U. S. Gentian.

The root of *Gentiana lutea* Linné (nat. ord. *Gentianeæ*).

Gentian contains the glucoside *gentiopicrin* (which splits, when heated with dilute acids, into gentiogenin and grape-sugar), *gentisic* acid, $C_{14}H_{10}O_5$, pectin, sugar (gentianose), and a little fixed oil. A dark-green coloration is produced when a ferric salt is added to a preparation of gentian: this is said to be due to the reaction with gentisic acid; if the preparation is treated with ferric hydrate, and then filtered, the tendency to become discolored is lost. Gentian is a bitter tonic.

Official Preparations.

- Extractum Gentiane Fluidum** . Made with a menstruum of diluted alcohol (see page 407).
Fluid Extract of Gentian. Dose, ten to thirty minims (0.6 to 1.8 C.c.).
- Extractum Gentiane** An aqueous extract made with cold water (see page 449).
Extract of Gentian. Dose, ten to thirty grains (0.6 to 1.9 Gm.).
- Tinctura Gentiane Composita** . Made by mixing 100 Gm. of gentian, 40 Gm. of bitter orange peel, and 10 Gm. of cardamom together, and percolating with a menstruum made by mixing 3 parts of alcohol with 2 parts of water to obtain 1000 C.c. (see page 368). Dose, one to two fluidrachms (3.7 to 7.4 C.c.).

CALUMBA. U. S. Calumba. [COLUMBO.]

The root of *Jateorhiza palmata* (Lamarck) Miens (nat. ord. *Menispermaceæ*).

This African root owes its virtues to *colombin*, $C_{21}H_{22}O_7$, and *berberine*, both of which are very bitter; starch and colombic acid are present, with a mucilage which is often troublesome by interfering with per-

colating operations. Calumba must not be in very fine powder if it is to be percolated with diluted alcohol. It is a bitter tonic.

Official Preparations.

- Extractum Calumbæ Fluidum** . Made with a menstruum of 3 parts of alcohol and 1 part of water; the calumba in No. 20 powder (see page 398).
Fluid Extract of Calumba. Dose, fifteen to thirty minims (0.9 to 1.8 C.c.).
- Tinctura Calumbæ** Made by percolating 100 Gm. of calumba, in No. 20 powder, with sufficient menstruum, consisting of 3 parts of alcohol and 2 parts of water, to make 1000 C.c. (see page 362).
Tincture of Calumba. Dose, one to two fluidrachms (3.7 to 7.4 C.c.).

QUASSIA. *U. S.* Quassia.

The wood of *Picroza excelsa* (Swartz) Lindley (nat. ord. *Simarubæ*).

Quassia contains *quassin*, $C_{10}H_{12}O_8$, which is intensely bitter, and soluble in both alcohol and water; there are also present resin, mucilage, etc. It is a bitter tonic.

Official Preparations.

- Extractum Quassie Fluidum** . Made with a menstruum of 1 part of alcohol and 2 parts of water (see page 418). Dose, five to ten minims (0.3 to 0.6 C.c.).
Fluid Extract of Quassia.
- Extractum Quassie** An aqueous extract, made with cold water (see page 456).
Extract of Quassia. Dose, one to two grains (0.06 to 0.13 Gm.).
- Tinctura Quassie** Made by percolating 100 Gm. of quassia with a menstruum of 35 parts of alcohol and 65 parts of water to obtain 1000 C.c. (see page 375). Dose, one-half to one fluidrachm (1.7 to 3.4 C.c.).
Tincture of Quassia.

CHIRATA. *U. S.* Chirata.

The entire plant, *Suertia Chirata* Hamilton (nat. ord. *Gentianeæ*).

Chirata contains a bitter glucoside, *chiratin*, $C_{28}H_{48}O_{15}$, and a very bitter principle, ophelic acid, $C_{13}H_{22}O_{10}$. It is used as a tonic and febrifuge.

Official Preparations.

- Extractum Chiratæ Fluidum** . Made with a menstruum prepared by mixing 2 parts of alcohol to 1 part of water (see page 400). Dose, half a fluidrachm (1.8 C.c.).
Fluid Extract of Chirata.
- Tinctura Chiratæ** Made by percolating 100 Gm. of chirata with sufficient menstruum, made by mixing 65 parts of alcohol to 35 parts of water to make 1000 C.c. (see page 364). Dose, one to two fluidrachms (3.7 to 7.4 C.c.).
Tincture of Chirata.

SALICINUM. *U. S.* Salicin.

A neutral principle obtained from several species of *Salix* and *Populus* (nat. ord. *Salicaceæ*).

Preparation.—A boiling concentrated decoction of the bark is treated with lead oxide until it becomes nearly colorless. Gum, tannin, and extractive matter, which would impede the crystallization of the salicin, are thus removed from the liquid; while a portion of the oxide is dissolved in combination probably with the salicin. To separate this portion of oxide, sulphuric acid is first added, and then barium sulphide, and the liquor is filtered and evaporated. Salicin is deposited, and may be purified by repeated solution and crystallization. It is a glucoside, splitting into saligenin and sugar under the influence of dilute acids and heat.

Salicinum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Colorless or white, silky, shining crystalline needles, or a crystalline powder, permanent in the air. When heated to 198° C. (388.4° F.), Salicin melts, yielding a colorless liquid, which, on cooling, congeals to a crystalline mass. Upon ignition it is consumed, leaving no residue.	Odorless; very bitter taste; neutral reaction.	At 15° C. (59° F.), 28 parts. Boiling, 0.7 part.	At 15° C. (59° F.), 30 parts. Boiling, 2 parts.	Almost insoluble in ether or chloroform.
TESTS FOR IDENTITY.		IMPURITIES. TEST FOR IMPURITIES.		
On heating a small portion of Salicin, in a test-tube, until it turns brown, then adding a few C.c. of water, and afterwards a drop of ferric chloride T.S., a violet color will be produced. Cold, concentrated, sulphuric acid dissolves Salicin with a red color; the solution, after the addition of water, becomes colorless, and deposits a dark red powder, insoluble in water or alcohol. On heating a small portion of Salicin with 1 C.c. of potassium dichromate T.S. and 2 C.c. of sulphuric acid, the odor of salicylic aldehyde (or of oil of meadow-sweet, <i>Spiræa ulmaria</i> , Linné, nat. ord. <i>Rosaceæ</i>) will become noticeable.		Alkaloids. { The aqueous solution of Salicin is not precipitated by tannic or picric acid, nor by mercuric potassium iodide T.S.		

Uses.—Salicin is used as a febrifuge, in doses of twenty to thirty grains (1.3 to 1.9 Gm.).

TARAXACUM. U. S. Taraxacum. [DANDELION.]

The root of *Taraxacum officinale* Weber (nat. ord. *Compositæ*), gathered in autumn.

Taraxacum owes its bitterness to *taraxacin*, $C_8H_{16}O$, an acrid crystalline principle, soluble in alcohol and water. It also contains pectin, sugar, resin, gum, etc.

Official Preparations.

Extractum Taraxaci Fluidum. Made with a menstruum of diluted alcohol (see page 426).

Fluid Extract of Taraxacum. Dose, one to three fluidrachms (3.7 to 7.4 C.c.).

Extractum Taraxaci An inspissated juice from fresh taraxacum (see page 457).

Extract of Taraxacum. Dose, thirty to sixty grains (1.9 to 3.8 Gm.).

LAPPA. U. S. Lappa. [BURDOCK.]

The root of *Arctium Lappa* Linné, and of some other species of *Arctium* (nat. ord. *Compositæ*).

Lappa contains a bitter substance, inulin, sugar, mucilage, etc.

Official Preparation.

Extractum Lappæ Fluidum. Made with a menstruum of diluted alcohol (see page 412).

Fluid Extract of Lappa. Dose, thirty to sixty minims (1.8 to 3.7 C.c.).

SCILLA. U. S. Squill.

The bulb of *Urginea maritima* (Linné) Baker (nat. ord. *Liliacæ*), deprived of its dry, membranaceous outer scales, and cut into thin slices, the central portions being rejected.

Squill contains the bitter principle *scillipicrin*, *scillitoxin*, *scillin*, and *scillain*, a poisonous glucoside. There are also present a large quantity

of mucilage, calcium oxalate, sinistrin, etc. Water and alcohol extract its virtues. It is expectorant, emetic, and diuretic.

Official Preparations.

- Acetum Scillæ** Made by percolating 100 Gm. of ground squill previously macerated in 900 C.c. of diluted acetic acid with the latter until 1000 C.c. are obtained (see page 437). Dose, fifteen to thirty minims (0.9 to 1.8 C.c.).
 Vinegar of Squill.
- Extractum Scillæ Fluidum** Made with a menstruum of 3 parts of alcohol and 1 part of water, thus avoiding the solution of the squill mucilage (see page 422). Dose, two to three minims (0.12 to 0.19 C.c.).
 Fluid Extract of Squill.
- Syrupus Scillæ** Made by dissolving 800 Gm. of sugar in 450 C.c. of vinegar of squill and enough water to make 1000 C.c. (see page 310).
 Syrup of Squill. Dose, thirty minims (1.8 C.c.).
- Syrupus Scillæ Compositus** Made with 80 C.c. each of fluid extracts of squill and senega, 2 Gm. of antimony and potassium tartrate, 750 Gm. of sugar, precipitated calcium phosphate to aid in clearing the filtrate, and enough water to make 1000 C.c. (see page 310).
 Compound Syrup of Squill. Dose, fifteen to thirty minims (0.9 to 1.8 C.c.).
- Tinctura Scillæ** Made by percolating 150 Gm. of squill with sufficient menstruum, made by mixing 3 parts of alcohol and 1 part of water, to make 1000 C.c. (see page 378). Dose, ten to twenty minims (0.6 to 1.2 C.c.).
 Tincture of Squill.

DIGITALIS. U. S. Digitalis. [FOXGLOVE.]

The leaves of *Digitalis purpurea* Linné (nat. ord. *Scrophularinæ*), collected from plants of the second year's growth.

Digitalis has been the subject of exhaustive investigation. The principle digitalin was at one time considered to be an alkaloid. It is, as usually seen, a mixture of digitoxin and other neutral principles. Digitoxin is converted into *toxiresin* by the action of diluted acids and heat. Digitalis is used as a sedative and cardiac stimulant.

Official Preparations.

- Infusum Digitalis** Made by pouring 500 C.c. of boiling water on 15 Gm. of digitalis, and, after macerating and straining, adding 100 C.c. of alcohol, 150 C.c. of cinnamon water, and water enough to make 1000 C.c. (see page 349). Dose, half a fluidounce (14.7 C.c.).
 Infusion of Digitalis.
- Extractum Digitalis Fluidum** Made with a menstruum of 2 parts of alcohol and 1 part of water (see page 404). Dose, one to two minims (0.06 to 0.12 C.c.).
 Fluid Extract of Digitalis.
- Extractum Digitalis** Made with a menstruum of 2 parts of alcohol and 1 part of water (see page 448). Dose, half a grain (0.03 Gm.).
 Extract of Digitalis.
- Tinctura Digitalis** Made by percolating 150 Gm. of digitalis with sufficient diluted alcohol to make 1000 C.c. (see page 366). Dose, ten to fifteen minims (0.6 to 0.9 C.c.).
 Tincture of Digitalis.

CONVALLARIA. U. S. Convallaria.

The rhizome and roots of *Convallaria majalis* Linné (nat. ord. *Liliacæ*).

This drug contains *convallarin*, a glucoside, which is split into *convallaretin* and glucose by the action of dilute acids; it also contains another glucoside, *convallamarin*, which is the active principle. Convallaria is a valuable sedative and cardiac stimulant, and is often used in place of digitalis. The fluid extract is the best preparation.

Official Preparation.

- Extractum Convallariæ Fluidum** Made with a menstruum of diluted alcohol (see page 402). Dose, five to fifteen minims (0.3 to 0.9 C.c.).
 Fluid Extract of Convallaria.

STROPHANTHUS. U. S. Strophanthus.

The seed of *Strophanthus hispidus* De Candolle (nat. ord. *Apocynaceæ*), deprived of its long awn.

Strophanthus contains a glucoside, *strophanthin*, an alkaloid, *inceline*, fatty matter, resin, extractive, etc. Strophanthin is the active principle. Alcohol and water extract it. Ether and benzin are sometimes used to percolate the drug with, to deprive it of the fatty matter before exhausting it with alcohol.

Official Preparation.

Tinctura Strophanthi . . . Made by percolating 50 Gm. of powdered strophanthus with a menstruum of 65 parts of alcohol and 35 parts of water until 1000 C.c. are obtained (see page 378). Dose, ten minims (0.6 C.c.).
Tincture of Strophanthus.

SPIGELIA. U. S. Spigelia. [PINKROOT.]

The rhizome and roots of *Spigelia marilandica* Linné (nat. ord. *Loganiaceæ*).

Spigelia contains a bitter principle, resin, and a trace of volatile oil, with tannin and wax. It is used as an anthelmintic. Alcohol and water extract its virtues.

Official Preparation.

Extractum Spigelia Fluidum . . . Made with a menstruum of diluted alcohol (see page 425). Dose, one to two fluidrachms (3.6 to 7.3 C.c.).
Fluid Extract of Spigelia.

CUSSO. U. S. Kouso. [BRAYERA, PHARM. 1880.]

The female inflorescence of *Hagenia abyssinica* (Bruce) Gmelin (nat. ord. *Rosaceæ*).

Brayera contains a bitter resinous principle, kosin, $C_{31}H_{33}O_{10}$, about 24 per cent. of tannin, gum, sugar, etc. It is used as an anthelmintic.

Official Preparation.

Extractum Cusso Fluidum . . . Made with a menstruum of alcohol (see page 403). Dose, one-half to one fluidounce (14.7 to 29.5 C.c.).
Fluid Extract of Kouso.

SANTONICA. U. S. Santonica. [LEVANT WORMSEED.]

The unexpanded flower-heads of *Artemisia pauciflora* Weber (nat. ord. *Compositæ*).

Santonica contains about 2 per cent. of *santonin*, resin, volatile oil, gum, etc. It is used as an anthelmintic. The dose is fifteen to fifty grains (0.9 to 3.2 Gm.).

SANTONINUM. U. S. Santonin.

A neutral principle obtained from Santonica. It should be kept in dark, amber-colored vials, and should not be exposed to light.

Preparation.—Santonin may be made by exhausting santonica mixed with lime with diluted alcohol, distilling off the alcohol, and adding acetic acid to the residue. The precipitated santonin is purified by dissolving it in alcohol, treating with animal charcoal, and crystallizing. Santonin forms soluble compounds with alkalis, and it may be precipitated from its solutions by acids.

Santoninum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Colorless, shining, flattened, prismatic crystals, not altered by exposure to air, but turning yellow on exposure to light. When heated to 170° C. (338° F.), Santonin melts, and forms, if rapidly cooled, an amorphous mass, which instantly crystallizes on coming in contact with a minute quantity of one of its solvents. At a higher temperature it sublimes, partly unchanged, and, when ignited, it is consumed, leaving no residue.	Odorless; nearly tasteless when first placed in the mouth, but afterwards bitter; neutral reaction.	Cold, Nearly in- soluble. Boiling, 250 parts.	At 15° C. (59° F.), 40 parts. Boiling, 3 parts.	Soluble in 140 parts of ether, in 4 parts of chloroform, and in solutions of caustic alkalies.
TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.		
With alcoholic solution of potassium hydrate, Santonin yields a bright pinkish-red liquid, which gradually becomes colorless. From its solution in alkalies it is completely precipitated by supersaturating with an acid.	Brucine or Strychnine. Alkaloids in general. Easily Carbonizable, Organic Substances.	{ If water be added, immediately after it is dissolved without color in sulphuric acid, it is completely precipitated, and the supernatant liquor should not have a bitter taste, nor should it be altered upon the addition of potassium dichromate T.S., Or of mercuric potassium iodide T.S. { Its solution in cold, concentrated sulphuric acid is at first colorless, but after some time it turns yellow, then red, and finally brown.		

Uses.—Santonin is used as an anthelmintic, in doses of two grains (0.13 Gm.).

Official Preparation.

Trochisci Santonini. . . Each troche contains about half a grain of santonin.
Troches of Santonin.

PICROTOXINUM. U. S. Picrotoxin.

A neutral principle obtained from the seed of *Anamirta paniculata* Colebrooke (nat. ord. *Menispermaceæ*).

Preparation.—Picrotoxin is made from the kernel of cocculus Indicus by treating an aqueous extract, which has been triturated with magnesia, with hot alcohol; the solution is evaporated, and the crystalline mass purified by recrystallization after decolorizing with animal charcoal.

Picrotoxinum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Colorless, flexible, shining, prismatic crystals, or a micro-crystalline powder, permanent in the air. When heated to about 200° C. (392° F.), the crystals melt, forming a yellow liquid, and upon ignition it is consumed, leaving no residue.	Odorless, very bitter taste; neutral reaction.	At 15° C. (59° F.), 240 parts. Boiling, 25 parts.	At 15° C. (59° F.), 9 parts. Boiling, 3 parts.	Soluble in acids and in solutions of the alkalies; very slightly soluble in ether or chloroform.

TESTS FOR IDENTITY.

Concentrated sulphuric acid dissolves Picrotoxin with a golden-yellow color, very gradually changing to reddish-brown, and showing a brown fluorescence.

On mixing about 0.2 Gm. of powdered sodium nitrate with 3 or 4 drops of sulphuric acid, in a small flat-bottomed capsule, sprinkling a minute quantity of Picrotoxin over it, and then adding from a pipette concentrated solution (1 in 4) of sodium hydrate, drop by drop, until it is in excess, the particles of Picrotoxin will acquire a brick-red to deep red color, which fades after some hours.

On diluting 2 C.c. of alkaline cupric tartrate V.S. with 10 C.c. of water, and adding a small portion of Picrotoxin, red cuprous oxide will be separated within half an hour at ordinary temperatures, and much more rapidly upon the application of heat.

The aqueous solution of Picrotoxin should remain unaffected by mercuric or platinum chloride T.S., tannic acid T.S., mercuric potassium iodide T.S., or other reagents for alkaloids (absence of *alkaloids*).

Uses.—It has been used as a tonic and antispasmodic, in doses of one-sixtieth of a grain (0.001 Gm.): it is very poisonous in large doses.

ERGOTA. U. S. Ergot. [ERGOT OF RYE.]

The sclerotium of *Claviceps purpurea* (Fries) Tulane (class *Fungi*), replacing the grain of rye, *Secale cereale* Linné (nat. ord. *Gramineæ*).

Ergot should be only moderately dried. It should be preserved in a close vessel, and a few drops of chloroform should be dropped upon it from time to time to prevent the development of insects. When more than one year old, it is unfit for use.

Ergot owes its activity to *sclerotic acid*, *sclererythrin*, *scleromucin*, *scleriodin*, and *picrosclerotin*; there are also present *scleroxanthin* and *sclerocrystallin*, with 25 per cent. of fixed oil, mycose, and protein compounds. Diluted alcohol is a good solvent for the active principles. It is used as a parturient and hæmostatic. Sclerotic acid has been used in medicine in doses of one-half to three-fourths of a grain (0.03 to 0.04 Gm.). Kobert believes that the activity of ergot is due to *ergotic* and *sphacelic acids* and the alkaloid *cornutine*.

Official Preparations.

Extractum Ergotæ Fluidum. Made with a menstruum of 98 parts of diluted alcohol and 2 parts of acetic acid (see page 405). Dose, one-half to four fluidrachms (1.8 to 14.7 C.c.).
Fluid Extract of Ergot.

Extractum Ergotæ. Made by evaporating the fluid extract of ergot to a pilular consistence (see page 449). Dose, five to twenty grains (0.3 to 1.2 Gm.).
Extract of Ergot.

Vinum Ergotæ. Made by percolating 150 Gm. of ergot with a menstruum composed of 150 C.c. of alcohol and 850 C.c. of white wine to make 1000 C.c. (see page 382). Dose, one to four fluidrachms (3.7 to 14.7 C.c.).
Wine of Ergot.

GOSSYPII RADICIS CORTEX. U. S. Cotton Root Bark.

The bark of the root of *Gossypium herbaceum* Linné, and of other species of *Gossypium* (nat. ord. *Malvaceæ*).

Cotton root bark contains a yellow resin, which becomes red upon exposure to air, fixed oil, tannin, starch, sugar, etc. It is emmenagogue. Dose, sixty grains (3.8 Gm.).

Official Preparation.

Extractum Gossypii Radicis Fluidum. Made with alcohol, 75 parts; glycerin, 25 parts; finishing with alcohol (see page 408). Dose, one-half to one fluidrachm (1.8 to 3.7 C.c.).
Fluid Extract of Cotton Root Bark.

CROCUS. U. S. Saffron.

The stigmas of *Crocus sativus* Linné (nat. ord. *Iridaceæ*).

Crocus. U. S.	ODOR AND TASTE.
Separate stigmas, or three, attached to the top of the style, about 3 Cm. long, flattish-tubular, almost thread-like, broader and notched above; orange-brown. Saffron should not include the yellow styles. When pressed between filtering paper, it should not leave an oily stain. When chewed, it stains the saliva deep orange-yellow. When soaked in water, it should not deposit any pulverulent, mineral matter, nor show the presence of organic substances differing in shape from that described.	Peculiar, strong, aromatic odor; aromatic and bitterish taste.
IMPURITIES.	TESTS FOR IMPURITIES.
Picric Acid and some other Coal-tar Colors.	{ On agitating 1 part of Saffron with 100,000 parts of water, the liquid will acquire a distinct yellow color. No color is imparted to benzin agitated with Saffron.
Added Water.	{ On drying Saffron at 100° C. (212° F.), it should not lose more than 14 per cent. of its weight.
Foreign Inorganic Substances.	{ When thus dried, and ignited with free access of air, 100 parts of the dry Saffron should not leave more than 7.5 per cent. of ash.

Saffron contains *polychroit*, $C_{25}H_{40}O_{13}$, a glucoside which splits into *crocine* and glucose, volatile oil, wax, fixed oil, protein compounds, sugar, wax, etc. Saffron is chiefly used as a coloring-substance. It is diaphoretic, anodyne, and carminative. Dose, twenty grains (1.2 Gm.).

Official Preparation.

Tinctura Croci Made by percolating 10 Gm. of saffron with sufficient diluted alcohol to make 100 C.c. (see page 366).

SANTALUM RUBRUM. U. S. Red Saunders.

The wood of *Pterocarpus santalinus* Linné filius (nat. ord. *Leguminosæ*).

This wood contains *santalic acid*, a resinous substance, *pterocarpin*, and *santol*. It is used solely as a red coloring. (See *Tinctura Lavandulæ Composita*.)

RHUS TOXICODENDRON. U. S. Rhus Toxicodendron. [POISON IVY.]

The fresh leaves of *Rhus radicans* Linné (nat. ord. *Anacardiaceæ*).

These leaves contain *toxicodendric acid*, fixed oil, tannin, mucilage, wax, etc. It is considered to be tonic, irritant, and rubefacient. Dose, five grains (0.3 Gm.).

Drugs containing Saponinoid Principles, with their Preparations.

QUILLAJA. U. S. Quillaja. [QUILLAJA, PHARM. 1880. SOAP BARK.]

The inner bark of *Quillaja Saponaria* Molina (nat. ord. *Rosaceæ*).

This South American bark owes its action to a peculiar principle, *saponin*, $C_{25}H_{44}O_{13}$, a glucoside, splitting upon heating with dilute acid into *sapogenin* and sugar. Saponin is a sternutatory white powder,

soluble in alcohol and hot water; its aqueous solution froths when agitated, like soapsuds; it is found in several other drugs. Quillaja also contains calcium sulphate. It is used principally for cleansing silk. It is sometimes used as a medicine, and is irritant, diuretic, and stimulating.

Official Preparation.

Tinctura Quillajæ. Made by boiling 200 Gm. of quillaja with 800 C.c. of water, and, after evaporation to 600 C.c., adding 350 C.c. of alcohol and enough water to make 1000 C.c. (see page 376).
Tincture of Quillaja.

SARSAPARILLA. U. S. Sarsaparilla.

The root of *Smilax officinalis* Kunth, *Smilax medica* Chamisso et Schlechtendal, *Smilax papyracea* Duhamel, and of other, undetermined species of *Smilax* (nat. ord. *Liliaceæ*).

Sarsaparilla contains a glucoside analogous to, if not identical with, saponin, termed *parillin*. When boiled with dilute acids, it splits into *parigenin* and grape-sugar. There are also present starch, resin, coloring-matter, and extractive. It is popularly believed to be an alterative. Alcohol and water are good solvents.

Official Preparations.

Decoctum Sarsaparillæ Compositum Made by boiling 100 Gm. of sarsaparilla, 20 Gm. each of sassafras, guaiacum wood, and glycyrrhiza, and 10 Gm. of mezereum, with 1000 C.c. of water (see page 353). Dose, four to six fluid-ounces (118.3 to 177.4 C.c.)
Compound Decoction of Sarsaparilla.

Extractum Sarsaparillæ Fluidum Made with a menstruum composed of 1 part of alcohol and 2 parts of water (see page 421). Dose, thirty to sixty minims (1.8 to 3.7 C.c.)
Fluid Extract of Sarsaparilla.

Extractum Sarsaparillæ Fluidum Compositum Made by mixing 750 Gm. of sarsaparilla, 120 Gm. of glycyrrhiza, 100 Gm. of sassafras, and 30 Gm. of mezereum together, and percolating with a menstruum of 1 part of alcohol and 2 parts of water, with 10 per cent. of glycerin (see page 422). Dose, thirty to sixty minims (1.8 to 3.7 C.c.)
Compound Fluid Extract of Sarsaparilla.

Syrupus Sarsaparillæ Compositus Made by mixing 200 C.c. of fluid extract of sarsaparilla, 15 C.c. each of the fluid extracts of glycyrrhiza and senna, 0.1 C.c. each of the oils of sassafras, anise, and gaultheria, dissolving in the mixture 650 Gm. of sugar, and adding enough water to make 1000 C.c. (see page 309). Dose, four fluidrachms (14.8 C.c.)
Compound Syrup of Sarsaparilla.

SENEGA. U. S. Senega.

The root of *Polygala Senega* Linné (nat. ord. *Polygalææ*).

Senega contains *polygalic acid* (sometimes called *senegin*), fixed oil, pectose, etc. Polygalic acid is analogous to, if not identical with, saponin. Alcohol and water are good menstrua for extracting its virtues. Liquid preparations of senega are very apt to gelatinize, owing to the presence of pectin: this is obviated by using ammonia water or other alkali to dissolve it. Senega is a valuable expectorant and stimulant. It is used in compound syrup of squill (see page 310).

Official Preparations.

- Extractum Senegæ Fluidum** . Made with a menstruum of 75 parts of alcohol, 20 parts of water, and 5 parts of ammonia water (see page 423).
 Fluid Extract of Senega. Dose, ten to thirty minims (0.6 to 1.2 C.c.).
- Syrupus Senegæ** Made with 200 C.c. of fluid extract of senega, 5 C.c. of ammonia water, 700 Gm. of sugar, and enough water to make 1000 C.c. (see page 310). Dose, one to two fluidrachms (3.7 to 7.4 C.c.).
 Syrup of Senega.

CAULOPHYLLUM. U.S. Caulophyllum. [BLUE COROSH.]

The rhizome and roots of *Caulophyllum thalictroides* (Linné) Michaux (nat. ord. *Berberidaceæ*).

Caulophyllum contains *saponin*, associated with resin, starch, gum, albumen, coloring-matter, extractive, etc. Alcohol is the best menstruum for extracting the virtues of this drug. It is sometimes used as an antispasmodic and emmenagogue.

Unofficial Drugs containing Glucosides or Bitter Principles.

- Adonis Vernalis.** A cardiac stimulant. Contains the glucoside adonidin, of which the dose is one-third of a grain (0.02 Gm.).
 Pheasant's Eye.
Asedarach. The bark of the root of *Melia Azedarach*. It contains a resinous principle, and is used as an emetic and anthelmintic, in doses of fifteen to thirty grains (0.9 to 1.9 Gm.).
 Asedarach. Cathartic. Used in the form of infusion.
- Cassia Marilandica.** The rhisome of *C. luteum* and other species. It contains about 8 per cent. of the glucoside chamelirin.
 American Senna. Stimulant, expectorant. Dose of fluid extract, ten to twenty-five drops (0.49 to 1.23 Gm.).
 Chamelirium. Contains *condurangin*, an amorphous powder, soluble in water, alcohol, and chloroform. It is poisonous.
 Starwort. The bark of the root of *Cornus florida*. It contains a bitter principle, *cornin*.
Cocillana Bark. Cardiac stimulant, diuretic.
 Sycocarpus Rusbyi. Contains *cotoin*, $C_{21}H_{19}O_6$. Used in diarrhoea. Dose, three grains (0.194 Gm.); dose of *cotoin*, one grain (0.065 Gm.).
 Condurango. The root of *F. Walteri*, indigenous to the United States. It contains gentisic acid and gentiopierin.
- Cornus.** The rhisome of *G. trifoliata* and others, indigenous to the United States. It contains the bitter principle of gillenin, resin, tannin, etc.
 Dogwood. From *G. officinalis*, indigenous to Southern Europe. It contains a bitter glucoside, gratiolin, etc.
 Coronilla Scorpioides. Contains a glucoside, and hederic and tannic acids. Dose, twenty grains (1.3 Gm.) or more, dried and powdered, given in the atrophy of children.
 Coto Bark. The rhisome of *H. niger*, grown in Europe. It contains a crystalline glucoside, helleborin, $C_{28}H_{44}O_{12}$.
- Fraseria.** The leaves of different species of *Ilex*, indigenous to the United States. It contains ilixanthin, $C_{17}H_{25}O_{11}$, and illicic acid.
 American Calumba.
 Gillenia. The leaves of *L. palustre*, grown in North America. It contains the glucoside ericocolin, $C_{24}H_{38}O_{11}$; also about 1 per cent. of volatile oil.
 Gillenia.
- Gratiola.** The leaves of *L. vulgare*, indigenous to Southern Europe. It contains ligustrin, etc.
 Hedge-Hyssop. The bark of *L. tulipifera*, found in the Northern United States. It contains liriiodendrin, which occurs in white prisms.
 Hedera Helix. Contains a glucoside, lupinin, $C_{23}H_{32}O_{14}$. The seeds are anthelmintic, diuretic, and emmenagogue.
 Ivy.
- Helleborus.** It contains a resinous substance called megarrhizitin, and a glucoside called megarrhin, possessing mydriatic properties.
 Black Hellebore.
 Ilex. The leaves and flowering branches of *M. officinalis*, indigenous to Europe. It contains coumarin, $C_9H_8O_2$, and melilotic acid, $C_8H_{10}O_5$.
 Ledum. The root of *P. quinquefolium*, found in North America. It contains pansaquillon, $C_{17}H_{25}O_6$.
 Marsh Tea. Contains para-cotoin, $C_{19}H_{17}O_6$.
- Ligustrum.**
 Privet.
 Liriiodendron.
 Tulip-Tree Bark.
 Lupinus Albus.
 Lupin.
 Megarrhiza Californica. (Man-Root.)
 Melilotus.
 Melilot.
- Panax.**
 Ginseng.
 Para-Coto Bark.

Unofficial Drugs containing Glucosides or Bitter Principles.—Continued.

Pisidia Erythrina.	Narcotic, anodyne. Dose of fluid extract is a fluidrachm (3.69 C.c.), to be carefully increased.
Jamaica Dogwood.	
Prinos.	The bark of <i>Prinos verticillatus</i> . It contains a bitter principle. It is a tonic, astringent, and alterative.
Black Alder.	
Rhamnus Catharticus.	From <i>R. catharticus</i> , found in Europe. It contains rhamnocathartin, which occurs as a yellowish mass, etc.
Purging Buckthorn.	
Ruta.	The leaves of <i>R. graveolens</i> , which grows in Southern Europe. It contains a volatile oil and rutin, $C_{25}H_{32}O_{15}$, which occurs in needle-shaped crystals. Emmenagogue. Dose, fifteen to thirty grains (0.972–1.94 Gm.), two or three times a day, preferably given in infusion.
Rue.	
Sabbatia.	A simple bitter. Dose, a drachm (3.88 Gm.), given in the form of fluid extract or decoction.
American Centaury.	
Salix.	The bark of <i>Salix alba</i> , and of other species of <i>Salix</i> . It contains a glucoside, <i>salicin</i> ($C_{13}H_{18}O_7$).
Willow.	Contains a glucoside, saponin.
Saponaria Officialis.	
Soapwort.	
Bouncing Bet.	
Simaruba.	
Simaruba.	The bark of the root of <i>S. officinalis</i> , grown in South America. It contains a bitter principle, a volatile oil, etc. Tonic. Dose, from twenty to sixty grains (1.296 to 3.88 Gm.), best given in infusion.
Taxus.	From <i>Taxus baccata</i> , grown in Asia. It contains volatile oil, taxina, etc.
Yew.	
Ustilago.	From <i>Zea Mays</i> . It contains a principle analogous to sclerotic acid. Used as a parturient. Dose, fifteen to thirty grains (0.9 to 1.9 Gm.).
Corn Smut.	
Viola Tricolor.	The flowering herb of <i>Viola tricolor</i> . It contains a bitter principle, salicylic acid, etc. It is expectorant and alterative, in doses of fifteen to forty grains (0.9 to 2.6 Gm.).
Pansy.	

Drugs containing Cathartic Principles, and their Preparations.

SENNA. U. S. Senna.

The leaflets of *Cassia acutifolia* Delile (Alexandria Senna), and of *Cassia angustifolia* Vahl (India Senna); (nat. ord. *Leguminosæ*).

Senna contains cathartic acid, which, under the influence of dilute acids and heat, splits into cathartogenic acid and glucose; there are also present phæoretin, sepnacrol, catharto-mannite, chrysophan, mucilage, etc. Cathartic acid is believed to be the chief purgative principle, although several of the others possess cathartic properties. When senna leaves are macerated in strong alcohol, the principles which produce griping and give odor and taste are dissolved, whilst the purgative properties are unaffected. Water and diluted alcohol are good solvents for its virtues. The dose of senna is four drachms to one ounce (15.5 to 31 Gm.) when given in infusion.

Official Preparations.

Extractum Sennæ Fluidum . .	Made with a menstruum of diluted alcohol (see page 424). Dose, one to four fluidrachms (3.7 to 14.8 C.c.).
Fluid Extract of Senna.	
Infusum Sennæ Compositum . 60	Gm. of senna, 120 Gm. each of manna and magnesium sulphate, 20 Gm. of fennel, and 1000 C.c. of boiling water (see page 350). Dose, four fluidounces (118.3 C.c.).
Compound Infusion of Senna.	
Syrupus Sennæ	Made by digesting 250 Gm. of senna in 700 C.c. of water, expressing and straining, adding 150 C.c. of alcohol mixed with 5 C.c. of oil of coriander, filtering the mixture, agitating with 700 Gm. of sugar, and adding water to make 1000 C.c. (see page 311).
Syrup of Senna.	
Confectio Sennæ	Made from 100 Gm. each of senna and tamarind, 160 Gm. of cassia fistula, 70 Gm. of prune, 120 Gm. of fig, 555 Gm. of sugar, 5 Gm. of oil of coriander, and water 500 C.c. (see Confectiones) to make 1000 Gm. Dose, two drachms (7.7 Gm.).
Confection of Senna.	

TAMARINDUS. U.S. Tamarind.

The preserved pulp of the fruit of *Tamarindus indica* Linné (nat. ord. *Leguminosæ*).

Tamarind belongs to the class of acid saccharine fruits (see page 849), and also to the cathartics. It is laxative, and is used in confection of senna. Copper is sometimes present in the acid pulp, owing to its having been concentrated in copper kettles.

CASSIA FISTULA. U.S. Cassia Fistula. [PURGING CASSIA.]

The fruit of *Cassia Fistula* Linné (nat. ord. *Leguminosæ*).

Cassia Fistula yields about 25 per cent. of pulp, which contains pectin, sugar, albuminous principles, salts, etc. The pulp is laxative, and is used in confection of senna.

FICUS. U.S. Fig.

The fleshy receptacle of *Ficus Carica* Linné (nat. ord. *Urticaceæ*), bearing fruit upon its inner surface.

Figs contain mucilaginous constituents, sugar, fat, gum, etc. They are nutritious, demulcent, and laxative, and the pulp is used in confection of senna.

PRUNUM. U.S. Prune.

The fruit of *Prunus domestica* Linné (nat. ord. *Rosaceæ*).

This fruit contains sugar, malic acid, pectin, salts, etc. The pulp is laxative, and is used in confection of senna.

RHEUM. U.S. Rhubarb.

The root of *Rheum officinale* Baillon (nat. ord. *Polygonaceæ*).

Rhubarb contains four resins, which are cathartic in their properties, —*erythroretin*, *phæoretin*, *aporetin*, *emodin*. There are also present chrysophan and chrysophanic acid, both yellow, the former yielding the latter and glucose when treated with diluted acids. The astringent properties of rhubarb are due to *rheo-tannic acid*, $C_{25}H_{20}O_{14}$; *rheumic acid*, $C_{20}H_{16}O_9$, and calcium oxalate are also present. The therapeutical properties of rhubarb depend upon the valuable natural combination of its cathartic and astringent constituents. It is given in doses of ten to twenty grains (0.64 to 1.29 Gm.).

Official Preparations.

Extractum Rhei	Made with a menstruum of 4 parts of alcohol and 1 part of water (see page 456). Dose, five to ten grains (0.33 to 0.64 Gm.).
Extract of Rhubarb.	
Extractum Rhei Fluidum	Made with a menstruum of 4 parts of alcohol and 1 part of water (see page 418). Dose, twenty minims (1.23 C.c.).
Fluid Extract of Rhubarb.	
Tinctura Rhei	Made by percolating 100 Gm. of rhubarb and 20 Gm. of cardamom with a menstruum of 600 C.c. of alcohol, 300 C.c. of water, and 100 C.c. of glycerin, to make 1000 C.c. (see page 376). Dose, one-half to one fluidrachm (1.85 to 3.70 C.c.).
Tincture of Rhubarb.	
Tinctura Rhei Aromatica	Made by percolating 200 Gm. of rhubarb, 40 Gm. each of cinnamon and cloves, and 20 Gm. of nutmeg, with a menstruum of 500 C.c. of alcohol, 400 C.c. of water, and 100 C.c. of glycerin, to make 1000 C.c. (see page 376). Dose, one-half to one fluidrachm (1.85 to 3.70 C.c.).
Aromatic Tincture of Rhubarb.	

Official Preparations.—Continued.

Tinctura Rhei Dulcis Sweet Tincture of Rhubarb.	Made by percolating 100 Gm. of rhubarb, 40 Gm. each of glycyrrhiza and anise, and 10 Gm. of cardamom, with a menstruum of 500 C.c. of alcohol, 400 C.c. of water, and 100 C.c. of glycerin, to make 1000 C.c. (see page 377). Dose, two to three fluidrachms (7.39 to 11 C.c.).
Syrupus Rhei Syrup of Rhubarb.	Made by mixing 100 C.c. of fluid extract of rhubarb with 4 C.c. of spirit of cinnamon, and 10 Gm. of potassium carbonate dissolved in 50 C.c. of water, then adding 50 C.c. of glycerin, and enough syrup to make 1000 C.c. (see page 308). Dose, one to four fluidrachms (3.70 to 14.8 C.c.).
Syrupus Rhei Aromaticus Aromatic Syrup of Rhubarb.	Made by adding 150 C.c. of aromatic tincture of rhubarb to 850 C.c. of syrup (see page 308).
Mistura Rhei et Sodæ Mixture of Rhubarb and Soda.	15 C.c. of fluid extract of rhubarb, 35 Gm. of sodium bicarbonate, 3 C.c. of fluid extract of ipecac, 350 C.c. of glycerin, 35 C.c. of spirit of peppermint, and water to make 1000 C.c. (see page 318). Dose, one to eight fluidrachms (3.70 to 29.57 C.c.).
Pulvis Rhei Compositus Compound Powder of Rhubarb.	25 Gm. of powdered rhubarb, 65 Gm. of magnesia, and 10 Gm. of ginger. (See Pulveres.) Dose, half a drachm to a drachm (1.94 to 3.88 Gm.).
Pilulæ Rhei Pills of Rhubarb.	Each pill contains about 3 grains (0.2 Gm.) of rhubarb and 1 grain (0.06 Gm.) of soap.
Pilulæ Rhei Compositæ Compound Pills of Rhubarb.	Each pill contains about 2 grains (0.13 Gm.) of rhubarb, $1\frac{1}{2}$ grains (0.1 Gm.) of purified aloes, 1 grain (0.06 Gm.) of myrrh, and $\frac{1}{16}$ grain (0.005 C.c.) of oil of peppermint.

CHRYSAROBINUM. U. S. Chrysarobin.

A neutral principle (in its commercial more or less impure form), extracted from Goa Powder, a substance found deposited in the wood of *Andira Araroba* Aguiar (nat. ord. *Leguminosæ*).

Chrysarobin is a pale orange-yellow, microcrystalline powder, permanent in the air, odorless and tasteless, almost insoluble in water, only slightly soluble in alcohol, readily soluble in 33 parts of boiling benzol. When heated to 151° C. (303.8° F.) it fuses, forming a dark opaque mass. On ignition it is wholly dissipated. When boiled with about 2000 parts of water (which produces only partial solution), the light reddish-brown filtrate does not affect litmus paper, and is not altered by ferric chloride T.S.

Sulphuric acid dissolves chrysarobin with a deep blood-red color; on pouring the solution into water, the substance separates again unchanged. On adding 0.1 Gm. of chrysarobin to 10 C.c. of potassium or sodium hydrate T.S., in a test-tube, and shaking the latter, the solution, which is at first yellow or yellowish-red, will gradually acquire a deep red color. This is caused by the absorption of oxygen, chrysarobin being converted into chrysophanic acid.

Chrysarobin has been largely used in certain skin diseases, notably psoriasis: it has fallen into disuse mainly on account of the almost indelible stain produced upon the skin and clothing when it is employed. Internally, chrysarobin is cathartic, in the dose of one-sixteenth grain (0.004 Gm.).

Official Preparation.

Unguentum Chrysarobini. Made by rubbing 5 Gm. of chrysarobin with 95 Gm. of benzoinated lard. (See Unguenta.)
Chrysarobin Ointment.

KAMALA. U. S. Kamala. [ROTTLEBA, PHARM. 1870.]

The glands and hairs from the capsules of *Mallotus philippinensis* (Lamarck) Mueller Arg. (nat. ord. *Euphorbiaceæ*).

Kamala contains *rottlerin*, $C_{22}H_{20}O_6$, nearly 75 per cent. of resins soluble in alcohol, coloring-matter, etc. It is used as a tæniifuge and purgative, and is administered in doses of one to three drachms (3.8 to 11.6 Gm.) suspended in mucilage or syrup.

CAMBOGIA. U. S. Gamboge.

A gum-resin obtained from *Garcinia Hanburii* Hooker filius (nat. ord. *Guttiferae*).

Gamboge contains about 75 per cent. of resin called *gambogic acid*, which is dissolved by alkaline solutions, producing a red color; 20 per cent. of gum is present, and this enables gamboge to be emulsified like the other gum-resins. It is a powerful hydragogue cathartic, and is generally used in combination with other substances, which modify its action, as in compound cathartic pills. Dose, one-half to three grains (0.03 to 0.19 Gm.).

JALAPA. U. S. Jalap.

The tuberous root of *Ipomœa Jalapa* Nuttall (nat. ord. *Convolvulaceæ*).

Jalap contains from 12 to 20 per cent. of resin, the greater part of which is *convolvulin*, $C_{62}H_{100}O_{32}$, a glucoside insoluble in ether; there are also present gum, sugar, starch, etc. The value of jalap depends exclusively upon the amount of convolvulin present, and the U. S. Pharmacopœia gives the following test of its efficiency: "On exhausting 100 parts of Jalap with alcohol, concentrating the tincture to 40 parts, and pouring it into water, a precipitate of resin should be obtained, which, when washed with water, and dried, should weigh not less than 12 parts, and of which not over 10 per cent. should be soluble in ether."

Jalap is an esteemed cathartic, and is generally used in combination with substances having similar properties. Dose, ten to twenty grains (0.6 to 1.3 Gm.).

Official Preparations.

Extractum Jalapæ	Made by exhausting jalap with alcohol and evaporating the tincture to a pilular consistence (see page 451). Dose, ten to twenty grains (0.6 to 1.3 Gm.).
Extract of Jalap.	
Pulvis Jalapæ Compositus .	Made by mixing 35 Gm. of powdered jalap with 65 Gm. of potassium bitartrate. Dose, thirty to sixty grains (1.94 to 3.88 Gm.).
(Pulvis Purgans.)	
Compound Powder of Jalap.	
Resina Jalapæ	Made by exhausting jalap with alcohol, evaporating the tincture, adding it to water, and collecting the precipitated resin (see page 461). Dose, two to five grains (0.13 to 0.32 Gm.).
Resin of Jalap.	

SCAMMONIUM. U. S. Scammony.

A resinous exudation from the living root of *Convolvulus Scammonia* Linné (nat. ord. *Convolvulaceæ*).

Scammony contains from 80 to 90 per cent. of a resin having cathartic properties, called *scammonin*, $C_{34}H_{56}O_{16}$: this is identical with the jalapin obtained from *Ipomœa orizabensis* (see U. S. Dispensatory, p. 757). Scammony is a hydragogue cathartic: it is usually combined with other purgatives. Dose, ten grains (0.64 Gm.).

Official Preparation.

Resina Scammonii. Made by digesting scammony with boiling alcohol several times, mixing Resin of Scammony. the tinctures, distilling off the alcohol, adding the residue to water, and collecting the precipitate (see page 462). Dose, five grains (0.3 Gm.).

PODOPHYLLUM. U. S. Podophyllum. [MAY APPLE.]

The rhizome and roots of *Podophyllum peltatum* Linné (nat. ord. *Berberideæ*).

Podophyllum contains *pieropodophyllin*, *podophyllotoxin*, and *podophyllinic acid*. The resinous substances extracted from the powdered rhizome with alcohol contain the purgative principles. It is cholagogue and cathartic, in doses of ten to twenty grains (0.64 to 1.3 Gm.).

Official Preparations.

Extractum Podophylli Made with a menstruum of 4 parts of alcohol and 1 part of water (see page 455). Dose, one to three grains (0.06 to 0.19 Gm.).

Extractum Podophylli Fluidum. Made with a menstruum of 4 parts of alcohol and 1 part of water (see page 417). Dose, five to fifteen minims (0.3 to 0.9 C.c.).

Resina Podophylli Made by percolating podophyllum with alcohol, distilling the alcohol from the tincture, and pouring the residue into water, cooled to 10° C. (50° F.), containing 1 per cent. of hydrochloric acid (see page 462). Dose, one-eighth to one-half grain (0.008 to 0.03 Gm.).

LEPTANDRA. U. S. Leptandra. [CULVER'S ROOT.]

The rhizome and roots of *Veronica virginica* Linné (nat. ord. *Scrophularineæ*).

Leptandra contains a crystalline principle, *leptandrin*,¹ resin, tannin, saponin, gum, mannite, etc. Crystalline leptandrin is bitter, and soluble in water, alcohol, and ether. Leptandra is cholagogue, cathartic, and alterative, in doses of twenty to forty grains (1.3 to 2.6 Gm.).

Official Preparations.

Extractum Leptandræ Made with a menstruum of 3 parts of alcohol and 1 part of water (see page 452). Dose, ten grains (0.6 Gm.).

Extractum Leptandræ Fluidum. Made with a menstruum of 3 parts of alcohol and 1 part of water (see page 412). Dose, twenty minims (1.2 C.c.).

RHAMNUS PURSHIANA. U. S. Cascara Sagrada.

The bark of *Rhamnus Purshiana* De Candolle (nat. ord. *Rhamnaceæ*).

This bark contains a neutral, crystallizable principle (probably a glucoside), resins, and tannic, malic, and oxalic acids.

Official Preparation.

Extractum Rhamni Purshianæ Fluidum. Made with a menstruum of diluted alcohol (see page 418). Dose, thirty minims (1.8 C.c.).

FRANGULA. U. S. Frangula. [BUCKTHORN.]

The bark of *Rhamnus Frangula* Linné (nat. ord. *Rhamnaceæ*), collected at least one year before being used.

This bark contains *frangulin*, $C_{20}H_{20}O_{10}$, sometimes called *rhamnoxanthin*, and emodin: both are glucosides. Tannin, resin, and a bitter principle are the other constituents. When frangula is fresh, it is

¹ This must not be confounded with the eclectic leptandrin, which is simply a resin extracted by alcohol.

emetic; when old, it is purgative, tonic, and diuretic. The dose is twenty grains (1.3 Gm.).

Official Preparation.

Extractum Frangulae Fluidum. Made with a menstruum of 5 parts of alcohol and 8 parts of water (see page 406). Dose, twenty minims (1.2 C.c.).

RUMEX. U. S. Rumex. [YELLOW DOCK.]

The root of *Rumex crispus* Linné, and of some other species of *Rumex* (nat. ord. *Polygonaceae*).

This root contains chrysophanic acid (rumicin, lapathin), mucilage, tannin, starch, calcium oxalate, gum, coloring-matter, etc. Alcohol or water extracts its virtues. It is considered to be tonic, alterative, and astringent. Dose, forty to sixty grains (2.6 to 3.9 Gm.).

Official Preparation.

Extractum Rumicis Fluidum. Made with diluted alcohol (see page 420). Dose, one fluidrachm (3.7 C.c.).

JUGLANS. U. S. Juglans. [BUTTERNUT.]

The bark of the root of *Juglans cinerea* Linné (nat. ord. *Juglandaceae*), collected in autumn.

Juglans contains *nucin*, $C_{39}H_{12}O_{10}$, fixed oil, volatile oil, tannin, etc. It is cathartic and tonic, in doses of sixty grains (3.9 Gm.).

Official Preparation.

Extractum Juglandis. Made with diluted alcohol (see page 451). Dose, ten grains (0.6 Gm.).

EUONYMUS. U. S. Euonymus. [WAHOO.]

The bark of the root of *Euonymus atropurpureus* Jacquin (nat. ord. *Celastrineae*).

This bark contains resins, a bitter principle called *euonymin*, *euonic acid*, starch, asparagin, and pectin. Euonymin is cholagogue, cathartic, and tonic. The dose of euonymus is sixty grains (3.9 Gm.).

Official Preparation.

Extractum Euonymi. Made with a menstruum of 2 parts of alcohol and 1 part of water (see page 449). Dose, one to three grains (0.06 to 0.1 Gm.).

ALOE BARBADENSIS. U. S. Barbadoes Aloes. [CURAÇAO ALOES.]

The inspissated juice of the leaves of *Aloe vera* (Linné) Webb (nat. ord. *Liliaceae*).

ALOE SOCOTRINA. U. S. Socotrine Aloes.

The inspissated juice of the leaves of *Aloe Perryi* Baker (nat. ord. *Liliaceae*).

Aloes contains *aloin*, a trace of volatile oil, and a substance which has been improperly called resin. The aloin present in Socotrine aloes is *socaloin*, $C_{15}H_{16}O_7$. This may be distinguished from nataloin and barbaloin by Histed's test, as follows: barbaloin and nataloin are colored bright red by nitric acid; socaloin is not colored red. If nataloin be added to a drop of sulphuric acid on a white porcelain plate and a rod dipped in nitric acid be passed over it, the color changes to blue; with the other aloins no blue color is produced. Aloes is cathartic and emmenagogue. Dose, ten to twenty grains (0.6 to 1.3 Gm.).

Official Preparations.

Extractum Aloes. Made by dissolving Socotrine aloes in boiling distilled water, cooling, decanting, straining, and evaporating (see page 445). Dose, five to ten grains (0.3 to 0.6 Gm.).

Aloe Purificata. See next article.

Purified Aloes.

ALOE PURIFICATA. U. S. Purified Aloes.

	Metric.	Old form.
Socotrine Aloes	1000 Gm.	16 oz. av.
Alcohol	200 C.c.	8 fl. oz.

Heat the Aloes, by means of a water-bath, until it is completely melted. Then add the Alcohol, and, having stirred the mixture thoroughly, strain it through a No. 60 sieve, which has just been dipped into boiling water. Evaporate the strained mixture by means of a water-bath, constantly stirring, until a thread of the mass becomes brittle on cooling. Lastly, break the product, when cold, into pieces of a convenient size, and keep it in well-stoppered bottles.

Purified Aloes is in irregular, brittle pieces of a dull brown or reddish-brown color, and having the peculiar aromatic odor of Socotrine Aloes. It is almost entirely soluble in alcohol.

Aloes, owing to its method of preparation, always contains mechanical impurities,—sand, earth, chips, etc. Alcohol reduces the consistency of the melted aloes so that it can be strained, and it is easily evaporated afterwards. Purified aloes is directed to be used in all the official preparations of the drug. (See preceding article.)

Official Preparations.

- Tinctura Aloes** Made by macerating 100 Gm. of purified aloes and 200 Gm. of powdered liquorice root in sufficient diluted alcohol to make 1000 C.c. (see page 359). Dose, two to four fluidrachms (7.4 to 14.8 C.c.).
- Tinctura Aloes et Myrrha** Made by macerating 100 Gm. each of purified aloes, myrrh, and liquorice root in a menstruum of 3 parts of alcohol and 1 part of water (see page 360). Dose, one to two fluidrachms (3.7 to 7.3 C.c.).
- Pilule Aloes** Each pill contains 2 grains each of purified aloes and soap.
- Pilule Aloes et Asafoetida** Each pill contains about 1½ grains each of purified aloes, asafoetida, and soap.
- Pilule Aloes et Ferri** Each pill contains about 1 grain each of purified aloes, dried ferrous sulphate, and aromatic powder, with sufficient confectio of rose.
- Pilule Aloes et Mastiches** Each pill contains about 2 grains of purified aloes and ½ grain each of mastic and red rose.
- Pilule Aloes et Myrrha** Each pill contains about 2 grains of purified aloes, 1 grain of myrrh, and ½ grain of aromatic powder.

ALOINUM. U. S. Aloin.

A neutral principle obtained from several varieties of Aloes, chiefly Barbadoes Aloes (yielding Barbaloin); and Socotra or Zanzibar Aloes (yielding Socaloin),—differing more or less in chemical composition and physical properties according to the source from which it is derived.

Barbaloin may be made by dissolving 1 part of Barbadoes Aloes in 10 parts of boiling water acidulated with hydrochloric acid, and after cooling the liquid is decanted from the resinous matter, evaporated to about 2 parts, and set aside two weeks for crystals to form. The crystals are washed with acetic ether and dried. Socaloin and nataloin are not often found in commerce (see page 956).

Aloinum. U.S.	ODOR AND TASTE.	SOLUBILITY.		
		Water.	Alcohol.	Ether.
Minute, acicular crystals, or a microcrystalline powder, varying in color from yellow to yellowish-brown, permanent in the air.	Odorless or possessing a slight odor of aloes; characteristic, bitter taste.	(Barbaloin) 60 parts 15° C. (59° F.). (Socaloin) 60 parts.	(Barbaloin) 20 parts. (Socaloin) 30 parts (absolute).	(Barbaloin) 470 parts. (Socaloin) 380 parts. (9 parts of acetic ether.)

TESTS.

When heated, Aloin melts, and, on ignition, it is consumed without leaving a residue.

An alcoholic solution of Aloin is neutral to litmus paper. An aqueous solution of Aloin is colored greenish-black by ferric chloride T.S., and slowly precipitated by basic lead acetate T.S.

On adding a minute portion of Barbaloin to a drop of cold nitric acid of specific gravity 1.200 on a white porcelain surface, a crimson color will be developed. Socaloin will produce scarcely any color when thus treated.

In alkaline solutions, Aloin is rapidly decomposed; in neutral or acid solutions, only slowly.

Uses.—Aloin is used as a cathartic, in doses of two grains (0.13 Gm.). The laxative dose is half a grain (0.03 Gm.).

COLOCYNTHIS. U.S. Colocynth.

The fruit of *Citrullus Colocynthis* Schrader (nat. ord. *Cucurbitaceæ*), deprived of its rind.

Colocynth contains *colocynthin*, *colocynthitin*, gum, resin, etc. Colocynthin is a very bitter glucoside, splitting under the action of diluted acids into colocynthein and grape-sugar. The seeds should be rejected. Colocynth is a hydragogue cathartic. Dose, five grains (0.3 Gm.).

Official Preparations.

Extractum Colocynthis Extract of Colocynth.	Made by percolating colocynth with diluted alcohol, distilling off the alcohol, evaporating the residue to dryness, and reducing the dry mass to powder (see page 447).
Extractum Colocynthis Compositum Compound Extract of Colocynth.	160 Gm. of extract of colocynth; 500 Gm. of purified aloes; 60 Gm. of cardamom; 140 Gm. each of resin of scammony and soap; 100 C.c. of alcohol (see page 448).

ELATERINUM. U.S. Elaterin. $C_{20}H_{28}O_6 = 347.20$.

A neutral principle obtained from Elaterium, a substance deposited by the juice of the fruit of *Ecballium Elaterium* (Linné) A. Richard (nat. ord. *Cucurbitaceæ*).

Preparation.—It may be made by evaporating an alcoholic tincture of elaterium to the consistence of thin oil, and throwing the residue while yet warm into a weak boiling solution of potassa. The potassa holds the green resin in solution, and the elaterin crystallizes as the liquor cools. Or it may be made by exhausting elaterium with chloroform, and adding ether to the solution, which precipitates the elaterin.

Elaterium.—When the fruit of the squirting cucumber is sliced and placed upon a sieve, a perfectly limpid and colorless juice flows out, which soon becomes turbid, and in the course of a few hours begins to deposit a sediment. This, when collected and carefully dried, is very light and pulverulent, of a yellowish-white color, slightly tinged with green, and is called elaterium. The yield is small,—only six grains from

forty cucumbers,—but the elaterium is very powerful, one-eighth of a grain purging violently. Commercial elaterium is not usually made in this way, but by expression or other processes, whereby the yield is increased. The elaterium is, of course, weaker.

Elaterinum. U.S.	TESTS FOR IDENTITY.
<p>Minute, white, hexagonal scales or prisms, permanent in the air, odorless, having a slightly bitter, acrid taste and a neutral reaction. Soluble in 4250 parts of water, and in 1820 parts of boiling water; also soluble in 337 parts of alcohol, in 34 parts of boiling alcohol, in 543 parts of ether, and in 2.4 parts of chloroform.</p> <p>At 190° C. (374° F.) the crystals begin to agglutinate, and at about 209° C. (408.2° F.) they melt, forming a yellowish-brown liquid. When ignited, they are consumed without leaving a residue.</p> <p>Elaterin is dissolved by solutions of the alkalies, and reprecipitated on supersaturating with an acid.</p> <p>On dissolving some crystals of Elaterin in melted carbolic acid, and then adding a few drops of strong sulphuric acid, a crimson color will be developed, which soon becomes scarlet.</p>	<p>A solution of Elaterin in cold, concentrated sulphuric acid assumes a yellow color, gradually changing to scarlet.</p> <p>The alcoholic solution of Elaterin should not be precipitated by tannic acid T.S., mercuric chloride T.S., or platinic chloride T.S. (absence of, and difference from, alkaloids).</p>

Elaterin is the purgative principle of elaterium. The dose is one-sixteenth of a grain (0.004 Gm.).

Official Preparation.

Trituratio Elaterini . . . 10 Gm. of elaterin are rubbed up with 90 Gm. of sugar of milk.
Trituration of Elaterin. Dose, one-half grain (0.03 Gm.).

BRYONIA. U.S. Bryonia. [BRYONY.]

The root of *Bryonia alba*, and of *Bryonia dioica* Linné (nat. ord. *Cucurbitaceæ*).

Bryonia contains bryonin, a bitter glucoside soluble in alcohol and in water, starch, sugar, resin, etc. Diluted alcohol extracts its virtues. It is used as a hydragogue cathartic, in doses of twenty grains (1.3 Gm.).

Official Preparation.

Tinctura Bryoniæ . . . Made by percolating 100 Gm. of bryonia with sufficient alcohol to make 1000 C.c. (see page 362). Dose, one to two fluidrachms (3.7 to 7.4 C.c.).
Tincture of Bryonia.

Drugs containing Astringent Principles, and their Preparations.

GALLA. U.S. Nutgall.

An excrescence on *Quercus lusitanica* Lamarek (nat. ord. *Cupuliferae*), caused by the punctures and deposited ova of *Cynips Gallæ tinctoria* Olivier (class *Insecta*; order *Hymenoptera*).

Nutmall contains about 50 per cent. of tannin, 2 per cent. of gallic acid, sugar, gum, resin, and starch. It is astringent. Dose, ten to fifteen grains (0.6 to 0.9 Gm.).

Official Preparations.

Tinctura Gallæ . . . Made by percolating 200 Gm. of powdered nutgall with a menstruum of 900 C.c. of alcohol and 100 C.c. of glycerin to obtain 1000 C.c. (see page 368). Dose, one fluidrachm (3.7 C.c.).
Tincture of Nutgall.
Unguentum Gallæ . . . Made by rubbing 20 Gm. of finely powdered nutgall with 80 Gm. of benzoinated lard. (See Unguenta.)
Nutmall Ointment.

ACIDUM TANNICUM. U. S. Tannic Acid.

[GALLOTANNIC ACID. DIGALLIC ACID.]

An organic acid obtained from nutgall.

Preparation.—Tannic acid may be made by the modification of Leconnet's method, which was formerly official, as follows:

Take of Nutgall, in fine powder, Ether, each, a sufficient quantity. Expose the Nutgall to a damp atmosphere for twenty-four hours, and then mix it with sufficient Ether, previously washed with water, to form a soft paste. Set this aside, covered closely, for six hours; then, having quickly enveloped it in a close canvas cloth, express it powerfully between tinned plates, so as to obtain the liquid portion. Reduce the resulting cake to powder, and mix it with sufficient Ether, shaken with one-sixteenth of its bulk of water, to form again a soft paste, and express as before. Mix the liquids, and allow the mixture to evaporate spontaneously until it assumes a syrupy consistence; then spread it on glass or tinned plates, and dry it quickly in a drying closet. Lastly, remove the dry residue from the plates with a spatula, and keep it in a well-stopped bottle.

The explanation of this process is that water and ether form a soluble compound with tannic acid, which may be separated from the nutgall residue by expression; then, by exposing the thick solution to heat, the ether and water are evaporated, leaving the tannic acid in soft, cellular, friable scales upon the plates. Tannic acid, chemically, is an anhydride of gallic acid, thus shown:

Acidum Tannicum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A light yellowish, amorphous powder, usually cohering in form of glistening scales, or spongy masses; gradually darkens on exposure to air and light.	Faint, peculiar odor; strongly astringent taste; acid reaction.	Cold, 1 part. Boiling, Very soluble.	Cold, 0.6 part. Boiling, Very soluble.	In 1 part of glycerin, aided by heat; sparingly in absolute alcohol, freely in diluted alcohol; almost insoluble in absolute ether, chloroform, benzol, and benzin.

TASTE.

When heated on platinum foil, it is gradually consumed, leaving not more than 0.2 per cent. of ash. With ferric chloride T.S., an aqueous solution of Tannic Acid forms a bluish-black ink. On adding to an aqueous solution (1 in 100) of Tannic Acid a small quantity of calcium hydrate T.S., a pale bluish-white, flocculent precipitate is produced, which is not dissolved on shaking (difference from *gallic acid*), and which becomes more copious and of a deeper blue by the addition of a moderate excess of calcium hydrate T.S., while a large excess of the latter imparts a pale pinkish tint to the solution.

Uses.—Tannic acid is powerfully astringent, in doses of three to ten grains (0.2 to 0.6 Gm.). Its solution in glycerin is a valuable liquid form of administration.

Official Preparations.

Glyceritum Acidi Tannici . 20 Gm. of tannic acid, 80 Gm. of glycerin. Dissolve (see page 319). Dose, ten to forty minims (0.6 to 2.6 C.c.).
Glycerite of Tannic Acid.
Unguentum Acidi Tannici . Made by rubbing 20 Gm. of tannic acid with 80 Gm. of benzoated lard. (See Unguenta.)
Ointment of Tannic Acid.
Trochisci Acidi Tannici . . Each troche contains about one grain of tannic acid. (See Trochisci.)
Troches of Tannic Acid.

ACIDUM GALLICUM. U. S. Gallic Acid.

An organic acid usually prepared from Tannic Acid.

Preparation.—The former official process may be used for making gallic acid: Take of Nutgall, in fine powder, 36 oz.; Purified Animal Charcoal, Distilled Water, each, a sufficient quantity. Mix the Nutgall with sufficient Distilled Water to form a thin paste, and expose the mixture to the air, in a shallow glass or porcelain vessel, in a warm place, for a month, occasionally stirring it with a glass rod, and adding from time to time sufficient Distilled Water to preserve the semi-fluid consistence. Then submit the paste to expression, and, rejecting the expressed liquor, boil the residue in 8 pints of Distilled Water for a few minutes, and filter while hot through Purified Animal Charcoal. Set the liquid aside that crystals may form, and dry them on bibulous paper. If the crystals be not sufficiently free from color, they may be purified by dissolving them in boiling Distilled Water, filtering through a fresh portion of Purified Animal Charcoal, and again crystallizing.

The present accepted view of the relative chemical positions of tannic and gallic acids—i. e., that tannic acid is an anhydride of gallic acid—seems to be practically confirmed by the above process, the tannic acid of the galls being converted into gallic acid through the continued maceration with water.

Acidum Gallicum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
White or pale fawn-colored solid, crystallizing from water in long, silky, interlaced needles or triclinic prisms, permanent in the air. When heated to 100° C. (212° F.), the crystals lose nearly 9.6 per cent. of combined water; at about 222° C. (431.6° F.) they begin to melt; at a higher temperature they are gradually decomposed; at a low red heat they are completely volatilized.	Odorless; astringent and slightly acidulous taste; acid reaction.	Cold, 100 parts. Boiling, 3 parts.	Cold, 5 parts. Boiling, 1 part.	Absolute ether, 40 parts; glycerin, 12 parts; very slightly soluble in chloroform, benzol, or benzin.

TESTS FOR IDENTITY.

If 5 C.c. of a cold saturated solution of the Acid be treated in a watch-glass with 6 drops of sodium hydrate T.S., a deep green color will gradually be developed. This color is changed to reddish or brownish-red by acids. An aqueous solution of the Acid should not precipitate alkaloïds, gelatin, albumen, nor starch T.S. (difference from and absence of tannic acid).

TESTS FOR IDENTITY.—Continued.

The Acid neither colors nor precipitates pure ferrous salts, but forms a bluish-black precipitate with ferric salts.

On adding to a cold aqueous solution of the Acid some calcium hydrate T.S., a bluish-white precipitate will form, where the test-solution is temporarily in excess, and will disappear on shaking. When the test-solution has been added in excess, the precipitate no longer dissolves, and the liquid acquires a tint which is blue by reflected and green by transmitted light, and becomes pink on the addition of a large excess of calcium hydrate T.S. (distinction from *tannic acid*).

Uses.—Gallic acid is astringent. Dose, five to fifteen grains (0.3 to 0.9 Gm.).

PYROGALLOL. U. S. Pyrogallol. [PYROGALLIC ACID.]

A triatomic phenol obtained chiefly by the dry distillation of gallic acid. Pyrogallol should be kept in dark amber-colored bottles.

When gallic acid is sublimed, it is converted by the heat into pyrogallol and carbon dioxide.

Pyrogallol. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvent.
Light, white, shining laminae, or fine needles; acquiring a gray or darker tint on exposure to air and light. When heated to 131° C. (267.8° F.), Pyrogallol melts, and may be sublimed unchanged. When ignited, it is consumed, leaving no residue.	Odorless; bitter taste; neutral and faintly acid reaction.	At 15° C. (59° F.), 1.7 parts. Boiling, Very soluble.	At 15° C. (59° F.), 1 part. Boiling, Very soluble.	Soluble in 1.2 parts of ether.

TESTS.

The aqueous solution, which is at first neutral and colorless, gradually acquires, by exposure to the air, a brown color and an acid reaction due to absorption of oxygen. The same change of color takes place very rapidly if the solution contains a caustic alkali.

The aqueous solution (1 in 10) of Pyrogallol reduces solutions of the salts of silver, gold, and mercury, even in the cold.

When freshly prepared, 1 C.c. of the aqueous solution (1 in 20) is colored brownish-red by a few drops of ferric chloride T.S., and this color is changed to a deep bluish-black on the addition of 1 or 2 drops of ammonia water. A bluish-black color is also produced in the aqueous solution of Pyrogallol by freshly prepared ferrous sulphate T.S.

Uses.—Pyrogallol is used in the form of ointment in the treatment of psoriasis, although its use is not without danger; it is also employed in photography.

CATECHU. U. S. Catechu.

An extract prepared from the wood of *Acacia Catechu* (Linné fl.) Willdenow (nat. ord. *Leguminosæ*).

Catechu contains catechu-tannic acid, a peculiar form of tannin, which is insoluble in ether and turns greenish-black with ferric salts. *Catechin* and *catechol* are also present. Owing to the decomposition of the

tannic acid, the liquid preparations often gelatinize. It is astringent and tonic. Dose, twenty grains (1.3 Gm.).

Official Preparations.

Tinctura Catechu Composita . . . Made by percolating 100 Gm. of catechu and 50 Gm. of cassia cinnamon with sufficient diluted alcohol to make 1000 C.c. (see page 364). Dose, one to four fluidrachms (3.7 to 14.8 C.c.).

Trochisci Catechu Each troche contains about 1 grain of catechu.
Troches of Catechu.

KINO. U. S. Kino:

The inspissated juice of *Pterocarpus marsupium* Roxburgh (nat. ord. *Leguminosæ*).

Kino contains kino-tannic acid, pyrocatechin, kino red, kinoin, gum, etc. Owing to the decomposition of the kino-tannic acid, the liquid preparations frequently gelatinize. Kino is astringent and tonic. Dose, twenty grains (1.3 Gm.).

Official Preparation.

Tinctura Kino . . . Made by dissolving 100 Gm. of kino in a mixture of 650 C.c. of alcohol, 150 C.c. of glycerin, and 200 C.c. of water, filtering, and washing the filter with enough alcohol to make 1000 C.c. of tincture (see page 370). Dose, one fluidrachm (3.7 C.c.).

HÆMATOXYLON. U. S. Hæmatoxylon. [LOGWOOD.]

The heartwood of *Hæmatoxylon campechianum* Linné (nat. ord. *Leguminosæ*).

Logwood contains *hæmatoxylin*, $C_{16}H_{14}O_6$, a colorless, sweet principle, which is reddened upon exposure to light, and turned blackish-purple upon contact with alkalis, yielding *hæmatein*, $C_{16}H_{12}O_6 \cdot H_2O$; it also contains tannin, resin, etc. It is used largely in the arts for dyeing. Logwood is astringent. Dose, forty grains (2.6 Gm.).

Official Preparation.

Extractum Hæmatoxyli . An aqueous extract made by evaporating the decoction (see page 450). Dose, twenty grains (1.3 Gm.).

KRAMERIA. U. S. Krameria. [RHATANY.]

The root of *Krameria triandra* Ruiz et Pavon, and of *Krameria Ixina* Linné (nat. ord. *Polygalææ*).

Krameria contains about 18 per cent. of kramero-tannic acid, starch, gum, rhatannic red, etc. It is a valuable astringent. Dose, twenty grains (1.3 Gm.).

Official Preparations.

Extractum Krameris An aqueous extract made with cold water (see page 452). Dose, fifteen grains (0.9 Gm.). Used in making Trochisci Krameris. (See Trochisci.)

Extractum Krameris Fluidum . Made with diluted alcohol containing 10 per cent. of glycerin (see page 412). Dose, thirty minims (1.8 C.c.). Used in making Syrupus Krameris (see page 307).

Tinctura Krameris Made by percolating 200 Gm. of krameria with sufficient diluted alcohol to make 1000 C.c. (see page 370). Dose, two fluidrachms (7.4 C.c.).

QUERCUS ALBA. U. S. White Oak.

The bark of *Quercus alba* Linné (nat. ord. *Cupuliferææ*).

White oak is largely used in tanning leather: it contains about 10 per cent. of tannic acid, with pectin, resin, and brownish-red coloring-matter. It is astringent. Dose, thirty grains (1.9 Gm.).

ROSA GALLICA. U.S. Red Rose.

The petals of *Rosa gallica* Linné (nat. ord. *Rosaceæ*), collected before expanding.

Red rose contains *quercitrin* and *quercilannic acid*: the pale red coloring-matter is made bright red by the addition of sulphuric acid. It is slightly astringent and tonic. The infusion of red rose is an elegant vehicle for many substances. (See Part VI.)

Official Preparations.

Extractum Rosæ Fluidum. Made with diluted alcohol containing 10 per cent. of glycerin (see page 419). Dose, one fluidrachm (8.7 C.c.). Used to make syrup of rose (see page 309).

Mel Rosæ Made by mixing the fluid extract with clarified honey (see page 313). Used as a flavor.

Confectio Rosæ 80 Gm. of red rose, 640 Gm. of sugar, 120 Gm. of clarified honey, and 160 C.c. of stronger rose water. Used as an excipient.

ROSA CENTIFOLIA. U.S. Pale Rose.

The petals of *Rosa centifolia* Linné (nat. ord. *Rosaceæ*).

Pale rose petals contain a little tannin, volatile oil, sugar, mucilage, etc. They are used principally on account of their flavor.

OLEUM ROSÆ. U.S. Oil of Rose.

A volatile oil distilled from the fresh flowers of *Rosa damascena* Miller (nat. ord. *Rosaceæ*.) It should be kept in well-stoppered vials, in a cool place, protected from light. When dispensed, it should be completely liquefied by warming, if necessary, and well mixed by agitation.

Oil of rose is made in Turkey by distillation. It is used solely as a perfume or flavor.

Oleum Rosæ. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.
		Alcohol.
A pale yellowish, transparent liquid. Specific gravity 0.865 to 0.880 at 20° C. (68° F.). The congealing and melting points of the Oil are subject to some variation, depending upon the amount of stearopten, but, when slowly cooled to a temperature, usually, between 16° and 21° C. (60.8° and 69.8° F.), it becomes a transparent solid, interspersed with numerous slender, shining, iridescent, scale-like crystals. Upon the application of the heat of the hand, the crystals should float in the upper portion of the liquefied Oil.	Strong, fragrant odor of rose; mild, slightly sweetish taste; neutral reaction.	Slightly soluble.

TEST.

If to 5 drops of the Oil, contained in a test-tube, 5 drops of concentrated sulphuric acid be added, a reddish-brown, thick mixture will be produced, but no white fumes or tarry odor should be developed, and the fragrant odor of the Oil should not be destroyed. If this mixture be shaken with 2 C.c. of alcohol, the resulting liquid may be turbid, but should be nearly colorless, and should not at once assume a red or reddish-brown color (absence of oil of ginger-grass, or Turkish oil of geranium, from *Andropogon Schœnanthus* Linné (nat. ord. *Gramineæ*), and of oil of rose geranium, from *Pelargonium Radula* (Cavanilles) Aiton, *Pelargonium capitatum* (Linné) Aiton, and *Pelargonium odoratissimum* (Linné) Aiton; nat. ord. *Geraniaceæ*).

RHUS GLABRA. U.S. Rhus Glabra.

The fruit of *Rhus glabra* Linné (nat. ord. *Anacardiææ*). (See page 848.)

RUBUS. U. S. Rubus. [BLACKBERRY.]

The bark of the root of *Rubus villosus* Aiton, *Rubus canadensis* Linné, and *Rubus trivialis* Michaux (nat. ord. *Rosaceæ*).

Rubus owes its astringent properties to tannic acid: there are also present gum, coloring-matter, etc. The dose is twenty grains (0.12 Gm.).

Official Preparation.

Extractum Rubi Fluidum. Made with a menstruum consisting of 2 parts of alcohol, 1 part of water, and 10 per cent. of glycerin (see page 420). Dose, a fluidrachm (3.7 C.c.). Used in making Syrupus Rubi (see page 309).

GERANIUM. U. S. Geranium. [CRANESBILL.]

The rhizome of *Geranium maculatum* Linné (nat. ord. *Geraniaceæ*).

Geranium contains about 15 per cent. of tannic acid, with brownish-red coloring-matter, starch, sugar, pectin, etc. It is astringent and tonic. Dose, thirty grains (1.9 Gm.).

Official Preparation.

Extractum Geranii Fluidum. Made with diluted alcohol containing 10 per cent. of glycerin (see page 407). Dose, a fluidrachm (3.7 C.c.).

HAMAMELIS. U. S. Hamamelis. [WITCHHAZEL.]

The leaves of *Hamamelis virginiana* Linné (nat. ord. *Hamamelaceæ*), collected in autumn.

Hamamelis contains tannic acid, chlorophyll, bitter principle, mucilage, etc. It is astringent, slightly hæmostatic, and sedative. Dose, sixty grains (3.9 Gm.).

Official Preparation.

Extractum Hamamelidis Fluidum. Made with 5 parts of alcohol, 8 parts of water, and 10 per cent. of glycerin (see page 409). Dose, a fluidrachm (3.7 C.c.).

CHIMAPHILA. U. S. Chimaphila. [PIPSISSEWA.]

The leaves of *Chimaphila umbellata* (Linné) Nuttall (nat. ord. *Ericaceæ*).

Chimaphila contains about 5 per cent. of tannic acid, with *chimaphilin*, *ericolin*, *arbutin*, *urson*, sugar, gum, etc. It is used as an astringent, diuretic, and tonic, in doses of thirty grains (1.8 C.c.).

Official Preparation.

Extractum Chimaphilæ Fluidum. Made with diluted alcohol (see page 399). Dose, a fluidrachm (3.7 C.c.).

UVA URSI. U. S. Uva Ursi. [BEARBERRY.]

The leaves of *Arctostaphylos Uva-ursi* (Linné) Sprengel (nat. ord. *Ericaceæ*).

Uva ursi contains about 6 per cent. of tannic acid, with gallic acid, *urson*, *arbutin*, *ericolin*, gum, resin, coloring-matter, etc. It is used as a diuretic, astringent, and tonic. Dose, thirty grains (1.9 Gm.).

Official Preparations.

Extractum Uvæ Ursi Fluidum. Made with a menstruum of 2 parts of alcohol, 5 parts of water, and 30 per cent. of glycerin (see page 427). Dose, one fluidrachm (3.7 C.c.).

Extractum Uvæ Ursi Made with a menstruum of 2 parts of alcohol and 5 parts of water (see page 457). Dose, five to ten grains (0.3 to 0.6 Gm.).

CASTANEA. U. S. Castanea. [CHESTNUT.]

The leaves of *Castanea dentata* (Marshall) Sudworth (nat. ord. *Cupuliferae*), collected in September or October, while still green.

Chestnut leaves contain tannic acid, mucilage, etc. They are astringent, tonic, and slightly sedative. Dose, thirty grains (1.9 Gm.).

Official Preparation.

Extractum Castaneae Fluidum. Made with boiling water, and contains 20 per cent. of alcohol and 10 per cent. of glycerin, for preservation (see page 399). Dose, two fluidrachms (7.4 C.c.).

SALVIA. U. S. Salvia. [SAGE.]

The leaves of *Salvia officinalis* Linné (nat. ord. *Labiatae*). (See page 863.)

Unofficial Astringent Substances.

- | | |
|----------------------------|--|
| Agrimonia. | From <i>A. Eupatoria</i> , grown in North America. It contains tannin and bitter principle. |
| Agrimony. | |
| Areca Nut. | Vermifuge. Dose, one to two drachms (3.9 to 7.8 Gm.). |
| Semen Arecae. | |
| (Betel Nut.) | |
| Bistorta. | The rhizome of <i>Polygonum B.</i> , grown in Canada and the United States. It contains about 20 per cent. of tannin, etc. |
| Bistort. | |
| Catechu Pallidum. | From <i>Uncaria Gambir</i> , grown in the East India Islands. It contains catechin, catechutannin, etc. |
| Gambir. | |
| Comptonia. | The leaves of <i>C. asplenifolia</i> , found in North America. It contains volatile oil, tannin, etc. |
| Sweet Fern. | |
| Diospyros. | The bark of <i>D. virginiana</i> , grown in the United States. It contains tannin and malic acid. |
| Persimmon. | |
| Epigaea. | From <i>E. repens</i> , found in North America. It contains tannin, and the principles common to the <i>Ericaceae</i> . |
| Trailing Arbutus. | |
| Epilobium. | From <i>E. angustifolium</i> , found in the Northern Hemisphere. It contains tannin, mucilage, etc. |
| Willow Herb. | |
| Epiphegus. | From <i>E. virginiana</i> , a parasitic plant found in North America. It contains tannin, bitter principle, etc. |
| Beech-drop. | |
| Hepatica. | The leaves of <i>H. triloba</i> , found in North America. It contains tannin, mucilage, etc. |
| Liverwort. | |
| Heuchera. | The root of <i>H. americana</i> , found in the United States. It contains about 20 per cent. of tannin. |
| Alum-root. | |
| Hieraceum. | From different species of <i>Hieraceum</i> , found in North America. It contains tannin. |
| Hawweed. | |
| Hippocastanum. | The bark of <i>Æsculus Hippocastanum</i> , grown in North America. It contains tannin and various other principles. |
| Horsechestnut Bark. | |
| Ilex Paraguayensis. | The leaves of <i>I. paraguayensis</i> , grown in Brazil. It contains 10 to 15 per cent. of caffeine, etc. |
| Maté, Paraguay Tea. | |
| Monesia. | From <i>Chrysophyllum glycyphlaum</i> , found in Brazil. A vegetable extract, alterative and astringent. Dose, from two to ten grains (0.13 to 0.6 Gm.) every hour or two. |
| Monesia. | |
| Myrobalanus. | From different species of <i>Terminalia</i> , grown in Southern Asia. It contains about 45 per cent. of gallo-tannic acid. |
| Myrobalans. | |
| Nymphaea. | The rhizome of <i>N. odorata</i> , found in the United States. It contains tannin and mucilage. |
| Water-Lily. | |
| Potentilla. | From <i>P. canadensis</i> , found in North America. It contains tannin. |
| Cinquefoil. | |
| Pulmonaria. | From <i>P. officinalis</i> , grown in Europe. It contains tannin. |
| Lungwort. | |
| Quercus Tinctoria. | From <i>Q. coccinea</i> , var. <i>tinctoria</i> , grown in the United States. It contains tannin, etc. |
| Black Oak Bark. | |
| Rhus Aromatica. | From <i>R. aromatica</i> . It contains tannin, coloring-matter, gum-resin, etc. |
| Sweet Sumach. | |
| Spiraea. | From <i>S. tomentosa</i> , found in North America. It contains tannin and bitter principle. |
| Hardhack. | |
| Statice. | The root of <i>S. Limonium</i> , grown in Europe. It contains tannin and volatile oil. |
| Marsh Rosemary. | |
| Tormentilla. | From <i>T. erecta</i> , grown in Europe. It contains about 20 per cent. of tannin. |
| Tormentil. | |

QUESTIONS ON CHAPTER LIX.

DRUGS CONTAINING GLUCOSIDES OR NEUTRAL PRINCIPLES.

- What are glucosides?
 If salicin is boiled with sulphuric acid, what does it yield?
 Explain the reaction which takes place.
 How may glucosides be split into glucose and the derived product?
 How do these principles act?
 How are glucosides usually found?
 Gentian—What is the Latin name? Whence is it derived?
 What does gentian contain?
 Into what does the glucoside gentiopicroin split when heated with dilute acids?
 What effect is produced by ferric salts upon preparations of gentian?
 To what is this reaction due?
 If treated with ferric hydrate, will the preparation still become discolored?
 What are the medicinal properties of gentian?
 Calumba—What was its former official name?
 Whence is it derived, and to what does it owe its virtues?
 What other constituents are present?
 For what is it used? What are the official preparations?
 Quassia—Whence is it derived?
 What are its constituents?
 To what does it owe its bitterness?
 What is the formula in symbols of quassin?
 What are its properties? What are the official preparations?
 Chirata—Whence is it derived?
 What principles does it contain? Give their formulas in symbols.
 What are its uses? What are the official preparations?
 Salicin—What is the Latin name? Give formula in symbols and molecular weight. What is salicin?
 How is it made? Describe odor, taste, chemical reaction, and solubility.
 Give tests for identity. What is the dose?
 Taraxacum—What is its synonyme? Whence is it derived?
 When should it be gathered? What are its constituents?
 To what does it owe its bitterness? What is the chemical composition of taraxacin?
 What are the official preparations?
 Lappa—What is its synonyme? Whence is it derived?
 What does it contain? What are its properties?
 Scilla—What is its definition? What principles does squill contain?
 What are good solvents? What are its properties?
 What are the official preparations?
 Digitalis—What is its synonyme? What is its definition?
 What is digitalin?
 Into what is digitoxin converted by the action of diluted acids and heat?
 What are its medicinal properties? What are its official preparations?
 What does it contain? What is a good solvent? What is the dose?
 Spigelia—What is its synonyme? Whence is it derived? What does it contain?
 What is a good solvent? What is its use? What are its official preparations?
 Cusco—What was the former official name? What is its definition?
 What does it contain? For what is it used? What is its official preparation?
 Santonica—What is its synonyme? What is its definition?
 How much santonin does it contain? What else is in it? What is the dose?
 Santonin—What is the Latin name? Give formula in symbols and molecular weight. What is santonin?
 How may it be made? Does it combine with alkalis?
 What action do acids have upon these solutions?
 How may the presence of alkaloids be detected? What is the dose?
 Picrotoxin—Give Latin name, formula in symbols, and molecular weight.
 What is picrotoxin? How is it made?
 Describe taste, odor, chemical reaction, and solubility. Give tests for identity.

What is the dose?

Ergot—What is the Latin name? What is its definition?

What are the constituents of ergot?

To which of these principles does it owe its activity?

What is a good solvent? For what is it used?

What are its official preparations?

Cotton root bark—Whence is it derived?

What are its constituents? What is the dose?

What are its official preparations?

Crocus—Whence is it derived? What glucoside does it contain?

Into what does this glucoside split? What are its other constituents?

What are its medicinal properties? What is the dose?

What are its official preparations?

Red saunders—What is the Latin official name? Whence is it derived?

What does it contain? For what is it used?

Rhus toxicodendron—What is its synonyme?

What do these leaves contain? What is the dose?

Quillaja—What is its synonyme? Whence is it derived?

Where does it come from? What glucoside does it contain?

Into what does this split upon heating with dilute acid?

What are the properties of saponin?

What else does it contain? What are its uses?

Sarsaparilla—Whence is it derived?

What glucoside does it contain?

Into what does this glucoside split when boiled with dilute acids?

What are its other constituents?

What are good solvents? What are its properties?

What are its official preparations?

Senega—Whence is it derived?

What does it contain? What are good solvents?

Why are preparations of senega apt to gelatinize?

How may this be obviated?

What are its properties? In what preparation is it used?

What are its official preparations?

Caulophyllum—What is its synonyme? Whence is it derived?

What does it contain? What is the best solvent?

What are its medical properties?

Senna—Whence is it derived? What does it contain?

Which of these is believed to be the chief purgative principle?

Under the influence of dilute acids and heat, into what does cathartic acid split?

Are the purgative principles soluble in strong alcohol?

What portions are soluble?

What are good solvents for the purgative principles?

What is the dose of senna given in infusion?

What are its official preparations?

Tamarind—What is the Latin name? What is tamarind?

What is its medicinal property?

In what official preparation is it used?

Where does the copper which is sometimes present come from?

Cassia fistula—What is its synonyme?

How much pulp does cassia fistula yield?

What does it contain? In what preparation is it used?

What is its medicinal property?

Fig—What is the Latin official name? What is its definition?

What do figs contain? What are their properties?

Into what official preparation do they enter?

Prune—What is the Latin official name? What does it contain?

What is its property? In what preparation is it used?

Rhubarb—What is the Latin official name? Whence is it derived?

What four cathartic resins does rhubarb contain?

What glucoside does it contain?

Into what does this split when treated with diluted acids?

To what are the astringent properties of rhubarb due?

What other ingredients are present?

Upon what do the medicinal properties of rhubarb depend? What is the dose?

What are the official preparations?

Chrysarobin—What is the Latin name? What is chrysarobin?

Describe its solubility.

At what temperature does it melt?

What color is its solution in alkaline solutions?

What change takes place on exposure to air?

Describe rationale of process.

What action does sulphuric acid have upon it?

What are its properties and uses? What are its official preparations?

Kamala—What is its definition? What was its former official name?

What does it contain? What is the dose?

Gamboge—What is the Latin name? Whence is it obtained?

What does it contain?

What effect have alkaline solutions upon the resin? What is the dose?

Jalap—Whence is it derived?

What glucoside does it contain? What other constituents?

Upon what does the value of jalap depend?

How may its efficiency be tested? What is the dose?

What are the official preparations?

Scammony—What is the Latin name? What is scammony?

What resin does it contain, and how much?

With what other principle is this identical? What is the dose?

What are its official preparations?

Podophyllum—What is its synonyme? Whence is it derived?

What does it contain? What is a good solvent? What is the dose?

What are the official preparations?

Leptandra—What is its synonyme? Whence is it derived?

What does it contain? What is the active principle?

Is this identical with the eclectic preparation leptandrin?

What are the properties of true leptandrin?

Leptandra—What is the dose? What are the official preparations?

Rhamnus Purshiana—Whence is it derived? What are the constituents?

Frangula—Whence is it derived?

What two glucosides does it contain? What other constituents?

What are its properties when fresh? and when old?

What is the dose? What are the official preparations?

Rumex—What is its synonyme? Whence is it obtained?

What does it contain? What are good solvents? What is the dose?

What are the official preparations?

Juglans—What is its synonyme? Whence is it derived?

What does it contain? What is the dose? What are its official preparations?

Euonymus—What is its synonyme? Whence is it derived?

What does it contain? What is the dose? What are its official preparations?

Aloes—What varieties of aloes are official? What are the Latin names? Whence are they derived?

What does aloes contain?

What variety of aloin is present in Socotrine aloes?

How may this be distinguished from barbaloin and from nataloin?

What is the dose? What are the official preparations of Socotrine aloes?

Purified aloes—What is the Latin name? How is it prepared?

What impurities are removed by this process?

What are the official preparations?

Aloin—Whence is it derived? How is it prepared?

What are its medicinal properties?

Colocynth—What is its definition? What glucoside does it contain?

Into what does this glucoside split under the action of diluted acids?

Are the seeds valuable? What is the dose? What are the official preparations?

Elaterin—Give Latin name, symbol, and atomic weight. What is elaterin?

How may it be prepared? What is elaterium, and how is it obtained?

What is the yield of elaterium from the cucumber?

How is commercial elaterium usually made? Describe odor, taste, chemical reaction, and solubility.

Give tests for identity. What is the dose? What are the official preparations?

Bryonia—What is its synonyme? Whence is it derived?

What does it contain? What is a good solvent? What is the dose?

- What are its official preparations?
 Nutgall—What is the Latin name? What are nutgalls?
 What do they contain? What is the dose? What are its official preparations?
 Tannic acid—What is the Latin official name? Give formula in symbols and molecular weight. What was the former official name?
 Describe rationale of process.
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 What is the dose? What are its official preparations?
 Gallic acid—What is the Latin official name? Give formula in symbols and molecular weight. What was the former official name?
 Describe rationale of process.
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 What is the dose? What are its official preparations?
 Into what is gallic acid converted when it is sublimed?
 Describe rationale of process. For what is pyrogallac acid used?
 Catechu—Whence is it derived? What does it contain?
 Why do its liquid preparations frequently gelatinize? What is the dose?
 What are its official preparations?
 Kino—What is it? What does it contain?
 Why do its liquid preparations frequently gelatinize? What is the dose?
 What are its official preparations?
 Hæmatoxylin—What is its synonyme? Whence is it derived?
 What does it contain?
 What effect do alkalies have upon hæmatoxylin?
 What are its medicinal properties? What is the dose?
 What are its official preparations?
 Krameria—What is its synonyme? Whence is it derived?
 What does it contain? What is the dose?
 What are its official preparations?
 White oak—Whence is it derived?
 What does it contain? What is its chief use?
 Red rose—What is the Latin official name? Whence is it derived?
 What does it contain?
 What effect does sulphuric acid have upon the coloring matter?
 For what is the infusion used?
 What are its medicinal properties? What are its official preparations?
 Pale rose—What is the Latin official name? Whence is it derived?
 What does it contain? For what is it used?
 Oil of rose—What is its synonyme? Whence is it obtained?
 What effect does cold have upon it? What is its principal use?
 Rhus glabra—Whence is it derived?
 Rubus—What is its synonyme? Whence is it derived?
 To what does it owe its virtues? What is the dose?
 What are its official preparations?
 Geranium—What is its synonyme?—What does it contain?
 What is the dose? What are its official preparations?
 Hamamelis—What is its synonyme? What does it contain?
 What is the dose? What are its official preparations?
 Chimaphila—What is its synonyme? What does it contain?
 What is the dose? What are its official preparations?
 Uva ursi—What is its synonyme? Whence is it derived?
 What does it contain? What is the dose? What are its official preparations?
 Castanea—What is its synonyme? Whence is it derived?
 When should the leaves be collected? What do they contain?
 What is the dose? What are its official preparations?
 Salvia—What is its synonyme? Whence is it derived?

CHAPTER LX.

ALKALOIDS.

THE alkaloids are unquestionably the most important of all the organic compounds which are of interest to the pharmacist, the most active and potent remedies that he dispenses belonging to this class of principles.

Chemically, alkaloids are either *amides* or *amines*.¹ If the former, they are composed of carbon, hydrogen, nitrogen, and oxygen; if the latter, the oxygen is wanting. Alkaloids are obtained from both the vegetable and the animal kingdom. They are found in nearly all the organs of plants, in roots, barks, stems, leaves, petals, seeds, etc. The distinctive features of alkaloids are as follows:

1. They all contain nitrogen. The non-volatile alkaloids (amides) are solids, the volatile alkaloids (amines) are liquids.

2. Alkaloids restore the color of reddened litmus. They combine with acids to form salts, and they are precipitated from their saline solutions upon the addition of alkalies.

3. They are generally the active principles of the plants in which they reside, and are mostly very poisonous or energetic remedies, having a bitter, acrid, or pungent taste.

4. They are mostly crystallizable and colorless, and are insoluble in water, but are soluble in alcohol, chloroform, benzin, benzol, and some in ether. Their salts, on the other hand, are mostly soluble in water, less so in alcohol, but insoluble in chloroform, ether, benzin, and benzol.

5. Alkaloids are mostly precipitated by one or more of the following reagents: potassio-mercuric iodide, auric chloride, tannic acid, phosphomolybdic acid, and picric acid.

The official nomenclature adopted for alkaloids requires that the last syllable shall terminate in *ine*: thus, quinine, morphine, strychnine. The Latin termination is *ina*: as, quinina, morphina, etc. The names of neutral principles and glucosides end in *in*: as, salicin, santonin, gelatin.

OPIUM. U. S. Opium.

The concrete, milky exudation obtained by incising the unripe capsules of *Papaver somniferum* Linné (nat. ord. *Papaveraceæ*), and yielding, in its normal, moist condition, not less than *nine per cent.* of crystallized morphine, when assayed. (See process, page 972.)

¹ Recent researches seem to prove that most alkaloids are derivatives of quinoline or of pyridine in a more or less modified form; many alkaloids are considered to be composed of a basic substance containing all the nitrogen of the alkaloid with a substance which either is an acid or has a neutral composition.

OPII PULVIS. U. S. Powdered Opium.

Opium, dried at a temperature not exceeding 85° C. (185° F.), and reduced to a very fine (No. 80) powder.

Powdered Opium, for pharmaceutical or medicinal purposes, when assayed by the process given under Opium, should yield not less than thirteen nor more than fifteen per cent. of crystallized morphine. Any Powdered Opium of a higher percentage may be brought within these limits by admixture with Powdered Opium of a lower percentage, in proper proportions.

Morphiometric Assay.—The proportion of morphine which any particular specimen of opium will furnish may be considered as the best test of its value, except that of an actual trial upon the system. The following is the official process for assaying it:

Opium, in any condition to be valued, *ten grammes* **10 Gm.**
 Ammonia Water, *three and five-tenths cubic centimeters* **3.5 C.c.**
 Alcohol,
 Ether,
 Water, each, *a sufficient quantity.*

Introduce the Opium (which, if fresh, should be in very small pieces, and if dry, in very fine powder) into a bottle having a capacity of about 300 C.c., add 100 C.c. of water, cork it well, and agitate frequently during twelve hours. Then pour the whole as evenly as possible upon a wetted filter having a diameter of 12 Cm., and, when the liquid has drained off, wash the residue with water, carefully dropped upon the edges of the filter and the contents, until 150 C.c. of filtrate are obtained. Then carefully transfer the moist Opium back to the bottle by means of a spatula, add 50 C.c. of water, agitate thoroughly and repeatedly during fifteen minutes, and return the whole to the filter. When the liquid has drained off, wash the residue, as before, until the second filtrate measures 150 C.c., and finally collect about 20 C.c. more of a third filtrate. Evaporate in a tared capsule, first, the second filtrate to a small volume, then add the first filtrate, rinsing the vessel with the third filtrate, and continue the evaporation until the residue weighs 14 Gm. Rotate the concentrated solution about in the capsule until the rings of extract are redissolved, pour the liquid into a tared Erlenmeyer flask having a capacity of about 100 C.c., and rinse the capsule with a few drops of water at a time, until the entire solution weighs 20 Gm. Then add 10 Gm. (or 12.2 C.c.) of alcohol, shake well, add 25 C.c. of ether, and shake again. Now add the ammonia water from a graduated pipette or burette, stopper the flask with a sound cork, shake it thoroughly during ten minutes, and then set it aside, in a moderately cool place, for at least six hours, or over night.

Remove the stopper carefully, and, should any crystals adhere to it, brush them into the flask. Place in a small funnel two rapidly-acting filters, of a diameter of 7 Cm., plainly folded, one within the other (the triple fold of the inner filter being laid against the single side of the outer filter), wet them well with ether, and decant the ethereal solution as completely as possible upon the inner filter. Add 10 C.c. of ether to the contents of the flask, rotate it, and again decant the ethereal layer upon the inner filter. Repeat this operation with another portion of 10 C.c. of ether. Then pour into the filter the liquid in the flask, in portions, in such a way as to transfer the greater portion of the crystals to the filter, and, when this has passed through, transfer the remaining crystals to the filter by washing the flask with several portions of water, using not more than about 10 C.c. in all. Allow the double filter to drain, then apply water to the crystals, drop by drop, until they are practically free from mother-water, and afterwards wash them, drop by drop, from a pipette, with alcohol previously saturated with powdered morphine. When this has passed through, displace the remaining alcohol by ether, using about 10 C.c. or more if necessary. Allow the filter to dry in a moderately warm place, at a temperature not exceeding 60° C. (140° F.), until its weight remains constant, then carefully transfer the crystals to a tared watch-glass and weigh them.

The weight found, multiplied by 10, represents the percentage of crystallized morphine obtained from the Opium.

OPIUM DEODORATUM. U.S. Deodorized Opium.

[OPIUM DENARCOTISATUM, PHARM. 1880.]

	Metric.	Old form.
Powdered Opium, containing 13 to 15 per cent. of morphine	100 Gm.	1 oz. av.
Ether	1400 C.c.	14 fl. oz.
Sugar of Milk, recently dried and in fine powder, a sufficient quantity,		
To make	100 Gm.	1 oz. av.

Macerate the Powdered Opium with 700 C.c. [old form 7 fl. oz.] of Ether, in a well-closed flask, during twenty-four hours, agitating from time to time. Pour off the clear, ethereal solution as far as possible, and repeat the maceration with two further portions of Ether, each of 350 C.c. [old form 3½ fl. oz.], first for twelve hours, and the last time for two hours. Collect the residue in a weighed dish, dry it, first by a very gentle heat, and finally at a temperature not exceeding 85° C. (185° F.), and mix it thoroughly, by trituration, with enough Sugar of Milk to make the product weigh 100 Gm. [old form 1 oz. av.].

Opium owes its value to the narcotic alkaloids present in it. Nineteen alkaloids have been proved to exist in various kinds of opium, and several more have been announced, but their existence has not been certainly confirmed. Two acids are found in opium combined with the alkaloids,—i.e., meconic and lactic acids; there are also present *meconin*, $C_{10}H_{10}O_6$, *meconoiosin*, $C_8H_{10}O_2$, both neutral principles, pectin, glucose, mucilage, caoutchouc, wax, and odorous, fatty, and coloring matters. *Meconic acid* is colored red by ferric salts, the color not being discharged by solution of mercuric chloride. A solution of potassium sulphocyanide is colored in a similar manner, but it is rendered colorless by solution of mercuric chloride. The alkaloids are as follows:

Morphine, $C_{17}H_{19}NO_3 \cdot H_2O$. The chief principle, and the first alkaloid discovered (see separate article, page 975).

Codeine, $C_{18}H_{21}NO_3$. An important narcotic alkaloid (see page 979).

Narcotine, $C_{22}H_{23}NO_7$. An alkaloid discovered and named by Desroze in 1803, and erroneously supposed to be the narcotic principle. It is white, tasteless, and inodorous, and crystallizes in silky flexible needles, usually larger than the crystals of morphine, fusible at 115.5° C. (240° F.) and volatilizable at 154.4° C. (310° F.), insoluble in cold water, soluble in 400 parts of boiling water, in 100 parts of cold alcohol, and in 24 parts of boiling alcohol, which deposits it upon cooling, and very soluble in ether. It is colored red by a mixture of sulphuric and nitric acids. It is *not narcotic*, but is said to be antiperiodic.

Thebaine (Paramorphine), $C_{19}H_{21}NO_3$, is white, crystallizable, of an acid and styptic rather than bitter taste, fusible at about 98.8° C. (210° F.) and volatilizable at 160° C. (320° F.), scarcely soluble in water, very soluble in alcohol and ether when cold, and still more so when heated. Alkalies precipitate it from its acid solutions, and, unless in very concentrated solution, do not dissolve it when added in excess. Unlike morphine, it is not reddened by nitric acid, nor does it become blue with solutions of ferric salts. It is colored red by a mixture of sulphuric and nitric acids. It is not narcotic, but in its effects on the

system is closely analogous to strychnine, producing tetanic spasms in the dose of a grain (0.06 Gm.).

Papaverine, $C_{21}H_{21}NO_4$, is crystallizable in needles, fusible at 98.8° C. (210° F.) and volatilizable at 154.4° C. (310° F.). It is insoluble in water, very sparingly soluble in cold alcohol or ether, more soluble in these liquids boiling hot, and deposited by them on cooling, soluble in benzol and chloroform. It is colored dark blue by sulphuric acid, changing to green if a crystal of potassium nitrate be added to it. It is narcotic.

Narceine, $C_{23}H_{25}NO_5$, is in white, silky crystals, inodorous, of a bitter taste, fusible at 76.6° C. (170° F.) and volatilizable at 215.5° C. (420° F.), soluble in 375 parts of cold and 220 of boiling water, soluble also in alcohol, and insoluble in ether. It forms a bluish compound with a little iodine, the color of which is destroyed by heat and the alkalia. It is rendered blue by the action of mineral acids so far diluted as not to decompose it; but, unlike morphine, it does not become blue by the action of ferric salts, nor red by that of nitric acid. Narceine is narcotic, and may be given in doses of one-third to one-half of a grain (0.02 to 0.03 Gm.).

Hydrocotarnine, $C_{13}H_{15}NO_3$, is soluble in alcohol, acetone, chloroform, benzin, and ether. It melts at 50° C. (122° F.), and loses at a somewhat greater heat the molecule of water with which it crystallizes. Sulphuric acid dissolves it, coloring it yellow in the cold, and crimson-red if heated. Nitric acid colors it yellow; ferric chloride does not affect its color.

Pseudomorphine, $C_{17}H_{19}NO_4$, possesses two properties of morphine: it dissolves in concentrated nitric acid with an intense orange-red, and in solution of ferric chloride with a blue color.

Cryptopine, $C_{21}H_{23}NO_5$, produces a blue color with sulphuric acid; it is but slightly soluble in water or alcohol. It is narcotic.

Protopine, $C_{20}H_{19}NO_5$, is insoluble in water, soluble in alcohol and chloroform.

Laudanine, $C_{20}H_{23}NO_4$. Colored red by sulphuric acid, a reddish-violet when heated.

Codamine, $C_{20}H_{23}NO_4$. Isomeric with laudanine; colored green with nitric acid and ferric chloride.

Rhoeadine, $C_{21}H_{21}NO_6$. Nearly insoluble in water, alcohol, ether, benzin, and chloroform; with sulphuric acid it turns a purple color.

Meconidine, $C_{21}H_{23}NO_4$. Amorphous; easily soluble in alcohol, ether, benzol, and chloroform; colored olive-green by sulphuric acid, orange-red by nitric acid.

Laudanosine, $C_{21}H_{23}NO_4$. Produces rose color with sulphuric acid, violet when heated; soluble in ether.

Lanthopine, $C_{23}H_{25}NO_4$. Easily soluble in chloroform, sparingly in alcohol, ether, or benzol.

Gnoscopine, $C_{24}H_{26}N_2O_{11}$. Crystallizable; soluble in chloroform, carbon disulphide, and benzol, but not in ether.

Deuteropine, $C_{23}H_{21}NO_5$. Similar to cryptopine.

Oxynarcotine, $C_{22}H_{23}NO_5$. Nearly insoluble in water, alcohol, chloroform, and benzol, but soluble in alkaline solutions.

Uses.—Opium is narcotic, sedative, and antispasmodic. The dose is one grain (0.06 Gm.).

Official Preparation of Opium.

Pulvis Opii In No. 50 powder, 8 grains represent about 12 grains of Powdered Opium.

Official Preparations of Powdered Opium.

Opium Deodoratum See page 973.
Deodorized Opium.

Acetum Opii Made by macerating and percolating 100 Gm. of powdered opium, 30 Gm. of nutmeg, and 200 Gm. of sugar, with sufficient diluted acetic acid to make 1000 C.c. (see page 436). Dose, twelve minims (0.7 C.c.).
Vinegar of Opium.

Extractum Opii An aqueous extract. 1 grain represents about 2 grains of opium. Dose, one-half grain (0.03 Gm.) (see page 454).
Extract of Opium.

Tinctura Opii Made by macerating and percolating 100 Gm. of powdered opium and 50 Gm. of precipitated calcium phosphate with sufficient diluted alcohol to make 1000 C.c. (see page 373). Dose, twelve minims (0.7 C.c.).
Tincture of Opium.

Tinctura Opii Deodorati Made by macerating and percolating 100 Gm. of powdered opium and 50 Gm. of precipitated calcium phosphate with 400 C.c. of water, expressing, repeating, mixing the expressed liquids, evaporating to 100 C.c., agitating with 200 C.c. of ether to dissolve the narcotine and odorous principles, separating the liquids, evaporating the aqueous portion, filtering, and adding sufficient water to make 800 C.c., then adding 200 C.c. of alcohol (see page 374). Dose, twelve minims (0.7 C.c.).
Tincture of Deodorized Opium.

Tinctura Opii Camphorata Made by macerating and percolating 4 Gm. each of powdered opium, benzoic acid, camphor, and 4 C.c. of oil of anise, with 40 C.c. of glycerin, and sufficient diluted alcohol to make 1000 C.c. (see page 374). Dose, one to four fluidrachms (3.7 to 14.7 C.c.).
Camphorated Tincture of Opium.

Vinum Opii Made by macerating and percolating 100 Gm. of powdered opium and 10 Gm. each of cassia cinnamon and cloves, with 150 C.c. of alcohol and 850 C.c. of white wine, to make 1000 C.c. (see page 383). Dose, twelve minims (0.7 C.c.).
Wine of Opium.

Pilule Opii Each pill contains 1 grain of powdered opium and $\frac{1}{4}$ grain of soap. (See Pilule.)
Pills of Opium.

Pulvis Ipecacuanhæ et Opii 10 Gm. each of powdered opium and ipecac, and 80 Gm. of sugar of milk. (See Pulveres, also Tincture of Ipecac and Opium.)
Powder of Ipecac and Opium.

Trochisci Glycyrrhizæ et Opii Each troche contains about $\frac{1}{4}$ grain of powdered opium and 2½ grains of extract of glycyrrhiza. (See Trochisci.)
Troches of Glycyrrhiza and Opium.

Official Preparation of Extract of Opium.

Emplastrum Opii 60 Gm. of extract of opium, 180 Gm. of Burgundy pitch, Opium Plaster. 760 Gm. of lead plaster, and 80 C.c. of water, to make 1000 Gm. (See Emplastra.)

MORPHINA. U. S. Morphine.

An alkaloid obtained from Opium.

Morphine was the first alkaloid to be discovered. The credit of its isolation belongs to Sertürner, an apothecary of Eimbeck, Germany, who announced its presence in opium in 1817, and named it *morphium*.

Preparation.—Morphine may be prepared by the former official process, as follows:

Take of Opium, sliced, 12 oz. troy; Water of Ammonia, 6 fl. oz.; Animal Charcoal, in fine powder, Alcohol, Distilled Water, each, a suf-

ficient quantity. Macerate the Opium with 4 pints of Distilled Water for twenty-four hours, and, having worked it with the hand, again macerate for twenty-four hours, and strain. In like manner, macerate the residue twice successively with the same quantity of Distilled Water, and strain. Mix the infusions, evaporate to 6 pints, and filter; then add 5 pints of Alcohol, and afterwards 3 fl. oz. of the Water of Ammonia, previously mixed with 8 fl. oz. of Alcohol. After twenty-four hours, pour in the remainder of the Water of Ammonia, mixed, as before, with 8 fl. oz. of Alcohol; and set the liquid aside for twenty-four hours that crystals may form. To purify these, boil them with 2 pints of Alcohol until they are dissolved, filter the solution, while hot, through Animal Charcoal, and set it aside to crystallize.

In this process the infusions containing the morphine, in combination with meconic and lactic acids, are treated with alcohol and water of ammonia: the former retains the coloring-matter, caoutchouc, resins, etc., in solution, whilst the ammonia combines with the natural acids, the morphine being precipitated as an insoluble precipitate.

Morphina. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvent.
Colorless or white, shining, prismatic crystals or fine needles, or a crystalline powder, permanent in the air. When heated to about 75° C. (167° F.), Morphine begins to lose its water of crystallization. Heated for some time at 100° C. (212° F.), it becomes anhydrous. At 254° C. (489.2° F.) it melts, forming a black liquid. Upon ignition it is consumed without leaving a residue.	Odorless; bitter taste; alkaline reaction.	At 15° C. (59° F.), 4350 parts. Boiling, 455 parts.	Cold, 300 parts. Boiling, 36 parts.	Soluble in 4000 parts of ether.

TESTS.

When crystals of Morphine are sprinkled upon nitric acid (specific gravity 1.250 to 1.300), they will assume an orange-red color. On shaking a small portion of Morphine in a test-tube with 10 C.c. of chlorine water, the latter will acquire a yellowish color. On now carefully pouring a small amount of ammonia water on the surface of the liquid, a brown or reddish-brown zone will form at the line of contact of the two liquids. If to a neutral 1-per-cent. solution of Morphine, made by the careful addition of dilute sulphuric acid, a few drops of ferric chloride T.S. be added, a blue color will be produced, which is destroyed by acids, alcohol, or heating.	More than traces of Narcotine, Papaverine, etc.	On treating Morphine with cold, concentrated sulphuric acid free from nitric acid, the liquid should not at once acquire more than a faintly yellowish tinge, And the subsequent addition of a small crystal of potassium permanganate should produce only a greenish, but no violet or purple, color. On precipitating the solution of any of the salts of Morphine by ammonia water, dissolving the washed precipitate in sodium hydrate T.S., shaking the solution with an equal volume of ether, and evaporating the ethereal solution, no appreciable residue should remain. On adding 4 C.c. of potassium or sodium hydrate T.S. to 0.2 Gm. of Morphine, a clear, colorless solution, free from any undissolved residue, should result.
	Difference from Strychnine.	
	Absence of Narcotine, Codeine, etc.	
	Absence of, and difference from, various other Alkaloids.	

Uses.—Morphine is rarely used medicinally, its salts—the sulphate, acetate, hydrochlorate, etc.—being preferred because of their solubility in water.

MORPHINÆ ACETAS. U. S. Morphine Acetate.

Preparation.—This salt may be made by the former official process, as follows :

Take of Morphine, in fine powder, 1 oz. troy ; Distilled Water 8 fl. oz. ; Acetic Acid a sufficient quantity. Mix the Morphine with the Distilled Water ; then carefully drop Acetic Acid into the mixture, stirring it constantly until the Morphine is neutralized and dissolved. Evaporate the solution, by means of a water-bath, to the consistence of syrup, and set aside until it concretes. Lastly, dry the salt with a gentle heat, and rub it into powder.

Care is required not to employ too much heat in the evaporation, as the acetate is easily decomposed, a portion of the acetic acid escaping and leaving an equivalent portion of uncombined morphine.

The salt itself is subject to loss of acetic acid, and this may be discovered upon attempting to make a solution. When turbidity results, due to the inability of the water to dissolve the alkaloid, a few drops of acetic acid are needed to make the solution perfect.

Morphine Acetas. U. S.	Tests.
A white or faintly yellowish-white, crystalline or amorphous powder, slowly losing acetic acid when exposed to the air, having a faintly acetous odor, a bitter taste, and a neutral or faintly alkaline reaction. When freshly prepared, the salt is soluble in 2.5 parts of water and in 47.6 parts of alcohol at 15° C. (59° F.). On protracted exposure to the air, the salt gradually loses some acetic acid, and becomes less soluble. It is also soluble in 1.5 parts of boiling water, in 14 parts of boiling alcohol, in 60 parts of boiling chloroform, in about 1700 parts of ether, and in 2100 parts of cold chloroform.	When heated, the salt loses water as well as acetic acid. Upon ignition, it is consumed, leaving no residue. The addition of potassium or sodium hydrate T.S. to an aqueous solution of the salt causes a white precipitate, which is soluble in an excess of the alkali, and which conforms to the reactions and tests of Morphine (see Morphina). On adding sulphuric acid to the salt, vapors of acetic acid are evolved.

Uses.—Morphine acetate is narcotic and sedative. Dose, one-eighth of a grain (0.008 Gm.).

MORPHINÆ HYDROCHLORAS. U. S. Morphine Hydrochlorate.

Preparation.—This salt may be prepared by a process similar to that used for making morphine acetate (see preceding article), by substituting hydrochloric acid for acetic acid. It is a more stable salt than the acetate.

Morphine Hydrochloras. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
White, feathery needles of a silky lustre, or minute, colorless, needle-shaped crystals, permanent in the air. When heated to 100° C. (212° F.), the salt loses its water of crystallization (14.38 per cent.). At 300° C. (572° F.) it coheres slightly, but does not completely melt; and upon ignition it is consumed, leaving no residue.	Odorless; bitter taste; neutral reaction.	At 15° C. (59° F.), 24 parts. Boiling, 0.5 part.	Cold, 62 parts. Boiling, 31 parts.	Very slightly soluble in ether or chloroform.

TESTS.

Solution of potassium or sodium hydrate T.S. added to an aqueous solution of the salt throws down a white precipitate, which is soluble in an excess of the alkali. The precipitate is affected by reagents in the same manner as morphine. (See Morphine.) The aqueous solution yields, with silver nitrate T.S., a white precipitate, insoluble in nitric acid.

Uses.—Morphine hydrochlorate is used very largely in Great Britain as a narcotic and sedative. The dose is one-eighth of a grain (0.008 Gm.).

MORPHINÆ SULPHAS. U.S. Morphine Sulphate.

Preparation.—This useful salt may be made by the former official process, as follows:

Take of Morphine, in fine powder, 1 oz. troy; Distilled Water 8 fl. oz.; Diluted Sulphuric Acid a sufficient quantity. Mix the Morphine with the Distilled Water, then carefully drop in Diluted Sulphuric Acid, constantly stirring until the Morphine is neutralized and dissolved. Evaporate the solution, by means of a water-bath, so that on cooling it may crystallize. Lastly, drain the crystals, and dry them on bibulous paper.

Morphine Sulphas. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvent.
White, feathery, acicular crystals of a silky lustre, permanent in the air. When heated for some time at 100° C. (212° F.), the salt loses 3 molecules (7.12 per cent.) of water of crystallization; the remaining two molecules (4.75 per cent.) are gradually expelled by raising the temperature to 130° C. (266° F.). At 255° C. (491° F.) the salt melts, and upon ignition it is consumed, leaving no residue.	Odorless; bitter taste; neutral reaction.	At 15° C. (59° F.), 21 parts. Boiling, 0.75 part.	At 5° C. (59° F.), 702 parts. Boiling, 144 parts.	Almost insoluble in ether.

TESTS FOR IDENTITY.

Solution of potassium or sodium hydrate T.S. added to an aqueous solution of the salt throws down a white precipitate, which is soluble in an excess of the alkali. The precipitate is affected by reagents in the same manner as morphine. (See Morphine.) The aqueous solution yields, with barium chloride T.S., a white precipitate insoluble in hydrochloric acid.

Uses.—Morphine sulphate is much more largely employed in the United States than any other salt of morphine: the dose is one-eighth of a grain (0.008 Gm.). The *solution of sulphate of morphine* formerly official was made by dissolving one grain of morphine sulphate in one fluidounce of distilled water: although the solution is more stable than that of any other of the morphine salts in use, it will in time become deteriorated, either through the presence of microscopic plants or from other causes, and hence it is not desirable to keep it on hand. This solution must not be confounded with *Magendie's solution*, which is *sixteen times as strong*,—i.e., sixteen grains in a fluidounce. This solution is often used hypodermically.

Official Preparations.

- Pulvis Morphine Compositus.** . . . Made by mixing 1 Gm. of morphine sulphate with 19 Gm. of powdered camphor and 20 Gm. each of glycyrrhiza and precipitated calcium carbonate. (See Pulveres.) Dose, ten grains (0.6 Gm.).
- Trochisci Morphine et Ipecacuanhe.** Each troche contains $\frac{1}{10}$ grain of morphine sulphate and $\frac{1}{15}$ grain of ipecac. (See Trochisci.)

CODEINA. U. S. Codeine.

An alkaloid obtained from Opium.

When the solution of the mixed morphine and codeine hydrochlorates is treated with ammonia, the former alkaloid is precipitated, and the codeine, remaining in solution, may be obtained by evaporation and crystallization. It may be purified by treating the crystals with hot ether, which dissolves them, and yields the codeine in colorless crystals on spontaneous evaporation.

Codeine is remarkable for being the most soluble alkaloid in use, there being no necessity for salifying it. It is usually seen in larger crystals than any other alkaloid.

Codeina. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
White, more or less translucent, orthorhombic prisms, or octohedral crystals, somewhat efflorescent in warm air. When heated to 100° C. (212° F.), Codeine loses its water of crystallization (5.67 per cent.). At about 155° C. (311° F.) it melts, forming a colorless liquid, and on ignition it is completely dissipated. If 0.1 Gm. of Codeine be dissolved in 6 C.c. of cold, concentrated sulphuric acid (free from nitrose), the resulting liquid should be colorless. If about 2 C.c. of this solution be poured into a small porcelain capsule, and 1 drop of highly diluted nitric acid (made by adding 1 drop of nitric acid to 200 C.c. of water) added, a bluish-red tint gradually changing to pale blue will be developed.	Odorless; slightly bitter taste; alkaline reaction.	At 15° C. (59° F.), 80 parts. Boiling, 17 parts.	Cold, 3 parts. Boiling, Very soluble.	In 2 parts of chloroform; also soluble in 30 parts of ether.

TESTS FOR IDENTITY AND PURITY.

Another portion of the same solution, of about 2 C.c., gently warmed, and mixed with 1 drop of a mixture of 1 volume of ferric chloride T.S. and 19 volumes of water, likewise assumes a bluish or blue tint (difference from *morphine*).

On adding to 5 C.c. of an aqueous solution of Codeine (1 in 100) 10 drops of bromine water, and shaking so as to redissolve the precipitate formed, the liquid will gradually develop a light claret-red tint. This tint may be developed at once by the addition of ammonia water. On sprinkling 0.05 Gm. of Codeine upon 2 C.c. of nitric acid (specific gravity 1.200), the crystals will turn red, but the acid, even when warmed, will acquire only a yellow color (difference from and absence of *morphine*).

Uses.—Codeine is sedative, in doses of one-fourth to one grain (0.016 to 0.06 Gm.).

APOMORPHINÆ HYDROCHLORAS. U.S. Apomorphine Hydrochlorate.

The hydrochlorate of an artificial alkaloid prepared from morphine or codeine. It should be kept in small, dark amber-colored vials.

Preparation.—It may be made by heating morphine in a closed tube with a great excess of hydrochloric acid for two or three hours to the temperature of 140°–150° C. (284°–302° F.). The contents of the tube are then dissolved in water, an excess of sodium bicarbonate added, and the precipitate exhausted with ether or chloroform. On the addition to the solution of a very small quantity of hydrochloric acid, crystals of apomorphine hydrochlorate form. The process is one of dehydration,—the morphine parting with one molecule of water, thus:

Apomorphine Hydrochloras. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Minute, grayish-white, shining, acicular crystals, turning greenish on exposure to light and air. The crystals are colored blood-red to orange by nitric acid, transiently violet to light brown by sulphuric acid, dark purple to orange by a mixture of these acids.	Odorless; faintly bitter taste; neutral reaction.	At 15° C. (59° F.), 45 parts. Boiling, slowly decomposed.	Cold, 45 parts. Boiling, slowly decomposed.	Almost insoluble in ether or chloroform.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
At 270° C. (518° F.) it fuses to a black mass, and when ignited it is consumed without leaving a residue. Addition of silver nitrate T.S. to an aqueous solution of the salt produces a white precipitate insoluble in nitric acid, but instantly reduced by ammonia water. On shaking a few C.c. of the saturated, aqueous solution of the salt with a few small particles of manganese dioxide, the liquid acquires a green color, which is turned reddish-brown by adding some crystals of oxalic acid. If the oxalic acid be added to the solution first, and then a few small particles of manganese dioxide, the liquid will, upon agitation, assume a deep brownish-red color.	Morphine. Water.	Addition of sodium bicarbonate solution to the aqueous solution throws down the white amorphous alkaloid, which soon turns green on exposure to air, and imparts a violet or blue color to chloroform, in which it is very soluble. If the salt impart, at once, an emerald-green color to 100 parts of water on being shaken with it a few times in a test-tube, it should be rejected.

Uses.—This remarkable compound is devoid of narcotic properties, but is powerfully emetic. The dose is one-fourth grain (0.016 Gm.), or, hypodermically, one-tenth grain (0.007 Gm.).

CINCHONA. U. S. Cinchona.

The bark of *Cinchona Calisaya* Weddell, *Cinchona officinalis* Linné, and of hybrids of these and of other species of *Cinchona* (nat. ord. *Rubiaceæ*), yielding, when assayed by the process given below, not less than 5 per cent. of total alkaloids, and at least 2.5 per cent. of quinine ($C_{20}H_{24}N_2O_2 + H_2O = 341.8$).

CINCHONA RUBRA. U. S. Red Cinchona.

The bark of *Cinchona succirubra* Pavon (nat. ord. *Rubiaceæ*), containing not less than 5 per cent. of its peculiar alkaloids.

The value of cinchona bark depends entirely upon the percentage of alkaloids present in it; and, as barks are found in the market greatly varying in quality, it is necessary to prove their worth by assay.

Assay of Cinchona. U. S.

I. FOR TOTAL ALKALOIDS.

Cinchona, in No. 80 (or finer) powder, and completely dried at 100° C.

(212° F.), *twenty grammes* **20 Gm.**

Alcohol,

Ammonia Water,

Chloroform,

Ether,

Normal Sulphuric Acid (V.S.),

Potassium Hydrate V.S., each, a sufficient quantity.

To 20 Gm. of Cinchona, in very fine powder, and contained in a bottle provided with an accurately ground glass stopper, add 200 C.c. of a previously prepared mixture of 19 volumes of alcohol, 5 volumes of chloroform, and 1 volume of ammonia water, stopper the bottle, and shake it thoroughly and frequently during four hours. Then separate the liquid by pouring it into another bottle through a funnel containing a pellet of cotton, in such a manner that no material loss by evaporation may result. Transfer 100 C.c. of the clear filtrate (representing 10 Gm. of Cinchona) to a beaker, and evaporate it to dryness. Dissolve the residue of crude alkaloids thus obtained in 10 C.c. of water and 4 C.c. of normal sulphuric acid, with the aid of a gentle heat, filter the cooled solution into a separatory funnel, and wash the beaker and filter until the filtrate no longer has an acid reaction, using as small a quantity of water as possible. Now add 5 C.c. of potassium hydrate V.S., or such an amount as will render the liquid decidedly alkaline, and extract the alkaloids by shaking the mixture, first with 20 C.c., and then repeatedly with 10 C.c. of chloroform, until a drop of the last chloroform extraction, when evaporated on a watch-glass, no longer leaves a residue. Evaporate the united chloroformic extracts in a tared beaker, dry the residue at 100° C. (212° F.), and weigh. The weight found, multiplied by *ten* (10), will give the percentage of *total alkaloids* in the specimen of Cinchona tested.

II. FOR QUININE.

Transfer 50 C.c. of the clear filtrate remaining over from the preceding process (and representing 5 Gm. of Cinchona) to a beaker, evaporate it to dryness, and proceed as directed in the assay for total alkaloids, using, however, only one-half the amounts of volumetric acid and alkali there directed. Add the united chloroformic extracts containing the alkaloids in solution, gradually, and in small portions at a time, to about 5 Gm. of powdered glass contained in a porcelain capsule placed over a water-bath, so that, when the contents of the capsule are dry, all or nearly all of the dry alkaloids shall be in intimate admixture with the powdered glass, and the chloroform be completely expelled. Now moisten the residue with ether, and, having placed a funnel containing a filter of a diameter of 7 Cm., and well wetted with ether, over a small graduated tube (A), transfer to the filter the ether-moistened residue from the capsule. Rinse the latter several times, if necessary, with fresh ether,

so as to transfer the whole of the residue to the filter, then percolate with ether added drop by drop, until exactly 10 C.c. of percolate have been obtained. Then collect another volume of 10 C.c., by similar, slow percolation with ether, in a second graduated tube (B). Transfer the contents of the two tubes completely (using ether for washing) to two small, tared capsules, properly marked (A and B) so as to avoid confusion, evaporate to a constant weight at 100° C. (212° F.), and weigh them. (The residue in A will contain practically all the quinine, together with a portion of the alkaloids less soluble in ether; the residue in B will consist almost entirely of these alkaloids.) From the amount of residue obtained in capsule A deduct that contained in B, and multiply the remainder by twenty (20). The product will represent, approximately, the percentage of quinine (containing 1 molecule of water) in the specimen of Cinchona tested.

About twenty alkaloids have been discovered in cinchona barks. Some of these are found in only one kind of bark, some are doubtless "split products,"—that is, not existing naturally in the bark, but the result of the action of chemical agents upon it.

Quinine, Quinidine, Cinchonine, and Cinchonidine are the most important alkaloids found in cinchona barks, and they, or their important salts, will be considered in separate articles. The acids present are *kinic*, or *quinic*, *cinchotannic*, and *kinovic*, or *quinovic*. The neutral principle is *kinovin*, or *quinovin*, whilst *cinchonic red*, volatile oil, and red and yellow coloring-matter are also present. The first four of the alkaloids in the following list are used practically. The full list is as follows:

Natural Alkaloids.—1. Quinine, $C_{20}H_{24}N_2O_2$. 2. Quinidine (Conchinine of Hesse), $C_{20}H_{24}N_2O_2$. 3. Cinchonine, $C_{20}H_{24}N_2O$. 4. Cinchonidine, $C_{20}H_{24}N_2O$. 5. Quinamine, $C_{19}H_{24}N_2O_2$. 6. Quinidamine (Conchinamine of Hesse), $C_{19}H_{24}N_2O_2$. 7. Homoquinine or Ultraquinine. 8. Cinchonamine. 9. Paytine, $C_{21}H_{24}N_2OH_2O$. 10. Homocinchonine, $C_{19}H_{22}N_2O$. 11. Homocinchonidine, $C_{19}H_{22}N_2O$. 12. Cusconine, $C_{23}H_{28}N_2O_2 \cdot 2H_2O$. 13. Cusconidine. 14. Aricine (Cinchovatine of Manzini), $C_{22}H_{28}N_2O_4$. 15. Paricine, $C_{16}H_{18}N_2O$. 16. Paytamine. 17. Dihomocinchonine. 18. Dicinchonine, $C_{40}H_{48}N_4O_3$? 19. Diquinidine (Diconchinine of Hesse), $C_{40}H_{48}N_4O_3$. 20. Javanine. 21. Cincholine.

The Artificial Alkaloids at present known are: 1. Quinicine, $C_{20}H_{24}N_2O_2$. 2. Cinchonicine, $C_{20}H_{24}N_2O$. 3. Quinamicine, $C_{19}H_{24}N_2O_2$. 4. Quinamidine, $C_{19}H_{24}N_2O_2$. 5. Protoquinamicine, $C_{17}H_{20}N_2O_2$. 6. Apoquinamine, $C_{19}H_{22}N_2O$. 7. Homocinchonicine, $C_{19}H_{22}N_2O$. 8. Hydrocinchonine, $C_{20}H_{26}N_2O$. These are chiefly produced by the action of heat upon the natural alkaloids.

One of the principal difficulties in preserving galenical preparations of cinchona arises from the alteration and precipitation which the cinchotannic acid and its compounds undergo upon keeping. Glycerin has proved to be very useful by dissolving and holding these in solution, and hence it is present in nearly every one of the preparations.

Official Preparations.

- Infusum Cinchonæ** Made by percolating 60 Gm. of cinchona with water containing 1 per cent. of aromatic sulphuric acid to obtain 1000 C.c. (see page 349). Dose, one fluidounce (29 C.c.).
Infusion of Cinchona.
Extractum Cinchonæ Made from cinchona with a menstruum of 3 parts of alcohol and 1 part of water (see page 446).
Extract of Cinchona.
Extractum Cinchonæ Fluidum Made from cinchona with a menstruum of 8 parts of alcohol and 2 parts of glycerin, finishing with a menstruum of 8 parts of alcohol and 2 parts of water (see page 400).
Fluid Extract of Cinchona. Dose, one to two fluidrachms (3.7 to 7.4 C.c.).

Official Preparations.—Continued.

- Tinctura Cinchonæ** Made by percolating 200 Gm. of cinchona with a menstruum of 875 C.c. of alcohol, 250 C.c. of water, and 75 C.c. of glycerin, to obtain 1000 C.c. (see page 365). Dose, one to four fluidrachms (3.7 to 14.7 C.c.).
- Tinctura Cinchonæ Composita** Made by percolating 100 Gm. of *red cinchona*, 80 Gm. of bitter orange peel, and 20 Gm. of *serpentaria* with a menstruum of 850 C.c. of alcohol, 75 C.c. of water, and 75 C.c. of glycerin, to obtain 1000 C.c. (see page 365). Dose, one to four fluidrachms (3.7 to 14.7 C.c.).
- Compound Tincture of Cinchona.**

QUININA. *U. S.* Quinine.

An alkaloid obtained from the bark of various species of *Cinchona* (nat. ord. *Rubiaceæ*).

Preparation.—This alkaloid is usually made by adding to the *cooled* acid solution of the sulphate a quantity of ammonia water or solution of soda just sufficient to precipitate the quinine, carefully avoiding an excess.

Quinina. <i>U. S.</i>	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A white, flaky, amorphous or crystalline powder, permanent in the air. When heated to 57° C. (134.6° F.), it melts, and at 100° C. (212° F.) loses about 9 per cent. (about 2 molecules) of its water of crystallization, the remainder being expelled at 125° C. (257° F.). The anhydrous alkaloid, when pure, melts at 173° C. (343.4° F.). On ignition, the alkaloid is consumed without leaving a residue.	Odorless; very bitter taste; alkaline reaction.	At 15° C. (59° F.), 1670 parts. Boiling, 760 parts.	At 15° C. (59° F.), 6 parts. Boiling, 2 parts.	Soluble in 23 parts of ether, in about 5 parts of chloroform, in about 200 parts of glycerin, and also soluble in carbon disulphide, benzoin, benzol, ammonia water, or diluted acids.

TESTS.	IMPURITIES.	TESTS FOR IMPURITIES.
The solution of Quinine in diluted sulphuric acid has a vivid blue fluorescence. On treating 10 C.c. of an aqueous, acidulated solution (about 1 in 1500) of Quinine with 2 drops of bromine water, and then with an excess of ammonia water, the liquid will acquire an emerald-green color. With proper adjustment of the reagents, more dilute solutions will give a paler tint, while more concentrated ones will acquire a deeper color, or deposit a green precipitate. Quinine should not be reddened by nitric acid (difference from <i>morphine</i>).	Readily Carbonizable, Organic Impurities. More than small proportions of other <i>Cinchona Alkaloids</i> .	Quinine should not impart more than a faintly yellowish tint to concentrated sulphuric acid. If 2 Gm. of Quinine be mixed, in a small mortar, with 1 Gm. of ammonium sulphate and 10 C.c. of distilled water, the mixture thoroughly dried on a water-bath, the residue (which should be strictly neutral to test-paper) agitated with 20 C.c. of water, then allowed to macerate for half an hour at 15° C. (59° F.), with occasional agitation, and filtered through a pellet of glass-wool, 5 C.c. of the filtrate transferred to a test-tube, and gently mixed, without shaking, with 7 C.c. of ammonia water (specific gravity 0.960), should produce a clear liquid. If the temperature during the maceration has been 16° C. (60.8° F.), 7.5 C.c. of ammonia water may be added; if 17° C. (62.8° F.), 8 C.c. (In each case a clear liquid indicates the absence of more than small proportions of other <i>cinchona alkaloids</i> .)

Uses.—The alkaloid quinine is never used medicinally. Pharmaceutically, it is employed in making elixirs, in iron and quinine citrate, in soluble iron and quinine citrate, and in syrup of iron, quinine, and strychnine phosphates.

QUININÆ SULPHAS. U. S. Quinine Sulphate.

Preparation.—The processes which are used for making quinine sulphate, commercially, are regarded as valuable trade secrets, and the manufacturers carefully guard them. The following process, which was formerly official, illustrates one method of making the sulphate of the principal alkaloid from cinchona :

Take of Yellow Cinchona, in coarse powder, 48 oz. troy ; Hydrochloric Acid $3\frac{1}{2}$ oz. troy ; Lime, in fine powder, 5 oz. troy ; Animal Charcoal, in fine powder, Sulphuric Acid, Alcohol, Water, Distilled Water, each, a sufficient quantity. Boil the Cinchona in 13 pints of water mixed with one-third of the Hydrochloric Acid, and strain through muslin. Boil the residue twice successively with the same quantity of Water and Acid as before, and strain. Mix the decoctions, and, while the liquid is hot, gradually add the Lime, previously mixed with 2 pints of Water, stirring constantly, until the quinine is completely precipitated. Wash the precipitate with Distilled Water, and, having pressed, dried, and powdered it, digest it in boiling Alcohol. Pour off the liquid, and repeat the digestion several times, until the Alcohol is no longer rendered bitter. Mix the liquids, and distil off the Alcohol until a brown viscid mass remains. Upon this, transferred to a suitable vessel, pour 4 pints of Distilled Water, and, having heated the mixture to the boiling point, add as much Sulphuric Acid as may be necessary to dissolve the quinine. Then add $1\frac{1}{2}$ oz. troy of Animal Charcoal, boil the liquid for two minutes, filter while hot, and set it aside to crystallize. Should the liquid, before filtration, be entirely neutral, acidulate it very slightly with Sulphuric Acid ; should it, on the contrary, change the color of litmus paper to a bright red, add more Animal Charcoal. Separate the crystals from the liquid, dissolve them in boiling Distilled Water slightly acidulated with Sulphuric Acid, add a little Animal Charcoal, filter the solution, and set it aside to crystallize. Lastly, dry the crystals on bibulous paper with a gentle heat, and keep them in a well-stopped bottle. The mother-water may be made to yield an additional quantity of Sulphate of Quinine by precipitating the quinine with Water of Ammonia, and treating the precipitated alkaloid with Distilled Water, Sulphuric Acid, and Animal Charcoal, as before.

The hydrochloric acid forms with the alkaloids soluble hydrochlorates. The lime decomposes the salts by uniting with the acid, and the alkaloids are precipitated with the excess of lime. These are dissolved out with boiling alcohol, the solution evaporated, acidulated with sulphuric acid, decolorized with animal charcoal, and crystallized.

Soda is often used instead of lime to precipitate the alkaloids, because quinine is less soluble in a solution of sodium chloride than in calcium chloride ; whilst several manufacturers prefer to use amylic alcohol for

exhausting the lime precipitate of alkaloids. Oil of turpentine and refined petroleum have also been substituted to some extent.

At least three sulphates of quinine have been obtained, of which two are now official. The first of these ($C_{20}H_{24}N_2O_2$) $_2$ $H_2SO_4 + 7H_2O$, is a "diquinic sulphate," is known and prescribed in Great Britain as *Quininæ Disulphas*, and is the official salt known as quinine sulphate, or *Quininæ Sulphas*, U. S.; the second, formed by dissolving the first in dilute sulphuric acid, has the formula $C_{20}H_{24}N_2O_2H_2SO_4 + 7H_2O$, and is the official quinine bisulphate, or *Quininæ Bisulphas*, U. S.; while the third, which is not official, is the acid sulphate, $C_{20}H_{24}N_2O_2 \cdot 2H_2SO_4 + 7H_2O$, and may be obtained from a solution of quinine in an excess of dilute sulphuric acid.

Quininæ Sulphas. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
White, silky, light and fine, needle-shaped crystals, fragile, and somewhat flexible, making a very light and easily compressible mass, lustreless from superficial efflorescence after standing in the air. The salt is liable to lose water on exposure to warm air, to absorb moisture in damp air, and to become colored by exposure to light. When long exposed to the air, or when kept at 50° to 60° C. (122° to 140° F.) for some hours, it loses most of its water of crystallization (all except 4.1 to 6.2 per cent., or 2 to 3 molecules), the last portion being slowly expelled at 100° to 115° C. (212° to 239° F.). On ignition, the salt burns slowly without leaving a residue.	Odorless; persistent, very bitter taste; neutral reaction.	At 15° C. (59° F.), 740 parts. Boiling, 30 parts.	At 15° C. (59° F.), 65 parts. Boiling, 3 parts.	Soluble in acidulated water, in 40 parts of glycerin, in 680 parts of chloroform, and freely in dilute acids.

TESTS.

On treating 10 C.c. of an aqueous solution (about 1 in 1300) of the salt with 2 drops of bromine water, then with an excess of ammonia water, the liquid will acquire an emerald-green color. With proper adjustment of the reagents, more dilute solutions will give a paler tint, while more concentrated ones will acquire a deeper color, or throw down a green precipitate.	Limit of Readily Carbonizable, Organic Impurities. Absence of more than 8 molecules, or 16.18 per cent., of Water.	Quinine Sulphate should not impart more than a faintly yellowish tint to concentrated sulphuric acid. If 1 Gm. of the salt be dried at a temperature of 115° C. (239° F.) until it ceases to lose weight, the residue should not weigh less than 0.838 Gm. If 2 Gm. of the salt (which must have been previously ascertained to be strictly neutral to litmus paper, or have been rendered so) be dried, as far as possible, at 100° C. (212° F.), the residue then agitated with 20 C.c. of water, and the mixture macerated for half an hour at 15° C. (59° F.), with occasional agitation, upon proceeding further as directed under Quinine (see Quinina) the results there given should be obtained.
A cold, saturated aqueous solution of the salt remains unaffected by potassium iodide T.S. (difference from <i>quinidine sulphate</i>).		
Ammonia water added to the aqueous solution of the salt throws down a white precipitate, soluble in an excess of ammonia water, and also in about 20 times its weight of ether. The aqueous solution of the salt yields, with barium chloride T.S., a white precipitate, insoluble in hydrochloric acid.	See Quinina.	
Quinine Sulphate should not produce a red color with nitric acid (difference from <i>morphine</i>).		

Uses.—Quinine sulphate is used as an antiperiodic, tonic, and antipyretic. The dose varies from two to twenty grains (0.13 to 1.3 Gm.). It may be given in the form of pills or in solution: in the latter case it is better to suspend it in syrup without using acid, with the addition of a little fluid extract of glycyrrhiza and a drop of ammonia water.

QUININÆ BISULPHAS. U. S. Quinine Bisulphate.

Preparation.—This salt is made by adding sulphuric acid to quinine sulphate suspended in water, evaporating the solution, and crystallizing the bisulphate.

Quinine Bisulphas. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Colorless, transparent or whitish, orthorhombic crystals, or small needles, efflorescing on exposure to air. At 100° C. (212° F.) it loses all its water of crystallization (nearly 23 per cent.), and at 135° C. (275° F.) it is converted into quinicine sulphate, which dissolves in diluted sulphuric acid with a yellow color without any blue fluorescence. On ignition, the salt is slowly consumed, leaving no residue.	Odorless; very bitter taste; strongly acid reaction.	At 15° C. (59° F.), 10 parts. Boiling, Very soluble.	At 15° C. (59° F.), 32 parts. Boiling, Very soluble.

Tests.

On treating 10 C.c. of an aqueous solution (about 1 in 1000) of the salt with 2 drops of bromine T.S., and then with an excess of ammonia water, the liquid will acquire an emerald-green color. With proper adjustment of the reagents, more diluted solutions will give a paler tint, while more concentrated ones will acquire a deeper color, or throw down a green precipitate. Ammonia water added to the aqueous solution of the salt throws down a white precipitate, soluble in an excess of ammonia water, and also in about 20 times its weight of ether. The aqueous solution of the salt yields, with barium chloride T.S., a white precipitate insoluble in hydrochloric acid. If 1 Gm. of the salt be dried at a temperature of 100° C. (212° F.) until it ceases to lose weight, the remainder, cooled in a desiccator, should weigh not less than 0.77 Gm. (corresponding to 7 molecules, or 23 (22.98) per cent., of water of crystallization).	Limit of Readily Carbonisable Organic Impurities.	Quinine Bisulphate should not impart more than a faintly yellowish tint to concentrated sulphuric acid. If 2 Gm. of the salt, dried at 100° C. (212° F.), be agitated with 16 C.c. of water, the mixture made exactly neutral with ammonia water, then brought to the volume of 20 C.c. by the addition of water, and macerated for half an hour at 15° C. (59° F.), upon proceeding further as directed for the corresponding test under Quinine (see Quinina) the results there given should be obtained.
	See Quinina.	

Uses.—The bisulphate has been introduced into medicine in preference to the ordinary sulphate, because of its greater solubility: being seventy times more soluble, it is better adapted for making into pills than the sulphate. It contains 13 per cent. less of the alkaloid than does the sulphate. The difference is to some extent compensated for by the greater solubility, and the dose given is usually that of the sulphate.

QUININÆ HYDROCHLORAS. U. S. Quinine Hydrochlorate.

Preparation.—Quinine hydrochlorate may be made by double decomposition between quinine sulphate and barium chloride, or by dissolving the alkaloid quinine in diluted hydrochloric acid, evaporating, and crystallizing.

Quininæ Hydrochloras. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
White, silky, light and fine, needle-shaped crystals. The salt is liable to lose water when exposed to warm air. When heated to 120° C. (248° F.) the salt loses its water of crystallization. At about 156° C. (312.8° F.), it begins to melt, but it is not fully melted until the temperature reaches 190° C. (374° F.). On ignition, it is slowly consumed, leaving no residue.	Odorless; very bitter taste; neutral or faintly alkaline reaction.	At 15° C. (59° F.), 34 parts. Boiling, 1 part.	At 15° C. (59° F.), 3 parts. Boiling, Very soluble.	Soluble in 9 parts of chloroform.

TESTS.

The saturated aqueous solution does not show any blue fluorescence, which, however, appears in some degree in more dilute solutions, and markedly so upon addition of dilute sulphuric acid. On treating 10 C.c. of an aqueous solution (about 1 in 1400) of the salt with 2 drops of bromine water, and then with an excess of ammonia, the liquid will acquire an emerald-green color. With proper adjustment of the reagents, more dilute solutions will give a paler tint, while more concentrated ones will acquire a deeper color, or throw down a green precipitate. Ammonia water added to the aqueous solution throws down a white precipitate soluble in an excess of ammonia water, or in 20 times its weight of ether. Silver nitrate T.S. produces a white precipitate insoluble in nitric acid.

The salt should not be reddened by nitric acid (difference from *morphine*). If 1 Gm. of the salt be dried at 100° C. (212° F.) until it ceases to lose weight, the residue should not weigh less than 0.9 Gm. (corresponding to 2 molecules, or 9 per cent., of water of crystallization).

Limit of Readily Carbonizable, Organic Impurities.

Absence of Barium.

Limit of Sulphate.

See Quinina.

Quinine Hydrochlorate should not impart more than a faintly yellowish tint to concentrated sulphuric acid.

The aqueous solution of the salt should not be rendered turbid by dilute sulphuric acid, and should not be rendered more than slightly turbid by barium chloride T.S.

If 3 Gm. of the salt (which must have been previously ascertained to be strictly neutral, or have been rendered so) be mixed, in a small capsule, with 1.5 Gm. of crystallized sodium sulphate and 30 C.c. of water, the mixture thoroughly dried on a water-bath, and the residue agitated with 30 C.c. of water, and allowed to macerate for half an hour at 15° C. (59° F.), with occasional agitation, upon proceeding further as directed under Quinine (see Quinina) the results there given should be obtained.

Uses.—This salt is used like the sulphate: it is much more soluble, and is preferable for hypodermic use. The dose is from two to twenty grains (0.13 to 1.3 Gm.).

QUININÆ HYDROBROMAS. U. S. Quinine Hydrobromate.

Preparation.—Quinine hydrobromate may be made by decomposing 40 parts of quinine sulphate dissolved in 400 parts of hot alcohol with 11 parts of potassium bromide dissolved in 30 parts of distilled water. Potassium sulphate crystallizes out, and the quinine hydrobromate in solution may be obtained by evaporation and crystallization. In drying the salt, care must be observed not to subject the crystals to heat sufficient to fuse them: a warm dry atmosphere should be relied upon to effect the drying, and all unnecessary exposure to light should be avoided.

Quinine hydrobromate may also be made by double decomposition between quinine sulphate and barium bromide, both in hot alcoholic solution. It is sometimes made by dissolving the alkaloid quinine in hot diluted hydrobromic acid until the latter is no longer acid to litmus paper, evaporating, and crystallizing.

Quininae Hydrobromas. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
White, light, silky needles. The salt is liable to lose water on exposure to warm or dry air. On ignition, the salt burns slowly without leaving a residue.	Odorless; very bitter taste; neutral or slightly alkaline reaction.	At 15° C. (59° F.), 54 parts.	At 15° C. (59° F.), 0.6 part.	Soluble in 6 parts of ether and 12 parts of chloroform.
When heated at 100° C. (212° F.), the salt loses its water of crystallization (4.25 per cent.). At 152° C. (305.6° F.) it begins to fuse, and becomes a syrupy liquid at 200° C. (392° F.). Upon ignition, it is slowly consumed, leaving no residue.		Boiling, Very soluble.	Boiling, Very soluble.	

TESTS.

On treating 10 C.c. of an aqueous solution (about 1 in 1300) with 2 drops of bromine water, and then with an excess of ammonia water, the liquid will acquire an emerald-green color. With proper adjustment of the reagents, more dilute solutions will give a paler tint, while more concentrated ones will acquire a deeper color, or throw down a green precipitate.

Ammonia water added to the aqueous solution throws down a white precipitate, soluble in an excess of ammonia water, and also in about 20 times its weight of ether.

On precipitating a saturated, aqueous solution of the salt with sodium hydrate T.S., filtering, supersaturating the filtrate with acetic acid, adding chloroform and a little chlorine water, and shaking, the chloroform will separate with a yellow color.

If 1 Gm. of the salt be dried at 100° C. (212° F.) until it ceases to lose weight, the residue should not weigh less than 0.957 Gm. (corresponding to 1 molecule, or 4.24 per cent., of water of crystallization).

Quinine Hydrobromate should not produce a red color with nitric acid (difference from morphine).

Limit of Readily Carbonizable, Organic Impurities.

See Quinina.

Quinine Hydrobromate should not impart more than a faintly yellowish tint to concentrated sulphuric acid.

If 3 Gm. of the salt (which must have been previously ascertained to be strictly neutral, or have been rendered so) be mixed, in a small capsule, with 1.2 Gm. of crystallized sodium sulphate and 30 C.c. of water, the mixture thoroughly dried on a water-bath, and the residue agitated with 30 C.c. of water, and allowed to macerate for half an hour at 15° C. (59° F.), with occasional agitation, upon proceeding further as directed under Quinine (see Quinina) the results there given should be obtained.

Uses.—Quinine hydrobromate is sometimes used hypodermically. Its dose is that of the sulphate, two to twenty grains (0.13 to 1.3 Gm.).

QUININÆ VALERIANAS. U. S. Quinine Valerianate.

Preparation.—In the former official process quinine was first obtained by decomposing the sulphate, by means of ammonia, and then combining it directly with valerianic acid, to form quinine valerianate, which crystallized from the solution when it cooled, because it is much less soluble in cold than in hot water.

Care must be observed in evaporating the solution and in drying this salt, because of its tendency to decompose. It may also be made by acting on an alcoholic solution of quinine sulphate with sodium valerianate. Quinine valerianate has been known to emit a phosphorescent light in the dark when rubbed in a mortar with a pestle.

Quinine Valerianas. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
White, or nearly white, pearly, lustrous, triclinic crystals, permanent in the air. When heated to about 90° C. (194° F.), the salt melts, forming a colorless liquid. At 100° C. (212° F.) it loses its water of crystallization, and also begins to lose valerianic acid. On ignition, it burns slowly without leaving a residue.	Slight odor of valerianic acid; bitter taste; neutral or slightly alkaline reaction.	At 15° C. (59° F.), 100 parts.	At 15° C. (59° F.), 5 parts.
		Boiling, 40 parts.	Boiling, 1 part.

Tests.

The aqueous solution, when acidulated with sulphuric acid, has a blue fluorescence, and emits the odor of valerianic acid. On treating 10 C.c. of an aqueous solution (about 1 in 1300) of the salt with 2 drops of bromine water, and then with an excess of ammonia water, the liquid will acquire an emerald-green color. With proper adjustment of the reagents, more dilute solutions will give a paler tint, while more concentrated ones will acquire a deeper color, or throw down a green precipitate. Ammonia water added to the aqueous solution throws down a white precipitate soluble in an excess of ammonia water, and also in about 20 times its weight of ether.	Limit of Readily Carbonisable, Organic Impurities.	Quinine Valerianate should not impart more than a faintly yellowish tint to concentrated sulphuric acid. The aqueous solution of the salt should not be rendered more than slightly turbid by barium chloride T.S.
	Limit of Sulphate.	

Uses.—This salt has no especial advantages over the sulphate. The proportion of valerianic acid is too small to have any influence as a nervine. Dose, two to ten grains (0.13 to 0.65 Gm.).

QUINIDINÆ SULPHAS. U. S. Quinidine Sulphate.

The neutral sulphate of an alkaloid obtained from the bark of several species of *Cinchona* (nat. ord. *Rubiaceae*).

Preparation.—This salt is obtained from the mother-liquors obtained after the crystallization of quinine.

Quinidine Sulphas. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
White, silky needles, permanent in the air. On ignition, the salt burns slowly without leaving a residue. It parts with its water of crystallization (4.6 per cent. by weight) at 120° C. (248° F.).	Odorless; very bitter taste; neutral or faintly alkaline reaction.	At 15° C. (59° F.), 100 parts.	At 15° C. (59° F.), 8 parts.	Very soluble in acidulated water and in 14 parts of chloroform, but almost insoluble in ether.
		Boiling, 7 parts.	Boiling, Very soluble.	

TESTS.

The aqueous solution, when acidulated with sulphuric acid, has a decided blue fluorescence. On treating 10 C.c. of an aqueous solution (about 1 in 1600) of the salt with 2 drops of bromine water, and then with an excess of ammonia water, the liquid will acquire an emerald-green color. With proper adjustment of the reagents, more dilute solutions will give a paler tint, while more concentrated ones will acquire a deeper color, or deposit a green precipitate. Barium chloride T.S. added to an aqueous solution of the salt throws down a white precipitate insoluble in hydrochloric acid. The salt should not be reddened by nitric acid (difference from *morphine*). A cold, saturated aqueous solution of the salt yields a white precipitate with potassium iodide T.S. (difference from *quinine sulphate*).

Limit of Readily Carbonisable, Organic Impurities.

Absence of more than Small Proportions of Other Cinchona Alkaloids.

Quinidine Sulphate should not impart more than a faintly yellowish tint to concentrated sulphuric acid.

If a little ammonia water is added to 3 C.c. of an aqueous solution of the salt saturated at 15° C. (59° F.), a white precipitate (*quinidine*) is produced, which requires more than 30 C.c. of ammonia water, or more than 30 times its weight of ether, to dissolve it.

Quinidine differs from quinine in being dextrogyre (quinine is lævo-gyre), and in being almost insoluble in ether.

Uses.—This salt is equally efficient with quinine sulphate in the treatment of malaria and as an antiperiodic and antipyretic. Dose, two to twenty grains (0.13 to 1.3 Gm.).

CINCHONINA. U. S. Cinchonine.

An alkaloid obtained from the bark of various species of Cinchona.

Preparation.—Cinchonine may be obtained from the mother-waters of quinine sulphate by diluting them with water, precipitating with ammonia, collecting the precipitate on a filter, washing and drying it, and then dissolving it in boiling alcohol, which deposits the cinchonine in a crystalline form upon cooling. It may be still further purified by a second solution and crystallization.

Cinchonina. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
White, lustrous prisms or needles, permanent in the air. At 240° C. (464° F.) the crystals fuse together, and at 258° C. (496.4° F.) they melt, forming a brown liquid. When ignited, they are consumed without leaving a residue.	Odorless; at first nearly tasteless, but developing a bitter after-taste; alkaline reaction.	At 15° C. (59° F.), Cold, 3760 parts.	Cold, 116 parts.	In 526 parts of ether; 163 parts of chloroform.
		Boiling, 3500 parts.	Boiling, 26.5 parts.	

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>On adding to a neutral or not more than faintly acid solution of Cinchonine, or any of its salts, enough potassium ferrocyanide T.S. to redissolve the precipitate first formed, and afterwards an acid, a golden-yellow precipitate will be formed, which, when redissolved by gently warming the liquid, will separate, on cooling, in minute scales or needles.</p> <p>On adding an excess of ammonia water to a solution of Cinchonine in a dilute acid, the alkaloid will be precipitated.</p>	<p>More than traces of Quinine or Quinidine.</p> <p>Readily Carbonizable, Organic Impurities.</p>	<p>A solution of the alkaloid (1 in 1000) in diluted sulphuric acid should not exhibit more than a faint blue fluorescence.</p> <p>The salt should not be colored, or but very slightly colored yellow, by the addition of concentrated sulphuric acid.</p>

Uses.—Cinchonine is not used medicinally, because of its insolubility in water. It is used pharmaceutically to some extent in elixirs, etc., as it is more soluble in alcohol.

CINCHONINÆ SULPHAS. U. S. Cinchonine Sulphate.

Preparation.—In consequence of its greater solubility, cinchonine sulphate remains behind in the mother-waters, when quinine sulphate crystallizes, in the process for preparing the latter. Cinchonine is obtained from quinine mother-liquors by precipitation with solution of soda. The precipitated cinchonine is washed, converted into a sulphate by the addition of sulphuric acid, decolorized, and crystallized.

Cinchoninas Sulphas. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Hard, white, lustrous, prismatic crystals, permanent in the air. At 100° C. (212° F.) the salt loses its water of crystallization, and at about 215° C. (419° F.) it melts, forming a brown liquid. On ignition, the salt is dissipated without leaving a residue. The aqueous solution of the salt yields a curdy precipitate with mercuric potassium iodide T.S.	Odorless; very bitter taste; neutral reaction.	At 15° C. (59° F.), 66 parts. Boiling, 13.59 parts.	Cold, 10 parts. Boiling, 3.25 parts.	In 78 parts of chloroform, almost insoluble in ether.

Tests.

<p>The salt yields with ammonia water a white precipitate (Cinchonine) which is very sparingly soluble in an excess of ammonia (difference from quinine). With barium chloride it yields a white precipitate insoluble in hydrochloric acid.</p> <p>If 1 part of the salt, reduced to powder, be macerated, with frequent agitation, with 80 times its weight of chloroform at 15° C. (59° F.), it should wholly, or almost wholly, dissolve (any more than traces of quinine sulphate or of cinchonidine sulphate remaining undissolved).</p>	<p>Limit of Quinine or Quinidine.</p> <p>Undue Amount of Water.</p> <p>Readily Carbonizable, Organic Impurities.</p>	<p>A solution of the salt (1 in 1000) acidulated with sulphuric acid should not show more than a faint blue fluorescence.</p> <p>If 1 Gm. be dried at 100° C. (212° F.) until it ceases to lose weight, the residue, cooled in a desiccator, should weigh not less than 0.95 Gm.</p> <p>The salt should not impart more than a faintly yellowish tinge to concentrated sulphuric acid.</p>
--	--	--

Uses.—Cinchonine sulphate is used as a tonic and febrifuge. Its cheapness has led to its extensive employment as a substitute for quinine. The dose is larger, however, as an antiperiodic: fifteen to forty grains (0.9 to 2.6 Gm.) have been given.

CINCHONIDINÆ SULPHAS. Cinchonidine Sulphate.

The neutral sulphate of an alkaloid obtained from the bark of various species of Cinchona.

Preparation.—This alkaloidal salt is also obtained from the quinine mother-liquors by fractional crystallization. The Indian barks contain a larger proportion of it than the South American varieties.

Cinchonidine Sulphas. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
White, silky, acicular crystals, slightly efflorescent on exposure to air. At 100° C. (212° F.) the salt loses its water of crystallization.	Odorless; very bitter taste; neutral or faintly alkaline reaction.	At 15° C. (59° F.), 70 parts. Boiling, 1.42 parts.	Cold, 66 parts. Boiling, 3 parts.	Freely soluble in acidulated water, and in 1316 parts of chloroform (the undissolved portions becoming gelatinous); very sparingly soluble in ether or benzol. The presence of sulphates of other cinchona alkaloids increases its solubility in ether and chloroform.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
At 215° C. (419° F.) the salt melts, and on ignition it is dissipated without leaving a residue. The aqueous solution of the salt yields, on addition of ammonia water, a white precipitate (Cinchonidine) which requires a large excess of ammonia to dissolve it, and which is soluble in about 75 parts of ether. With barium chloride T.S. a white precipitate, insoluble in hydrochloric acid, is formed. If concentrated sulphuric acid be added to a small quantity of the salt, not more than a faintly yellowish color should be developed (limit of readily carbonizable, organic impurities). Upon adding to this liquid a crystal of potassium dichromate, a yellowish-green color is produced, which gradually changes to grass-green.	More than traces of Quinine or Quinidine Sulphate. Foreign Organic Matters. Undue Amount of Water. More than small proportions of Cinchonine Sulphate, or more than small proportions of Quinidine Sulphate.	A solution of the salt (about 1 in 1000) in diluted sulphuric acid should not show more than a slight blue fluorescence. The salt should not be colored by the addition of sulphuric acid. If 1 Gm. be dried at 100° C. (212° F.) until it ceases to lose weight, the residue, cooled in a desiccator, should weigh not less than 0.920 Gm. If 0.5 Gm. of the salt be macerated, with frequent agitation, at the ordinary temperature, with 20 C.c. of cold distilled water, 0.5 Gm. of potassium and sodium tartrate added, the mixture macerated, with frequent agitation, for one hour at 15° C. (59° F.), then filtered, and a drop of ammonia water added to the filtrate, not more than a slight turbidity should appear.

Uses.—This salt closely resembles quinine sulphate in its medicinal effects, and may be used for the same purposes in somewhat larger doses.

NUX VOMICA. U. S. Nux Vomica.

The seed of *Strychnos Nux-vomica* Linné (nat. ord. *Loganiaceæ*).

Nux vomica contains *strychnine*, *brucine*, $C_{25}H_{33}N_3O_4$, probably *loganin*, *igasuric acid*, protein compounds, gum, fixed oil, sugar, etc. Strychnine is official, and will be considered separately. Brucine is readily soluble in alcohol and in chloroform; it is colored bright red by nitric acid, and its solution acquires a rose-red coloration with chlorine water. The presence of igasurine is now considered doubtful. The fixed oil is soluble in alcohol, and the alkaloids are soluble in the oil: in making the extract the oil should be separated and shaken with diluted alcohol to dissolve the alkaloids. This solution should be evaporated and mixed with the extract. Nux vomica is poisonous in large doses; in doses of three grains (0.19 Gm.) it is tonic.

Official Preparations.

- Extractum Nucis Vomice** Made with a menstruum of 3 parts of alcohol and 1 part of water (see page 452). Dose, one-half to two grains (0.03 to 0.13 Gm.).
Extract of Nux Vomica.
- Extractum Nucis Vomice Fluidum** . Made with a menstruum of 3 parts of alcohol and 1 part of water, with 5 per cent. of acetic acid (see page 415). Dose, one to three minims (0.06 to 0.18 C.c.).
Fluid Extract of Nux Vomica.
- Tinctura Nucis Vomice** Made by dissolving 20 Gm. of extract of nux vomica in a mixture of 3 parts of alcohol and 1 part of water, to make 1000 C.c. (see page 373). Dose, twenty minims (1.2 C.c.).
Tincture of Nux Vomica.

STRYCHNINA. U. S. Strychnine.

An alkaloid obtained from Nux Vomica, and also obtainable from other plants of the natural order *Loganiaceæ*.

Preparation.—Strychnine may be made by the process formerly official, as follows:

Take of Nux Vomica, rasped, 48 oz. troy; Lime, in fine powder, 6 oz. troy; Hydrochloric Acid, $3\frac{1}{2}$ oz. troy; Alcohol, Diluted Alcohol, Diluted Sulphuric Acid, Water of Ammonia, Purified Animal Charcoal, Water, each, a sufficient quantity. Macerate the Nux Vomica for twenty-four hours in 16 pints of water, acidulated with one-third of the Hydrochloric Acid; then boil for two hours, and strain with expression through a strong muslin bag. Boil the residue twice successively in the same quantity of acidulated Water, each time straining as before. Mix the decoctions and evaporate to the consistence of thin syrup; then add the Lime previously mixed with a pint of Water, and boil for ten minutes, frequently stirring. Pour the whole into a double muslin bag, and, having thoroughly washed the precipitate, press, dry, and powder it. Treat the powder repeatedly with Diluted Alcohol, in order to remove the brucine, until the washings are but faintly reddened

by nitric acid. Then boil it repeatedly with Alcohol until deprived of its bitterness, mix the several tinctures, and distil off the Alcohol by means of a water-bath. Having washed the residue, mix it with a pint of Water, and, applying a gentle heat, drop in enough Diluted Sulphuric Acid to neutralize and dissolve the alkaloid. Then add Purified Animal Charcoal, and, having boiled the mixture for a few minutes, filter, evaporate, and set aside to crystallize. Dissolve the crystals in Water, and add sufficient Water of Ammonia to precipitate the Strychnine. Lastly, dry this on bibulous paper, and keep it in a well-stopped bottle.

In this process strychnine hydrochlorate is formed: this is decomposed by lime, and the strychnine is dissolved out of the excess of lime with boiling alcohol (the brucine having been previously removed by treatment with diluted alcohol), the alcoholic solution is evaporated, and sulphuric acid added to dissolve the alkaloid; the solution is decolorized and evaporated to crystallize. The crystals of strychnine sulphate are dissolved and strychnine precipitated by adding ammonia water.

Strychnina. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Colorless, transparent, octohedral or prismatic crystals, or a white, crystalline powder, permanent in the air. When heated to 268° C. (514.4° F.), Strychnine melts. Upon ignition, it is consumed, leaving no residue.	Odorless; intensely bitter taste, which is still perceptible in a highly dilute (1 in 700,000) solution; alkaline reaction.	At 15° C. (59° F.), 6700 parts. Boiling, 2500 parts.	At 15° C. (59° F.), 110 parts. Boiling, 12 parts.	Soluble in 7 parts of chloroform, but almost insoluble in ether.
TEST FOR IDENTITY.		IMPURITY. TEST FOR IMPURITY.		
If a minute quantity of Strychnine be dissolved in about 0.5 C.c. of concentrated sulphuric acid, on a white porcelain surface, and a small crystal of potassium dichromate slowly drawn across the liquid with a glass rod, there will be produced at first, momentarily, a blue color, which quickly changes to purplish-blue, then gradually to violet, purplish-red, and cherry-red, and finally to orange or yellow.		Brucine.	{ On dissolving 0.02 Gm. of Strychnine in 2 C.c. of nitric acid (specific gravity 1.300), in a small test-tube, the acid should not turn more than faintly yellow.	

Uses.—Strychnine is tonic in doses of one-sixtieth of a grain (0.001 Gm.). It may sometimes be given in doses of one-twentieth of a grain (0.003 Gm.).

STRYCHNINÆ SULPHAS. U. S. Strychnine Sulphate.

Preparation.—This salt is prepared during the process for making strychnine. (See preceding article.)

Strychnine Sulphas. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvent.
Colorless or white, prismatic crystals, efflorescent in dry air. When heated to 100° C. (212° F.), the salt slowly loses its water of crystallization (10.51 per cent.); more rapidly when heated to 110° C. (230° F.). When quickly heated to 200° C. (392° F.), the salt fuses. Upon ignition, it is consumed, leaving no residue.	Odorless; intensely bitter taste, which is still perceptible in a highly dilute (1 in 700,000) solution; neutral reaction.	At 15° C. (59° F.), 50 parts. Boiling, 2 parts.	At 15° C. (59° F.), 109 parts. Boiling, 8.5 parts.	Almost insoluble in ether.
TESTS FOR IDENTITY.		IMPURITY. TEST FOR IMPURITY.		
On adding potassium or sodium hydrate T.S. to an aqueous solution of the salt, a white precipitate is thrown down, which is insoluble in an excess of the alkali, and which should respond to the reactions and tests of strychnine (see Strychnina). Barium chloride T.S. added to the aqueous solution throws down a white precipitate insoluble in hydrochloric acid.		Brucine.	{ On dissolving 0.05 Gm. of Strychnine Sulphate in 2 C.c. of nitric acid (specific gravity 1.300), in a small test-tube, the acid should not turn more than faintly yellow.	

Uses.—Strychnine sulphate is more useful, medicinally, than strychnine only because it is much more soluble. The dose is one-twentieth of a grain (0.003 Gm.).

GELSEMIUM. U. S. Gelsemium. [YELLOW JASMINE.]

The rhizome and roots of *Gelsemium sempervirens* (Linné) Persoon (nat. ord. *Loganiaceae*).

Gelsemium contains *gelsemine*, $C_{11}H_{15}NO_2$, gelseminic acid, volatile oil, starch, resin, fat, coloring-matter, etc. Alcohol is the best solvent for its active principles. It is used as an antispasmodic and sedative. Dose, three grains (0.19 Gm.).

Official Preparations.

Extractum Gelsemii Fluidum. Made with alcohol (see page 407). Dose, two to three minims (0.12 to 0.18 C.c.).
Fluid Extract of Gelsemium.
Tinctura Gelsemii Made by percolating 150 Gm. of gelsemium with a menstruum of 65 parts of alcohol and 35 parts of water until 1000 C.c. are obtained (see page 368). Dose, ten to twenty minims (0.6 to 1.2 C.c.).
Tincture of Gelsemium.

PHYSOSTIGMA. U. S. Physostigma. [CALABAR BEAN.]

The seed of *Physostigma venenosum* Balfour (nat. ord. *Leguminosae*).

Physostigma contains *physostigmine*, or *eserine*, $C_{15}H_{21}N_3O_2$, as it is more frequently called. This alkaloid is amorphous and without taste, soluble in water, but more soluble in alcohol, ether, chloroform, carbon disulphide, and benzol. It also contains *calabarine*, an alkaloid derived from eserine, with a neutral principle, *physosterin*, starch, protein compounds, mucilage, etc.

Physostigma is sedative, and acts as a powerful poison, contracting the pupil of the eye. Dose, one to three grains (0.06 to 0.19 Gm.).

Official Preparations.

Extractum Physostigmatis. Made with alcohol (see page 455). Dose, one-eighth of a grain (0.008 Gm.).
Extract of Physostigma.
Tinctura Physostigmatis. Made by percolating 150 Gm. of physostigma with sufficient alcohol to make 1000 C.c. (see page 375). Dose, twenty minims (1.2 C.c.).
Tincture of Physostigma.

PHYSOSTIGMINÆ SALICYLAS. U. S. Physostigmine Salicylate.

[ESERINE SALICYLATE.]

The salicylate of an alkaloid obtained from Physostigma.

Preparation.—This salt may be made by adding 2 parts of physostigmine to a solution of 1 part of salicylic acid in 35 parts of boiling distilled water, and allowing the salt to crystallize on cooling.

Physostigminæ Salicylas. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Colorless or faintly yellowish, shining, acicular, or short, columnar crystals, gradually turning reddish when long exposed to air and light. When heated on platinum foil, the salt is completely dissipated.	Odorless; bitter taste; faintly acid reaction.	At 15° C. (59° F.), 150 parts.	At 15° C. (59° F.), 12 parts.
		Boiling, 30 parts.	Boiling, Very soluble.

TESTS FOR IDENTITY.

When heated to about 179° C. (354.2° F.), the salt melts. Upon ignition, it is consumed, leaving no residue. On adding a small portion of the salt to colorless, concentrated sulphuric acid, the latter assumes a tint not deeper than yellow. If a minute portion of the salt be added to a few C.c. of ammonia water, in a small capsule, the liquid will acquire a yellowish-red color. On evaporating the liquid, on a water-bath, a blue residue will be left, which yields, with alcohol, a blue solution becoming violet-red upon supersaturation with acetic acid, and exhibiting a strong, reddish fluorescence. The aqueous solution of the salt, when mixed with ferric chloride T.S., assumes a deep violet color.

Uses.—The salts of physostigmine, or eserine, are used to contract the pupil of the eye. The advantage possessed by the salicylate is that it is more permanent and less liable to deliquesce. The dose for internal administration should not be more than one-twentieth of a grain (0.003 Gm.).

PHYSOSTIGMINÆ SULPHAS. U. S. Physostigmine Sulphate.

[ESERINE SULPHATE.]

The sulphate of an alkaloid obtained from Physostigma.

This salt has the disadvantage of being very deliquescent: the salicylate is to be preferred.

Physostigmine Sulphas. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
A white or yellowish-white, micro-crystalline powder, very deliquescent when exposed to moist air, and gradually turning reddish by exposure to air and light. At 105° C. (221° F.), the salt melts, and upon ignition it is consumed, leaving no residue.	Odorless; having a bitter taste and a neutral reaction.	Very soluble.	Very soluble.

Tests.

On adding a small portion of the salt to colorless, concentrated sulphuric acid, the latter should not assume a tint deeper than yellow.

If a minute portion of the salt be added to a few C.c. of ammonia water in a small capsule, the liquid will acquire a yellowish-red color. On evaporating this liquid on a water-bath, a blue or bluish-gray residue will be left, which yields, with alcohol, a blue solution becoming violet-red upon supersaturation with acetic acid, and exhibiting a strong reddish fluorescence. The aqueous solution of the salt yields, with barium chloride T.S., a white precipitate, insoluble in hydrochloric acid.

Uses.—The dose of physostigmine sulphate is one-twentieth of a grain (0.003 Gm.).

BELLADONNÆ FOLIA. U.S. Belladonna Leaves.

The leaves of *Atropa Belladonna* Linné (nat. ord. *Solanaceæ*).

BELLADONNÆ RADIX. U.S. Belladonna Root.

The root of *Atropa Belladonna* Linné (nat. ord. *Solanaceæ*).

Belladonna owes its activity to *atropine*, $C_{17}H_{23}NO_3$, and a small quantity of *hyoscyamine*: belladonine is also present. Atropine and hyoscyamine and some of their salts are official. Belladonna is narcotic and poisonous: it dilates the pupil of the eye. Dose, one to two grains (0.06 to 0.12 Gm.).

Official Preparations.

Leaves.

Extractum Belladonnæ Foliorum Alcoholicum. Made with belladonna leaves and a menstruum of 2 parts of alcohol and 1 part of water (see page 445). Dose, one-fourth grain (0.016 Gm.).
Alcoholic Extract of Belladonna Leaves.

Emplastrum Belladonnæ. Made by incorporating 2 parts of alcoholic extract of belladonna leaves with 4 parts each of resin plaster and soap plaster. (See Emplastra.)
Belladonna Plaster.

Tinctura Belladonnæ Foliorum. Made by percolating 150 Gm. of belladonna leaves with sufficient diluted alcohol to make 1000 C.c. (see page 361). Dose, ten to twenty minims (0.6 to 1.2 C.c.).
Tincture of Belladonna Leaves.

Unguentum Belladonnæ. Made by rubbing 10 Gm. of alcoholic extract of belladonna with 5 Gm. of diluted alcohol, and incorporating 85 Gm. of benzoinated lard. (See Unguenta.)
Belladonna Ointment.

Root.

Extractum Belladonnæ Radicis Fluidum. Made from belladonna root with a menstruum of 4 parts of alcohol and 1 part of water (see page 397). Dose, one to two minims (0.06 to 0.12 C.c.).
Fluid Extract of Belladonna Root.

Linimentum Belladonnæ. Made by dissolving 5 Gm. of camphor in 95 C.c. of fluid extract of belladonna (see page 340).
Belladonna Liniment.

ATROPINA. U.S. Atropine.

An alkaloid obtained from *Belladonna*. As it occurs in commerce, it is always accompanied by a small proportion of *hyoscyamine* extracted along with it, from which it cannot be readily separated.

Preparation.—This alkaloid may be prepared by adding sulphuric acid to a concentrated alcoholic tincture of the root to convert the atropine into the sulphate, distilling off the alcohol, adding water to the residuary liquid, filtering to separate oil and resin, and treating the filtrate with potassium hydrate and chloroform. By evaporating the latter, atropine is obtained.

Atropina. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
White, acicular crystals, or a more or less amorphous, white powder, and gradually assuming a yellowish tint on exposure to air. Its saturated aqueous solution acquires a pink color upon the addition of a drop of phenolphthalein T.S. At about 108° C. (226.4° F.) it melts, forming a colorless liquid; at about 140° C. (284° F.) it begins to give off white, acrid fumes, and when ignited it is consumed without leaving a residue. Atropine and its salts are decomposed by prolonged contact with sodium or potassium hydrate, and, if heated with either of them, evolve ammonia.	Odorless; bitter and acrid taste; markedly alkaline reaction.	At 15° C. (59° F.), Cold, 130 parts.	3 parts.	Soluble in 4 parts of chloroform, 16 parts of ether, and about 50 parts of glycerin.

TESTS FOR IDENTITY, QUALITATIVE TESTS, ETC.

With sulphuric acid Atropine yields a colorless solution, which is not colored by nitric acid (absence of and difference from *morphine*). If a small quantity of Atropine, or one of its salts, be heated with a few C.c. of concentrated sulphuric acid, a peculiar odor, recalling that of a mixture of rose, orange flower, and melilot, will become noticeable. On now gradually adding minute fragments of potassium dichromate, the odor will change to that of oil of bitter almond, the rose odor disappearing as more dichromate is added.

On dissolving a small quantity (about 0.1 Gm.) of Atropine in 2 C.c. of alcohol, and adding an equal volume of mercuric chloride T.S., a yellow precipitate, which soon turns red, is produced.

On adding concentrated sulphuric acid to Atropine, no color should be produced (absence of readily carbonisable, organic impurities). The aqueous solution of Atropine, or of any of its salts, is not precipitated by platonic chloride T.S. (difference from most other alkaloids).

With gold chloride it yields a precipitate which, when recrystallized from boiling water acidulated with hydrochloric acid, is deposited, on cooling, in minute crystals, forming a yellow, lustreless powder on drying (difference from *hyoscyamine*).

Uses.—Atropine is chiefly used to dilate the pupil of the eye: the sulphate, however, is preferred, on account of its solubility. It has the properties of *belladonna* when given internally, and is narcotic. Dose, one one-hundred-and-twentieth to one-sixtieth of a grain (0.0005 to 0.001 Gm.).

ATROPINÆ SULPHAS. U.S. Atropine Sulphate.

Preparation.—Atropine sulphate may be prepared by suspending 120 grains of atropine in 4 fl. dr. of distilled water and adding diluted

sulphuric acid until the alkaloid is dissolved and the solution is neutral. The latter is then evaporated to dryness at a temperature not exceeding 37.7° C. (100° F.).

Atropine Sulphas. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A white, indistinctly crystalline powder, permanent in the air. At 187° C. (309° F.) the salt melts, forming a brownish-yellow liquid. When ignited, it chars, emits acrid vapors, and is completely consumed.	Odorless; very bitter, nauseating taste; neutral reaction.	At 15° C. (59° F.), 0.4 part.	Cold, 6.2 parts.	2270 parts of ether; 694 parts of chloroform.

TESTS FOR IDENTITY.

On adding sodium carbonate T.S. to a concentrated aqueous solution of the salt, a white precipitate is obtained which answers to the reactions of Atropine. (See Atropine.) An aqueous solution of the salt yields, with barium chloride T.S., a white precipitate insoluble in hydrochloric acid.

Uses.—Atropine sulphate is preferred to the alkaloid for use as a mydriatic: an aqueous solution is generally employed for this purpose. The internal dose is from one one-hundred-and-twentieth to one-sixtieth of a grain (0.0005 to 0.001 Gm.).

HYOSCYAMUS. U.S. Hyoscyamus. [HENBANE.]

The leaves and flowering tops of *Hyoscyamus niger* Linné (nat. ord. *Solanaceæ*), collected from plants of the second year's growth.

Hyoscyamus contains *hyoscyamine*, $C_{17}H_{23}NO_3$, *hyoscine*, $C_{17}H_{23}NO_3$, *hyoscyapicrin*, $C_{27}H_{43}O_{14}$, chlorophyll, mucilage, extractive, etc. Hyoscyamus is narcotic, hypnotic, and slightly laxative. Dose, five grains (0.3 Gm.).

Official Preparations.

Extractum Hyoscyami Made with 2 parts of alcohol and 1 part of water (see page 450). Dose, one to two grains (0.06 to 0.12 Gm.).
Extract of Hyoscyamus.
Extractum Hyoscyami Fluidum Made with 2 parts of alcohol and 1 part of water (see page 410). Dose, five minims (0.3 C.c.).
Fluid Extract of Hyoscyamus.
Tinctura Hyoscyami Made by percolating 150 Gm. of hyoscyamus with sufficient diluted alcohol to make 1000 C.c. (see page 369). Dose, one fluidrachm (3.7 C.c.).
Tincture of Hyoscyamus.

HYOSCINÆ HYDROBROMAS. U.S. Hyoscine Hydrobromate.

The hydrobromate of an alkaloid obtained from Hyoscyamus. It should be kept in small, well-stoppered vials.

Hyoscine is prepared by evaporating the mother-waters obtained after the crystallization of hyoscyamine.

Hyoscinæ Hydrobromas. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Colorless, transparent, rhombic crystals, permanent in the air. When heated to 100° C. (212° F.) the salt loses its water of crystallization, and fuses to a thick, syrupy mass, which becomes quite fluid at 160° C. (320° F.).	Odorless; acid, slightly bitter taste; neutral reaction.	At 15° C. (59° F.), 1.9 parts.	Cold, 13 parts.	Very slightly soluble in ether or chloroform.

TESTS FOR IDENTITY.

When ignited, it is consumed, leaving no residue. Addition of ammonia water to the aqueous solution of the salt (1 in 60) produces no change, but sodium or potassium hydrate T.S. causes a white turbidity. Addition of silver nitrate T.S. to the aqueous solution produces a yellowish-white precipitate, which is insoluble in nitric acid, but, when filtered off and washed, is soluble in ammonia water diluted with its own volume of water.

If 5 drops of fuming nitric acid be added to 0.01 Gm. of the salt, in a small porcelain capsule, and the mixture be evaporated to dryness on a water-bath, a scarcely tinted residue will be left, which, when treated, after cooling, with a few drops of an alcoholic solution of potassium hydrate, will assume a violet color.

Uses.—The salts of hyoscyne are very powerful, and impure amorphous hyoscyamine often contains hyoscyne. Hyoscyne hydrobromate is a soporific in small doses, one one-hundred-and-twentieth of a grain (0.0005 Gm.), but powerfully narcotic in larger doses.

HYOSCYAMINÆ HYDROBROMAS. U. S. Hyoscyamine Hydrobromate.

The hydrobromate of an alkaloid obtained from *Hyoscyamus*. It should be kept in small, well-stoppered bottles.

This salt was introduced into the U. S. P. 1890. It is somewhat more stable than the sulphate.

Hyoscyaminæ Hydrobromas. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A yellowish-white, amorphous, resin-like mass, or prismatic crystals, deliquescent on exposure to air. At 78° C. (172.4° F.) the salt melts, forming a nearly colorless liquid. When ignited, it is consumed, leaving no residue.	Tobacco-like odor, particularly when damp; acid, nauseous, and bitter taste; neutral reaction.	At 15° C. (59° F.), 0.3 part.	Cold, 2 parts.	3000 parts of ether, or 250 parts of chloroform.

TESTS FOR IDENTITY.

An aqueous solution of the salt is not precipitated by platinic chloride T.S. (difference from most other alkaloids). With gold chloride T.S. it yields a precipitate which, when recrystallized from a small quantity of boiling water acidulated with hydrochloric acid, is deposited, on cooling, in minute, lustrous, golden-yellow scales (difference from *atropine*).

The aqueous solution of the salt yields, with silver nitrate T.S., a yellowish-white precipitate, which is insoluble in nitric acid, but, when filtered off and washed, is soluble in ammonia water diluted with its own volume of water.

Uses.—This salt is used as a narcotic and sedative. The dose is one-sixtieth of a grain (0.001 Gm.).

HYOSCYAMINÆ SULPHAS. U. S. Hyoscyamine Sulphate.

The neutral sulphate of an alkaloid obtained from *Hyoscyamus*. It should be kept in small, well-stoppered vials.

Preparation.—The acidulated tincture of the seeds, deprived of their fixed oil, is evaporated and almost neutralized with soda, and then precipitated with tannin. The moist precipitate, mixed with lime, is exhausted with alcohol, and the solution acidulated, concentrated, and agitated with ether to remove coloring-matter and oil. The hyoscyamine sulphate is decolorized and recrystallized.

Hyoscyaminæ Sulphas. U. S.	TESTS FOR IDENTITY.
White, indistinct crystals, or a white powder, deliquescent on exposure to damp air, odorless, having a bitter and aacid taste and a neutral reaction, soluble in 0.5 part of water and in 2.5 parts of alcohol, very slightly soluble in ether or chloroform. An aqueous solution of the salt is not precipitated by platinic chloride T.S. (difference from most other alkaloids).	With gold chloride T.S. it yields a precipitate which, when recrystallized from boiling water acidulated with hydrochloric acid, is deposited, on cooling, in minute, lustrous, golden-yellow scales (difference from <i>atropine</i>). The aqueous solution yields with barium chloride a white precipitate insoluble in hydrochloric acid.

Uses.—This salt of hyoscyamine is used as a narcotic and sedative, in doses of one-sixtieth of a grain (0.001 Gm.): it is largely used by alienists in controlling maniacal excitement. It is occasionally used as a mydriatic.

STRAMONII FOLIA. U. S. Stramonium Leaves.

The leaves of *Datura Stramonium* Linné (nat. ord. *Solanaceæ*).

STRAMONII SEMEN. U. S. Stramonium Seed.

The seed of *Datura Stramonium* Linné (nat. ord. *Solanaceæ*).

Stramonium contains *daturine*, which has been proved to be a mixture of hyoscyamine and atropine: the leaves contain albumen, mucilage, and potassium nitrate. In the seeds there is found about 25 per cent. of fixed oil, with resins, mucilage, etc. Stramonium is narcotic and poisonous. Dose, two to three grains (0.13 to 0.19 Gm.).

Official Preparations.

Extractum Stramonii Seminis Extract of Stramonium Seed.	Made with stramonium seed and a menstruum of diluted alcohol (see page 456). Dose, half a grain (0.03 Gm.).
Extractum Stramonii Seminis Fluidum Fluid Extract of Stramonium Seed.	Made with stramonium seed and a menstruum of 3 parts of alcohol and 1 part of water (see page 425). Dose, one to two minims (0.06 to 0.12 C.c.).
Tinctura Stramonii Seminis Tincture of Stramonium Seed.	Made by percolating 150 Gm. of stramonium seed with sufficient diluted alcohol to make 1000 C.c. (see page 378). Dose, twenty minims (1.2 C.c.).
Unguentum Stramonii Stramonium Ointment.	Made by rubbing 10 Gm. of extract of stramonium seed with 5 Gm. of water, and incorporating with 85 Gm. of benzoinated lard. (See Unguenta.)

DULCAMARA. U. S. Dulcamara. [BITTERSWEET.]

The young branches of *Solanum Dulcamara* Linné (nat. ord. *Solanaceae*).

Dulcamara contains *solanine*, an alkaloid, and *dulcamarin*, $C_{23}H_{34}O_{10}$, a glucoside: the latter is the bitter and sweet principle. The other constituents are gum, wax, fat, resin, etc.

Official Preparation.

Extractum Dulcamaræ Fluidum . Made with diluted alcohol (see page 404). Dose, thirty Fluid Extract of Dulcamara. to sixty minims (1.8 to 3.7 C.c.).

PILOCARPUS. U. S. Pilocarpus. [JABORANDI.]

The leaflets of *Pilocarpus Selloanus* Engler (Rio Janeiro Jaborandi), and of *Pilocarpus Jaborandi* Holmes (Pernambuco Jaborandi), (nat. ord. *Rutaceæ*).

Pilocarpus contains *pilocarpine*, $C_{11}H_{16}N_2O_2$, and a volatile oil consisting principally of *dipentene*, $C_{10}H_{16}$, a terpene. The leaves are coriaceous and difficult to powder. It is diaphoretic and sialagogue. Dose, twenty grains (1.3 Gm.).

Official Preparation.

Extractum Pilocarpi Fluidum . Made with diluted alcohol (see page 416). Dose, fifteen to thirty minims (0.9 to 1.8 C.c.).

PILOCARPINÆ HYDROCHLORAS. U. S. Pilocarpine Hydrochlorate.

The hydrochlorate of an alkaloid obtained from Pilocarpus.

Preparation.—Pilocarpine is added to diluted hydrochloric acid until it is neutralized, and the solution is then concentrated and crystallized.

Pilocarpinæ Hydrochloras. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Minute, white crystals, deliquescent on exposure to damp air. When heated to 197° C. (386.6° F.) the salt melts, and upon ignition it is consumed, leaving no residue.	Odorless; faintly bitter taste; neutral reaction.	Very soluble.	Very soluble.	Almost insoluble in ether or chloroform.

TESTS FOR IDENTITY.

Concentrated sulphuric acid dissolves the salt to a colorless liquid, with evolution of hydrochloric acid vapor. If a small fragment of potassium dichromate be added to a few drops of this solution, on a white porcelain surface, the dichromate will gradually dissolve with a vivid dark green color.

Fuming nitric acid dissolves the salt with a faintly greenish tint. The aqueous solution (1 in 100) of the salt is precipitated by iodine T.S., bromine water, mercuric chloride T.S., and most other reagents for alkaloids.

If the aqueous solution be slightly acidulated, the subsequent addition of ammonia water will produce no precipitate. Sodium hydrate T.S. produces a precipitate only in a concentrated solution of the salt.

The aqueous solution yields with silver nitrate T.S. a white precipitate insoluble in nitric acid.

Uses.—Pilocarpine hydrochlorate is a diaphoretic and sialagogue, and is often used hypodermically. Dose, one-eighth to one-fourth of a grain (0.008 to 0.016 Gm.).

COLCHICI RADIX. U. S. Colchicum Root.

The corm of *Colchicum autumnale* Linné (nat. ord. *Liliaceæ*).

COLCHICI SEMEN. U. S. Colchicum Seed.

The seed of *Colchicum autumnale* Linné (nat. ord. *Liliaceæ*).

The alkaloid *colchicine* is found in both the corm and seed of colchicum. It is the active principle. There are present in the root starch, gum, fat, sugar, resin, etc. In the seed a fixed oil is found in addition to the other principles. The toughness of the seeds is due to their composition and structure, being composed chiefly of horny albumen made up of cells having very thick walls and surrounded by a closely adherent testa. The seeds may be exhausted of their active principle by digesting them, without bruising or powdering them, in hot alcohol.

Official Preparations.

- Extractum Colchici Radicis** Made with a menstruum of 35 parts of acetic acid and 150 parts of water (see page 447). Dose, one to two grains (0.06 to 0.13 Gm.).
Extract of Colchicum Root.
- Extractum Colchici Radicis Fluidum** . Made with 2 parts of alcohol and 1 part of water (see page 401). Dose, two to eight minims (0.12 to 0.5 C.c.).
Fluid Extract of Colchicum Root.
- Vinum Colchici Radicis** Made by percolating 400 Gm. of colchicum root with 150 C.c. of alcohol and 850 C.c. of white wine, to make 1000 C.c. (see page 382). Dose, ten minims (0.6 C.c.).
Wine of Colchicum Root.
- Extractum Colchici Seminis Fluidum** . Made with a menstruum of 2 parts of alcohol and 1 part of water (see page 402). Dose, two to eight minims (0.12 to 0.5 C.c.).
Fluid Extract of Colchicum Seed.
- Tinctura Colchici Seminis** Made by percolating 150 Gm. of colchicum seed with a menstruum of 3 parts of alcohol and 2 parts of water, to make 1000 C.c. (see page 366). Dose, one-half fluidrachm (1.8 C.c.).
Tincture of Colchicum Seed.
- Vinum Colchici Seminis** Made by percolating 150 Gm. of colchicum seed with 150 C.c. of alcohol and 850 C.c. of white wine, to make 1000 C.c. (see page 382). Dose, one-half fluidrachm (1.8 C.c.).
Wine of Colchicum Seed.

VERATRUM VIRIDE. U. S. Veratrum Viride. [AMERICAN HELLEBORE.]

The rhizome and roots of *Veratrum viride* Solander (nat. ord. *Liliaceæ*).

Veratrum viride contains the alkaloids *jervine*, *veratroidine*, *pseudojervine*, and *rubijervine*. It was supposed for many years to owe its activity to veratrine. There are also present resins, starch, coloring-matter, etc. It is a cardiac sedative, poisonous, with emetic and diaphoretic properties. Dose, one to two grains (0.06 to 0.13 Gm.).

Official Preparations.

- Extractum Veratri Viridis Fluidum** . Made with alcohol (see page 428). Dose, one to two minims (0.06 to 0.12 C.c.).
Fluid Extract of Veratrum Viride.
- Tinctura Veratri Viridis** Made by percolating 400 Gm. of veratrum viride with sufficient alcohol to make 1000 C.c. (see page 380). Dose, two to four minims (0.12 to 0.24 C.c.).
Tincture of Veratrum Viride.

VERATRINA. U. S. Veratrine.

A mixture of alkaloids obtained from the seed of *Asagracea officinalis* (Schlechtendal et Chamisso) Lindley (nat. ord. *Liliaceæ*).

Preparation.—The seeds are exhausted with alcohol, and the alcohol recovered by distillation. The residuary liquid contains veratrine in its natural combination with veratric acid; this is diluted with water

(which precipitates the resins) and filtered; potassa or ammonia is added to the filtrate, when veratrine is precipitated. It is then redissolved, decolorized, and reprecipitated. Veratrine is used externally, in neuralgia, rheumatism, etc. It is sternutatory and very poisonous.

Veratrina. U.S.	ODOR AND TASTE.	SOLUBILITY.	
		Alcohol.	Other Solvents.
A white or grayish-white, amorphous or semi-crystalline powder, permanent in the air. When heated to 175° C. (347° F.) Veratrine melts, forming a light brown liquid. Upon ignition, it is consumed, leaving no residue.	Odorless, but causing intense irritation and sneezing when even a minute quantity reaches the nasal mucous membrane; acid taste, leaving a sensation of tingling and numbness on the tongue; feebly alkaline reaction.	At 15° C. (59° F.), 3 parts. Boiling, Very soluble.	Very slightly soluble in cold or hot water, soluble in 6 parts of ether, and in 2 parts of chloroform.

TESTS FOR IDENTITY.

With nitric acid, Veratrine forms a yellow solution. On triturating Veratrine with concentrated sulphuric acid, in a glass mortar, the yellow or orange-red solution exhibits, by reflected light, a greenish fluorescence, which becomes more intense upon the addition of more acid, while the liquid is deep red by transmitted light.

On heating a small portion of Veratrine with a few C.c. of hydrochloric acid, the liquid will acquire a deep red color.

Official Preparations.

Oleatum Veratrinæ . . . Made by dissolving 2 Gm. of veratrine in 98 Gm. of oleic acid (see Oleate of Veratrine. page 342). Used externally.

Unguentum Veratrinæ . Made by rubbing 4 Gm. of veratrine with 6 Gm. of olive oil and 90 Gm. of benzoinated lard. (See Unguenta.) Used externally.

CHELIDONIUM. U.S. Chelidonium. [CELANDINE.]

The entire plant, *Chelidonium majus* Linné (nat. ord. *Papaveraceæ*).

Chelidonium contains *chelerythrine*, *chelidonine*, $C_{19}H_{17}N_3O_3$, *chelidoxanthin*, and *chelidonic acid*. It is bitter and acrid. Used as a diuretic. Dose, forty grains (2.6 Gm.).

SANGUINARIA. U.S. Sanguinaria. [BLOODROOT.]

The rhizome of *Sanguinaria canadensis* Linné (nat. ord. *Papaveraceæ*), collected in autumn.

Sanguinaria contains *sanguinarine*, $C_{19}H_{17}NO_4$, a colorless alkaloid, which yields bright red salts: another alkaloid is present which as yet is unnamed. It also contains malic and citric acids, starch, resins, coloring-matter, etc. The liquid preparations invariably deposit a reddish precipitate upon the sides of the bottle. It is alterative, sternutatory, stimulant, and emetic. The dose is ten grains (0.6 Gm.).

Official Preparations.

Extractum Sanguinaris Fluidum . Made with a menstruum of 3 parts of alcohol and 1 part of water (see page 421). Dose, three to five minims (0.18 to 0.3 C.c.).
Fluid Extract of Sanguinaria.

Tinctura Sanguinaris Made by percolating 150 Gm. of sanguinaria with a menstruum of 3 parts of alcohol and 2 parts of water with 2 per cent. of acetic acid, to make 1000 C.c. (see page 377). Dose, fifteen to thirty minims (0.9 to 1.8 C.c.).
Tincture of Sanguinaria.

STAPHISAGRIA. U. S. Staphisagria. [STAVESACRE.]

The seed of *Delphinium Staphisagria* Linné (nat. ord. *Ranunculaceæ*).

Staphisagria contains three alkaloids, *delphinine*, *delphisine*, and *delphinoidine*; also *staphisain*, with fixed oil, protein compounds, mucilage, etc. The alkaloids are soluble in chloroform, fixed oils, alcohol, and ether, and an oleoresin made with benzin is a good preparation. It is used principally externally, for killing body-vermin, and is very poisonous.

ACONITUM. U. S. Aconite.

The tuber of *Aconitum Napellus* Linné (nat. ord. *Ranunculaceæ*).

Aconite contains *aconitine*, $C_{33}H_{45}NO_{12}$, *isaconitine*, $C_{33}H_{45}NO_{12}$, and *pseudaconitine*, $C_{36}H_{49}NO_{11}$. *Aconine*, $C_{26}H_{39}NO_{11}$, and *pseudaconine*, $C_{27}H_{41}NO_9$, are products of hydrolysis.

Aconitic acid, $H_4C_6O_8$, is present, together with resins, sugar, fat, coloring-matter, etc. Aconitic acid may be produced by heating citric acid to $155^{\circ} C.$ ($311^{\circ} F.$). Alcohol is the best menstruum for preparations of aconite. Aconite is sedative and very poisonous. Dose, one grain (0.06 Gm.). The dose of aconitine is one three-hundredth of a grain (0.0002 Gm.).

Official Preparations.

- Extractum Aconiti** Made with alcohol (see page 445). Dose, one-half grain (0.03 Gm.).
 Extract of Aconite.
Extractum Aconiti Fluidum . Made with a menstruum of 3 parts of alcohol and 1 part of water (see page 394). Dose, one-half to one minim (0.03 to 0.06 C.c.).
 Fluid Extract of Aconite.
Tinctura Aconiti Made by percolating 350 Gm. of aconite with a menstruum of 70 parts of alcohol and 30 parts of water, to make 1000 C.c. (see page 359). Dose, one to two minims (0.06 to 0.12 C.c.).
 Tincture of Aconite.

HYDRASTIS. U. S. Hydrastis. [GOLDEN SEAL.]

The rhizome and roots of *Hydrastis canadensis* Linné (nat. ord. *Ranunculaceæ*).

Hydrastis contains *hydrastine*, $C_{22}H_{23}NO_6$, *berberine*, $C_{20}H_{17}NO_4$, *xanthopuccine*, sugar, starch, resin, coloring-matter, etc. The salts of hydrastine are white, those of berberine are bright yellow. Hydrastis is used as an alterative and tonic, in doses of twenty to forty grains (1.3 to 2.6 Gm.).

Official Preparations.

- Extractum Hydrastis Fluidum** . Made with a menstruum of 6 parts of alcohol, 3 parts of water, and 1 part of glycerin (see page 410). Dose, one to two fluidrachms (3.7 to 7.4 C.c.).
 Fluid Extract of Hydrastis.
Tinctura Hydrastis Made by percolating 200 Gm. of hydrastis with sufficient diluted alcohol to make 1000 C.c. (see page 369). Dose, one-half to one fluidrachm (1.8 to 3.7 C.c.).
 Tincture of Hydrastis.
Glyceritum Hydrastis Made by exhausting 1000 Gm. of hydrastis with alcohol, adding 250 C.c. of water, evaporating off the alcohol, adding 500 C.c. of glycerin and enough water to make 1000 C.c. (see page 320).
 Glycerite of Hydrastis.

HYDRASTININÆ HYDROCHLORAS. U. S. Hydrastinine Hydrochlorate.

This is the hydrochlorate of an artificial alkaloid, *hydrastinine*, made by acting on colorless hydrastine with oxidizing agents. It was introduced into the U. S. P. 1890.

Hydrastinine Hydrochloras. U. S.	ODOR, TASTE, AND REACTIONS.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Light yellow, amorphous granules, or a pale yellow, crystalline powder, deliquescent on exposure to damp air. When heated to 173° C. (333.4° F.), the salt undergoes partial fusion, but does not liquefy. Upon ignition it is consumed, leaving no residue.	Odorless; bitter, saline taste; acid reaction.	At 15° C. (59° F.), 0.3 part.	Cold, 3 parts.	Difficultly soluble in ether or chloroform.

TESTS FOR IDENTITY.

A dilute, aqueous solution of the salt (up to about 1 in 100,000) has a decided blue fluorescence. The salt dissolves in sulphuric acid with effervescence, coloring the acid yellowish-red. An aqueous solution of the salt is not precipitated by ammonia water.

An aqueous solution of the salt yields, with silver nitrate T.S., a white precipitate insoluble in nitric acid.

On adding to 2 C.c. of an aqueous solution of the salt (1 in 100) an excess of bromine water, a yellow precipitate is produced, which is dissolved by ammonia water to a nearly colorless liquid (difference from *hydrastine*, with which the ammonia produces a brick-red precipitate).

Uses.—Hydrastinine hydrochlorate is an oxytocic, in doses of one-half to one grain (0.03 to 0.06 Gm.).

MENISPERMUM. U. S. *Menispermum*. [YELLOW PARILLA. CANADIAN MOONSEED.]

The rhizome and roots of *Menispermum canadense* Linné (nat. ord. *Menispermaceæ*).

Menispermum contains *menispermine*, *berberine*, resin, starch, tannin, coloring-matter, etc. It is alterative and tonic, in doses of twenty to forty grains (1.3 to 2.6 Gm.).

Official Preparation.

Extractum Menispermis Fluidum. Made with a menstruum of 2 parts of alcohol and 1 part of water (see page 414).
Fluid Extract of *Menispermum*.

ASPIDOSPERMA. U. S. *Aspidosperma*. [QUEBRACHO.]

The bark of *Aspidosperma Quebracho-blanco* Schlechtendal (nat. ord. *Apocynaceæ*).

This bark contains *aspidospermine*, *aspidospermatine*, *aspidosamine*, *quebrachine*, *hypoquebrachine*, and *quebrachamine*. It is used as an anti-periodic, in doses of ten to twenty grains (0.6 to 1.2 Gm.).

Official Preparation.

Extractum Aspidospermatis Fluidum. Made with a menstruum of 2 parts of alcohol and 1 part of water with 10 per cent. of glycerin (see page 396). Dose, one-half to one fluidrachm (1.8 to 3.7 C.c.).
Fluid Extract of *Aspidosperma*.

GRANATUM. U. S. *Pomegranate*.

The bark of the stem and root of *Punica Granatum* Linné (nat. ord. *Lythraceæ*).

Pomegranate contains four alkaloids, *pelletierine*, *isopelletierine*, *methypelletierine*, *pseudopelletierine*. The latter is solid and crystallizable;

the others are liquid. It also contains punico-tannic acid, $C_{27}H_{16}O_{13}$, sugar, mannite, pectin, gum, etc. Pomegranate is anthelmintic, in doses of thirty grains (1.9 Gm.).

PAREIRA. U. S. Pareira. [PAREIRA BRAVA.]

The root of *Chondodendron tomentosum* Ruiz et Pavon (nat. ord. *Menispermaceae*).

This root contains *pelosine*, or *cissampeline*. This has been proved to be identical with *buxine* and *beberine*, alkaloids obtained from *Buxus sempervirens* and *Nectandra Rodiei*. Pareira is tonic, diuretic, and aperient. The dose is forty grains (2.6 Gm.).

Official Preparation.

Extractum Pareiræ Fluidum. Made with a menstruum of 72 parts of alcohol, 18 parts of water, and 10 parts of glycerin (see page 415). Dose, one fluidrachm (3.7 C.c.).

IPECACUANHA. U. S. Ipecac.

The root of *Cephaelis Ipecacuanha* (Brotero) A. Richard (nat. ord. *Rubiaceae*).

Ipecac contains *emetine*, $C_{25}H_{40}N_2O_8$, *ipecacuanhic acid*, pectin, starch, resin, sugar, etc. It is emetic and expectorant. The dose is five to thirty grains (0.3 to 1.8 Gm.). The apothegmatic matter which is dissolved by hydro-alcoholic liquids when percolating it, is slowly precipitated when added to water or syrup. It may be separated by allowing the aqueous liquid to stand until the separation is completed, and then filtering.

Official Preparations.

- Extractum Ipecacuanhæ Fluidum** . . . Made with a menstruum of 3 parts of alcohol and 1 part of water (see page 411). Dose, ten to thirty minims (0.6 to 1.8 C.c.).
- Fluid Extract of Ipecac.**
- Trochisci Ipecacuanhæ** Each troche contains about one-third grain of ipecac. (See Trochisci.)
- Troches of Ipecac.**
- Trochisci Morphine et Ipecacuanhæ** . Each troche contains about one-fortieth grain of morphine and one-twelfth grain of ipecac.
- Troches of Morphine and Ipecac.**
- Syrupus Ipecacuanhæ** Made from 70 C.c. of fluid extract of ipecac, 10 C.c. of acetic acid, 100 C.c. of glycerin, 700 Gm. of sugar, and water to make 1000 C.c. (see page 306). Dose, thirty minims to two fluidrachms (1.8 to 7.4 C.c.).
- Syrup of Ipecac.**
- Tinctura Ipecacuanhæ et Opii** . . . Made by evaporating 100 C.c. of deodorized tincture of opium to 80 C.c., and adding 10 C.c. of fluid extract of ipecac and sufficient diluted alcohol to make 100 C.c. (see page 370). Dose, ten minims (0.6 C.c.).
- Tincture of Ipecac and Opium.**
- Vinum Ipecacuanhæ** Made by mixing 100 C.c. of fluid extract of ipecac with 100 C.c. of alcohol and 800 C.c. of white wine (see page 383). Dose, one fluidrachm (3.7 C.c.).
- Wine of Ipecac.**
- Pulvis Ipecacuanhæ et Opii** Made by triturating together 10 Gm. of powdered ipecac, 10 Gm. of powdered opium, and 80 Gm. of powdered sugar of milk. (See Pulveres.) Dose, ten grains (0.6 Gm.).
- Powder of Ipecac and Opium.**

COCA. U. S. Coca.

[ERYTHROXYLON, PHARM. 1880.]

The leaves of *Erythroxylon Coca* Lamarck (nat. ord. *Linacæ*).

Erythroxylon contains *cocaine*, $C_{17}H_{21}NO_4$, and *hygrine*, combined with cocatannic acid. Coca is a nervous stimulant, with diaphoretic

properties. Cocaine is remarkable for its action as a local anæsthetic when applied to mucous membranes. The dose of coca is from thirty to sixty grains (1.9 to 3.8 Gm.). (See U. S. Dispensatory, 17th edition, page 417.)

Official Preparation.

Extractum Cocæ Fluidum Made with diluted alcohol (see page 401). Dose, one-half to one fluidrachm (1.8 to 3.7 C.c.).
Fluid Extract of Coca.

COCAINÆ HYDROCHLORAS. U. S. Cocaine Hydrochlorate.

The hydrochlorate of an alkaloid obtained from Coca.

The alkaloid cocaine and its salts are now mostly made in South America at points adjacent to the habitat of the drug.

Cocainæ Hydrochloras. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Colorless, transparent crystals, or a white crystalline powder, permanent in the air.	Odorless; saline, slightly bitter taste, producing upon the tongue a tingling sensation, followed by numbness of some minutes' duration; neutral reaction.	At 15° C. (59° F), 0.48 part. Boiling, Very soluble.	Cold, 3.5 parts. Boiling, Very soluble.	Soluble in 2800 parts of ether or in 17 parts of chloroform.

TESTS FOR IDENTITY AND QUANTITATIVE TESTS.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>The prolonged application of heat to the salt or to its solution induces decomposition. At 193° C. (379.4° F.) the salt melts with partial sublimation, forming a light brownish-yellow liquid. When ignited, it is consumed without leaving a residue.</p> <p>On adding 5 drops of a 5-per-cent. solution of chromic acid to 5 C.c. of a 2-per-cent. solution of Cocaine Hydrochlorate, a yellow precipitate is produced which redissolves on shaking; on now adding 1 C.c. of hydrochloric acid, a permanent orange-yellow precipitate will be formed. If a small quantity of the salt be rubbed, with a glass rod, on a dry, white porcelain surface, with an equal bulk of mercurous chloride, and the mixture then breathed upon, it will acquire a dark gray, or grayish-black, color. The aqueous solution of the salt yields, with silver nitrate T.S., a white precipitate insoluble in nitric acid.</p> <p>The addition of sulphuric or nitric acid to the salt, at the ordinary temperature, should develop no color.</p>	<p>Water of Crystallization.</p> <p>Cinnamyl-Cocaine and some other Bases derived from Coca.</p>	<p>On heating a small quantity of the powdered salt for twenty minutes, at a temperature of 100° C. (212° F.), it should not suffer any material loss.</p> <p>If 1 drop of a mixture of 1 volume of decinormal potassium permanganate V.S. and two volumes of water be added to 5 C.c. of a 2-per-cent. solution of Cocaine Hydrochlorate, mixed with 3 drops of diluted sulphuric acid, and contained in a small, clean glass-stoppered vial, the pink tint produced by the permanganate should not entirely disappear within half an hour.</p>

Uses.—Cocaine hydrochlorate is used as a local anæsthetic and cerebral stimulant. The dose is from one-quarter to one grain (0.016 to 0.065 Gm.).

GUARANA. U. S. Guarana.

A dried paste chiefly consisting of the crushed or pounded seeds of *Paullinia Cupana* Kunth (*Paullinia sorbilis* Martius; nat. ord. *Sapindaceæ*).

Guarana contains caffeine, $C_8H_{10}N_4O_2$, and about 25 per cent. of tannin, with resin, mucilage, starch, volatile oil, saponin, etc. It is used as a nervous stimulant, in doses of thirty to sixty grains (1.9 to 3.8 Gm.). It is effective only in comparatively large doses.

Official Preparation.

Extractum Guaranae Fluidum. Made with 3 parts of alcohol and 1 part of water (see page 409). Dose, one to two fluidrachms (3.7 to 7.4 C.c.).

CAFFEINA. U. S. Caffeine.

$C_8H_{10}N_4O_2 + H_2O$; 211.68. [THEINE.]

A feebly basic, proximate principle, obtained from the dried leaves of *Thea sinensis* Linné (nat. ord. *Ternstroemiaceæ*), or from the dried seeds of *Coffea arabica* Linné (nat. ord. *Rubiaceæ*), and found also in other plants.

Caffeine is usually prepared from tea or coffee by precipitating a decoction with lead acetate, removing the excess of lead from the filtrate by hydrogen sulphide, adding ammonia water, evaporating, and recrystallizing.

Caffeina. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Fleecy masses of flexible crystals, generally quite long, and of a silky lustre, permanent in the air.	Odorless; bitter taste; neutral reaction.	At 15° C. (59° F.), 80 parts. Boiling, About 2 parts.	Cold, 33 parts. Boiling, Very soluble.	In 7 parts of chloroform, and in 555 parts of ether.
TESTS FOR IDENTITY.		IMPURITIES.	TESTS FOR IMPURITIES.	
When heated to 100° C. (212° F.), Caffeine loses its water of crystallization, and at 229° C. (444.2° F.) it melts, forming a colorless liquid. When ignited, Caffeine is completely volatilized without charring or leaving a residue. On dissolving a small quantity of Caffeine in concentrated sulphuric acid, and adding a minute fragment of potassium dichromate to the liquid, the latter will acquire a yellowish-green color, which gradually becomes green. If a small quantity of Caffeine be dissolved in about 1 C.c. of hydrochloric acid, a little potassium chlorate added, the whole evaporated to dryness on a water-bath, and the capsule then inverted over a vessel containing a few drops of ammonia water, the residue will acquire a rich purple color, which is destroyed by alkalis.		Organic Impurities.	{ Caffeine should dissolve in strong sulphuric or nitric acid without producing a color. Its aqueous solution should not be precipitated by mercuric potassium iodide T.S.	
		Other Alkaloids.		

Uses.—Caffeine is a nervous stimulant. It is chiefly used in nervous headaches of a certain type. The dose is from one to three grains (0.06 to 0.19 Gm.).

CAFFEINA CITRATA. U.S. Citrated Caffeine.

	Metric.	Old form.
Caffeine	50 Gm.	1 oz. av.
Citric Acid	50 Gm.	1 oz. av.
Distilled Water, hot	100 C.c.	2 fl. oz.

Dissolve the Citric Acid in the hot Distilled Water, add the Caffeine, and evaporate the resulting solution, on a water-bath, to dryness, constantly stirring towards the end of the operation. Reduce the product to a fine powder and transfer it to well-closed bottles.

This is not a definite chemical salt, but a mixture of caffeine and citric acid, caffeine being a feeble alkaloid: hence the common name *citrate of caffeine* is improper. It is used as a cerebral stimulant in doses of three to eight grains (0.19 to 0.5 Gm.).

A white powder, odorless, having a purely acid taste and an acid reaction. One part of Citrated Caffeine forms a clear, syrupy solution with about 3 parts of water. Upon dilution with water this yields a white precipitate (caffeine), which redissolves when about 25 parts of water have been added. It is also soluble in a mixture of 2 volumes of chloroform and 1 volume of alcohol.

CAFFEINA CITRATA EFFERVESCENS. U.S. Effervescent Citrated Caffeine.

	Metric.	Old form.
Caffeine	10 Gm.	70 grains.
Citric Acid	10 Gm.	70 grains.
Sodium Bicarbonate	330 Gm.	5 oz. av. 122 grains.
Tartaric Acid	300 Gm.	5 oz. av.
Sugar, in very fine powder	350 Gm.	5 oz. av. 262 grains.
Alcohol, a sufficient quantity,		
To make	1000 Gm.	or about 16 oz. av.

Triturate the solid ingredients, separately well dried, to a fine, uniform powder. Mix this with Alcohol to a soft paste, and rub it through a No. 6 tinned-iron sieve or enamelled colander. Then dry it, and reduce it to a coarse, granular powder. Keep the product in well-stoppered bottles. This effervescent salt is used for preparing a pleasant stimulating draught by adding a teaspoonful to four fluid-ounces of water.

CONIUM. U.S. Conium. [HEMLOCK.]

The full-grown fruit of *Conium maculatum* Linné (nat. ord. *Umbelliferae*), gathered while yet green.

Conium contains *coniine*, $C_8H_{17}N$, *conhydrine*, $C_8H_{17}NO$, and *methylconiine*, $C_8H_{16}CH_3N$; also a little volatile oil and fixed oil. Coniine is a liquid volatile alkaloid, and contains no oxygen. Its odor resembles that of the urine of mice. It is soluble in water, alcohol, and ether. Conium is narcotic and sedative. Dose, five grains (0.3 Gm.).

Official Preparations.

Extractum Conii	Made with diluted alcohol containing 2 per cent. of acetic acid to fix the alkaloid (see page 448). Dose, one-half to one grain (0.03 to 0.06 Gm.).
Extract of Conium.	
Extractum Conii Fluidum	Made with diluted alcohol containing 2 per cent. of acetic acid to fix the alkaloid (see page 402). Dose, five to twenty minims (0.3 to 1.2 C.c.).
Fluid Extract of Conium.	

SCOPARIUS. U. S. Scoparius. [BROOM.]

The tops of *Cytisus Scoparius* (Linné) Link (nat. ord. *Leguminosæ*).

Scoparius contains *sparteine*, a colorless liquid alkaloid, having the composition $C_{15}H_{28}N_2$. It also contains *scoparin*, $C_{21}H_{22}O_{10}$, which probably represents the diuretic and purgative action of the drug. The dose of scoparius in dropsical complaints is twenty to thirty grains (1.3 to 1.9 Gm.).

Official Preparation.

Extractum Scoparii Fluidum. Made with a menstruum of diluted alcohol (see page 423).
Fluid Extract of Scoparius. Dose, twenty to forty minims (1.2 to 2.4 C.c.).

SPARTEINÆ SULPHAS. U. S. Sparteine Sulphate.

The neutral sulphate of an alkaloid obtained from Scoparius.

The salts of sparteine are mostly crystallizable, although the alkaloid itself is liquid.

Sparteine Sulphas. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Colorless, white, prismatic crystals, or a granular powder, liable to attract moisture when exposed to damp air. When heated to about 83° C. (181.4° F.), the salt begins to lose its water of crystallization, all of which escapes at 100° C. (212° F.). At about 136° C. (276.8° F.) it melts, and upon ignition it is consumed, leaving no residue.	Odorless, and having a saline, somewhat bitter taste, and a neutral reaction.	Very soluble.	Very soluble.

Tests.

If 25 C.c. of ether be added to about 0.1 Gm. of Sparteine Sulphate in a test-tube, then a few drops of dilute ammonia water, so that the latter shall not be in excess, and an ethereal solution of iodine (1 in 50) be afterwards added until the liquid, when shaken, turns from an orange to a dark reddish-brown color, the bottom and sides of the test-tube will after a short time be found coated with minute, dark greenish-brown crystals, distinctly seen with a lens after the liquid has been poured out.

On shaking 0.05 Gm. of the salt, in a test-tube, with 5 C.c. of potassium or sodium hydrate T.S., the liquid will at first be turbid, and small drops of sparteine will gradually collect on the surface. If a strip of moistened red litmus paper be suspended in the mouth of the test-tube, and a gentle heat be then applied, the test-paper will gradually acquire a blue color, but no ammoniacal odor should be perceptible (absence of *ammonium salts*).

LOBELIA. U. S. Lobelia.

The leaves and tops of *Lobelia inflata* Linné (nat. ord. *Lobeliaceæ*), collected after a portion of the capsules have become inflated.

Lobelia contains *lobeline*, *lobelic acid*, *lobelacrin*, wax, resin, gum, etc. Lobeline, the alkaloid, is liquid, and contains no oxygen. Lobelia is expectorant and emetic. Dose, ten to forty grains (0.6 to 2.6 Gm.).

Official Preparations.

Extractum Lobelie Fluidum. Made with diluted alcohol (see page 413). Dose, ten to twenty minims (0.6 to 1.2 C.c.).
Fluid Extract of Lobelia.

Tinctura Lobelie Made by percolating 200 Gm. of lobelia with sufficient diluted alcohol to make 1000 C.c. (see page 372). Dose, one-half to one fluidrachm (1.8 to 3.7 C.c.).
Tincture of Lobelia.

TABACUM. U. S. Tobacco.

The commercial, dried leaves of *Nicotiana Tabacum* Linné (nat. ord. *Solanaceæ*).

Tobacco contains *nicotine*, $C_{10}H_{14}N_2$, a liquid alkaloid, which is colorless, very acrid, poisonous, and rapidly turns brown on exposure to air. It is soluble in water, alcohol, and ether. Tobacco is sedative and emetic. Dose, one to five grains (0.06 to 0.3 Gm.).

Unofficial Drugs containing Alkaloids.

- Akasga** (Boundou, Quai, Ikaga, Icaya). An ordeal poison, used in a district on the West Coast of Africa. The alcoholic extract acts similarly to *nux vomica*.
- Alstonia Constricta**. The bark of *A. constricta*, found in Australia. It contains *alstonine*, which is very bitter.
- Australian Fever Bark**. The root of *B. tinctoria*, found in North America. It contains an alkaloid and *baptisin*, which is an impure resin, containing some of the alkaloid.
- Baptisia**. From *B. vulgaris*, found in Europe and America. It contains *berberine*, *oxyacanthine*, and *tannin*.
- Berberis**. The leaves of *Peumus B.*, found in Chili. It contains *boldine*, volatile oil, *tannin*, etc.
- Barberry Bark**. Cardiac stimulant. Dose of a tincture of the fresh stems (4 oz. to 1 pint), thirty minims (1.85 C.c.) every four hours.
- Boldus**. The seeds of *C. arabica*, found in most tropical countries. It contains about 1 per cent. of *caffeine*, $C_8H_{10}N_4O_2 \cdot H_2O$, and fixed oil.
- Boldo**. Stimulant and alterative. Various species of the *Celastraceæ* have medicinal properties.
- Cactus Grandiflorus**. The fruit of *Anamirta C.*, found in the East Indies. It contains *menispermine*, *picrotoxin*, etc.
- Night-blooming Cereus**. The flowers of *Colchicum autumnale*, found in Europe. They contain a large percentage of *colchicine*.
- Coffea**. The plant of *C. trifolia*, found in North America. It contains a yellow crystalline alkaloid, *berberine*, and a white one, named *coptine*.
- Coffea**. The rhizome of *C. Teeta*, found in East India. It contains a very large percentage of *berberine*.
- Celastrus**. The tubers of *Dicentra canadensis*, grown in North America. It contains the alkaloid *corydaline*, which is very bitter, acrid resin, etc.
- Cocculus Indicus**. An extract made by South American Indians from plants belonging to the genus *Strychnos*. It contains an extremely poisonous alkaloid, named *curarine*.
- Fish-berries**. Poisonous, narcotic. It contains *cytisine* ($C_{20}H_{27}N_5O$) and *laburine*.
- Colchici Flores**. The seed of *D. consolida*, found in Central Europe. It contains the poisonous alkaloid *delphinine*.
- Colchicum Flowers**. From the bark of *Alstonia scholaris*, found in the Philippine Islands. It contains $\frac{1}{4}$ per cent. of a bitter alkaloid, *ditamine*, and 2 per cent. of *ditain*, an uncrystallizable bitter substance.
- Coptis**. The leaves of *D. myoporoides*, found in Australia. It contains a very poisonous alkaloid, *duboisine*, which is colored reddish-brown by sulphuric acid.
- Goldthread**. A cardiac stimulant and local mydriatic. It contains the alkaloid *ephedrine*.
- Coptis Teeta**. The bark of *E. guineense*, found in Africa. It contains the colorless alkaloid *erythrophleine*. Emetic, narcotic, and astringent.
- East Indian Goldthread**. Dose of the extract, $\frac{1}{16}$ to $\frac{1}{8}$ grain (0.015 to 0.02 Gm.).
- Corydalis**. Soporific and analgesic. It contains a glucoside and an alkaloid, said to be *morphine*. The extract has been given in doses commencing with 12.3 grains (0.8 Gm.), increasing to 185 grains (12 Gm.) a day.
- Turkey Corn**. The plant of *F. officinalis*, found in Europe. It contains the alkaloid *fumarine*.
- Curare**. The plant of *G. luteum*. It contains the alkaloids *sanguinarine*, *glauanine*, and *glaucopterine*.
- Wourari**. An acrid, narcotic poison. It contains two resins and a very poisonous bitter principle, "superbine."
- Cytisus Laburnum**. The seed of *Strychnos Ignatii* (nat. ord. *Loganiaceæ*).
- Laburnum**.
- Delphinium**.
- Larkspur Seed**.
- Dita**.
- Dita Bark**.
- Duboisia**.
- Duboisia**.
- Ephedra Vulgaris**.
- Erythrophileum**.
- Sassy Bark**.
- Eschscholtzia Californica**.
- Chamisso**.
- Fumaria Officinalis**.
- Fumitory**.
- Glaucium**.
- Horn Poppy**.
- Gloriosa Superba**.
- Ignatia**.
- Bean of St. Ignatius**.

Unofficial Drugs containing Alkaloids.—Continued.

Isopyrum Thalictroides.	It contains two alkaloids, <i>isopyrine</i> and <i>pseudo-isopyrine</i> .
Jedersonia Diphylla.	Tonic, expectorant, and emetic. It is used as a substitute for <i>senega</i> .
Twin-Leaf.	
Manaca.	A portion of the root and stem of <i>Franciscoa uniflora</i> , a Brazilian plant. Antirheumatic, given in the form of fluid extract, in the dose of ten to thirty drops, three times a day.
Mandragora Officinalis.	Anæsthetic. It contains an alkaloid, <i>mandragorine</i> , and another alkaloid, both of which possess mydriatic properties.
Mandrake.	An ordeal poison. It contains an alkaloid, <i>muavinum</i> .
Muawin Bark.	The petals of <i>Papaver R.</i> , cultivated. They contain the alkaloid <i>rhæadine</i> and some coloring-matter.
Rhœas.	The poisonous seeds of this tree contain a volatile liquid alkaloid, <i>sophorine</i> .
Red Poppy.	
Sophora Speciosa.	The nuts of this tree (kola nuts) contain caffeine. They are a cardiac stimulant.
Stereulia Acuminata.	It contains two alkaloids, <i>trianospermine</i> and <i>trianospermatine</i> , and a bitter principle, "tayuin."
Tayuya Ficiifolia.	The rhizome of <i>V. album</i> , found in Europe. It contains the alkaloids <i>fervine</i> , $C_{22}H_{27}NO_2$, <i>pseudofervine</i> , <i>rubijervine</i> , <i>veratralbine</i> , etc.
Veratrum Album.	Tonic. Dose, forty grains (2.6 Gm.). It contains berberine.
White Veratrum.	
Xanthorrhiza.	
Yellow Root.	

Unofficial Alkaloids and their Salts.

Aconitine, $C_{34}H_{45}NO_{12}$.	From <i>Aconitum Napellus</i> . It exists in an amorphous and crystalline form; inodorous, and of a bitter and acrid taste; sparingly soluble in water, but freely so in alcohol, ether, and chloroform. Used principally for neuralgia, in the form of an ointment. A most violent poison. Commercial aconitine is very variable in quality. Dose of the pure alkaloid, one-six-hundred-and-fortieth of a grain (0.0001 Gm.).
Alstonine, $C_{21}H_{25}N_3O_4$.	From the bark of <i>Alstonia constricta</i> . A brownish-yellow, amorphous powder, readily soluble in alcohol.
Anagyrrine, $C_{14}H_{15}N_3O_2$.	A yellowish, amorphous, hygroscopic, poisonous alkaloid, from <i>Anagyris foetida</i> . Soluble in water, alcohol, and ether.
Analgen (Ortho-ethoxy-anomobenzoylamido-cholinoline), $C_{15}H_{14}N_2O_2$.	Antipyretic and antirheumatic. Dose, seven and five-tenths to fifteen grains (0.5 to 0.97 Gm.), repeated, if necessary, to seventy-five grains (4.86 Gm.) a day.
Antispasmin (Narcin Sodium, Sodium Salicylate).	Hypnotic and analgesic. Dose, one-half to one grain (0.032 to 0.065 Gm.).
Aspidospermine, $C_{22}H_{25}N_3O_2$.	From the bark of <i>Aspidosperma Quebracho</i> . It is a weak base, forming amorphous salts. The hydrochlorate is given in doses of one-thirtieth to one-twentieth of a grain (0.002 to 0.003 Gm.).
Beberine, $C_{15}H_{21}NO_2$.	From the bark of <i>Nectandra Rodiæi</i> . A pale yellow, amorphous powder, of a resinous aspect, inodorous, very bitter, very slightly soluble in water, inflammable, and of an alkaline reaction. <i>Beberine sulphate</i> is given in doses of two to five grains (0.13 to 0.3 Gm.).
Benzoyl Ego- nine, $C_{15}(H).H_{12}NO_4$ or $C_9H_{14}(C_7H_5O)NO_2$.	Cardiac stimulant. Prepared by heating cocaine in aqueous solution to decomposition.
Benzoyl Tropeine.	Local anæsthetic.
Berberine, $C_{20}H_{17}NO_4$.	From the bark of the root of <i>Berberis vulgaris</i> and others. It occurs in minute yellow crystals, has a bitter taste, is soluble in 100 parts of cold water, and insoluble in ether. Its medicinal action is similar to that of quinine. Dose, one to eight grains (0.06 to 0.5 Gm.).
Betaine Trimethyl- glycoll.	An alkaloid found in the juice of the sugar beet.
Boldina.	From the leaves of <i>Peumus Boldus</i> . It imparts to water a bitter taste, is soluble in alcohol, ether, chloroform, etc., and is colored red by nitric and sulphuric acids. The yield of alkaloid is about $\frac{1}{10}$ per cent.
Buxine.	From the bark of <i>Buxus sempervirens</i> . It is identical with the beberine of <i>nectandra</i> bark.
Chelerythrine.	From <i>Chelidonium majus</i> . This alkaloid is identical with sanguinarine. It is an acrid poison.

Unofficial Alkaloids and their Salts.—Continued.

- Chinoidine (Quinoidine).** A mixture of alkaloids, mostly amorphous, obtained as a by-product in the manufacture of the crystallizable alkaloids from cinchona. Dose, five to thirty grains (0.3 to 1.9 Gm.).
- Chinol, Chinoline monohydrochloride, $C_9H_8N.Cl.O$.** Antipyretic and analgesic. Dose, three to five grains (0.19 to 0.32 Gm.).
- Chinoline (Quinoline, Leuocoline), C_9H_7N .** An artificial alkaloid. A colorless, oily liquid. Sp. gr. 1.081 at 10° C. (50° F.). Antipyretic and antiseptic.
- Chlorogenine.** Identical with *alstonine* (see above).
- Cinchonidinæ Salicylas, Cinchonidine Salicylate, $C_{15}H_{22}N_2O_7.C_7H_5O_2$.** Antirheumatic. Dose, fifteen to twenty grains (0.971 to 1.29 Gm.) a day.
- Cicutine.** From *Cicuta virosa*. A volatile alkaloid.
- Cocaine (Erythroxyline), $C_{17}H_{21}NO_4$.** From the leaves of *Erythroxylon Coca*. Colorless prisms of a strong alkaline reaction, a bitter taste, producing a transient numbness upon the tongue, soluble in 700 parts of water, more soluble in alcohol and ether. It is decomposed on being heated with strong hydrochloric acid. Used largely as a local anæsthetic.
- Colchicine, $C_{17}H_{19}NO_6$.** From *Colchicum autumnale*. It is colorless or yellow, amorphous, soluble in water, alcohol, and chloroform; has a saffron-like odor and a bitter taste. Its aqueous solution is colored yellow on the addition of hydrochloric acid. The yield of alkaloid is about $\frac{1}{2}$ per cent. Used in gout, rheumatism, neuralgia, etc. Dose, one-hundredth of a grain (0.0006 Gm.) three times a day.
- Conhydrine, $C_8H_{17}NO$.** From *Conium maculatum*. It occurs in pearly, iridescent plates, which are easily fusible; odor similar to that of coniine.
- Coniine, $C_8H_{15}N$.** From *Conium maculatum*. A volatile alkaloid, inflammable, strong alkaline reaction, a strong odor, soluble in water, alcohol, ether, chloroform, etc. Used as an antispasmodic. Dose, one-fourth of a grain (0.016 Gm.). Coniine hydrobromate is given in doses of one-sixteenth of a grain (0.004 Gm.).
- Corydaline.** From the tubers of *Dicentra canadensis*. A white, amorphous powder; its solution has a very bitter taste.
- Curarine, $C_{18}H_{25}N$.** From *curare*. It occurs in colorless prisms having a very bitter taste. It is colored red by nitric acid.
- Cytisine, $C_{20}H_{27}N_3O$.** From *Cytisus Laburnum*. It occurs in white crystals, is inodorous, and has a bitter, somewhat caustic taste, and an alkaline reaction. Soluble in water and alcohol. It is colored orange-yellow by nitric acid.
- Daturine.** See page 1001. Dose, one-sixty-fourth of a grain (0.001 Gm.).
- Delphinine, $C_{23}H_{35}NO_6$.** From the seed of *Delphinium Staphisagria*. It occurs in flat prisms; taste bitter, followed by persistent tingling. Nearly insoluble in water.
- Duboisine.** From several species of *Duboisia*. It crystallizes in fine colorless needles. Used as a substitute for atropine. Dose, one-sixty-fourth of a grain (0.001 Gm.).
- Emetine, $C_{28}H_{45}N_3O_8$.** From *Cephaelis Ipecacuanha*. It is a yellowish-white powder, sparingly soluble in water, but dissolves in alcohol, ether, etc. Emetine is colored bright yellow or orange by chlorinated lime. The yield of alkaloid is about 1 per cent.
- Erythrophleine Hydrochlorate.** Obtained from *Erythrophleum guineense* (Sassy bark). Used in place of cocaine. Dose, one-eighth of a grain (0.008 Gm.).
- Ethyl-oxy-Caffeine.** Called also Ethoxycaffeine. Given in migraine, in doses of six to eight grains (0.38 to 0.5 Gm.).
- Fumarine.** From *Fumaria officinalis*. It occurs in a white, crystalline form, is of a bitter taste, scarcely soluble in water, but soluble in alcohol.
- Geissospermine, $C_{15}H_{24}N_2O_7.H_2O$.** From *Geissospermum luteum*. It occurs in small white prisms, nearly insoluble in ether and water, and readily soluble in alcohol and dilute acids.
- Gelsemine, $C_{11}H_{19}NO_3$.** From *Gelsemium sempervirens*. It occurs in an amorphous, white powder, of a very bitter taste and an alkaline reaction, slightly soluble in cold water. It is colored red changing to purple when heated with sulphuric acid. *Gelsemine hydrochlorate* has been given in doses of one-sixteenth of a grain (0.004 Gm.).
- Glaucine.** From *Glaucium luteum*. A white, crystalline powder.
- Glaucopierine.** From *Glaucium luteum*. A white, crystalline powder.
- Guaranine.** From *Paullinia sorbilis*. Identical with caffeine.
- Homatropine Hydrobromate.** Salt of a derivative of atropine. Dose, one-fourth of a grain (0.016 Gm.).

Unofficial Alkaloids and their Salts.—*Continued.*

- Hydrastine,**
 $C_{21}H_{23}O_4$. From *Hydrastis canadensis*. It occurs in white, shining, quadrangular prisms, soluble in alcohol, ether, and chloroform, insoluble in water. By adding nitric acid to a small portion of the alkaloid a red color is produced, and a brown-red by sulphuric acid. The yield of alkaloid is about 1½ per cent.
- Hygrine.** From the leaves of *Erythroxylon Coca*. A volatile alkaloid, of a pale yellow color and a burning taste.
- Hyoscine.** Obtained from *Hyoscyamus niger* in the process for obtaining hyoscyamine, and also by boiling hyoscyamine with baryta water, when decomposition takes place, forming hyoscine and hyoscinic acid. Dose, one-sixty-fourth of a grain (0.001 Gm.).
- Jervine,**
 $C_{20}H_{25}N_2O_3$. From *Veratrum album*. It occurs, when pure, as a white powder, tasteless, insoluble in water and ether, but soluble in alcohol and chloroform.
- Kairine,**
 $C_{10}H_{15}NO.HCl$. The hydrochlorate of an artificial alkaloid prepared from chinoline. It occurs in commerce as a grayish or yellowish crystalline powder, having a slight phenol-like odor, and a saline, bitter, somewhat aromatic taste, Soluble in boiling water. Dose, fifteen grains (0.9 Gm.).
- Kairoline,**
Tetrahydro-
methylquino-
line, or Tetra-
hydroethyl-
quinoline. Antipyretic. The sulphates are the commercial salts.
- Laurotetanine.** An alkaloid found in a number of plants belonging to the Laurineæ. A powerful poison, acting like strychnine.
- Lobeline.** From *Lobelia inflata*. It is a volatile, yellow, somewhat aromatic liquid, having an acrid taste. Soluble in alcohol, ether, and fixed oils.
- Lupinine,**
 $C_{21}H_{25}N_2O_3$. From different species of *Lupinus*. It occurs in colorless, rhombic prisms having a fruity odor and a very bitter taste.
- Lupuline.** From *Humulus Lupulus*. A liquid alkaloid which has a strong coniline-like odor and an alkaline taste.
- Menispermine,**
 $C_{15}H_{24}N_2O_3$. From *Cocculus indicus*.
- Muscarine,**
 $C_8H_{15}NO_2$. From *Amanita muscaria*. A colorless, crystalline powder, very deliquescent, sparingly soluble in chloroform, and insoluble in ether.
- Nicotine,**
 $C_{10}H_{14}N_2$. From *Nicotiana Tabacum*. A poisonous, oily liquid. It has an unpleasant tobacco-like odor, a burning taste, and a strongly alkaline reaction.
- Oxyacanthine,**
 $C_{20}H_{28}N_2O_{11}$. From *Berberis vulgaris*. It is white, turning yellow on exposure to sunlight, having a bitter taste and an alkaline reaction. Soluble in 30 parts of boiling alcohol and in 1 part of cold alcohol, insoluble in water. Sulphuric acid colors it brown-red, turning to bright red on being heated.
- Parthenine.** From *Parthenium Hysterophorus*. Used in doses of seven to ten grains (0.4 to 0.6 Gm.) in neuralgia.
- Pelletierine,**
 $C_8H_{15}NO$. From *Punica Granatum*. A dextrogyrate liquid, easily soluble in water, alcohol, and ether, and especially so in chloroform. *Pelletierine Sulphate* and *Pelletierine Tannate* have been used as tæniocides in doses of five grains (0.3 Gm.).
- Pelosine.** From *Chondodendron tomentosum*. It is amorphous, insoluble in water, slightly soluble in ether.
- Pitarine,**
 C_8H_9N . From the leaves of *Duboisia Hopwoodii*. A colorless liquid, of a nicotine odor and an acrid taste; on exposure to light it turns yellow and brown; freely soluble in water, alcohol, etc.
- Punicine.** Identical with Pelletierine. See above.
- Quebrachine,**
 $C_{21}H_{25}N_2O_2$. From the bark of *Aspidosperma Quebracho*. It yields crystallizable salts, and is colored yellow by sunlight.
- Sanguinarine,**
 $C_{19}H_{17}NO_4$. From *Sanguinaria canadensis*. It occurs in white crystals having a bitter, acrid taste; soluble in ether and alcohol.
- Solanine.** From *Dulcamara* and other plants. Has been given in doses of one grain.
- Sophorine.** From the seeds of *Sophora speciosa*. A poisonous alkaloid.
- Staphisagrine,**
 $C_{22}H_{33}NO_4$. From *Delphinium Staphisagria*. It is amorphous, very soluble in ether and in 200 parts of water.
- Thalline,**
Tetrahydro-
paraquinanisol,
 $C_9H_9N(OCH_3)$. A hæmostatic. The sulphate and tartrate are powerful antipyretics. Dose, from four to eight grains (0.259 to 0.518 Gm.).
- Theine.** See Caffeine.
- Theobromine,**
 $C_7H_9N_4O_2$. From *Theobroma Cacao*. It occurs in minute, colorless or white, bitter crystals, sparingly soluble in water, alcohol, and ether.
- Veratroidine,**
 $C_{31}H_{72}N_2O_{14}$. From *Veratrum viride*. It is a white powder, of a bitter taste, soluble in alcohol, ether, chloroform, etc. It is colored yellow by sulphuric acid.

QUESTIONS ON CHAPTER LX.

ALKALOIDS.

What are alkaloids, chemically? Where are they found?

What are their distinctive features?

According to the adopted nomenclature, what is the last syllable of the names of alkaloids? What of the names of neutral principles?

Opium—What is opium? How and where is it obtained? How much dry extract should dried opium yield when exhausted with cold water and evaporated to dryness?

How much morphine should opium in its normal moist condition yield when assayed by the official process?

Powdered opium—What is the Latin name?

Of what degree of fineness is powdered opium, and at what temperature should it be dried? How much morphine should it contain?

How may powdered opium of higher percentage of morphine be brought to the proper strength? What is the official process for assaying it?

Deodorized opium—What quality of opium is directed to be used?

How is it prepared?

If opium having a higher percentage of morphine is used in this process, how may the proper quantity to be used be ascertained?

To what does opium owe its value?

How many alkaloids have been proved to exist in opium?

What acids are found combined with these alkaloids?

What other principles are also present?

Which of these alkaloids and their salts are official in the U. S. Pharmacopœia?

Which was the first alkaloid discovered? When and by whom was it discovered?

Morphine—What is the Latin official name?

Give formula in symbols and molecular weight.

What was its former official name?

Explain the objects and the steps in the process for preparing morphine.

Describe odor, taste, chemical reaction, and solubility. Give tests and uses.

Morphine acetate—What is the Latin official name?

Give formula in symbols and molecular weight.

What was its former official name?

What happens if too much heat is used in evaporating the solution?

Is this salt a very permanent one? What change sometimes takes place?

How may its solubility be increased?

Describe odor, taste, chemical reaction, and solubility. Give tests and doses.

Morphine hydrochlorate—What is the Latin name?

Give formula in symbols and molecular weight. How may it be prepared?

Is this salt more stable than morphine acetate?

Describe odor, taste, chemical reaction, and solubility. Give tests and doses.

Morphine sulphate—What is the Latin name?

Give formula in symbols and molecular weight.

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

What is the dose? What are the official preparations?

How strong was the solution formerly official?

What is the strength of Magendie's solution?

Codeine—Give the Latin name, formula in symbols, and molecular weight.

How may it be prepared? Why is codeine used in preference to its salts?

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the presence of morphine be detected?

Apomorphine hydrochlorate—How is it prepared? Give rationale of process.

Describe odor, taste, chemical reaction, and solubility. Give tests and doses.

Cinchona—What is its official definition?

Yellow cinchona—What is the Latin name? What is its synonyme?

Whence is it derived? How much quinine should it contain?

Red cinchona—What is the Latin name? What is its synonyme?

Whence is it derived? How much quinine should it contain?

Upon what does the value of cinchona bark depend?

How may the value be ascertained?

Give the process of the U. S. Pharmacopœia for its assay: first, for ascertaining the total amount of alkaloids; second, for ascertaining the amount of quinine.

How many alkaloids have been discovered in cinchona barks?

Have all of these been found in any one variety of bark?

Do they all exist naturally in the bark?

Which are the most important alkaloids?

What acids are found in cinchona bark? What other principles are found?

How are the artificial alkaloids chiefly produced?

Why is it difficult to preserve the galenical preparations of cinchona?

How may this difficulty be in a measure obviated?

What are the official preparations?

Quinine—Give Latin name, formula in symbols, and molecular weight.

How is it usually made?

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

Why is it difficult to preserve the galenical preparations of cinchona? more than 1 per cent. of quinidine, and more than traces of cinchonine.

For what is it used?

Quinine sulphate—What is the Latin name? Give formula in symbols and molecular weight.

What was the former official name? Give the process.

How many quinine sulphates have been obtained?

Which of these are official in the U. S. Pharmacopœia?

What is the difference in chemical composition between quinine sulphate (U. S. Pharmacopœia) and quinine bisulphate?

What is the difference in chemical composition between quinine bisulphate and the acid sulphate?

Quinine sulphate—Describe odor, taste, chemical reaction, solubility, and tests.

How may the following impurities be detected?—viz.: Foreign organic matters; ammonium salts; more than 16.18 per cent. of water; absence of more than about 1 per cent. of cinchonidine or quinidine, and of more than traces of cinchonine.

What is the dose? How is it best given in the liquid form?

Quinine bisulphate—What is the Latin official name?

Give formula in symbols and molecular weight. How is it made?

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Foreign organic matters; free water.

What advantage has this salt over the sulphate for use in medicine?

How much weaker is it than the sulphate?

Quinine hydrochlorate—What is the Latin name?

Give formula in symbols and molecular weight. How may it be made?

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Foreign organic matter; sulphate. What is the dose?

Why is this salt preferable to quinine sulphate for hypodermic use?

Quinine hydrobromate—What is the Latin official name?

Give formula in symbols and molecular weight. How may it be made?

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Foreign organic matters; free water; sulphate. What is the dose?

Quinine valerianate—What is the Latin official name?

Give formula in symbols and molecular weight.

How may it be made by double decomposition?

What special care must be observed in preparing this salt?

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Foreign organic matters; sulphate.

Has this salt any special advantage over the sulphate? What is the dose?

Quinidine sulphate—What is the Latin official name?

Give formula in symbols and molecular weight. How is it obtained?

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Foreign organic matters; more than small proportions of cinchonidine or quinine.

In what respects does quinidine differ from quinine? How does this salt compare in efficiency with quinine sulphate? What is the dose?

Cinchonine—What is the Latin official name?

- Give formula in symbols and molecular weight. How may it be obtained?
Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
How may the following impurities be detected?—viz.: More than traces of quinine or quinidine; foreign organic matters. For what purposes is it used?
- Cinchonine sulphate—What is the Latin official name?
Give formula in symbols and molecular weight. How is it obtained?
Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
How may the following impurities be detected?—viz.: More than traces of quinine sulphate or of quinidine sulphate; more than 6 per cent. of moisture; foreign organic matters. What is the dose?
- Cinchonidine sulphate—What is the Latin official name?
Give formula in symbols and molecular weight.
How is it obtained? Which barks contain most of it?
Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
How may the following impurities be detected?—viz.: More than traces of quinine sulphate or of quinidine sulphate; foreign organic matters; more than 8 per cent. of moisture; more than 0.5 per cent. of cinchonine sulphate, or more than 1.5 per cent. of quinidine sulphate. What is the dose?
- Nux vomica—What is its definition? What does it contain?
In what is brucine soluble? What action does nitric acid have upon it?
What action does chlorine water have upon it?
Are the alkaloids soluble in the fixed oil? How may they be separated from it?
What is the dose? What are its official preparations?
- Strychnine—Give the Latin name, formula in symbols, and molecular weight.
Describe odor, taste, chemical reaction, solubility, and tests.
How may the following impurity be detected?—viz.: More than traces of brucine.
Strychnine sulphate—Give formula in symbols and molecular weight.
How is it prepared? Describe taste, chemical reaction, and solubility.
Why is the sulphate more useful than the alkaloid? What is the dose?
- Gelsemium—Give its synonyme and definition. What does it contain?
What is the best solvent for its active principles? What is the dose?
What are the official preparations?
- Physostigma—What is its synonyme? Whence is it derived? What does it contain?
What is the dose? What are its official preparations?
- What are the physical properties of physostigmine?
Physostigmine salicylate—How may it be made?
Describe taste, chemical reaction, and solubility.
What advantages does this salt possess over the alkaloid? What is the dose?
- Belladonna leaves—What is the definition?
Belladonna root—What is the definition?
To what does belladonna owe its activity?
What is the dose? What are its official preparations?
- Atropine—Give the Latin name, formula in symbols, and molecular weight.
How may it be prepared?
Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
What is the dose? Why is the sulphate preferred?
- Atropine sulphate—How may it be prepared? Describe odor, taste, chemical reaction, and solubility. Give tests for identity. What is the dose?
- Hyoscyamus—What is its synonyme? What is its definition?
What does it contain? What is the dose? What are the official preparations?
What salt prepared from it is official? What are the properties of hyoscyne?
- Hyoscyamine sulphate—What is the Latin official name?
Give formula in symbols and molecular weight. How is it prepared?
Describe odor, taste, chemical reaction, and solubility. Give tests and dose.
- Stramonium leaves—Whence are they derived?
Stramonium seed—Whence is it derived?
What do the leaves contain? What do the seeds contain?
What is the dose? What are the official preparations?
- Dulcamara—What is its synonyme? Whence is it derived? What does it contain?
Which is the bitter and sweet principle? What are the official preparations?
- Pilocarpus—What is its synonyme? Whence is it derived? What does it contain?
Is it easily powdered? What is the dose? What are the official preparations?
- Pilocarpine hydrochlorate—Give the Latin name, formula in symbols, and molecular weight. How is it prepared?
Describe odor, taste, chemical reaction, and solubility. Give tests and dose.

- Colchicum root—Whence is it derived?
 Colchicum seed—Whence is it derived? What is the active principle?
 What does the root contain? What do the seeds contain?
 Why are the seeds so tough? How may they be exhausted of their active principle?
 What are the official preparations?
 Veratrum viride—What is its synonyme? Whence is it derived?
 What does it contain? To what was it formerly supposed to owe its activity?
 What is the dose? What are the official preparations?
 Veratrine—Whence is it obtained, and how is it prepared?
 What are its properties and uses? Describe odor, taste, chemical reaction, solubility, and tests for identity. What are its official preparations?
 Chelidonium—What is its synonyme?
 What does it contain? What are its properties? What is the dose?
 Sanguinaria—What is its synonyme? What is its definition?
 What does it contain? What is the dose? What are its official preparations?
 Staphisagria—What is its synonyme? Whence is it derived?
 What does it contain? What are good solvents? For what is it used?
 Aconite—Whence is it derived? What does it contain?
 How may aconitic acid be produced?
 What is the best menstruum for preparations of aconite?
 What is the object of using tartaric acid in the menstruum?
 What are its properties and dose?
 What is the dose of aconitine? What are its official preparations?
 Hydrastis—What is its synonyme? What is its definition? What does it contain?
 What difference in appearance is there between the salts of hydrastine and those of berberine? What is the dose? What are its official preparations?
 Menispermum—What is its synonyme? Whence is it derived?
 What does it contain? What is the dose?
 Pomegranate—What is the Latin official name? Whence is it derived?
 What does it contain? Which of the alkaloids is solid and crystallizable?
 Which of the alkaloids are liquid? What is the dose?
 Pareira—What is its synonyme? Whence is it derived?
 What does it contain?
 With what is this alkaloid identical?
 What is the dose? What are its official preparations?
 Ipecacuanha—Whence is it derived? What does it contain?
 What is the dose? What are its official preparations?
 How may the apothegmatic matter which is dissolved by hydro-alcoholic liquids be separated?
 Erythroxylon—What is its synonyme? Whence is it derived?
 What does it contain?
 What is the dose?
 What are its official preparations?
 What remarkable property does cocaine possess?
 Guarana—What is it, and whence is it derived? What does it contain?
 What is the dose?
 What are its official preparations?
 Caffeine—What is the Latin name?
 Give formula in symbols and molecular weight. Whence is it obtained?
 How is it prepared?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 How may the presence of other alkaloids be detected?
 What is the dose?
 Conium—What is its synonyme? What is its definition?
 What does it contain?
 What are the peculiarities of coniine?
 In what is coniine soluble?
 What are the properties and dose of conium?
 What are its official preparations?
 Lobelia—What is its definition? What does it contain?
 What is the dose?
 What are its official preparations?
 Tobacco—What is the Latin official name? Whence is it derived?
 What does it contain? What are the properties of nicotine?
 What are the properties and the dose of tobacco?

CONDENSED CHART OF THE VEGETABLE OFFI

NATURAL ORDER. Official Name.	Botanical Name.	Synonyme.	Part used, or Description.	Habitat.
Algæ.				
Chondrus . . .	C. crispus and Gigartina ma- millosus.	Carragheen. Irish Moss.	Whole plant.	North Atlantic coast.
Anacardiæ.				
Mastiche . . .	Pistacia Lentis- cus.		Concrete res- inous exuda- tion.	Mediterranean basin.
Rhus Glabra .	Rhus glabra.		Fruit.	North America.
Rhus Toxicod- endron . . .	R. radicans.	Poison Ivy.	Fresh leaves.	North America.
Apocynacæ.				
Apocynum . .	A. cannabinum.	Canadian Hemp.	Root.	United States.
Aspidosperma .	A. Quebracho- blanco.	Quebracho.	Bark.	Argentine Re- public.
Strophanthus .	S. hispidus.		Seed.	Tropical Africa.
Aristolochiacæ.				
Serpentaria . .	Aristolochia S. and A. reticu- lata.	Virginia Snakeroot.	Rhizome and roots.	United States.
Aroidæ.				
Calamus . . .	Acorus C.	Sweet Flag.	Rhizome.	
Asclepiadæ.				
Asclepias . . .	A. tuberosa.	Pleurisy Root.	Root.	United States.
Berberidacæ.				
Caulophyllum .	C. thalictroides.	Blue Cohosh.	Rhizome and roots.	North America.
Podophyllum .	P. peltatum.	May-Apple.	Rhizome and roots.	North America.
Betulacæ.				
Oleum Betulæ Volatile . . .	Betula lenta.	Oil of Sweet Birch.	Volatile oil from bark.	
Burseracæ.				
Myrrha	Commiphora M.		Gum-resin.	East Africa and Arabia.
Caprifoliacæ.				
Sambucus . .	S. canadensis.	Elder.	Flowers.	North America.
Viburnum Op- ulus	V. opulus.	Cramp Bark.	Bark.	United States.
Viburnum Pru- nifolium . . .	V. prunifolium.		Bark.	United States.

CIAL DRUGS, WITH THEIR PREPARATIONS.

English Name.	Medical Properties, Dose.	Constituents.	Official Preparations in heavy type; those into which the Drug enters, in Roman type.
Chondrus.	Demulcent.	Mucilaginous compounds, etc.	
Mastic.	Stimulant.	Volatile oil, masticic acid, masticin.	Pills of Aloes and Mastic.
Rhus Glabra.	Diuretic.	Acid calcium and potassium malates, tannin.	Fluid Extract.
Rhus Toxicodendron.	Irritant; rubefacient; gr. ij-v.	Toxicodendric acid, tannin, fixed oil, wax, mucilage.	
Apocynum.	Antiperiodic, emetic; gr. v-xx.	Tannin, resin, apocynin, etc.	Fluid Extract.
Aspidosperma.	Tonic, antispasmodic; gr. xv-3j.	Aspidospermine, quebrachine, etc.	Fluid Extract.
Strophanthus.	Sedative; m iv-vij.	Kombic acid, strophanthin.	Tincture.
Serpentaria.	Stimulant; gr. xx.	Volatile oil, acorin, resin.	Fluid Extract, Tincture, Compound Tincture of Cinchona.
Calamus.			Fluid Extract.
Asclepias.	Expectorant; gr. xxx.	Tannin, resins, etc.	Fluid Extract.
Caulophyllum.	Antispasmodic; gr. xx.	Saponin, resins.	
Podophyllum.	Cathartic; gr. xx.	Resin, starch, sugar.	Extract, Fluid Extract, Resin.
Volatile Oil of Betula.			
Myrrh.	Stimulant, tonic; gr. xx.	Volatile oil, resin, gum, bitter principle.	Tincture, Compound Iron Mixture, Pills of Aloes and Myrrh, Tincture of Aloes and Myrrh, Compound Pills of Rhubarb.
Sambucus.	Diaphoretic; gr. lx.	Volatile oil, resin, mucilage.	
Viburnum Opulus.		Valerianic acid, etc.	Fluid Extract.
Black Haw.	Antidysmenorrhœic; gr. lx.	Valerianic acid, resin, tannin.	Fluid Extract.

NATURAL ORDER. Official Name.	Botanical Name.	Synonyme.	Part used, or Description.	Habitat.
Celastraceæ. Euonymus . .	E. atropurpureus.	Wahoo.	Bark of root.	United States.
Chenopodiaceæ. Chenopodium .	C. ambrosioides, var. anthelminticum.	American Wormseed.	Fruit.	North America.
Oleum Chenopodii	C. ambrosioides, var. anthelminticum.	Oil of American Wormseed.	Volatile oil.	
Compositæ. Absinthium . .	Artemisia A.	Wormwood.	Leaves and tops.	Northern Asia and naturalized.
Anthemis . . .	A. nobilis.	Chamomile.	Flower-heads.	Southern and Western Europe.
Arnica Flores .	Arnica montana.		Flower-heads.	Mts. of Europe.
Arnica Radix .	Arnica montana.		Rhizome and root.	Mts. of Europe.
Calendula . . .	C. officinalis.	Marigold.	Florets.	S. Europe, cult.
Eupatorium . .	E. perfoliatum.	Thoroughwort.	Leaves and flowering tops.	North America.
Grindelia . . .	G. robusta and G. squarrosa.		Leaves and flowering tops.	North America.
Inula	I. Helenium.	Elecampane.	Root.	C. and S. Europe.
Lactucarium .	Lactuca virosa.		Concrete milk-juice.	C. and S. Europe.
Lappa	Arctium L.	Burdock.	Root.	Europe, Northern Asia.
Matricaria . .	M. Chamomilla.	German Chamomile.	Flower-heads.	Europe.
Oleum Erigerontis	Erigeron canadense.	Oil of Fleabane.	Volatile oil.	
Pyrethrum . .	Anacyclus P.	Pellitory.	Root.	Mediterranean basin.
Santonica . . .	Artemisia pauciflora.	Levant Wormseed.	Unexpanded flower-heads.	Turkestan.
Tanacetum . .	T. vulgare.		Leaves and tops.	Asia, nat.
Taraxacum . .	T. officinale.	Dandelion.	Root.	Europe, nat.
Coniferæ. Oleum Cadinum	Juniperus Oxycedrus.	Oleum Juniperi Empyreumaticum.	Product of dry distillation.	
Oleum Juniperi	Juniperus communis.		Volatile oil.	
Oleum Picis Liquidæ . .	Pinus palustris.		Volatile oil.	
Oleum Sabinæ .	Juniperus Sabina.		Volatile oil.	
Oleum Terebinthinæ	Pinus palustris and others.		Volatile oil.	

English Name.	Medical Properties, Dose.	Constituents.	Official Preparations in heavy type; those into which the Drug enters, in Roman type.
Euonymus.	Laxative; gr. lx.	Euonymin, asparagin, resins.	Extract.
Chenopodium.	Anthelmintic; gr. xx.	Volatile oil.	
Oil of Chenopodium.	Anthelmintic; m v.	$\text{C}_{10}\text{H}_{16}$,— $\text{C}_{10}\text{H}_{16}\text{O}$.	
Absinthium.	Tonic; gr. xxx.	Volatile oil, absinthin, tannin, etc.	
Anthemis.	Stimulant; gr. xl.	Volatile oil, resin, etc.	
Arnica Flowers.	Vulnerary; gr. x.	Volatile oil, arnicin.	Tincture.
Arnica Root.	Vulnerary; gr. x.	Volatile oil, arnicin, resin.	Extract, Fluid Extract, Tincture.
Calendula.	Vulnerary; gr. xxx.	Trace volatile oil, calendulin, etc.	Tincture.
Eupatorium.	Tonic; gr. xxx.	Eupatorin, volatile oil, tannin.	Fluid Extract.
Grindelia.	Sedative; gr. xxx.	Volatile oil, resin.	Fluid Extract.
Inula.	Stimulant; gr. lx.	Helenin, inulin, acrid resin.	
Lactucarium.	Sedative; gr. iij.	Lactucin, lactucic acid, lactucerin.	Tincture.
Lappa.	Alterative; gr. lx.	Mucilage, inulin, tannin.	Fluid Extract.
Matricaria.	Stimulant; gr. xl.	Volatile oil, anthemic acid.	
Oil of Erigeron.	Stimulant; m v.	$\text{C}_{10}\text{H}_{16}$.	
Pyrethrum.	Sialagogue; gr. xl.	Resin, fixed oils, inulin.	Tincture.
Santonica.	Anthelmintic; gr. xx.	Volatile oil, santonin, resin.	
Tansy.	Emmenagogue; gr. xl.	Volatile oil, tanaacetin, resin, tannin.	
Taraxacum.	Cholagogue; gr. lx.	Inulin, pectin, taraxacin.	Extract, Fluid Extract.
Oil of Cade.	Parasiticide; externally.	Empyreumatic products.	
Oil of Juniper.	Stimulant; m v.	$\text{C}_{10}\text{H}_{16}$.	Spirit, Compound Spirit of Juniper.
Oil of Tar.	Used externally.	$\text{C}_{10}\text{H}_{16}$.	
Oil of Savine.	Stimulant; m ij.	$\text{C}_{10}\text{H}_{16}$.	
Oil of Turpentine.	Stimulant; m x.	$\text{C}_{10}\text{H}_{16}$.	Liniment, Rectified Oil of Turpentine, Cantharides Cerate.

NATURAL ORDER. Official Name.	Botanical Name.	Synonyme.	Part used, or Description.	Habitat.
Pix Burgundica	Abies excelsa.	Colophony.	Prepared resin.	Europe.
Pix Liquida .	Pinus palustris and others.		Empyreumatic oleoresin.	United States.
Resina	Pinus palustris and others.		Residue (from distil. turp.).	United States.
Sabina	Juniperus S.		Tops.	Europe and N. America.
Terebinthina .	Pinus palustris and others.	Canada Balsam, Balsam of Fir.	Concrete oleoresin.	United States.
Terebinthina Canadensis .	Abies balsamea.		Liquid oleoresin.	North America.
Convolvulaceæ.				
Jalapa	Ipomœa J.		Tuberous root.	Eastern Mexico.
Scammonium .	Convolvulus Scammonia.		Resinous exudation.	Western Asia.
Cruciferae.				
Oleum Sinapis Volatile . .	Sinapis nigra.		Volatile oil.	
Sinapis Alba .	Brassica alba.		Seed.	Asia and Southern Europe.
Sinapis Nigra .	Brassica nigra.		Seed.	Asia and Southern Europe.
Cucurbitaceæ.				
Bryonia . . .	B. alba and B. dioica.	Bryony.	Root.	Central and Southern Europe.
Colocythis . .	Citrullus C.		Fruit.	Southern and Western Asia.
Pepo	Cucurbita P.		Seed.	Asia and America.
Cupuliferae.				
Castanea . . .	C. dentata.	Chestnut.	Leaves.	North America.
Creosotum . .	From Fagus sylvatica.			
Galla	Quercus lusitanica.		Exorescence.	Levant.
Quercus Alba .	Q. alba.		Bark.	North America.
Ericaceæ.				
Chimaphila . .	C. umbellata.	Pipsissewa.	Leaves.	Northern Continents.
Oleum Gaultheriæ	Gaultheria procumbens.	Oil of Wintergreen.	Volatile oil.	
Uva Ursi . . .	Arctostaphylos Uva-ursi.	Bearberry.	Leaves.	Northern Hemisphere.
Euphorbiaceæ.				
Cascarilla . . .	Croton Eluteria.		Bark.	Bahama Islands.
Elastica . . .	Hevea.	Caoutchouc.	Milk-juice.	South America.

English Name.	Medical Properties, Dose.	Constituents.	Official Preparations in heavy type; those into which the Drug enters, in Roman type.
Burgundy Pitch.	Irritant.	Volatile oil, resin.	Plaster, Iron Plaster, Opium Plaster, Cantharidal Pitch Plaster.
Tar.	Irritant; gr. xxx.	Pyroligneous acid, acetone, etc.	Syrup, Ointment.
Resin.	Mild stimulant.	Abietic anhydride.	Cerate, Plaster, Cantharides Cerate.
Savine.	Irritant; gr. v.	Volatile oil, resin, tannin.	Fluid Extract.
Turpentine.	Stimulant; gr. xxx.	Volatile oil, abietic anhydride.	
Canada Turpentine.	Stimulant.	Volatile oil, bitter principle.	Flexible Collodion.
Jalap.	Hydragogue cathartic; gr. xx.	Resin, starch, gum.	Extract, Compound Powder, Resin.
Scammony.	Hydragogue cathartic; gr. x.	Resin, gum.	Resin.
Volatile Oil of Mustard.	Rubefacient; m $\frac{1}{2}$.	Allyl sulphocyanide.	Compound Liniment of Mustard.
White Mustard.	Stimulant; gr. cxx.	Fixed oil, myrosin, sinalbin, mucilage.	
Black Mustard.	Stimulant; gr. cxx.	Fixed oil, myrosin, sinigrin, mucilage.	Mustard Paper.
Bryonia.	Hydragogue cathartic; gr. xx.	Bryonin.	Tincture.
Colocynth.	Purgative; gr. v.	Colocynth resin, pectin, etc.	Extract.
Pumpkin Seed.	Tanifuge; \mathfrak{z} i.	Fixed oil, proteids, starch.	
Castanea.	Tonic, astringent; gr. xxx.	Tannin, etc.	Fluid Extract.
Creosote.			Water.
Nutgall.	Astringent; gr. xv.	Tannin, gallic acid, mucilage, resin.	Tincture, Ointment.
White Oak.	Astringent; gr. xxx.	Tannin, pectin, resin.	
Chimaphila.	Astringent, diuretic; gr. xxx.	Arbutin, ericolin, tannin, chimaphilin.	Fluid Extract.
Oil of Gaultheria.	Flavoring; gr. v.	Methyl salicylate, $\text{CH}_3\text{C}_6\text{H}_4\text{O}_2$.	Spirit, Troches of Morphine and Ipecac, Compound Syrup of Sarsaparilla.
Uva Ursi.	Diuretic, astringent; gr. xxx.	Tannin, arbutin, gallic acid, ericolin.	Extract, Fluid Extract.
Cascarilla.	Tonic; gr. xx.	Volatile oil, cascarillin, resin.	
India Rubber.			Mustard Paper.

NATURAL ORDER. Official Name.	Botanical Name.	Synonyms.	Part used, or Description.	Habitat.
Kamala . . .	Mallotus philippinensis.	Bottlera.	Glands and hairs.	Asia.
Oleum Ricini .	Ricinus communis.		Fixed oil.	India, United States.
Oleum Tiglii .	Oroton Tiglium.		Fixed oil.	India, cult.
Stillingia . . .	S. sylvatica.	Queen's Root.	Root.	Southern United States.
Filices.				
Aspidium . . .	Dryopteris Filix-mas and D. marginalis.	Male Fern.	Rhizome.	Europe and N. America.
Fungi.				
Ergota	Claviceps purpurea, upon Secale cereale.	Ergot of Rye.	Sclerotium.	Europe and United States.
Gentianaceæ.				
Chirata	Swertia C.		Entire plant.	Northern India.
Gentiana . . .	G. lutea.		Root.	C. and S. Europe.
Geraniaceæ.				
Geranium . . .	G. maculatum.	Cranesbill.	Rhizome.	North America.
Gramineæ.				
Amylum	Zea Mays.		Fecula of seed.	Tropics.
Saccharum . . .	S. officinarum.	Cane Sugar.		Europe, North America.
Triticum	Agropyrum repens.	Couch-Grass.	Rhizome.	
Zea	Z. Mays.	Corn Silk.	Styles and stigmas.	
Guttiferæ.				
Cambogia . . .	Garcinia Hanburii.		Gum-resin.	Anam and Siam.
Hamamelaceæ.				
Hamamelis . . .	H. virginiana.	Witchhazel.	Leaves.	North America.
Styrax	Liquidambar orientalis.		Balsam.	Asia Minor.
Hydrophyllaceæ.				
Eriodictyon . .	E. glutinosum.		Leaves.	
Iridææ.				
Crocus	C. sativus.		Stigmas.	Western Asia.
Iris	I. versicolor.	Blue Flag.	Rhizome and roots.	North America.
Juglandaceæ.				
Juglans	J. cinerea.	Butternut.	Bark of root.	North America.
Labiataæ.				
Hedeoma	H. pulegioides.	Pennyroyal.	Leaves and tops.	North America.
Marrubium . . .	M. vulgare.	Horehound.	Leaves and tops.	Europe, nat.

English Name.	Medical Properties, Dose.	Constituents.	Official Preparations in heavy type; those into which the Drug enters, in Roman type.
Kamala.	Tœnifuge; gr. lx.	Resins, rottlerin.	
Castor Oil.	Cathartic; ℥ss.	Ricinolein and palmitin.	Flexible Collodion, Compound Liniment of Mustard, Ointment of Red Mercuric Oxide, Compound Pills of Antimony.
Croton Oil.	Purge; m. i.	Crotonolic acid?	
Stillingia.	Alterative; gr. xx.	Resin, fixed oil, starch.	Fluid Extract.
Aspidium.	Tœnifuge; gr. lx.	Fixed oil, illicic acid, etc.	Oleoresin.
Ergot.	Parturient; gr. x.	Fixed oil, sclerotic acid, scleromucin, sclererythrin.	Fluid Extract, Wine.
Chirata.	Tonic; gr. xx.	Ophelic acid, chiro-ratin.	Fluid Extract, Tincture.
Gentian.	Tonic; gr. xx.	Gentiopiecin, gentisic acid, pectin.	Extract, Fluid Extract, Compound Tincture.
Geranium.	Astringent; gr. xxx.	Tannin, pectin, starch.	Fluid Extract.
Starch.			Glycerite.
Sugar.			Syrup, etc.
Triticum.	Diuretic; gr. c.	Glucose, triticin.	Fluid Extract.
Zea.			
Gamboge.	Hydragogue cathartic; gr. iv.	Gum, resin, cambogic acid.	Compound Cathartic Pills.
Hamamelis.	Astringent, hæmorrhagic; gr. lx.	Tannin, bitter principle.	Fluid Extract.
Storax.	Expectorant; gr. xv.	Styrol, cinnamic acid, storesin.	Compound Tincture of Benzoin.
Eriodictyon.			Fluid Extract.
Saffron.	Diaphoretic; gr. xx.	Volatile oil, proteids, etc.	Tincture.
Iris.	Alterative; gr. xv.	Resin, tannin, gum.	Extract, Fluid Extract.
Juglans.	Cathartic; gr. lx.	Nucin, fixed oil, tannin.	Extract.
Hedeoma.	Stimulant; gr. xxx.	Volatile oil.	
Marrubium.	Expectorant; gr. xxx.	Trace of volatile oil, marrubiin, tannin.	

NATURAL ORDER. Official Name.	Botanical Name.	Synonyms.	Part used, or Description.	Habitat.
Melissa	M. officinalis.	Balm.	Leaves and tops.	Europe, nat.
Mentha Piperita	M. piperita.		Leaves and tops.	Europe and N. America.
Mentha Viridis	M. viridis.		Leaves and tops.	Europe and N. America.
Oleum Hedeoma	Hedeoma pulegioides.	Oil of Pennyroyal.	Volatile oil.	
Oleum Lavandulae Florum	Lavandula officinalis.		Volatile oil.	
Oleum Menthae Piperitae	Mentha piperita.		Volatile oil.	
Oleum Menthae Viridis	Mentha viridis.		Volatile oil.	
Oleum Rosmarini	Rosmarinus officinalis.		Volatile oil.	
Oleum Thymi	Thymus vulgaris.		Volatile oil.	
Salvia	S. officinalis.	Sage.	Leaves.	Southern Europe, cult.
Scutellaria	S. lateriflora.	Scullcap.	Herb.	North America.
Thymol	Thymus vulgaris.		Phenol.	Southern Europe, cult.
Laurineae. Camphora	Cinnamomum C.		Stearopten.	China and Japan.
Cinnamomum Cassia	Cinnamomum.		Bark of the shoots.	Ceylon and China.
Cinnamomum Saigonicum	Cinnamomum.		Bark.	
Cinnamomum Zeylanicum	C. zeylanicum.		Inner bark of shoots.	
Oleum Cinnamomi	Cinnamomum.	Oil of Cassia.	Volatile oil.	
Oleum Sassafras	Sassafras officinalis.		Volatile oil.	
Sassafras	S. variifolium.		Bark of root.	North America.
Sassafras Medulla	S. variifolium.		Pith.	North America.
Leguminosae.				
Acacia	A. Senegal.	Gum Arabic.	Gummy exudation.	Africa.

English Name.	Medical Properties, Dose.	Constituents.	Official Preparations in heavy type; those into which the Drug enters, in Roman type.
Melissa.	Stimulant; gr. xxx.	Volatile oil, tannin, bitter principle.	Spirit.
Peppermint.	Stimulant; gr. xxx.	Volatile oil, trace of tannin.	
Spearmint.	Stimulant; gr. xxx.	Volatile oil, resin.	
Oil of Hede- oma.	Stimulant; m v.		
Oil of Laven- der Flow- ers.	Scent; m iij.	$C_{10}H_{18}$ and com- pound ethers.	Spirit, Compound Tincture of Lav- ender, Aromatic Spirit of Am- monia, Liniment of Soft Soap, Diachylon Ointment.
Oil of Pep- permint.	Stimulant; m iij.	$C_{10}H_{18}O$, $C_{10}H_{20}O$.	Water, Spirit, Troches, Com- pound Pills of Rhubarb, Vege- table Cathartic Pills.
Oil of Spear- mint.	Stimulant; m iij.	$C_{10}H_{18}$, $C_{10}H_{14}O$.	Water, Spirit.
Oil of Rose- mary.	Stimulant; m iij.	$C_{10}H_{18}$ — $C_{10}H_{16}O$, $C_{10}H_{18}O$.	Soap Liniment, Compound Tinc- ture of Lavender.
Oil of Thyme.	Stimulant; m ij.	Cymene, $C_{10}H_{14}$, thymene, $C_{10}H_{16}$, thymol, $C_{10}H_{14}O$.	
Salvia.	Astringent; gr. xx.	Volatile oil, tan- nin, resin.	Fluid Extract.
Scutellaria.	Antispa- smic; gr. lx.	Bitter principle.	
Thymol.	Antiseptic; gr. xxx.	$C_{10}H_{14}O$.	
Camphor.	Stimulant; gr. v-x.	$C_{15}H_{18}O$.	Water, Liniment, Spirit, Soap Liniment, Camphorated Tincture of Opium, Belladonna Liniment, Compound Liniment of Mustard, Compound Powder of Morphine.
Cassia Cin- namon.	Stimulant; gr. xx.	Volatile oil, tan- nin, mannite, sugar.	Compound Tincture of Cardamom, Compound Tincture of Catechu, Compound Tincture of Lavender, Aromatic Tincture of Rhubarb, Wine of Opium.
Saigon Cin- namon.	Stimulant; gr. xx.	Volatile oil, etc.	Tincture, Aromatic Powder.
Ceylon Cin- namon.	Stimulant; gr. xx.	Volatile oil, etc.	
Oil of Cin- namon.	Stimulant; m ij.	Cinnamic alde- hyde, C_9H_8O .	Water, Spirit, Aromatic Sulphuric Acid.
Oil of Sassa- fras.	Stimulant; m v.	Safrene, $C_{15}H_{18}$, sa- frol, $C_{10}H_{10}O_2$.	Troches of Cube, Compound Syrup of Sarsaparilla.
Sassafras.	Stimulant; gr. xl.	Volatile oil, tan- nin, sassafrid.	Compound Decoction of Sarsapa- rilla, Compound Fluid Extract of Sarsaparilla.
Sassafras Pith.	Demulcent.	Mucilage.	Mucilage.
Acacia.	Demulcent.	Gummic acid com- bined with cal- cium, magne- sium, and potas- sium.	Mucilage, Emulsion of Almond, Pills of Ferrous Iodide, Pills of Phosphorus, Compound Chalk Powder, Troches of Chalk, Troches of Cube, Troches of Glycyrrhiza and Opium.

NATURAL ORDER. Official Name.	Botanical Name.	Synonyms.	Part used, or Description.	Habitat.
Catechu } Miso- see.	Acacia C.		Extract from wood.	India.
Cassia Fis- tula . . .	C. Fistula.	Purging Cas- sia.	Fruit.	Eastern India.
Senna . . .	Cassia acutifolia and C. angusti- folia.		Leaflets.	Eastern and Central Africa.
Tamarindus	T. indica.		Preserved pulp of fruit.	India, West In- dies.
Balsamum Peruvi- anum . .	Toluidera Pereira		Balsam.	Central Amer- ica.
Balsamum Tolu- tanum . .	Toluidera Balsa- mum.		Balsam.	Venezuela.
Chrysaro- binum . .	Andira Araroba.		Principle from Goa powder.	Brazil.
Copaiba . .	C. Langsdorffii.	Balsam of Copaiba.	Oleoresin.	South America.
Glycyrrhiza	G. glabra.	Liquorice Root.	Root.	Europe.
Hematoxy- lon . . .	H. campechi- anum.	Logwood.	Heart-wood.	Central Amer- ica.
Kino . . .	Pterocarpus Mar- supium.		Inspissated juice.	East Indies.
Oleum Co- paiba . .	Copaifera Langa- dorffii.		Volatile oil.	
Physo- stigma . .	P. venenosum.	Calabar Bean.	Seed.	Western Africa.
Resina Co- paiba . .	Copaifera Langa- dorffii.		Residue.	
Santalum Rubrum .	Pterocarpus san- talinus.		Wood.	Madras, cult.
Scoparius .	Cytisus S.	Broom.	Tops.	Asia and Eu- rope.
Tragacantha	Astragalus gum- mifer and others.		Gummy exu- dation.	Western Asia.
Lichenes. Cetraria . . .	C. islandica.	Iceland Moss.	Whole plant.	Northern Hemi- sphere.

English Name.	Medical Properties, Dose.	Constituents.	Official Preparations in heavy type; those into which the Drug enters, in Roman type.
Catechu.	Astringent; gr. xx.	Catechutannic acid, catechin.	Troches, Compound Tincture.
Cassia Fistula.	Laxative; gr. lx.	Sugar, pectin.	Confection of Senna.
Senna.	Cathartic; gr. lx.	Chrysophanic acid, phæoretin, cathartic acid, sennacrol, sennapicrin.	Fluid Extract, Confection, Compound Infusion, Syrup, Compound Powder of Glycyrrhiza.
Tamarind.	Laxative; gr. lx.	Tartaric, citric, malic, and acetic acids.	Confection of Senna.
Balsam of Peru.	Expectorant; η xxx.	Cinnamein, resin, cinnamic and benzoic acids.	
Balsam of Tolu.	Expectorant; gr. xx.	Resins, cinnamic and benzoic acids.	Syrup, Tincture, Pills of Ferrous Iodide, Pills of Phosphorus, Compound Tincture of Benzoin, Ointment.
Chrysarobin.	Irritant; gr. xx.		
Copaiba.	Stimulant; η xxx.	Volatile oil, resins, copaivic acid.	Mass.
Glycyrrhiza.	Expectorant; gr. lx.	Glycyrrhizin, asparagin, resin, sugar.	Fluid Extract, Pure Extract, Ammoniated Glycyrrhizin, Compound Powder, Compound Decoction of Sarsaparilla, Compound Fluid Extract of Sarsaparilla, Mass of Mercury; Pills of Ferrous Iodide, Compound Powder of Morphine, Compound Syrup of Sarsaparilla, Sweet Tincture of Rhubarb, Tincture of Aloes, Tincture of Aloes and Myrrh.
Hæmatorylon.	Astringent; gr. xl.	Hæmatorylin, tannin, resin.	Extract.
Kino.	Astringent; gr. xx.	Kinotannic acid, pyrocatechin.	Tincture.
Oil of Copaiba.	Stimulant; η x.	$C_{15}H_{24}$.	
Physostigma.	Sedative; gr. iij.	Eserine, starch, proteids.	Extract, Tincture.
Resin of Copaiba.	Stimulant; gr. x.	Copaivic acid.	
Red Saunders.	Coloring; gr. lx.	Santalal acid, santal.	Compound Tincture of Lavender.
Scoparius.	Diuretic; gr. x.	Volatile oil, scoparin, sparteine.	Fluid Extract.
Tragacanth.	Demulcent.	Tragacanthin, starch.	Mucilage, Pills of Ferrous Carbonate, Troches of Tannic Acid, Troches of Ammonium Chloride, Troches of Catechu, Troches of Ipecac, Troches of Krameria, Troches of Potassium Chlorate, Troches of Santonin, Troches of Ginger, Emulsion of Chloroform.
Cetraria.	Demulcent; gr. xl.	Lichenin, cetraric acid.	Decoction.

NATURAL ORDER. Official Name.	Botanical Name.	Synonyms.	Part used, or Description.	Habitat.
Liliaceæ.				
Allium	A. sativum.		Bulb.	Europe, cult.
Aloe Barbaden- sis	A. vera.	Curaçao Aloes.	Inspissated juice.	Africa.
Aloe Socotrina	A. Perryi.		Inspissated juice.	
Colchici Radix	C. autumnale.		Corm.	Europe.
Colchici Semen	C. autumnale.		Seed.	Europe.
Convallaria . .	C. majalis.		Rhizome and roots.	Europe.
Sarsaparilla . .	Smilax officinalis, Smilax medica, Smilax papy- racea.		Root.	Tropical Amer- ica.
Scilla	Urginea mariti- ma.		Sliced bulb.	Mediterranean basin.
Veratrum Vi- ride	V. viride.	American Hellebore.	Rhizome and roots.	North America.
Linææ.				
Coca	Erythroxylon C.	Erythroxy- lon.	Leaves.	South America.
Linum	L. usitatissimum.	Flaxseed.	Seed.	Southern Eu- rope, cult.
Oleum Lini . .	L. usitatissimum.	Oil of Flax- seed.	Fixed oil.	Southern Eu- rope, cult.
Lobeliaceæ.				
Lobelia	L. inflata.		Leaves and tops.	North America.
Loganiaceæ.				
Gelsemium . .	G. sempervirens.	Yellow Jas- mina.	Rhizome and roots.	Southern United States.
Nux Vomica . .	Strychnos Nux- vomica.		Seed.	India.
Spigelia	S. marilandica.	Pinkroot.	Rhizome and roots.	United States.
Lycopodiaceæ.				
Lycopodium . .	L. clavatum and others.		Spores.	Europe and N. America.
Magnoliaceæ.				
Illicium	I. verum.	Star-Anise.	Fruit.	Southwestern China.
Oleum Anisi . .	(See Pimpinella Anisum) Illi- cium verum.		Volatile oil.	
Malvaceæ.				
Althæa	A. officinalis.	Marshmal- low.	Root.	Europe, nat.
Gossypii Radix Cortex	G. herbaceum and others.		Bark of root.	Asia, Africa, cult.
Gossypium Pu- rificatum . . .	G. herbaceum and others.		Hairs of seed.	Tropics.
Oleum Gossypii Seminis	G. herbaceum and others.		Fixed oil.	

English Name.	Medical Properties, Dose.	Constituents.	Official Preparations in heavy type; those into which the Drug enters, in Roman type.
Garlic.	Stimulant; gr. lx.	Mucilage, volatile oil.	Syrup.
Barbadoes Aloes.	Laxative; gr. xv.	Aloin, resin.	
Socotrine Aloes.	Laxative; gr. xv.	Aloin, resin, little volatile oil.	Purified Aloes, Extract.
Colchicum Root.	Sedative, emetic; gr. v.	Colchicine, starch, resin.	Extract, Fluid Extract, Wine.
Colchicum Seed.	Sedative; gr. v.	Colchicine, fixed oil.	Fluid Extract, Tincture, Wine.
Convallaria.	Cardiac sedative; gr. v-x.	Convallamarin, convallarin.	Fluid Extract.
Sarsaparilla.	Akterative; gr. xxx.	Parillin, resin.	Fluid Extract, Compound Fluid Extract, Compound Decoction.
Squill.	Expectorant.	Scillipicrin, scillitoxin, scillin, sinistrin.	Vinegar, Fluid Extract, Tincture.
Veratrum Viride.	Cardiac sedative; gr. ij.	Jervine, veratrodine, resin.	Fluid Extract, Tincture.
Coca.	Stimulant; gr. xxx.	Cocaine.	Fluid Extract.
Linseed.	Demulcent; gr. lx.	Fixed oil, mucilage.	
Linseed Oil.	Cathartic; f3i.	Linolein, palmitin, myristin.	Lime Liniment, Soft Soap.
Lobelia.	Emetic; gr. x.	Lobeline.	Fluid Extract, Tincture.
Gelsemium.	Antispasmodic; gr. iij.	Volatile oil, gelsemine.	Fluid Extract, Tincture.
Nux Vomica.	Tonic; gr. ij.	Strychnine, brucine, proteids.	Extract, Fluid Extract, Tincture.
Spigelia.	Anthelminthic; gr. lx.	Volatile oil, bitter principle.	Fluid Extract.
Lycopodium.	Used externally.	Fixed oil.	
Illicium.	Stimulant; gr. xx.	Volatile oil, resin, fat.	
Oil of Anise.	Stimulant; m ij.	C ₁₀ H ₁₆ , and anethol, C ₁₀ H ₁₂ O.	Water, Spirit, Camphorated Tincture of Opium, Troches of Glycyrrhiza and Opium, Elixir of Phosphorus, Compound Spirit of Orange, Compound Syrup of Sarsaparilla.
Althsea.	Demulcent; gr. lx.	Asparagin, starch.	Syrup, Mass of Mercury, Pills of Ferrous Carbonate, Pills of Phosphorus.
Cotton Root Bark.	Emmenagogue; gr. lx.	Yellow resin, fixed oil, etc.	Fluid Extract.
Purified Cotton.		Cellulose, fixed oil.	Pyroxylin.
Cotton Seed Oil.	Demulcent; f3ss.	Olein, palmitin.	Ammonia Liniment, Camphor Liniment.

NATURAL ORDER. Official Name.	Botanical Name.	Synonyme.	Part used, or Description.	Habitat.
Menispermaceæ.				
Calumba . . .	Jateorhiza palmata.	Columbo.	Root.	Eastern Africa.
Menispermum .	M. canadense.	Yellow Parilla, Canadian Moonseed.	Rhizome and roots.	North America.
Pareira	Chondodendron tomentosum.	Pareira Brava.	Root.	Brazil.
Myristicaceæ.				
Macis	Myristica fragrans.		Arillode of seed.	Molucca Islands.
Myristica . . .	M. fragrans.		Seed.	Molucca Islands.
Oleum Myristicæ	Myristica fragrans.		Volatile oil.	
Myrtaceæ.				
Caryophyllus .	Eugenia aromatica.		Unexpanded flowers.	Molucca Islands.
Eucalyptus . .	E. globulus.		Leaves.	Australia.
Oleum Cajuputi	Melaleuca Leucadendron.		Volatile oil.	East Indian Islands.
Oleum Caryophylli	Eugenia aromatica.		Volatile oil.	
Oleum Eucalypti	Eucalyptus globulus, E. oleosa, and others.		Volatile oil.	
Oleum Myrciæ	Myrcia acris.	Oil of Bay.	Volatile oil.	
Oleum Pimentæ	Pimenta officinalis.	Oil of Allspice.	Volatile oil.	
Pimenta . . .	P. officinalis.	Allspice.	Nearly ripe fruit.	Tropical America.
Oleaceæ.				
Manna	Fraxinus Ornus.		Conc. sacch. exudation.	Mediterranean basin.
Oleum Olivæ .	Olea europæa.		Fixed oil.	Southern Europe.
Orchidæ.				
Cypripedium .	C. pubescens and C. parviflorum.	Ladies' Slipper.	Rhizome and root.	North America.
Vanilla	V. planifolia.		Fruit.	Eastern Mexico.
Papaveraceæ.				
Chelidonium .	C. majus.	Celandine.	Whole plant.	Europe, North America.
Opil Pulvis . .			Powder.	

English Name.	Medical Properties, Dose.	Constituents.	Official Preparations in heavy type; those into which the drug enters, in Roman type.
Calumba.	Tonic; gr. xx.	Columbin, berberine.	Fluid Extract, Tincture.
Menispermum.	Alterative; gr. xxx.	Berberine, menis-pine.	Fluid Extract.
Parcira.	Diuretic; gr. xl.	Pelosine.	Fluid Extract.
Mace.	Stimulant; gr. xv.	Volatile oil, resin.	
Nutmeg.	Stimulant; gr. xv.	Volatile oil, fixed oil, proteids.	Vinegar of Opium, Aromatic Powder, Compound Tincture of Lavender, Aromatic Tincture of Rhubarb, Troches of Sodium Bicarbonate.
Oil of Nutmeg.	Stimulant; ℥ ij.	Myristicine, $C_{10}H_{18}$, and myristicol, $C_{10}H_{14}O$.	Spirit, Aromatic Spirit of Ammonia.
Cloves.	Stimulant; gr. x.	Volatile oil, tannin, resin.	Compound Tincture of Lavender, Aromatic Tincture of Rhubarb, Wine of Opium.
Eucalyptus.	Febrifuge; gr. xx.	Volatile oil, tannin, resin.	Fluid Extract.
Oil of Cajuput.	Diaphoretic; ℥ v.	Cajuputol, $C_{10}H_{18}O$.	
Oil of Cloves.	Stimulant; ℥ iv.	$C_{10}H_{18}$, and eugenol, $C_{10}H_{12}O_2$.	
Oil of Eucalyptus.	Febrifuge; ℥ x.	$C_{10}H_{14}$, $C_{10}H_{16}$, $C_{10}H_{18}O$.	
Oil of Myrcia.	Stimulant.	$C_{10}H_{16}$ and $C_{10}H_{12}O_2$.	Spirit.
Oil of Pimenta.	Stimulant; ℥ iv.	$C_{10}H_{16}$ and $C_{10}H_{12}O_2$.	Spirit of Myrcia.
Pimenta.	Stimulant; gr. xx.	Volatile oil, tannin, resin.	
Manna.	Laxative; ℥ i.	Mannite, fraxin, resin, glucose.	Compound Infusion of Senna.
Olive Oil.	Laxative; ℥ i.	Olein, palmitin, arachin, stearin.	Spermaceti Cerate, Lead Plaster, Diachylon Ointment, Iron Plaster, Burgundy Pitch Plaster, Veratrine Ointment.
Cypripedium.	Diaphoretic; gr. xv.	Volatile oil, tannin, resins.	Fluid Extract.
Vanilla.	Stimulant; gr. xx.	Vanillin, fixed oil, resin, sugar.	Tincture, Troches of Iron.
Chelidonium.	Diuretic; gr. xl.	Chelidonine, chele-rythrine.	
Powdered Opium.	Narcotic; gr. i.	Morphine, narcotine, codeine, etc.	Vinegar, Extract, Pills, Tincture, Wine, Camphorated Tincture, Powder of Ipecac and Opium, Troches of Glycyrrhiza and Opium, Deodorized Opium, Tincture of Deodorized Opium.

NATURAL ORDER. Official Name.	Botanical Name.	Synonyms.	Part used, or Description.	Habitat.
Opium	<i>Papaver somniferum</i> .		Concrete milky exud.	Western Asia, cult.
Sanguinaria . .	<i>S. canadensis</i> .	Bloodroot.	Rhizome.	North America.
Pedaliaceæ.				
Oleum Sesami .	<i>Sesamum indicum</i> .	Sesame Oil, Teel Oil, Benne Oil.	Fixed oil.	India.
Phytolaccaceæ.				
Phytolaccæ . .	<i>P. decandra</i> .	Poke Berry.	Fruit.	North America.
Fructus				
Phytolaccæ . .	<i>P. decandra</i> .	Poke Root.	Root.	North America.
Radix				
Piperaceæ.				
Cubeba	<i>Piper C.</i>		Unripe fruit.	Java, cult.
Matico	<i>Piper angustifolium</i> .		Leaves.	Tropical America.
Oleum Cubebæ .	<i>Piper Cubeba</i> .		Volatile oil.	
Piper	<i>P. nigrum</i> .	Black Pepper.	Unripe fruit.	India, cult.
Polygalæ.				
Krameria . . .	<i>K. triandra</i> and <i>Ixina</i> .		Root.	South America.
Senega	<i>Polygala S.</i>		Root.	United States.
Polygonaceæ.				
Rheum	<i>R. officinale</i> .		Root.	Western and Central China.
Rumex	<i>R. crispus</i> and others.	Yellow Dock.	Root.	Europe, nat.
Ranunculaceæ.				
Aconitum . . .	<i>A. Napellus</i> .		Tuber.	Europe, Asia.
Cimicifuga . .	<i>C. racemosa</i> .	Black Snake-root.	Rhizome and roots.	North America.
Hydrastis . . .	<i>H. canadensis</i> .	Golden Seal.	Rhizome and roots.	North America.
Pulsatilla . . .	<i>Anemone P., A. pratensis</i> .		Herb.	Europe.
Staphisagria .	<i>Delphinium S.</i>	Stavesacre.	Seed.	Europe.
Rhamnaceæ.				
Frangula . . .	<i>Rhamnus F.</i>	Buckthorn.	Bark.	Western Asia, cult.
Rhamnus Purshiana .	<i>Rhamnus Purshiana</i> .		Bark.	Western Asia, cult.
Rosaceæ.				
Amygdala . . .	<i>Prunus Amygdalus</i> , var. <i>amara</i> .		Seed.	Western Asia, cult.
Amara				
Amygdala Dulcis	<i>Prunus Amygdalus</i> , var. <i>dulcis</i> .		Seed.	Western Asia, cult.

English Name.	Medical Properties, Dose.	Constituents.	Official Preparations in heavy type; those into which the Drug enters, in Roman type.
Opium.	Narcotic; gr. i.	Morphine, narco- tine, codeine.	Powder.
Sanguinaria.	Alterative; gr. x.	Sanguinarine, resins, starch.	Fluid Extract, Tincture.
Oil of Sesamum.	Demulcent; fʒi.	Olein, myristin, palmitin, stearin.	
Phytolacca Fruit.	Laxative; gr. xx.	Sugar, gum.	
Phytolacca Root.	Alterative; gr. xx.	Resin, tanrin.	Fluid Extract.
Cubeb.	Stimulant; gr. xx.	Volatile oil, resin, cubebin.	Fluid Extract, Oleoresin, Tincture.
Matico.	Stimulant; gr. lx.	Volatile oil, artan- thic acid.	Fluid Extract, Tincture.
Oil of Cubeb.	Stimulant; m. x.	$C_{10}H_{18} - C_{15}H_{24}$.	
Pepper.	Stimulant; gr. x.	Volatile oil, resin, piperine, fat.	Oleoresin.
Krameria.	Astringent; gr. xx.	Kramero-tannic acid, rhatanic red.	Extract, Fluid Extract, Tincture.
Senega.	Expecto- rant; gr. xv.	Polygalic acid, pec- tin, fixed oil.	Fluid Extract.
Rhubarb.	Purgative, astringent; gr. x.	Chrysophan, ery- threoretin, emod- in, phæoretin, tannin.	Extract, Fluid Extract, Pills, Compound Pills, Compound Powder, Tincture, Aromatic Tincture, Sweet Tincture.
Bumex.	Alterative; gr. lx.	Tannin, chryso- phanic acid.	Fluid Extract.
Aconite.	Sedative; gr. i.	Resin, aconitic acid, aconitine.	Extract, Fluid Extract, Tincture.
Cimicifuga.	Alterative; gr. xxx.	Crystalline prin- ciple, resin, tan- nin.	Extract, Fluid Extract, Tincture.
Hydrastis.	Alterative, tonic; gr. xl.	Berberine, hydras- tine, xanthopu- cine.	Fluid Extract, Tincture, Glycer- ite.
Pulsatilla.	Irritant, diaphoretic; gr. iv.	Oily substance, anemonic acid.	
Staphisagria.	Used exter- nally.	Delphinine, fixed oil.	
Frangula.	Laxative; gr. xx.	Frangulin, tannin, emodin.	Fluid Extract.
Rhamnus Purshiana.	Laxative; gr. xx.	Purgative resins, chrysophanic acid.	Fluid Extract.
Bitter Almond.	Demulcent.	Fixed oil, proteids, amygdalin.	Syrup.
Sweet Almond.	Demulcent.	Fixed oil, proteids.	Emulsion, Syrup.

NATURAL ORDER. Official Name.	Botanical Name.	Synonyms.	Part used, or Description.	Habitat.
Oleum Amygdalæ Amaræ	Prunus Amygdalus, var. amara.		Volatile oil.	
Oleum Amygdalæ Expressum	Prunus Amygdalus, var. dulcis, Prunus A., var. amara.		Fixed oil.	
Prunum . . .	Prunus domestica.		Fruit.	Western Asia, cult.
Prunus Virginiana . . .	P. serotina.		Bark.	North America.
Rubus . . .	R. canadensis, R. villosus, R. trivialis.	Blackberry.	Bark of root.	North America.
Rubus Idæus . . .	R. idæus.		Fruit.	Europe and Asia, cult.
Cusso . . .	Hagenia abyssinica.		Female inflorescence.	Abyssinia.
Oleum Rosæ	Rosa damascena.		Volatile oil.	Roumelia.
Quillaja . .	Q. Saponaria.	Soap Bark.	Bark.	Chili and Peru.
Rosa Centifolia . .	R. centifolia.		Petals.	Western Asia, cult.
Rosa Gallica	R. gallica.		Petals.	Southern Europe, cult.
Rubiaceæ.				
Cinchona . . .	Cinchonas with 5 per cent. of alkaloids.		Bark.	South America.
Cinchona Rubra . .	C. succiruba.		Bark.	South America.
Ipecacuanha . .	Cephaelis I.		Root.	Brazil.
Rutaceæ.				
Aurantii Amari Cortex . . .	Citrus vulgaris.		Rind of fruit.	Northern India, and cult.
Aurantii Dulcis Cortex . . .	Citrus Aurantium.		Rind of fresh fruit.	Northern India, and cult.
Oleum Aurantii Cortex . . .	Citrus vulgaris, C. Aurantium.		Volatile oil.	
Oleum Aurantii Florum . .	Citrus vulgaris.	Oil of Neroli.	Volatile oil.	
Limonis Cortex	Citrus Limonum.		Rind of recent fruit.	Northern India, and cult.
Limonis Succus	Citrus Limonum.		Juice.	Northern India, and cult.
Oleum Bergamottæ . . .	Citrus Bergamia.	Oleum Bergamii.	Volatile oil.	
Oleum Limonis	Citrus Limonum.		Volatile oil.	
Buchu	Barosma betulina and B. crenulata.		Leaves.	Southern Africa.
Pilocarpus . .	P. Selloanus and P. Jaborandi.	Jaborandi.	Leaflets.	Brazil.
Xanthoxylum .	X. americanum and X. Clavaherculis.	Prickly Ash.	Bark.	North America.

English Name.	Medical Properties, Dose.	Constituents.	Official Preparations in heavy type; those into which the Drug enters, in Roman type.
Oil of Bitter Almond. Expressed Oil of Almond.	Sedative ; m i. Laxative.	Benzaldehyde, C_7H_6O . Olein, palmitin.	Water, Spirit. Ointment of Rose Water, Phosphorated Oil, Emulsion of Chloroform.
Prune.	Laxative.	Sugar, pectin, malic acid.	Confection of Senna.
Wild Cherry. Rubus.	Sedative ; gr. xl. Astringent ; gr. xx.	Tannin, amygdalin, emulsin. Tannin.	Fluid Extract, Infusion, Syrup. Fluid Extract.
Raspberry.	Refrigerant.	Volatile oil, pectin, glucose.	Syrup.
Koussou.	Anthelmintic ; gr. lx.	Tannin, acrid resin, koesin.	Fluid Extract.
Oil of Rose.	Scent.	Elæopten, stearopten.	
Quillaja.	Irritant ; gr. xv.	Saponin.	Tincture.
Pale Rose.	Astringent ; gr. x.	Volatile oil, tannin.	
Red Rose.	Tonic ; gr. xx.	Volatile oil, quercitrin.	Fluid Extract, Confection, Pills of Alocs and Mastic.
Cinchona.	Tonic ; gr. xx.	Quinine, quinidine, cinchonine, cinchonidine, etc.	Extract, Fluid Extract, Infusion, Tincture.
Red Cinchona.	Tonic, antiperiodic ; gr. xx.	Vide Cinchona.	Compound Tincture of Cinchona.
Ipecac.	Expectorant ; gr. v.	Emetine, ipecacuanhic acid, pectin.	Fluid Extract, Troches, Powder of Ipecac and Opium, Troches of Morphine and Ipecac.
Bitter Orange Peel.	Stimulant, tonic ; gr. xl.	Volatile oil, hesperidin, etc.	Fluid Extract, Tincture.
Sweet Orange Peel.	Stimulant.	Volatile oil, hesperidin, etc.	Syrup, Tincture.
Oil of Orange Peel.	Flavoring.	$C_{10}H_{16}$.	Spirit, Compound Spirit, Spirit of Myrcia.
Oil of Orange Flowers.	Flavoring.	$C_{10}H_{16}$.	
Lemon Peel.	Flavoring.	Volatile oil, hesperidin.	Spirit.
Lemon Juice.	Refrigerant.	Citric acid, water, etc.	
Oil of Bergamot.			
Oil of Lemon.			Spirit, Compound Spirit.
Buchu.	Diuretic ; gr. xx.	Volatile oil, diosphenol, resin, mucilage, rutin.	Fluid Extract.
Pilocarpus.	Sialagogue ; gr. xx.	Volatile oil, pilocarpine.	Fluid Extract.
Xanthoxylum.	Alterative ; gr. xv.	Acrid green oil, resin.	Fluid Extract.

NATURAL ORDER. Official Name.	Botanical Name.	Synonyms.	Part used, or Description.	Habitat.
Santalaceæ. Oleum Santali .	Santalum album.	Oil of Sandal Wood.	Volatile oil.	
Sapindaceæ. Guarana . . .	Paullinia Cu- pana and P. sorbilla.		Dried paste from seeds.	Northern and Western Bra- zil.
Scitamineæ. Cardamomum .	Elettaria repens.		Fruit.	Malabar, cult.
 Zingiber . . .	Z. officinale.		Rhizome.	West Indies, India.
Scrophularinæ. Digitalis . . .	D. purpurea.	Foxglove.	Leaves.	Europe.
 Leptandra . .	Veronica virgi- nica.	Culver's Root.	Rhizome and root.	North America.
Simarubæ. Quassia	Picræna excelsa.		Wood.	Jamaica.
Solanaceæ. Belladonnæ Fo- lia	Atropa B.		Leaves.	Central and Southern Eu- rope.
 Belladonnæ Ra- dix	Atropa B.		Root.	Central and Southern Eu- rope.
 Capsicum . . .	C. fastigiatum.	Cayenne Pep- per, African Pepper.	Fruit.	Tropical Amer- ica.
 Dulcamara . .	Solanum D.	Bitter-sweet.	Young branches.	Europe, nat.
 Hyoscyamus .	H. niger.	Henbane.	Leaves and flowering tops.	Europe and Asia.
 Stramonii Folia	Datura Stramo- nium.		Leaves.	Asia, nat.
 Stramonii Se- men	Datura Stramo- nium.		Seeds.	Asia, nat.
 Tabacum . . .	Nicotiana T.		Commercial dried leaves.	America.
Sterculiaceæ. Oleum Theo- bromatis . .	Theobroma Ca- cao.	Butter of Cacao.	Fixed oil.	South America.
Styracæ. Benzoinum . .	Styrax Benzoin.		Balsamic resin.	Sumatra.
Thymelacæ. Mezereum . .	Daphne M., and others.		Bark.	Europe.
Umbelliferae. Conium } } Subord. } Can- } phyto- } sperma-	C. maculatum.	Hemlock.	Full-grown fruit.	Europe, nat.

English Name.	Medical Properties, Dose.	Constituents.	Official Preparations in heavy type; those into which the Drug enters, in Roman type.
Oil of Santal.	Stimulant; m. x.	$C_{15}H_{24}O - C_{15}H_{22}O$.	
Guarana.	Stimulant; gr. lx.	Caffeine, saponin.	Fluid Extract.
Cardamom.	Stimulant; gr. x.	Volatile oil, fixed oil.	Aromatic Powder, Tincture, Compound Tincture, Sweet Tincture of Rhubarb, Tincture of Rhubarb, Compound Tincture of Gentian, Compound Extract of Colocynth.
Ginger.	Stimulant; gr. xv.	Volatile oil, gingerol, resin.	Fluid Extract, Oleoresin, Aromatic Powder, Tincture, Compound Powder of Rhubarb.
Digitalis.	Cardiac stimulant; gr. ij.	Digitalin, resin, pectin.	Extract, Fluid Extract, Infusion, Tincture.
Leptandra.	Alterative; gr. xxx.	Leptandrin, resin, saponin, tannin.	Extract, Fluid Extract.
Quassia.	Tonic; gr. xx.	Mucilage, resin, quassin.	Extract, Fluid Extract, Tincture.
Belladonna Leaves.	Sedative; gr. ij.	Atropine, hyoscyamine, belladonnine.	Alcoholic Extract, Tincture.
Belladonna Root.	Sedative; gr. i.	Atropine, hyoscyamine, belladonnine.	Fluid Extract.
Capsicum.	Stimulant; gr. v.	Capsaicin, fixed oil.	Fluid Extract, Oleoresin, Tincture.
Dulcamara.	Alterative; gr. xxx.	Resin, dulcamarin.	Fluid Extract.
Hyoscyamus.	Narcotic; gr. v.	Hyoscyamine, hyoscine.	Extract, Fluid Extract, Tincture.
Stramonium Leaves.	Narcotic; gr. iij.	Daturine, mucilage.	
Stramonium Seeds.	Narcotic; gr. ij.	Daturine, fixed oil.	Extract, Fluid Extract, Tincture.
Tobacco.	Emetic; gr. v.	Nicotine, resin, gum.	
Oil of Theobroma.	Emollient.	Stearin, palmitin, olein.	Suppositories.
Benzoin.	Stimulant; gr. xxx.	Benzoic acid, cinnamic acid.	Benzoinated Lard, Tincture, Compound Tincture.
Mezereum.	Sialagogue, stimulant; gr. v.	Soft acrid resin, daphnin.	Fluid Extract, Compound Decoction of Sarsaparilla, Compound Fluid Extract of Sarsaparilla.
Conium.	Sedative; gr. v.	Fixed oil, conifine.	Extract, Fluid Extract.

NATURAL ORDER. Official Name.	Botanical Name.	Synonyms.	Part used, or Description.	Habitat.
Coriandrum . . .	C. sativum.		Fruit.	Europe, cult.
Oleum Coriandri . . .	Coriandrum sativum.		Volatile oil.	
Ammoniacum . . .	Dorema A.		Gum-resin.	Eastern Persia.
Anisum . . .	Pimpinella A. (see Illicium verum).		Fruit.	Asia, cult.
Asafoetida . . .	Ferula foetida.		Gum-resin.	Persia.
Carum . . .	C. Carvi.		Fruit.	Central and W. Asia, cult.
Feniculum . . .	F. capillaceum.		Fruit.	Southern Europe, cult.
Oleum Anisi . . .	Pimpinella Anisum.		Volatile oil.	
Oleum Cari . . .	Carum Carvi.		Volatile oil.	
Oleum Feniculi . . .	Feniculum capillaceum.		Volatile oil.	
Sumbul . . .	Ferula S.		Root.	Asia.
Urticaceæ.				
Ficus . . .	F. Carica.		Fleshy receptacle.	Western Asia, cult.
Cannabis Indica . . .	C. sativa.	Indian Hemp.	Flowering tops of female plant.	Asia.
Humulus . . .	H. Lupulus.		Strobiles.	Europe and Asia.
Lupulinum . . .	H. Lupulus.		Glandular powder from strobiles.	Europe and Asia.
Ulmus . . .	U. fulva.	Slippery Elm.	Inner bark.	North America.
Valerianaceæ.				
Valeriana . . .	V. officinalis.		Rhizome and root.	Europe, nat.
Vitaceæ.				
Vinum Album . . .	Vitis vinifera.		Fermented juice of grapes.	
Vinum Rubrum . . .	Vitis vinifera.		Fermented juice of grapes.	
Zygophylleæ.				
Guaiaci Lignum	G. officinale and G. sanctum.		Heart-wood.	West Indies and South America.
Guaiaci Resina . . .	G. officinale.		Resin of wood.	West Indies and South America.

English Name.	Medical Properties, Dose.	Constituents.	Official Preparations in heavy type; those into which the Drug enters, in Roman type.
Coriander.	Stimulant; gr. xx.	Volatile oil, fat, mucilage.	
Oil of Coriander.	Stimulant; m iij.	$\text{C}_{10}\text{H}_{16}\text{O}$.	Syrup of Senna, Compound Spirit of Orange, Confection of Senna.
Ammoniac.	Stimulant; gr. xv.	Volatile oil, resin, gum.	Emulsion, Ammoniac Plaster with Mercury.
Anise.	Stimulant; gr. xx.	Volatile oil, fixed oil, sugar.	Sweet Tincture of Rhubarb.
Asafetida.	Nervine; gr. x.	Volatile oil, gum-resin.	Emulsion, Pills, Tincture, Pills of Aloes and Asafetida.
Caraway.	Stimulant; gr. xx.	Volatile oil, resin, little tannin.	Compound Tincture of Cardamom.
Fennel.	Stimulant; gr. xx.	Volatile and fixed oil, sugar.	Compound Infusion of Senna.
Oil of Anise.	Stimulant; m iij.	$\text{C}_{10}\text{H}_{16}$, and anethol, $\text{C}_{10}\text{H}_{12}\text{O}$.	Water, Spirit, Compound Spirit of Orange, Camphorated Tincture of Opium, Troches of Glycyrrhiza and Opium, Elixir of Phosphorus, Compound Syrup of Sarsaparilla.
Oil of Caraway.	Stimulant; m v.	Carvine, $\text{C}_{10}\text{H}_{16}$, and carvol, $\text{C}_{10}\text{H}_{14}\text{O}$.	Compound Spirit of Juniper.
Oil of Fennel.	Stimulant; gr. x.	$\text{C}_{10}\text{H}_{16}$, and anethol, $\text{C}_{10}\text{H}_{12}\text{O}$.	Water, Compound Spirit of Juniper, Compound Powder of Glycyrrhiza.
Sumbul.	Stimulant; gr. x.	Volatile oil, resin, valerianic acid.	Tincture.
Fig.	Laxative.	Cellular tissue, sugar, gum, fat, etc.	Confection of Senna.
Indian Cannabis.	Nervine; gr. v.	Resin, cannabinine.	Extract, Fluid Extract, Tincture.
Hops.	Tonic; gr. xl.	Volatile oil, resin, tannin.	Tincture.
Lupulin.	Tonic; gr. v.	Volatile oil, lupuline, resin.	Fluid Extract, Oleoresin.
Elm.	Demulcent.	Mucilage.	Mucilage.
Valerian.	Nervine; gr. xxx.	Valerianic, formic, and acetic acids.	Fluid Extract, Tincture, Ammoniated Tincture.
White Wine.	Stimulant.	Alcohol, bouquet, etc.	Vina.
Red Wine.	Stimulant.	Alcohol, bouquet, etc.	Vina.
Guaiacum Wood.	Anti-rheumatic, diaphoretic; gr. lx.	Resin, extractive.	Compound Decoction of Sarsaparilla.
Guaiac.	Anti-rheumatic, gr. xv.	Guaiacic acid, Guaiac yellow.	Tincture, Ammoniated Tincture, Compound Pills of Antimony.

CHAPTER LXI.

PRODUCTS FROM ANIMAL SUBSTANCES.

THE animal products of pharmaceutical interest are not numerous, but some of them are very important. Their chemical composition is not very well understood.

Protein compounds are universally found in animal and vegetable substances,—indeed, are essential to all living organisms. In their chemical composition nitrogen is always a constituent, together with carbon, hydrogen, and oxygen, and often a small quantity of sulphur. Very little is definitely known of the exact composition of the protein compounds: they are usually colloids and uncrystallizable, varying in their solubilities in aqueous liquids; they are generally coagulated by heat, and on exposure to air, heat, and moisture they decompose, undergoing *putrefaction*. If warmed to 70° C. (158° F.) in contact with *Millon's reagent*, they yield a purple-red color: this reagent is made by dissolving ten grammes of mercury in twenty grammes of nitric acid (sp. gr. 1.42), diluting the solution with an equal volume of water, and decanting after allowing it to stand twenty-four hours.

The animal products of interest in pharmacy are grouped according to the *class* to which they belong, as follows: 1. *Mammalia*. 2. *Pisces*. 3. *Aves*. 4. *Insecta*. 5. *Reptilia*. 6. *Annelida*. There are no official products from the last two classes.

Official Products derived from the Class *Mammalia*.

ADEPS. U. S. Lard.

The prepared internal fat of the abdomen of *Sus Scrofa* Linné (class *Mammalia*; order *Pachydermata*), purified by washing with water, melting, and straining. Lard should be kept in well-closed vessels impervious to fat, and in a cool place.

Preparation.—The adipose matter adhering to the kidneys, mesentery, and omentum of the hog is the usual source of the best lard. This, after careful removal of the membranes and adhering flesh, should be cut into small pieces, malaxated with successive portions of cold water until this remains clear, and then heated *moderately*, in a tinned, iron, or copper vessel, over a *slow* fire, until the melted fat becomes perfectly clear and anhydrous. Lastly, it is to be strained into earthen pots, being occasionally stirred as it cools; and the pots should be securely covered with waxed or varnished paper, and kept in a cool, dry cellar.

The purification of lard, by which the “odor of the pig” is separated, is attended with considerable labor. In France this is an industry by itself, large quantities of purified lard being used in making pomades

(see page 855). The process usually consists in spreading the lard, which has been heated with a little powdered alum, strained, and cooled, upon an inclined slate or marble slab so arranged that a stream of water can trickle on it. Whilst the water is running, the lard is thoroughly worked with a spatula, stirrer, or muller, so that a fresh surface is continually exposed to the action of the water. This tedious process is continued until the lard is *completely washed and deodorized*.

Adeps. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.
A soft, white, unctuous solid. It melts at 38° to 40° C. (100.4° to 104° F.) to a clear liquid, which is colorless in thin layers, and which should not separate an aqueous layer, and at or below 30° C. (86° F.) it is a soft solid. Sp. gr. about 0.932 at 15° C. (59° F.).	Faint odor, free from rancidity; bland taste; neutral reaction.	Entirely soluble in ether, benzoin, chloroform, and carbon disulphide; insoluble in water; very slightly soluble in alcohol.

IMPURITIES.	TESTS FOR IMPURITIES.
Alkalies.	Distilled water, boiled with Lard, should not acquire an alkaline reaction.
Starch.	Distilled water, boiled with Lard, should not be colored blue by iodine T.S.
Chlorides.	A portion of distilled water, boiled with Lard, when filtered, acidulated with nitric acid, and treated with silver nitrate T.S., should not yield a white precipitate soluble in ammonia.
Free Fatty Acids.	If 10 Gm. of Lard be dissolved in chloroform, and the solution mixed with 10 C.c. of alcohol and 1 drop of phenolphthalein T.S., it should not require more than 0.2 C.c. of normal potassium hydrate V.S. to produce a pink tint after strong shaking.
More than 5 per cent. of Cotton Seed Fats.	If 5 C.c. of melted and filtered Lard be, while warm, intimately mixed by agitation, in a test-tube, with 5 C.c. of an alcoholic solution of silver nitrate (made by dissolving 0.1 Gm. of silver nitrate in 10 C.c. of deodorized alcohol and adding 2 drops of nitric acid), and the mixture then heated for five minutes in a water-bath, the liquid fat should not acquire a reddish or brown color, nor should any dark color be produced at the line of contact of the two liquids.

Lard, like most animal fats and oils, consists of stearin, palmitin, and olein, its consistence, when pure, depending largely upon the relative proportion of these principles: olein, being the liquid principle, can readily be separated from the other two, by subjecting lard in cold weather to strong pressure, when the *olein (lard oil)* is pressed out, the solid residue (*stearin*) being used for various purposes, particularly for the manufacture of candles. Lard is used in pharmacy principally as a base for ointments: it needs protection from rancidity, however. (See *Adeps Benzoïnatus*.)

ADEPS BENZOÏNATUS. U.S. Benzoïnated Lard.

	Metric.	Old form.
Lard	1000 Gm.	16 oz. av.
Benzoïn, in coarse powder	20 Gm.	140 grains.

Melt the Lard by means of a water-bath. Tie the Benzoïn loosely

in a piece of coarse muslin, suspend it in the melted Lard, and, stirring frequently, continue the heat for two hours, covering the vessel and not allowing the temperature to rise above 60° C. (140° F.). Lastly, having removed the Benzoin, strain the Lard, and stir occasionally while it cools.

When Benzoinated Lard is to be kept or used during warm weather, 5 per cent. (or more, if necessary) of the Lard should be replaced by White Wax.

Certain balsamic substances, when digested with lard or fats, have the property of preventing or retarding rancidity: benzoin is most frequently used for this purpose. The temperature at which it is digested should not exceed 60° C. (140° F.), or the agreeable vanilla-like odor of the benzoin will be dissipated. The method of adding tincture of benzoin to cold lard does not produce as good a product, for it is darker in color, less fragrant, and sometimes acts as an irritant when applied in certain skin diseases.

OLEUM ADIPIS. U.S. Lard Oil.

A fixed oil expressed from Lard at a low temperature.

Preparation.—This oil, which consists principally of olein, is made by exposing lard to a low temperature and then pressing it powerfully in a hydraulic press.

As found in commerce, it is almost *invariably adulterated with paraffin oil*. As it is largely employed as a lubricating oil, this admixture is not particularly injurious, but for its principal use in pharmacy, as the base of citrine ointment, the presence of the paraffin oil prevents solidification.

Oleum Adipis. U.S.	IMPURITIES.	TESTS FOR IMPURITIES.
A colorless or pale yellow, oily liquid, having a peculiar odor and bland taste. Sp. gr. 0.910 to 0.920 at 15° C. (59° F.). At a temperature a little below 10° C. (50° F.) it usually commences to deposit a white, granular fat, and at or near 0° C. (32° F.) it forms a semi-solid, white mass. When it is brought in contact with concentrated sulphuric acid, a dark, reddish-brown color is instantly produced.	<p>More than about 5 per cent. of Cotton Seed Oil.</p> <p>Appreciable Quantities of Paraffin Oils.</p>	<p>If 5 C.c. of the Oil be thoroughly shaken, in a test-tube, with 5 C.c. of an alcoholic solution of silver nitrate (made by dissolving 0.1 Gm. of silver nitrate in 10 C.c. of deodorized alcohol, and adding 2 drops of nitric acid), and the mixture heated for about five minutes in a water-bath, the Oil should remain nearly or quite colorless, not acquiring a reddish or brown color, nor should any dark color be produced at the line of contact of the two liquids.</p> <p>If 5 C.c. of the Oil, contained in a small flask, be mixed with a solution of 2 Gm. of potassium hydrate in 2 C.c. of water, then 5 C.c. of alcohol added, and the mixture heated for about five minutes on a water-bath, with occasional agitation, a perfectly clear and complete solution should be formed, which, on dilution with water to the volume of 50 C.c., should form a transparent, light yellow liquid, without the separation of an oily layer.</p>

ADEPS LANÆ HYDROSUS. U.S. Hydrous Wool-Fat.

The purified fat of the wool of sheep (*Ovis Aries* Linné; class *Mammalia*; order *Ruminantia*), mixed with not more than 80 per cent. of water.

This substance, to which the name of *lanoline* is commonly applied, is made by a patented process, which consists essentially of purifying the fatty matter obtained from the wool of the sheep (*suint*), by repeated treatment with water, in a centrifugal machine. *Wool-fat* differs from *hydrous wool-fat* in containing no water.

<i>Adeps Lanae Hydrosus. U.S.</i>	ODOR.	SOLUBILITY.
A yellowish-white or nearly white, ointment-like mass. It melts at about 40° C. (104° F.).	Faint, peculiar odor.	Insoluble in water, but miscible with twice its weight of the latter, without losing its ointment-like character. With ether or chloroform it yields turbid, neutral solutions.
TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
Hydrous Wool-Fat melts at about 40° C. (104° F.). When heated on a water-bath, it finally leaves a residue amounting to not less than 70 per cent., which is transparent while melted, and, when cold, appears as a yellow, tough, unctuous mass, completely soluble in ether or chloroform, and only partially soluble in alcohol. A solution (1 in 50) of a portion of this mass in chloroform, when poured on the surface of concentrated sulphuric acid, gradually develops a deep brown color at the line of contact of the two layers.	<p>Alkalies.</p> <p>Free Fatty Acids.</p> <p>Fats and Ammonia.</p>	<p>When a portion is ignited, it should not leave more than 0.3 per cent. of ash, which should not have an alkaline reaction. If 2 Gm. of the same mass be dissolved in 10 C.c. of ether and mixed with 2 drops of phenolphthalein T.S., a colorless liquid results.</p> <p>The above colorless liquid should be decidedly reddened by 1 drop of normal potassium hydrate V.S.</p> <p>If 10 Gm. of Hydrous Wool-Fat be heated, together with 50 C.c. of water, on a water-bath, until the fat is melted, there should result an upper, translucent and light yellow, fatty layer, and a lower, clear, aqueous layer, which latter should not yield glycerin upon evaporation, and, when a portion of it is heated with some potassium or sodium hydrate T.S., it should not emit vapors of ammonia.</p>

Uses.—This substance is used largely as a basis for ointments, for which it is admirably adapted.

SEVUM. U. S. Suet. [MUTTON SUET.]

The internal fat of the abdomen of *Ovis Aries* Linné (class *Mammalia*; order *Ruminantia*), purified by melting and straining.

Suet should be kept in well-closed vessels impervious to fat. It should not be used after it has become rancid.

Preparation.—Suet is made by a process similar to that for lard. (See *Adeps*.)

SEVUM. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Alcohol.	Other Solvents.
A white, smooth, solid fat.	Nearly inodorous, gradually becoming rancid on exposure to air; bland taste; neutral reaction.	Boiling, 44 parts.	About 60 parts of ether, 2 parts of benzin, and insoluble in water.

TEST FOR IDENTITY.

From its solution in benzoin, kept in a stoppered flask, it slowly separates in a crystalline form on standing. It melts between 45° and 50° C. (113° and 122° F.), and congeals between 37° and 40° C. (98.6° and 104° F.).

Uses.—Suet is firmer than lard, owing to its containing a larger proportion of stearin. It is used in making mercurial ointment.

PEPSINUM. U. S. Pepsin.

A proteolytic ferment or enzyme obtained from the glandular layer of fresh stomachs from healthy pigs, and capable of digesting not less than 8000 times its own weight of freshly coagulated and disintegrated egg albumen, when tested by the process given below.

If it be desired to use a diluent for reducing Pepsin of a higher digestive power to that required by the Pharmacopoeia, Sugar of Milk should be employed for this purpose.

Preparation.—Pepsin is largely made by the following process of Prof. Scheffer. The mucous membrane of hogs' stomachs is macerated in water acidulated with hydrochloric acid for several days, with frequent stirring. The strained liquid, if not clear, is clarified by allowing it to stand for twenty-four hours, and decanting. Sodium chloride is then thoroughly mixed with it. After several hours the floating pepsin is skimmed from the surface and put on a cotton cloth to drain, and finally is submitted to strong pressure to get rid of the saline solution. This pepsin, when air-dried, is very tough, parchment-like or leathery, varying in color from a dim straw-yellow to a brownish-yellow. *Purified pepsin*, or *scaly pepsin*, is made by redissolving the pepsin in acidulated water and precipitating as before, immersing the product when perfectly dry in pure water for a short time, after which it is rapidly dried, and is in the form of yellowish scales.

Pepsinum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.
A fine, white, or yellowish-white, amorphous powder, or thin, pale yellow or yellowish, transparent or translucent grains or scales. It slowly attracts moisture when exposed to the air. On heating a solution of Pepsin in acidulated water to 100° C. (212° F.), it becomes milky, or yields a light, flocculent precipitate, and loses all proteolytic power. In a dry state it can bear this temperature without injury.	Slight but not disagreeable odor; a mildly acidulous or slightly saline taste, usually followed by a suggestion of bitterness. It may be neutral, but should never be alkaline.	Soluble, or for the most part soluble, in about 100 parts of water, with more or less opalescence; more soluble in water acidulated with hydrochloric acid; insoluble in alcohol, ether, or chloroform.

VALUATION OF PEPSIN.

Prepare, first, the following three solutions: *A.* To 294 C.c. of water add 6 C.c. of diluted hydrochloric acid. *B.* In 100 C.c. of solution *A* dissolve 0.067 Gm. of the Pepsin to be tested. *C.* To 95 C.c. of solution *A*, brought to a temperature of 40° C. (104° F.), add 5 C.c. of solution *B*. The resulting 100 C.c. of liquid will contain 2 C.c. of diluted hydrochloric acid, 0.00335 Gm. of the Pepsin to be tested, and 98 C.c. of water. Immerse and keep a fresh hen's egg during fifteen minutes in boiling water; then remove it and place it into cold

VALUATION OF PEPSIN.—Continued.

water. When it is cold, separate the white, coagulated albumen, and rub it through a clean sieve having 80 meshes to the linear inch. Reject the first portion passing through the sieve. Weigh off 10 Gm. of the second, cleaner portion, place it in a flask of the capacity of about 200 C.c., then add one-half of solution *C*, and shake well, so as to distribute the coherent albumen evenly throughout the liquid. Then add the second half of solution *C*, and shake again, guarding against loss. Place the flask in a water-bath, or thermostat, kept at a temperature of 38° to 40° C. (100.4° to 104° F.), for six hours, and shake it gently every fifteen minutes. At the expiration of this time the albumen should have disappeared, leaving at most only a few, thin, insoluble flakes. (Trustworthy results, particularly in comparative trials, will be obtained only if the temperature be strictly maintained between the prescribed limits, and if the contents of the flasks be agitated uniformly, and in equal intervals of time.) The relative proteolytic power of Pepsin stronger or weaker than that described above may be determined by ascertaining, through repeated trials, how much of solution *B* made up to 100 C.c. with solution *A* will be required exactly to dissolve 10 Gm. of coagulated and disintegrated albumen under the conditions given above.

Uses.—Pepsin is used to aid the digestion of food, and is given in dyspepsia, in doses of three to thirty grains (0.19 to 1.9 Gm.).

PEPSINUM SACCHARATUM. U. S. Saccharated Pepsin.

	Metric.	Old form.
Pepsin	10 Gm.	1 oz. av.
Sugar of Milk, recently dried, and in No. 80 powder	90 Gm.	9 oz. av.
To make	100 Gm.	10 oz. av.

Triturate the Pepsin with the Sugar of Milk to a fine uniform powder. Keep the product in well-stoppered bottles.

This is simply pepsin of a definite strength reduced with sugar of milk, so that ten grains represent one grain of pepsin. Saccharated pepsin, when tested by the process given under Pepsin (see *Pepsinum*), with the modification that 0.67 Gm. of it are to be taken in preparing solution *B*, should digest 300 times its own weight of freshly coagulated and disintegrated egg albumen.

PANCREATINUM. U. S. Pancreatin.

A mixture of the enzymes naturally existing in the pancreas of warm-blooded animals, usually obtained from the fresh pancreas of the hog (*Sus scrofa* Linné; class *Mammalia*; order *Pachydermata*).

Pancreatin is believed to be a mixture of the peculiar ferments or enzymes found in the pancreatic juice, the liquid which is secreted by the pancreas or *sweetbread*. These enzymes have been termed *trypsin*, *amylase*, and *steapsin*. Pancreatin digests albuminoids and converts starch into glucose. Prolonged contact with mineral acids renders it inert.

Pancreatinum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
A yellowish, yellowish-white, or grayish, amorphous powder.	Odorless, or having a faint, peculiar, not unpleasant odor, and a somewhat meat-like taste.	Completely but slowly soluble in water.	Insoluble.

TASTE.

If there be added to 100 C.c. of tepid water contained in a flask 0.28 Gm. of Pancreatin and 1.5 Gm. of sodium bicarbonate, and afterwards 400 C.c. of fresh cow's milk previously heated to 38° C. (100.4° F.), and if this mixture be maintained at the same temperature for thirty minutes, the milk should be so completely peptonized, that, if a small portion of it be transferred to a test-tube and mixed with some nitric acid, no coagulation should occur. Peptonized milk, prepared in the manner just described, or even when the process is allowed to go on to the development of a very distinct bitter flavor, should not have an odor suggestive of rancidity.

Uses.—Pancreatin is used to aid digestion: it should not be given in combination with acids; weak alkalies assist its action.

MOSCHUS. U. S. Musk.

The dried secretion from the preputial follicles of *Moschus moschiferus* Linné (class *Mammalia*; order *Ruminantia*).

Musk contains cholesterin, ammonia, an acid principle, wax, fat, albuminous and gelatinous principles, and an odorous matter not yet determined. About 10 per cent. of Musk is soluble in alcohol, the tincture being light brownish-yellow, and on the addition of water becoming slightly turbid. About 50 per cent. of Musk is soluble in water, the solution being deep brown, faintly acid, and strongly odorous. When ignited with free access of air, Musk gives off a peculiar, somewhat urinous odor, and leaves behind not more than 8 per cent. of a grayish ash.

Musk is antispasmodic and stimulant. Dose, five to fifteen grains (0.3 to 0.9 Gm.).

Official Preparation.

Tinctura Moschi. . . Made by macerating 50 Gm. of musk with sufficient diluted alcohol to make 1000 C.c. (see page 372). Dose, thirty minims to two fluidrachms (1.8 to 7.3 C.c.).
Tincture of Musk.

ACIDUM LACTICUM. U. S. Lactic Acid.

An organic acid, usually obtained by subjecting milk-sugar or grape-sugar to lactic fermentation; composed of 75 per cent., by weight, of absolute Lactic Acid [$\text{HC}_3\text{H}_5\text{O}_3 = 89.79$], and 25 per cent. of water.

Preparation.—Lactic acid may be made from sour milk, cheese, meat-juice, lactin, and from many vegetable products. Formerly it was obtained from cheese, and owing to its frequent occurrence in the decomposition of animal products it is considered here. It is now most conveniently prepared by treating cane-sugar with sulphuric acid, so as to convert it into invert sugar, then adding solution of caustic soda and heating the mixture until it ceases to precipitate Fehling's solution, showing the absence of sugar. Sulphuric acid is added, and the sodium sulphate formed is crystallized out, an addition of alcohol causing the precipitation of the remainder. The alcoholic liquid contains impure lactic acid: one-half of it is heated and zinc carbonate added until effervescence ceases; the other half of the alcoholic liquid is now added and the whole allowed to cool. Zinc lactate crystallizes

out; this, by treatment with hydrogen sulphide, yields zinc sulphide, lactic acid remaining in solution.

Acidum Lacticum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBIL. TY.		
		Water.	Alcohol.	Other Solvents.
A colorless, syrupy liquid, absorbing moisture on exposure to damp air. Sp. gr. 1.213.	Odorless; very acid taste; acid reaction.	Freely miscible.	Freely miscible.	Freely miscible with ether, but insoluble in chloroform, benzoin, or carbon disulphide.
TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.		
<p>It is not vaporized by a heat below 160° C. (320° F.); at higher temperatures it emits inflammable vapors, then chars, and is finally entirely volatilized; 5 Gm., after combustion, should not leave more than 0.05 Gm. of residue. On adding some potassium permanganate to a mixture of equal volumes of Lactic and sulphuric acids, and gently heating, the odor of aldehyde becomes perceptible.</p> <p>To neutralize 4.5 Gm. of Lactic Acid should require 37.5 C.c. of potassium hydrate V.S. (each C.c. corresponding to 2 per cent. of absolute acid), phenolphthalein being used as indicator.</p>	Chloride.	{ 10 C.c. of a 1-per-cent. aqueous solution of the Acid should not be rendered opalescent by the addition of 1 C.c. of silver nitrate T.S.		
	Sulphate.	{ 10 C.c. of a 10-per-cent. aqueous solution should remain unaffected by 1 C.c. of barium chloride T.S.,		
	Sarcolactic Acid.	{ Nor should the above solution be affected by 1 C.c. of copper sulphate T.S.		
	Lead, Iron, etc.	{ No precipitate in the same aqueous solution by 1 C.c. of ammonium sulphide T.S., after addition of excess of ammonia.		
	Sugars.	{ On adding a few drops of the Acid to 10 C.c. of hot alkaline cupric tartrate V.S., no red cuprous oxide should be separated.		
	Glycerin.	{ When mixed and heated with excess of zinc carbonate, and the mixture dried at 100° C. (210° F.), and extracted with absolute alcohol, the latter should not leave a sweet residue on evaporation.		
	Organic Impurities.	{ Cold, concentrated sulphuric acid shaken with an equal volume of Lactic Acid should assume at most only a pale yellow color.		

Uses.—Lactic acid is chiefly used to form the lactates, which are believed to be more easily assimilated than most salts. It is rarely prescribed alone, but may be given in doses of one to three fluidrachms, largely diluted. It is used in preparing syrup of calcium lactophosphate.

SACCHARUM LACTIS. U. S. Sugar of Milk.

A peculiar crystalline sugar, obtained from the whey of cow's milk by evaporation, and purified by recrystallization.

Preparation.—Sugar of milk is prepared from the whey of cow's milk. By the addition of diluted sulphuric acid and subsequent evaporation the albuminous matter is coagulated; this is filtered out and the liquid set aside to crystallize. Animal charcoal is sometimes used to decolorize the solution.

Saccharum Lactis. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Other Solvents.
White, hard, crystalline masses, yielding a white powder feeling gritty on the tongue, permanent in the air.	Odorless; faintly sweet taste; neutral reaction.	At 15° C. (59° F.), 6 parts. Boiling, 1 part.	Insoluble in alcohol, ether, or chloroform.
TESTS FOR IDENTITY.	IMPURITIES.	TEST FOR IMPURITIES.	
On adding to a few C.c. of a hot, saturated, aqueous solution of Sugar of Milk an equal volume of sodium hydrate T.S., and gently warming, the liquid will turn yellow and brownish-red. On the further addition of a few drops of copper sulphate T.S., a brick-red precipitate will appear.	Cane-Sugar.	{ If about 1 Gm. of powdered Sugar of Milk be sprinkled upon about 5 C.c. of cold sulphuric acid contained in a flat-bottomed capsule, the acid may acquire a greenish or reddish, but no brown or brownish-black, color within half an hour.	

Uses.—Sugar of milk is a useful diluent, and is largely used in medicine and pharmacy. The hardness of the crystals is of great assistance in securing thorough admixture of the ingredients in compound powders, by necessitating prolonged trituration.

FEL BOVIS. U.S. Oxgall. .[FEL TAURI.]

The fresh bile of *Bos Taurus* Linné (class *Mammalia*; order *Ruminantia*).

Oxgall is of complex chemical composition, the most important constituents being the sodium salts of resinous acids, or gall acids, and coloring-matters. These acids are as follows: *glycocholic acid*, $C_{25}H_{45}NO_6$, *taurocholic acid*, $C_{25}H_{45}NSO_7$, *hyoglycocholic acid*, $C_{27}H_{45}NO_6$, *hyotaurocholic acid*, $C_{27}H_{45}NSO_6$, and *chenotaurocholic acid*, $C_{25}H_{45}NSO_6$.

Oxgall is officially described as a brownish-green or dark green, somewhat viscid liquid, having a peculiar odor, a disagreeable, bitter taste, and a neutral or faintly alkaline reaction. Sp. gr. 1.018–1.028. A mixture of 2 drops of Oxgall and 10 C.c. of water, when treated first with a drop of freshly prepared solution of 1 part of sugar in 4 parts of water, and afterwards with sulphuric acid, cautiously added, until the precipitate first formed is redissolved, gradually acquires a brownish-red color, changing successively to carmine, purple, and violet.

It is used in making the succeeding preparation.

FEL BOVIS PURIFICATUM. U.S. Purified Oxgall.

	Metric.	Old form.
Fresh Oxgall	300 C.c.	8 fl. oz.
Alcohol	100 C.c.	1 fl. oz.

Evaporate the Oxgall, in a tared porcelain capsule, on a water-bath, to about 100 Gm. [old form 1 oz. av.], then add to it the Alcohol, mix the whole thoroughly, and set it aside, well covered, for three or four days. Then decant the clear solution, filter the remainder, and,

having mixed the liquids and distilled off the Alcohol, evaporate the remainder to a pilular consistence.

The addition of alcohol to the concentrated liquid is for the purpose of separating mucilaginous matter.

The official description and tests are as follows: A yellowish-green, soft solid, having a peculiar odor, and a partly sweet and partly bitter taste. It is very soluble in water and in alcohol. A solution of 1 part of Purified Oxgall in about 100 parts of water behaves towards sugar and sulphuric acid like the solution mentioned under Oxgall. (See *Fel Bovis*.) The aqueous solution of Purified Oxgall should yield no precipitate on the addition of alcohol.

Uses.—Oxgall is not used so extensively as it was at one time. It is administered with the intention of supplying a deficiency of bile in the intestines, in certain indications. Its usefulness is questionable. The dose is ten to fifteen grains (0.6 to 0.97 Gm.).

CETACEUM. U. S. Spermaceti.

A peculiar, concrete, fatty substance, obtained from *Physeter macrocephalus* Linné (class *Mammalia*; order *Cetacea*).

Preparation.—Spermaceti is made by the forcible expression of the oleaginous compound found in the head of the sperm-whale to separate the olein: the solid fat is termed *cetin*.

Spermaceti is a mixture of various fats. When recrystallized from alcohol, *cetin* is obtained, while the alcohol on evaporation deposits an oil, *cetin-elain*, which when saponified yields *cetin-elaidic acid*, an acid resembling, but distinct from, oleic acid. The cetin which crystallizes out of the alcohol is essentially *cetyl palmitate*, $C_{16}H_{33}(C_{16}H_{31}O_2)$. There are small amounts of fats containing *stearic acid*, $C_{18}H_{35}O_2$, *myristic acid*, $C_{14}H_{27}O_2$, and *lauric-stearic acid*, $C_{12}H_{23}O_2$, with the alcohol radicals corresponding to these acids.

Uses.—Spermaceti is one of the solid fatty substances employed to give consistency to cerates and ointments: it is used in the well-known ointment of rose-water, or cold cream.

Cetaceum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
White, somewhat translucent, slightly unctuous masses of a scaly-crystal-line fracture and a pearly lustre. Becomes yellow and rancid by exposure to air. Specific gravity about 0.945 at 15° C. (59° F.). Melts near 50° C. (122° F.), and congeals near 45° C. (113° F.).	Odorless; bland, mild taste; neutral reaction.	Insoluble.	Cold, Nearly insoluble. Boiling, Soluble.	Soluble in ether, chloroform, carbon disulphide, fixed and volatile oils; only slightly soluble in cold benzine.

IMPURITY.

TESTS FOR IMPURITY.

Stearic Acid. { If 1 Gm. of Spermaceti be boiled with 1 Gm. of anhydrous sodium carbonate and 50 C.c. of alcohol, and the mixture cooled and filtered, the filtrate, upon being supersaturated with acetic acid, may become turbid, but should not afford a precipitate.

Official Preparation.

Ceratum Cetacei . . . Made by melting together 100 Gm. of spermaceti, 350 Gm. of white Spermaceti Cerate. wax, and 550 Gm. of olive oil. (See Cerata.)

Official Products of the Class Pisces.

ICHTHYOCOLLA. U.S. Isinglass.

The swimming-bladder of *Acipenser Huso* Linné, and of other species of *Acipenser* (class Pisces; order Sturiones).

Preparation.—Russian isinglass is the kind designated by the Pharmacopœia: it is made by washing and drying the swimming-bladders or air-bags of the Russian sturgeon, by stretching them upon flat boards to dry. It is described as in separate sheets, sometimes rolled, of a horny or pearly appearance; whitish or yellowish, semi-transparent, iridescent, inodorous, insipid; almost entirely soluble in boiling water and in boiling diluted alcohol. The solution in 24 parts of boiling water forms, on cooling, a transparent jelly.

American isinglass is in flat, ribbon-like bands, having somewhat the appearance of rolled and crumpled thin manilla paper: it has a fishy odor, and is much inferior to the official isinglass.

Isinglass is the purest form of gelatin attainable: it is used in making court-plaster, and, owing to its forming an insoluble compound with tannin, is employed in clarifying coffee and other similar liquids.

Official Preparation.

Emplastrum Ichthyocolle . Made by dissolving 10 Gm. of isinglass in sufficient hot water to make 120 Gm., coating taffeta with one-half of the solution, then mixing the other half with 40 Gm. of alcohol and 1 Gm. of glycerin and applying it in successive layers. The reverse side of the taffeta is coated with tincture of benzoin.

OLEUM MORRHUÆ. U.S. Cod Liver Oil.

[OLEUM JECORIS ASELLI.]

A fixed oil obtained from the fresh livers of *Gadus Morrhua* Linné, or of other species of *Gadus* (class Pisces; order Teleostei; family Gadidæ).

Preparation.—The best method of preparing cod liver oil is to heat the livers in a wooden tank by means of low-pressure steam. The resulting mass is carefully drained,—the livers themselves containing, besides oil, a considerable portion of watery fluid, which passes off with it in the form of emulsion and separates on standing. In the case of the finest varieties, the oil, which is made only in the winter months, is drawn off by taps from the bottom of the cooking-tank and then put into a cooling-house to freeze. The solid frozen mass is put into canvas bags, and submitted, whilst at a low temperature, to severe pressure, whereby the pure oil is expressed. This constitutes the light oil of commerce.

Cod liver oil consists chiefly of olein. Palmitin and stearin are present in small proportions; minute traces of iodine, chlorine, bromine, phosphorus, and sulphur are found, but these are not in sufficient quantity to have any medicinal effect. Recent investigators assert

that cod liver oil owes its virtues to the alkaloids *aselline* and *morrhaine* associated with morrhucic, formic, butyric, and phosphoric acids. Preparations are upon the market containing these substances and free from any of the oil or oily constituents. Very valuable results have been claimed for these preparations.

Oleum Morrhue. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Alcohol.	Other Solvents.
A pale yellow, thin, oily liquid. Sp. gr. 0.920–0.925 at 15° C. (59° F.).	Peculiar, slightly fishy, but not rancid odor; bland, slightly fishy taste; faintly acid reaction.	Scarcely soluble.	Readily soluble in ether, chloroform, or carbon disulphide; also in 2.5 parts of acetic ether.
TESTS FOR IDENTITY.		IMPURITIES.	TEST FOR IMPURITIES.
<p>If 1 drop of the Oil be dissolved in 20 drops of chloroform, and the solution shaken with 1 drop of sulphuric acid, the solution will acquire a violet-red tint, rapidly changing to rose-red and brownish-yellow.</p> <p>If a glass rod, moistened with sulphuric acid, be drawn through a few drops of the Oil, on a porcelain plate, a violet color will be produced.</p> <p>If 2 or 3 drops of fuming nitric acid be allowed to flow alongside of 10 or 15 drops of the Oil, contained in a watch-glass, a red color will be produced at the point of contact. On stirring the mixture with a glass rod, this color becomes bright rose-red, soon changing to lemon-yellow (distinction from <i>seal oil</i>, which shows at first no change of color, and from <i>other fish oils</i>, which become at first blue, and afterwards brown and yellow).</p>		Other Fish Oils and many Vegetable Oils.	When the Oil is allowed to stand for some time at 0° C. (32° F.), very little or no solid fat should separate.

Uses.—Cod liver oil is used as a nutrient and alternative in wasting diseases, notably phthisis. Dose, one to four fluidrachms (3.7 to 14.7 C.c.).

Official Products of the Class Aves.

VITELLUS. U.S. Yolk of Egg.

The yolk of the egg of *Gallus Bankiva* var. *domesticus* Temminck (class *Aves*; order *Gallinæ*).

Yolk of egg contains *vitellin*, a protein compound resembling casein, albumen, fat, cholesterin, inorganic salts, coloring-matter, etc. There is also present water in the proportion of about 50 per cent. *White of egg* consists principally of albumen with 80 per cent. of water. The inorganic salt present in largest proportion is potassium chloride.

Uses.—Yolk of egg is valuable in pharmacy as an emulsifying agent, its value lying chiefly in the fact of its being an excellent nucleus and a perfect natural emulsion. (See Emulsions, Part V.)

Official Preparation.

Glyceritum Vitelli. . . . 45 Gm. of fresh yolk of egg and 55 Gm. of glycerin. Mix well, Glycerite of Yolk of Egg. and express through muslin.

Official Products of the Class Insecta.

CANTHARIS. U. S. Cantharides. [SPANISH FLIES.]

Cantharis vesicatoria De Geer (class *Insecta*; order *Coleoptera*.)

Cantharides should be thoroughly dried at a temperature not exceeding 40° C. (104° F.), and kept in well-closed vessels.

Cantharides owe their blistering properties to *cantharidin*, $C_{10}H_{12}O_4$. This is a white substance, in the form of crystalline scales, of a shining micaceous appearance, inodorous, tasteless, almost insoluble in water and in cold alcohol, but soluble in ether, chloroform, benzol, formic and glacial acetic acids, the oils, and in hot alcohol, which deposits it upon cooling. It fuses at 210° C. (410° F.), is volatilizable by heat without decomposition, and its vapor condenses in acicular crystals. The subliming point of isolated cantharidin is 100° C. (212° F.), or the temperature of boiling water. Cantharidin is believed to be the anhydride of cantharidic acid. The latter forms definite salts with bases: these may be obtained by heating cantharidin with alkaline solutions. The most satisfactory test of cantharidin is its vesicating property.

Uses.—Cantharides are aphrodisiac and poisonous: when applied externally they produce vesication.

Official Preparations.

- Ceratum Cantharidis** . . . 320 Gm. of cantharides, 180 Gm. of yellow wax, 180 Gm. of resin, 220 Gm. of lard, and 150 C.c. of oil of turpentine. Moisten the cantharides with the oil of turpentine and set aside for 48 hours, then add it to the wax, resin, and lard, strain through muslin, and keep the mixture in a melted state for half an hour, or until reduced to 1000 Gm., then stir until cold. (See Cerata.)
- Cantharides Cerate.**
- Colloidum Cantharidatum** . (See page 338.)
Cantharidal Colloidion.
- Tinctura Cantharidis** . . . Made by percolating 50 Gm. of powdered cantharides with sufficient alcohol to make 1000 C.c. (see page 363). Dose, three to ten minims (0.18 to 0.6 C.c.).
- Tincture of Cantharides.**

COCCUS. U. S. Cochineal.

The dried female of *Coccus cacti* Linné (Class, *Insecta*; Order, *Hemiptera*).

The odor of cochineal is faint; its taste slightly bitterish. It contains a red coloring-matter soluble in water, alcohol, and water of ammonia, slightly soluble in ether, insoluble in fixed and volatile oils. On macerating Cochineal in water, the insect swells up, but no insoluble powder should be separated.

Cochineal owes its red color to *carminic acid*, $C_{17}H_{13}O_{10}$. It contains mucilage, fat, inorganic salts, etc. Its only use in pharmacy is to impart a bright red color to various preparations, like compound tincture of cardamom, elixirs, etc.

CERA FLAVA. U. S. Yellow Wax.

A peculiar, concrete substance, prepared by *Apis mellifica* Linné (Class, *Insecta*; Order, *Hymenoptera*).

CERA ALBA. U. S. White Wax.

Yellow wax, bleached.

Preparation.—Wax is now known to be a peculiar secretion of bees. Yellow wax is obtained on the large scale by first abstracting the honey from the combs by shaving off the ends of the cells, draining, and then placing them in centrifugals. The honey is rapidly whirled out, water is added, and the wax is thoroughly and quickly cleaned; it is then melted and strained and run into flat dishes or moulds to cool and harden.

Beeswax is a mixture of three different substances, which may be separated from one another by alcohol,—viz.: 1, *myricin*, insoluble in boiling alcohol, and consisting chiefly of myricyl palmitate, $C_{30}H_{51}(C_{16}H_{31}O_2)$, which is a compound of *palmitic acid*, $C_{16}H_{33}O_2$, and *myricyl alcohol*, $C_{30}H_{51}O$; 2, *cerotic acid*, $C_{27}H_{54}O_2$ (formerly called *cerin* when obtained only in an impure state), which is dissolved by boiling alcohol, but crystallizes out on cooling; 3, *cerolein*, which remains dissolved in the cold alcoholic liquid. This latter is probably a mixture of fatty acids, as indicated by its acid reaction to litmus paper.

Cera Flava. U. S.	ODOR AND TASTE.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A yellowish to brownish-yellow solid. It is brittle when cold, and when broken presents a dull, granular, not crystalline fracture, but becomes plastic by the heat of the hand. It melts at 63°–64° C. (145.4°–147.2° F.). Sp. gr. 0.955–0.967 at 15° C. (59° F.).	Agreeable, honey-like odor; faint, balsamic taste.	Insoluble.	Cold, Only partially soluble. Boiling, Almost completely soluble.	Completely soluble in ether, chloroform, and in fixed and volatile oils. Partially soluble in cold benzol or carbon disulphide, and completely in these liquids at a temperature of 25° to 30° C. (77° to 86° F.).

IMPURITIES.

TESTS FOR IMPURITIES.

Fats, or Fatty Acids, Japan Wax, Resin.	{	If 1 Gm. of Yellow Wax be boiled for half an hour with 35 C.c. of a 15-per-cent. aqueous solution of sodium hydrate, the volume being preserved by the occasional addition of water, the Wax should separate, on cooling, without rendering the liquid opaque, and no precipitate should be produced in the filtered liquid by hydrochloric acid.
Soap.		The above reagent should not produce a precipitate in water which has been boiled with a portion of the Wax.
Paraffin.		If 5 Gm. of Yellow Wax be heated in a flask for fifteen minutes with 25 C.c. of sulphuric acid to 160° C. (320° F.), and the mixture then diluted with water, no solid, wax-like body should separate.
Tallow and Other Fats.		If a portion of Yellow Wax be ignited on platinum, it should not emit the odor of acrolein.

White Wax.—The color of yellow wax is discharged by exposing it with an extended surface to the combined influence of air, light, and moisture. The process of bleaching is often conducted upon a large scale. The wax, previously melted, is made to fall in streams upon a revolving cylinder kept constantly wet, upon which it con-

cretes, forming thin layers. These, having been removed, are spread upon linen cloths stretched on frames, and exposed to the air and light, care being taken to wet and occasionally turn them. In a few days they are partially bleached; but to deprive the wax completely of color it is necessary to repeat the whole process once, if not oftener. When sufficiently white, it is melted and cast into small circular cakes.

It is a yellowish-white solid, generally in the form of circular cakes, about four inches (10 cm.) in diameter, somewhat translucent in thin layers, having a slightly rancid odor and an insipid taste. It melts at about 65° C. (149° F.). Sp. gr. 0.965–0.975. In other respects it has the characteristics and answers to the tests mentioned under Yellow Wax (see above).

Uses.—Wax is used in pharmacy principally to give consistence to cerates and ointments.

Unofficial Animal Products.

Class Mammalia.

Acidum Butyricum, a colorless liquid, having a disagreeable odor and a rancid taste. Density, 0.973.
C4H8O2.

Butyric acid.

Ambra Grisea.

Ambergris.

A morbid excretion from the intestines of *Physeter macrocephalus*, found floating on the sea. It is friable when cold, of a gray or brown-gray color. It contains 85 per cent. of ambrein, etc. Used in perfumery.

Sanguis.

Blood.

The arterial fluid of the ox, *Bos Taurus*. It is of a red color, opaque, and has a peculiar odor. It contains 78 per cent. of water, 8 per cent. of albumen, 5 per cent. of fibrin, etc. The red color is due to hæmoglobin.

Butyrum.

Butter.

From the milk of the cow, *Bos Taurus*. Obtained by allowing the cream to separate from the milk, collecting and churning. A soft, yellow, neutral substance, of a pleasant, sweet odor and a bland taste. It contains 30 per cent. of olein, and about 68 per cent. of palmitin and stearin, etc.

Castoreum.

Castor.

From the preputial follicles of both the male and female animals *Castor Fiber*. The follicles occur in pairs, are pyriform, of a brown or blackish color, a peculiar odor, and a bitter, acrid, and nauseous taste. It contains a volatile oil, and from 15 to 40 per cent. of a bitterish resinous substance, etc.

Civetta.

Civet.

An odorless substance obtained from two animals of the genus *Viverra* which inhabit the East Indies. It is semi-solid, unctuous, yellowish, becoming brown and thicker by exposure to air; of a very strong, peculiar odor, and a bitterish, acrid, and nauseous taste. It contains volatile oil, and resinous and other matters. Used in perfumery.

Extractum Carnis.

Extract of Beef.

Prepared by subjecting beef contained in iron cylinders heated by steam to a temperature of 220° F. for several hours, collecting, when cool, the solidified juice, and preserving it in well-closed cans.

Fibrin.

Obtained when blood is allowed to coagulate or is whipped with a bundle of twigs. It is at first, when pure, a gelatinous mass, which changes to a white, tenacious material, consisting of minute fibrils.

Gelatina.

Gelatin.

Obtained by boiling in water, bone, skins, cartilage, tendons, etc., until dissolved, then drying the resulting jelly in the air. It occurs in thin, transparent sheets. The different varieties which occur in commerce are Russian, French, Cooper's, and Coxe's gelatin.

Hæmoglobin, from

the blood of swine,

C206H1008N156S8-

FeO17.

From dog's blood,

C206H1008N156S8-

FeO18.

Used as a substitute for iron in the treatment of anæmia. Dose, one and a half grains (0.09 Gm.).

Hæmol and Hæmo-

gallol.

Two blood preparations containing iron.

Hydræcum.

Hyraceum.

The product of *Hyrax capensis*, an animal of Southern Africa. It is found on the rugged sides of mountains, and is supposed to be the excrement or the dried urine of the animal. It is rather hard, tenacious, of a blackish-brown color, and of a taste and smell similar to those of castor.

Unofficial Animal Products.—Continued.

Inglavin.	From the gizzards of <i>Gallus Bankiva</i> . Prepared by a process similar to that employed in preparing pepsin. The dried and powdered gizzards are often used as digestives.
Kefir.	A peculiar fermented milk, having all the virtues of Koumys.
Keratin.	The organic basis of horny tissues, hair, nails, feathers, epithelium, etc. Used for coating pills so as to enable them to pass through the acid juices of the stomach and be dissolved in the alkaline intestinal fluids.
Koumys.	Prepared by dissolving 4 ounces of white sugar in 1 gallon of skimmed milk and placing in bottles of the capacity of 1 quart; add 2 ounces of baker's yeast, or a cake of compressed yeast, to each bottle, cork and tie securely, then set in a warm place until fermentation is well under way; then lay the bottles on their sides in a cool cellar. In three days fermentation will have progressed sufficiently to permit the koumys to be in good condition.
Kumys.	
Koumiss.	
Lac.	From the mammary glands of the cow, <i>Bos Taurus</i> . It is a white, opaque liquid, having a slight odor and a bland and sweet taste. Sp. gr. 1.030. It contains 85 per cent. of water and about 15 per cent. of solids.
Milk.	
Milk-Casein.	The most abundant of the albuminoids obtained from milk by the addition of rennet.
Neat's-foot Oil.	Prepared by boiling the feet of cattle, deprived of their hoofs, with water, removing the oil which rises to the surface, and allowing it to remain for some time in warm water. Used for softening leather.
Paraglobulin.	Obtained from blood serum, lymph, chyle, etc. It is a granular substance, gradually becoming more compact.
Peptones.	The product of the action of gastric and pancreatic juices, or of pepsin alone, upon albuminoids during the process of digestion.
Ptomaines.	Alkaloidal substances found in dead bodies or decomposed animal matter, as choline, muscarine, neurine, gadinine, tetanine, dimethylamine, trimethylamine, triethylamine, putrescine, cadaverine, saprine, neuridine, collidine, hydrocollidine, parvoline, and tyrotoxicon (diabenzene).
Cadaveric Alkaloids.	
Ptyalin.	A fermentative substance occurring in saliva, and having the power of converting starch into dextrin.
Sodii Choleas.	Prepared by evaporating fresh oxgall to one-half, and precipitating the slimy and coloring matters with an equal bulk of alcohol, treating the filtrate with animal charcoal, distilling off the alcohol, and washing the residue with ether. It occurs as a white, sticky mass, having a penetrating odor, and a peculiar, sweetish, afterwards bitter taste. (See <i>Fel Bovis Purificatum</i> .)
Sodium Choleate.	
Spongia.	Used mechanically. In the shape of sponge tent it is employed for dilating sinuses.
Thiol, also	Antirheumatic, and used for the same purposes as ichthyol. Dose of
Ichthyol.	liquid thiol, five to ten drops, or of the dried preparation, one to two grains.
Thiolineic Acid.	Used as a substitute for thiol and ichthyol. It has been called sulphurated linseed oil.
Urea,	A hydragogue diuretic. Dose, ten grains (0.648 Gm.) every six hours.
Carbamide,	
CO(NH ₂) ₂ .	
Sperm Oil.	From the cranial cavities of <i>Physeter macrocephalus</i> . It is of a yellow or brown-yellow color. Sp. gr. 0.920. On cooling, it deposits spermaceti and stearin.
Whale Oil.	From <i>Balaena mysticetus</i> . It has a peculiar fishy odor and unpleasant taste.
Porpoise Oil.	From <i>Delphinus Phocaena</i> . Prepared by heating the belly-blubber of the porpoise. It is, when fresh, of a pale yellow color.
Seal Oil.	From <i>Phoca</i> of various species.
Dugong Oil.	From <i>Halicore Dugong</i> . Habitat, waters of Eastern Australia. This oil is generally used as a substitute for cod liver oil in Australia.
Class Pieces.	
Eulachon Oil.	From <i>Thaleichthys Pacificus</i> , a small fish found on the Pacific coast. This oil has been proposed as a substitute for cod liver oil.
Menhaden Oil.	From <i>Alosa Menhaden</i> . Habitat, Atlantic coast. Used in dressing leather.
Shark Oil.	From the liver of the shark, <i>Squalus Garcharias</i> , and other species. It is of a light yellow color, and has an acid taste. Sp. gr. 0.870-0.880.
Skate Oil.	From the liver of <i>Raja Batis</i> . Employed largely in France and Belgium. It is of a bright yellow color. Sp. gr. 0.928.
Liparin.	A mixture of 100 parts of olive oil and 6 parts of oleic acid. Used as a substitute for cod-liver oil. Dose, one to four fluidrachms (3.69 to 14.7 Cc.).

Unofficial Animal Products.—Continued.

Class Aves.

Albumen Ovi.
Egg-Albumen.
Vitellin.

It exists in solution, enclosed in a net-work of delicate membranes, in the white of eggs.
It exists in the yolk of eggs. Closely resembles fibrin.

Class Insecta.

Acidum Formicum.
Formic Acid.

Obtained by distilling the ant (*Formica rufa*). It is a colorless liquid, having a pungent odor, and produces a burning sensation when applied to the skin. Its vapor is inflammable. Used for neuralgic and rheumatic pains.

Cobweb.

The web of *Tegeneria domestica*. It has been recommended in phthisis and chronic intermittents, but is most useful in controlling hemorrhage by simply applying it to the bleeding surfaces.

Blatta.

Cockroach.

The insect *Blatta orientalis*, about one inch long, oblong, flat, of a reddish-black color, odor very disagreeable. It contains fetid oil, extractive, antihydropin, etc. Used as a diuretic.

Red Ant.

The insect *Formica rufa*. It contains a volatile oil and formic acid.

Class Reptilia.

Crotalus.

Prepared from the venom of the rattlesnake (*Crotalus horridus*). While the snake is under chloroform the poison contained in the fang is pressed out and mixed with 9 parts of glycerin. Used in diphtheritis scarlatina.

Phnyin.

From the glandular secretion and dried skin of the toad (*Bufo viridis* and *B. cinereus*). Similar in its effects to digitalin.

Class Annelida.

Hirudo.

Leech.

From *Sanguiruga medicinalis* and *S. officinalis*. From three to six inches long, smooth, soft, round, tapering at the ends, composed of about one hundred rings; of a blackish-green color. Used for local depletion.

Official Animal Substances.

OFFICIAL NAME.	Class and Order.	Part Used.	English Name.	Official Preparations.
Acidum Lacticum.			Lactic Acid.	Syrup of Calcium Lactophosphate.
Acidum Oleicum.			Oleic Acid.	Oleate of Mercury, Oleate of Veratrine, Oleate of Zinc.
Adeps.	Class Mammalia. Order Pachydermata.	Prepared internal fat.	Lard.	Benzoated Lard, Cerate, Camphor Cerate, Resin Cerate, Ointment, Cantharides Cerate, Mercurial Ointment, Tar Ointment.
Adeps Lانس Hydrosus.	Class Mammalia.	Purified fat of the wool of sheep.	Hydrous Wool-Fat.	
Cantharis.	Class Insecta. Order Coleoptera.		Cantharides.	Cerate, Colloдия, Tincture.
Carbo Animalis.		Prepared from bone.	Animal Charcoal.	Purified Animal Charcoal.
Cera Alba.		Yellow wax bleached.	White Wax.	Cerate, Camphor Cerate, Spermaceti Cerate, Ointment of Rose Water.
Cera Flava.	Class Insecta. Order Hymenoptera.	Prepared concrete substance.	Yellow Wax.	Resin Cerate, Ointment, Cantharides Cerate, Burgundy Pitch Plaster, Resin Plaster, Tar Ointment.
Cetaceum.	Class Mammalia. Order Cetacea.	Concrete fatty substance.	Spermaceti.	Cerate, Ointment of Rose Water.
Coccus.	Class Insecta. Order Hemiptera.	Dried female.	Cochineal.	Compound Tincture of Caradomom.
Fel Bovis.	Class Mammalia. Order Ruminantia.	Fresh bile.	Oxgall.	Purified Oxgall.

Official Animal Substances.—Continued.

OFFICIAL NAME.	Class and Order.	Part Used.	English Name.	Official Preparations.
Glycerinum.			Glycerin.	Suppositories, Elixir of Phosphorus, Glycerites, and many preparations.
Ichthyocolla.	Class Pisces. Order Sturionones.	Swimming-bladder.	Isinglass.	Plaster.
Mel.	Class Insecta. Order Hymenoptera.	Saccharine secretion.	Honey.	Clarified Honey.
Moschus.	Class Mammalia. Order Ruminantia.	Dried secretion.	Musk.	Tincture.
Oleum Adipis.		Fixed oil.	Lard Oil.	Ointment of Mercuric Nitrate.
Oleum Morrhue.	Class Pisces. Order Teleostei.	Fixed oil.	Cod Liver Oil.	
Pancreatinum.	Class Mammalia. Order Pachydermata.	Enzymes from pancreas.	Pancreatin.	
Pepsinum.		Ferment from fresh stomach of the hog.	Pepsin.	Saccharated Pepsin.
Saccharum Lactis.			Sugar of Milk.	Extract of Nux Vomica, Extract of Opium, Saccharated Pepsin, Saccharated Ferrous Iodide, Deodorized Opium, Powder of Ipecac and Opium, Triturations.
Sevum.	Class Mammalia. Order Ruminantia.	Internal fat of abdomen.	Suet.	Mercurial Ointment.
Vitellus.	Class Aves. Order Gallinæ.	Yolk of the egg.	Yolk of Egg.	Glycerite.

QUESTIONS ON CHAPTER LXI.

PRODUCTS FROM ANIMAL SUBSTANCES.

- Where are protein compounds found?
 What are their constituents?
 What are their physical properties?
 What is Millon's reagent?
 What color does it produce in contact with protein compounds?
 From what classes are the animal products which are of interest in pharmacy derived?
 Lard—What is the Latin name? Whence is it obtained?
 How is it prepared?
 What is the process, used largely in France, of purifying lard?
 Describe odor, taste, chemical reaction, and solubility.
 How may the following impurities be detected?—viz.: Alkalies; starch; salt; water.
 Of what does lard consist?
 To what is its consistence due?
 For what is lard used in pharmacy?

- Benzoinated lard—What is the Latin official name?
 What was the name of this preparation in the U. S. P. 1870?
 How is it prepared? What temperature should be used?
 Does the method of adding tincture of benzoin to lard and mixing make as good a product as the official method? Why?
- Lard oil—What is the Latin official name? How is it prepared?
 Give description and specific gravity.
 What is its usual adulteration?
 Is this admixture particularly injurious?
 What is the Latin official name of hydrous wool-fat?
 How much water does it contain?
- Suet—What is the Latin official name? Whence is it obtained, and how prepared?
 Describe odor, taste, specific gravity, and solubility. Give tests for identity.
 For what is it used?
 What is pepsin, and whence obtained?
 How much coagulated egg albumen should it be capable of digesting?
- Saccharated pepsin—What is the Latin official name?
 How much official pepsin does it contain?
 Describe Prof. Scheffer's process for making it.
 How is purified pepsin or scaly pepsin prepared?
 Describe odor, taste, specific gravity, and solubility. Give tests for identity.
 What is the dose?
- Musk—What is the Latin official name? Whence is it obtained?
 What does it contain? What is the dose? What are its official preparations?
- Lactic acid—How much absolute acid does it contain?
 How may it be made?
 Describe odor, taste, specific gravity, and solubility. Give tests for identity.
 How may the following impurities be detected?—viz.: Hydrochloric acid; sulphuric acid; sarcosolactic acid; lead, iron; sugars; glycerin; organic impurities.
- What is the dose?
- Sugar of milk—What is the Latin name?
 Give formula in symbols and molecular weight. Whence is it obtained?
 How is it prepared?
 Describe odor, taste, specific gravity, and solubility. Give tests for identity.
 How may the presence of cane-sugar be detected?
- What are its uses? Why is it specially useful in pharmacy?
- Oxgall—What is the Latin official name? What are its constituents?
 Describe odor, taste, and chemical reaction.
 For what is it used?
- Purified oxgall—What is the Latin official name? How is it prepared?
 Describe odor, taste, and chemical reaction.
 What is the official test for it? What is the dose?
- Isinglass—What is the Latin official name? Whence is it derived?
 How is it prepared?
 What is the form of American isinglass?
 For what purposes is it used? What are the official preparations?
- Spermaceti—What is the Latin official name? Whence is it obtained?
 Give description and specific gravity.
 Describe odor, taste, chemical reaction, and solubility.
 How is it made?
 What is its composition? For what is it used?
 What are its official preparations?
- Cod liver oil—What is the Latin official name? Whence is it obtained?
 How is it best prepared?
 How is the light oil of commerce prepared?
 What are its constituents? Give description and specific gravity.
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 What is the dose?
- Yolk of egg—What is the Latin official name? What does it contain?
 Of what does white of egg chiefly consist?
 For what is yolk of egg useful in pharmacy?
 What are its official preparations?
- Cantharides—What is the Latin name? Whence is it obtained?
 To what do cantharides owe their blistering properties?
 Describe the physical properties of cantharidin.

What is cantharidin believed to be, chemically?

Does this acid form salts? How may they be obtained?

What is the most satisfactory test of cantharidin?

What are the medicinal properties of cantharides?

Name its official preparations.

Cochineal—What is the Latin name? What is its definition?

What does it contain?

To what does it owe its red color?

For what is it used?

Yellow wax—What is the Latin official name? Whence is it obtained?

White wax—What is the Latin official name? What is its definition?

What is wax? How is it obtained commercially?

What are the constituents of beeswax?

Which of these is soluble in alcohol?

Describe odor, taste, chemical reaction, and solubility.

How may the following impurities be detected?—viz.: Fats or fatty acids; Japan wax; resin; soap; paraffin.

How is white wax made? What is its specific gravity?

Describe odor, taste, and chemical reaction.

What is its principal use in pharmacy?

CHAPTER LXII.

PHARMACEUTICAL TESTING.

A KNOWLEDGE of the methods of using tests with the view of identifying or ascertaining the amount of impurities in articles of the *materia medica*, is now demanded of the pharmacist. The professional chemist can no longer claim the exclusive right to handle the test-tube and the burette, for the principles of analysis, so far as they relate to medicinal chemicals, must be understood by the practical pharmacist. It is not within the scope of this work to enter into the minute details of the application of each test, the many excellent works on analysis which have been issued within the last five years fully supplying all needs in this direction.¹

The introduction of many new tests into the last Pharmacopœia, however, requiring the use of various reagents and test-solutions, necessitates a brief review of the methods employed in analysis, with some definitions of common terms.

Synthesis and Pharmacy treat of the creation or preparation of compounds by *building them up* from their constituents: thus, by heating together iodine and sulphur, the compound, sulphur iodide, is made.

Analysis is the opposite operation: it treats of the decomposition of the compound by *separating* its constituents: if sulphur iodide be boiled with water, the iodine will be volatilized and may be collected, whilst the sulphur remains with the water, and thus the compound is decomposed and its constituents are separated.

The principles of analysis are based upon the application of one chemical substance, of known properties and composition, to another, which results in some change in the color, form, or state of aggregation of one or both substances, and which is intended to lead to the identification of the substance examined, or to the ascertainment of its quantity.

All analytical methods require the use of *reagents* and *test-solutions*. These may be defined as substances employed in producing the phenomena above described, or the *reactions* upon which the value of the analysis is based. A list of official reagents and test-solutions is given on pages 1069–1092.

Two kinds of analysis, depending upon the extent of the examination, are in use: 1. Qualitative or qualitative. 2. Quantitative or quantitative.

¹ The practical pharmacist should be provided with one or all of the following works: Fresenius's "Analysis," Hoffman and Power's "Examination of Medicinal Chemicals," Sutton's "Volumetric Analysis," Allen's "Commercial Organic Analysis," and Trimble's "Practical and Analytical Chemistry."

In *qualitative* analysis, the aim is merely the *identity* or the *quality* of the objects sought for in the substance examined.

In *quantitative* analysis, not only must the substance sought for be identified, but the *quantity* which is present must also be ascertained. Two methods of quantitative analysis are in use, known as the Gravimetric and the Volumetric.

In *gravimetric* quantitative analysis, as its name indicates, the quantities of the constituents are isolated and *weighed*, either separately or in combination.

In *volumetric* quantitative analysis, the constituents are determined, either wholly or in part, in *volume* or *measure*, by dissolving a given weight of a pure salt or body in a definite volume of water or other liquid, thus forming a *standard* or *normal solution*, and using an accurately measured quantity of such a solution to produce a given effect upon the substance which is being tested. The advantages of the volumetric method consist in the ease and rapidity with which the operations may be effected, because liquids can be measured more rapidly than they can be weighed.

It is obvious that volumetric analysis can be used only where some distinctly visible phenomenon occurs in the liquid, which enables the operator to determine accurately a point when the reaction is completed.

In volumetric analysis, accurately made solutions of definite strength are employed. In the Pharmacopœia these are termed test-solutions and volumetric solutions. In general practice the term *normal solution* is used, but, unfortunately, it is applied to several kinds of volumetric solutions, which may be defined as follows :

1. A normal solution is primarily and legitimately one which contains the *molecular weight* of a *univalent* substance, expressed in grammes, dissolved in *one litre* of pure water: thus, the molecular weight of sodium hydrate is 39.96, and hence normal solution of sodium hydrate contains 39.96 grammes of sodium hydrate in 1000 grammes, or 1 litre, of distilled water. When the substance is *bivalent*, the normal solution contains *one-half* of the molecular weight, expressed in grammes, in each litre, as in the volumetric solution of oxalic acid. The molecular weight of oxalic acid is 125.7, and the normal solution is made by dissolving 62.85 grammes of the acid in 1000 C.c. of distilled water. *Decinormal* and *centinormal* solutions are respectively $\frac{1}{10}$ and $\frac{1}{100}$ the strength of normal solutions. Normal solutions of this kind have more than one use, for they are employed in determining the strength and purity of many substances.

2. The term normal solution is, unfortunately, applied also to a liquid of which a given volume (100 C.c.) corresponds with, or exactly saturates, a given weight (1 Gm.) of only *one* substance. These test-liquids are used for technical purposes, and are of use only when employed for the single object for which they were designed: they are intended to indicate the percentage of the pure substance contained in the product examined. They are often employed by manufacturing chemists.

3. Still another kind of normal solution has its strength based on a *special reaction* which takes place when the solution is used for the purpose for which it was intended, the molecular weight or saturating

power having no relation to its strength.¹ Normal solution of potassium permanganate is sometimes made in this way, based on the amount of oxygen that it can transfer to the substance under examination.

Proximate analysis is a term applied to the examination of organic substances with the view of isolating or determining the proximate principles present, as the proximate analysis of cinchona bark in proving the presence or quantity of the quinine, cinchonine, kinic acid, etc.

Ultimate analysis is a term applied to the examination of organic substances to determine their ultimate elements, as in an analysis of quinine to prove the number of atoms of carbon, hydrogen, oxygen, and nitrogen in it.

Proximate and ultimate analyses require individual skill and experience and the application of methods which can be properly mastered only by special study and practical experience under competent instructors. They should never be attempted by the tyro.

Pharmacopoeial testing and volumetric analysis, on the other hand, are directly in the line of the work of the practical pharmacist, and the apparatus required is simple, whilst the operations to be performed are mostly those which he is called upon to perform daily upon a larger scale.

Practice and experience in analytical work will, if conscientiously followed, prove invaluable in training the pharmacist in those habits of accuracy, neatness, and thoroughness which are absolutely essential to the successful pursuit of his profession.

Apparatus used in Testing.

The United States Pharmacopœia very wisely adopted the metric system in all analytical operations requiring definite weights or measures. It is admirably fitted for analytical work, and is used almost universally by chemists throughout the world: hence the apparatus employed is always based on the metric method.

FIG. 358.

Analytical apparatus case.

It is well for the pharmacist to set apart a case, especially in the laboratory, in which to keep this apparatus. It should never be used for dispensing purposes. Fig. 358 represents such a case, which may be made as attractive as the taste of the owner dictates.

¹ It is greatly to be desired that these last two solutions shall receive some other and appropriate names, and that hereafter the term "normal solution" shall have but one signification.

Graduated Flasks are needed for making standard and normal solutions. These should be accurately stoppered, and the mark on the neck should extend all the way around, and be in the narrowest part. Litre, half-litre, and quarter-litre flasks are all useful (see Fig. 359).

Graduated Jars.—A tall, cylindrical, glass-stoppered jar, graduated into one hundred or one thousand equal parts, is of great service in making test-solutions in smaller quantities (see Fig. 360).

The **Burette** is indispensable in volumetric testing. It is a graduated glass tube, about one-half inch (12.5 mm.) in diameter and twenty inches (50.8 cm.) in length, having its lower end drawn to a narrow orifice, and the other slightly flared to facilitate the pouring in of the test-liquid: to the lower extremity is attached a piece of rubber tubing, the other end of the tubing being armed with a short piece of glass tube having a capillary orifice. The graduations on the tube are extended to one hundred parts or more, each part being subdivided into five or ten equal parts (see Fig. 361). The rubber tube is closed with a spring pinchcock, the form shown in Fig. 173 being preferred. Fig. 362 represents a convenient holder for the burette whilst in use: the latter may be adjusted to any height to accommodate a large or a small beaker. For test solutions that are decomposed by organic substances, like solution of potassium permanganate, the rubber tube is

FIG. 360.

FIG. 361.

FIG. 359.

Litre flask.

Graduated jar.

Burette (enlarged view of end).

Burette-holder in use.

unsuitable, and *all glass* burettes must be used: these are closed with a small glass stopcock. To facilitate the reading of the divisions on the burette, Erdmann's float is employed (see Fig. 363): this is an elongated glass bulb, of slightly less diameter than the burette, loaded at one end with mercury, and having a little glass hook at the top to facilitate its being lifted out with a bent wire: a line is scratched on the bulb around the middle, and it is floated in the liquid in the burette. The actual height of the liquid is a matter of indifference, because the reading is made by comparing the line on the float with that on the burette. With practice, excellent work may be performed without the use of the float, by adopting the habit of always reading off where the lowest point of the

meniscus touches the graduated mark. If the operator is compelled to work in a poor light, the reading of the line may be facilitated by placing a small card, having its lower half blackened, just behind the burette in such a position that the straight line of division between the black and the white portion is very slightly below the surface of the liquid in the burette.

Pipettes may be used for qualitative testing or in small operations. These are intended to be filled by sucking into the graduated tube the quantity of liquid desired: it is retained there by pressing the moistened forefinger on the upper orifice; of course upon raising the finger and applying it again the desired quantity may be made to flow out (see Fig. 364).

The greater part of the apparatus used in such analytical work as the pharmacist is likely to be called upon to perform has been already described in Part I. and elsewhere, and the operations of making solutions, filtration, precipitation, etc., are familiar ones. Glass funnels, beakers, test-tubes, stirring-rods, porcelain capsules, crucibles, reagent and test-solution bottles, etc., will be required.

The amber-glass reagent bottles made by Whittall, Tatum & Co., of Philadelphia (see Fig. 365), are well adapted for the purpose of containing the test-liquids. The bottles hold about four fluidounces, and the

FIG. 363.

Use of the pipette.

FIG. 365.

Reagent bottle.

labels are blown in the glass, the surface of the letters being ground off so that they can be read distinctly. Paper labels are not well adapted for test-liquids, because they are soon destroyed by the corrosive action of acid vapors or the ink-marks are bleached out.

REAGENTS.

I.—PRELIMINARY REMARKS.

Official Substances as Reagents.—Some official substances (chemicals, chemical solutions, etc.) are sufficiently pure to be used as reagents, if they comply with the tests of purity prescribed by the Pharmacopœia. In the case of others, the presence of certain impurities, though immaterial for their use as medicines, renders their employment as reagents unsuitable. Whenever a greater degree of purity is required than is provided for by the text of the Pharmacopœia, it will be specially mentioned in the following lists.

Abbreviations and Signs Used :

T.S. = Test-solution.

V.S. = Volumetric solution.

$\frac{N}{1}$ = Normal (see, under "Volumetric Solutions" in List III.).

$\frac{N}{2}$ = Seminormal; $\frac{N}{10}$ = Decinormal; $\frac{N}{100}$ = Centinormal.

$\frac{2N}{1}$ = Double-normal (sometimes written: 2 N).

* (asterisk) in front of a figure denotes that the quantity or value expressed by the figure is approximate. In the case of a volumetric solution, for instance, *25 C.c. means "about 25 C.c.," and this is to be interpreted as standing for "24.5 to 25.5 C.c.," the allowable variation in such cases being two per cent. either way. In the text of the Pharmacopœia, this is expressed by saying "about 25 C.c.," or "about 16 per cent. of iron," etc.

Keeping of Reagents.—Reagents should be kept in bottles made of glass free from lead and arsenic, and proof against corrosion by acids and alkalies, preferably in those made of Bohemian glass.

The bottles should be closed by well-ground glass stoppers. Stoppers of bottles containing alkali hydrates, ammonium sulphide, ammonia water, tannic acid, and other substances rapidly attacking ground glass surfaces, should be lubricated with a thin film of petrolatum.

Reagents easily affected by light, such as hydrogen sulphide T.S., ammonium sulphide T.S., chlorine water, etc., should be kept in bottles made of dark amber-colored glass.

NOTE.—As some of the following test-solutions are in certain cases directed in definite quantities in lieu of the regular volumetric solutions, it is important that they should always be prepared of the *exact strength prescribed*.

II.—LIST OF REAGENTS AND TEST-SOLUTIONS.

NOTE.—The reagents are arranged in alphabetical order. The test-solutions are usually mentioned in connection with the principal chemical or other substance from which they are prepared. The volumetric solutions will be found in List III. (Nos. 116–185).

Whenever *water* is required or mentioned as a solvent in the tests given in the Pharmacopœia, or in the preparation of any reagent, it is understood that *distilled water* shall be used.

1. **Absolute Alcohol.**—Ethyl alcohol, $C_2H_5OH = 45.9$.—Use the official absolute alcohol [*Alcohol Absolutum*].

2. **Acetic Acid.**— $HC_2H_3O_2 = 59.86$.—Use the official acetic acid [*Acidum Aceticum*].

3. **Albumen Test-Solution.**—Carefully separate the white of a hen's egg from the yolk, shake it thoroughly with 100 C.c. of water, and filter. This solution should be freshly made when required.

4. **Aluminum.**—Metallic aluminum, $Al = 27.04$, in the form of foil, wire, or ribbon. It should be tested for arsenic by Fleitmann's method (see below, No. 18), when no color should be imparted to the silver nitrate within two hours.

5. **Ammonia Water.**— $\text{NH}_3 = 17.01$.—Use the official ammonia water [*Aqua Ammoniac*].

6. **Ammonium Carbonate Test-Solution.**—Dissolve 10 Gm. of ammonium carbonate, $\text{NH}_4\text{HCO}_3 \cdot \text{NH}_3 \cdot \text{NH}_4\text{CO}_3 = 156.77$ [*Ammonii Carbonas*, U. S. P.], in a mixture of 10 C.c. of ammonia water and 40 C.c. of water.

For detecting arsenic sulphide in presence of antimony sulphide, the addition of ammonia water is omitted, and 10 Gm. of the salt are dissolved in a sufficient quantity of water to make 100 C.c.

7. **Ammonium Chloride Test-Solution.**—Dissolve 10 Gm. of ammonium chloride, $\text{NH}_4\text{Cl} = 58.88$ [*Ammonii Chloridum*, U. S. P.], in enough water to make 100 C.c.

8. **Ammonium Molybdate Test-Solution.**—Dissolve 1 Gm. of finely powdered ammonium molybdate, $(\text{NH}_4)_2\text{MoO}_4 = 195.76$, in 6.7 C.c. of hot water, using a little ammonia water, if necessary, to effect solution. Then gradually pour the liquid into a mixture of 8.8 C.c. of nitric acid (sp. gr. 1.414) and 8.4 C.c. of water. Preserve the test-solution in the dark, and, if a sediment should form in it after some days, carefully decant the clear solution from it.

9. **Ammonium Oxalate Test-Solution.**—Dissolve 4 Gm. of pure, crystallized ammonium oxalate, $(\text{NH}_4)_2\text{C}_2\text{O}_4 + \text{H}_2\text{O} = 141.76$, in enough water to make 100 C.c. Or, dissolve 4 Gm. of pure oxalic acid (see below, No. 121) in 100 C.c. of water, add 20 C.c. of ammonia water, boil to expel excess of ammonia, and bring the volume to 118 C.c.

On evaporating a portion of the test-solution, and igniting the residue, it should be completely volatilized (absence of *fixed impurities*). The test-solution should not be rendered turbid by hydrogen sulphide T.S., nor by ammonium sulphide T.S. (absence of *metals*). The precipitate produced in it by silver nitrate T.S., or by barium chloride T.S., should dissolve without residue upon addition of nitric acid (absence of *chloride*, and *sulphate*, respectively).

10. **Ammonium Phosphate Test-Solution.**—Dissolve 1 Gm. of ammonium phosphate, $(\text{NH}_4)_2\text{HPO}_4 = 181.82$, together with 2 C.c. of ammonia water, in enough water to make 100 C.c. This solution does not keep well. It should be freshly made when required, or frequently renewed.

11. **Ammonium Sulphide Test-Solution.**—Saturate 8 parts of pure ammonia water with pure, washed hydrogen sulphide, and add to the solution (which now contains ammonium sulphhydrate, $\text{NH}_4\text{HS} = 50.99$) 2 parts of ammonia water, which converts the greater portion of the ammonium sulphhydrate into ammonium sulphide, $(\text{NH}_4)_2\text{S} = 68.0$. The solution should be perfectly clear and colorless, and, on being evaporated, leave no residue. It should not be rendered turbid either by magnesium sulphate T.S. (absence of *free ammonia*), or by calcium chloride T.S. (absence of *ammonium carbonate*). It should be protected against air and light by being kept in small, dark amber-colored bottles, in a dark place. As soon as a notable deposit of sulphur has made its appearance in the solution, it should be rejected.

Ammonium polysulphide test-solution is occasionally required. This is a yellow liquid, prepared by dissolving a small quantity of pure sulphur in the preceding, colorless ammonium sulphide test-solution.

12. **Arsenic Test, Bettendorff's.**—To a small quantity of the liquid to be tested, which should contain much pure concentrated hydrochloric acid or should be a solution of the substance to be tested in pure, concentrated hydrochloric acid, add an equal volume of a saturated solution of freshly prepared stannous chloride in pure, concentrated hydrochloric acid, together with a small piece of pure tin-foil. The presence of arsenic is revealed by the production of a brown color or brown precipitate, the appearance of which is hastened by a gentle heat (see Stannous Chloride, No. 108).

13. **Arsenic Test, Fleitmann's.**—Into a test-tube of at least 15 Cm. in length, and 15 to 18 Mm. in diameter, place a single, solid piece of zinc (see below, No. 115), weighing about 1 to 1.25 Gm., and add about 6 C.c. of potassium hydrate T.S. [*Liquor Potassæ*, U. S. P.], both ingredients having previously been proven free from arsenic by having been subjected, *alone*, to the test about to be described, during at least two hours, with negative result. Now add the liquid to be tested, which must not contain any free acid, nor very materially increase the volume of the contents of the test-tube. Immediately secure over the mouth of the test-tube a previously prepared cap made of three thicknesses of pure filter paper free from dust, and apply to the upper filter paper a drop of a saturated, aqueous solution of silver nitrate acidulated with nitric acid (see Silver Nitrate T.S., No. 86). Then place the tube at once, upright, into a box containing sand heated to about 90°C . (194°F .),

and fitted with a cover, so as to exclude light and dust, and permit the reaction to proceed for such a time as may be specially prescribed in each case. The presence of arsenic (but not of antimony) is revealed by the production, upon the moistened paper cap, of a brown or black stain. In absence of arsenic, if the test has been carefully conducted, the spot will remain colorless.

In place of zinc, metallic aluminum, best in form of wire, cut into small pieces, may be employed (*Gatehouse's* modification). The method of testing, and the results, are the same as in *Fleitmann's* test.

14. Arsenic Test, Gutzeit's.—Into a test-tube of at least 15 Cm. in length, and 15 to 18 Mm. in diameter, place a single, solid piece of zinc (see below, No. 115), weighing about 1 to 1.25 Gm., and add about 5 C.c. of a mixture, previously prepared and kept in readiness for this purpose, of 10 C.c. of pure sulphuric acid of sp. gr. 1.835, and 190 C.c. of water, the ingredients having previously been proven free from arsenic by having been subjected, *alone*, to the test about to be described, during at least two hours, with negative result. Now add the liquid to be tested, which should not be alkaline, nor exceed 1 C.c. About 1 Cm. below the open end of the test-tube insert a loose plug, about 1 Cm. long, of glass-wool or cotton, which has been moistened with 0.5 C.c. of lead acetate T.S. Then secure over the mouth a cap made of three thicknesses of clean filter paper, and apply to the upper one a drop of a saturated, aqueous solution of silver nitrate, acidulated with nitric acid (see Silver Nitrate T.S., No. 96). Place the tube into a box to exclude light, and let the reaction proceed as long as may be prescribed in each case. The presence of arsenic is shown by the production, upon the moistened paper cap, of a bright yellow stain which becomes black or brown by application of water. Antimony colors the spot black or brown at once without showing a yellow color while dry. In this case, traces of arsenic may be overlooked; it is therefore advisable to subject a fresh portion of the specimen to *Fleitmann's* test (see No. 13), which responds only to arsenic. If the plug moistened with lead acetate T.S. be strongly colored, so that doubt exists whether the coloration be due to metallic silver reduced by arsenic, or to silver sulphide, produced by an escape of H_2S through the plug, moisten the silver stain with diluted nitric acid, which will dissolve the metallic silver reduced by arsenic, but will not affect the black silver sulphide. Or else, put on a new cap of filtering paper, moistened with a drop of lead acetate T.S. If this remain colorless, sulphide is absent.

15. Barium Carbonate.—Pure barium carbonate, $BaCO_3$, = 196.75, prepared by dissolving 12 parts of pure, crystallized barium chloride in 20 parts of boiling water, then adding a solution of 5 parts of ammonium carbonate in 10 parts of boiling water, and afterwards 5 parts of ammonia water; finally washing the precipitate thoroughly and drying it.

16. Barium Chloride Test-Solution.—Prepared from pure barium chloride, $BaCl_2 + 2H_2O$, = 243.56. The aqueous solution of the salt should be perfectly neutral, and should not yield a precipitate with hydrogen sulphide T.S. or ammonium sulphide T.S. (absence of *metals*, etc.). The aqueous solution, after being precipitated by diluted sulphuric acid in slight excess, yields a filtrate which should not leave any permanent residue when evaporated and heated on platinum-foil (absence of *other fixed bases and salts*). Diluted alcohol, after remaining in contact with it for several hours, should, upon ignition, show a pure yellowish-green colored flame, without red streaks (absence of *traces of strontium*). To prepare the *test-solution*, dissolve 12.2 Gm. of the salt in enough water to make 100 C.c. (This solution is of normal strength = $\frac{N}{1}$ V.S., so as to permit of its use for volumetric purposes also.)

17. Barium Hydrate Test-Solution.—A saturated solution of barium hydrate [barium hydroxide, $Ba(OH)_2$, = 170.82] in water. This solution rapidly absorbs carbon dioxide from the air. It is preferably prepared freshly as wanted.

18. Barium Nitrate Test-Solution.—Prepared from pure barium nitrate, $Ba(NO_3)_2$, = 260.68. This salt should respond to the same tests as barium chloride (see No. 16). In addition, its aqueous solution, slightly acidulated with nitric acid, should not be rendered turbid by silver nitrate T.S. (absence of *chloride*). To prepare the *test-solution*, dissolve 1 Gm. of the salt in water to make 15.8 C.c. (This solution is of half normal strength = $\frac{N}{2}$ V.S., so as to permit of its use for volumetric purposes also.)

19. Benzoin, or Petroleum Ether.—Use the official benzoin [*Bensinum*].

20. Benzol, or Benzene.—Benzol, C_6H_6 , = 77.82, is a colorless, transparent liquid of a peculiar, aromatic odor, of a sp. gr. of 0.8846 at 15° C. (59° F.), congealing at 0° C. (32° F.), and boiling at 80.87° C. (176.7° F.). It is insoluble in water, but

soluble in 4 parts of alcohol, and in ether. In concentrated sulphuric acid it should dissolve without producing a color. On shaking 2 C.c. of benzol with 0.5 C.c. of sulphuric acid and 1 drop of fuming nitric acid, no green or blue tint should be produced (absence of *thiophene*).

21. **Brazil Wood Test-Solution.**—See under *Indicators* (No. 49).

22. **Bromine Water** (Bromine Test-Solution), Br = 79.76.—An aqueous solution of bromine [*Bromum*, U. S. P.], prepared by dissolving 1 C.c. of bromine in enough water to make 100 C.c.

23. **Calcium Chloride Test-Solution.**—Dissolve 10.925 Gm. of crystallized calcium chloride, $\text{CaCl}_2 + 6\text{H}_2\text{O} = 218.41$, in enough water to make 100 C.c. (This solution is of normal strength = $\frac{N}{1}$ V.S., so as to permit of its use for volumetric purposes also.)

24. **Calcium Hydrate Test-Solution** (Lime Water), $\text{Ca}(\text{OH})_2 = 73.83$.—Use the official lime water [*Liquor Calcis*].

25. **Calcium Sulphate Test-Solution.**—Introduce transparent crystals of native gypsum (selenite), $\text{CaSO}_4 + 2\text{H}_2\text{O} = 171.65$, into a flask filled with water, and decant the clear, saturated solution when required. One part of gypsum requires, at 15° C. (59° F.), 898 parts of water for solution.

26. **Carbon Disulphide.**—Use the official carbon disulphide [*Carboni Disulphidum*].

27. **Chlorine Water** (Chlorine Test-Solution), Cl = 85.87.—Use the official chlorine water [*Aqua Chlori*]. Since it rapidly deteriorates by keeping, it should be frequently renewed, or freshly prepared when required.

28. **Chloroform**, $\text{CHCl}_3 = 119.08$.—Use the official chloroform [*Chloroformum*].

29. **Cobaltous Nitrate Test-Solution.**— $\text{Co}(\text{NO}_3)_2 + 6\text{H}_2\text{O} = 290.14$. The crystallized, commercial salt is sufficiently pure, if, after it is dissolved in water, and the cobalt completely precipitated by ammonium sulphide T.S., the filtrate leaves no residue on evaporation. To make the *test-solution*, dissolve 1 Gm. of the salt in 10 C.c. of water.

30. **Cochineal Test-Solution.**—See under *Indicators* (No. 50).

31. **Copper** (Metallic Copper), Cu = 63.18, in form of wire, foil, or turnings. The commercial article, brightened, if necessary, by scouring with diluted hydrochloric acid, is suitable for all purposes except testing for arsenic. If required for this purpose, the absence of arsenic must first be proven. A small portion (about 0.5 Gm.) of the copper is to be dissolved in hot, concentrated sulphuric acid, and this solution subjected to Gutzeit's test (see No. 14). No color should be imparted to the silver nitrate within two hours (absence of *arsenic*).

32. **Cupric Ammonium Sulphate Test-Solution.**—A solution of cupri-tetrammonium sulphate, $\text{Cu}(\text{NH}_4)_2\text{SO}_4 + \text{H}_2\text{O} = 245.0$. To copper sulphate T.S. add ammonia water, until the precipitate first formed is nearly, but not completely, redissolved; then filter. This solution is apt to decompose on keeping. It should be made freshly when required.

33. **Cupric Sulphate Test-Solution.**—Dissolve 10 Gm. of cupric sulphate, $\text{CuSO}_4 + 5\text{H}_2\text{O} = 248.8$ [*Cupri Sulphas*, U. S. P.], in enough water to make 100 C.c.

34. **Cupric Tartrate Test-Solution.**—See below, under *Volumetric Solutions*, No. 117.

35. **Corallin Test-Solution.**—See under *Indicators* (No. 51).

36. **Diphenylamine, and Diphenylamine Test-Solution.**—See under *Indicators* (No. 52).

37. **Eosin Test-Solution.**—See under *Indicators* (No. 53).

38. **Ether.**—Use the official ether [*Ether*]. It should be strictly neutral to litmus paper.

39. **Ferric Ammonium Sulphate Test-Solution.**—Dissolve 10 Gm. of ferric ammonium sulphate [*Ferri et Ammonii Sulphas*, U. S. P.] in enough water to make 100 C.c.

40. **Ferric Chloride Test-Solution.**—Dissolve 10 Gm. of ferric chloride, $\text{Fe}_2\text{Cl}_6 + 12\text{H}_2\text{O} = 539.60$ [*Ferri Chloridum*, U. S. P.], in enough water to make 100 C.c.

41. **Ferrous Sulphate Test-Solution.**—Dissolve a clear crystal of ferrous sulphate, $\text{FeSO}_4 + 7\text{H}_2\text{O} = 277.42$ [*Ferri Sulphas*, U. S. P.], in about 10 parts of water previously boiled to expel air. This solution should be freshly prepared immediately before use.

42. **Ferrous Sulphide**, $\text{FeS} = 87.86$.—A heavy solid, in form of black or brownish-black irregular masses, or fused into sticks, soluble in sulphuric or hydrochloric acid with copious evolution of hydrogen sulphide. On dissolving 2 Gm. of ferrous sulphide in pure nitro-hydrochloric acid diluted with a little water, evaporating the

solution to dryness, and testing the residue for arsenic by Gutzeit's method (see No. 14), no color should be imparted to the silver nitrate within two hours.

43. **Fluorescein Test-Solution.**—See under *Indicators* (No. 54).

44. **Gelatin Test-Solution.**—Dissolve 1 Gm. of isinglass [*Ichthyocolla*, U. S. P.] in 50 C.c. of water, by the aid of a gentle heat, and filter if necessary. This solution should be freshly made when wanted for use.

45. **Gold Chloride Test-Solution.**—The commercial chloride of gold, usually prepared by dissolving gold in nitro-hydrochloric acid and carefully evaporating to dryness, mostly consists of aurochloric acid, $\text{HAuCl}_4 + 2\text{H}_2\text{O} = 375.1$, which is converted into neutral auric chloride, $\text{AuCl}_3 = 302.81$, by fusing it at a temperature not exceeding 150°C. (302°F.), moistening the residue (now consisting of auric and aurous chloride) with enough hot water to produce a syrupy liquid (whereby the aurous chloride is decomposed into auric chloride and metallic gold), and then pouring off the clear liquid from the precipitate. To prepare the *test-solution*, dissolve the liquid finally obtained in the before-mentioned process in 20 volumes of water. Or, dissolve 1 Gm. of dry auric chloride in 30 C.c. of water.

46. **Hydrochloric Acid, Pure, for Tests, $\text{HCl} = 36.87$.**—In addition to the tests prescribed for this acid in the text of the Pharmacopœia, it is required to conform to the following more rigorous tests, before it can be employed as a reagent: The addition of 1 C.c. of barium chloride T.S. to 1 C.c. of the acid diluted with 9 C.c. of water should cause no turbidity within twenty-four hours (absence of *sulphuric acid*). A crystal of diphenylamine dropped into the acid should not turn blue (absence of *free chlorine*). On substituting it for sulphuric acid in Gutzeit's test, as described under No. 14, no color should be imparted to the silver nitrate within two hours (absence of *arsenic or antimony*).

47. **Hydrogen Sulphide, $\text{H}_2\text{S} = 33.98$.**—A gas generated by treating ferrous sulphide with diluted sulphuric acid, and washing the gas by passing it through water.

48. **Hydrogen Sulphide Test-Solution, or Hydrosulphuric Acid, $\text{H}_2\text{S} = 33.98$.**—A saturated, aqueous solution of hydrogen sulphide. To prepare about 1 liter of the solution, treat 20 Gm. of ferrous sulphide, in a suitable apparatus, with a mixture of 20 C.c. of pure sulphuric acid, sp. gr. 1.835, and 250 C.c. of water, pass the gas through a wash-bottle containing a small quantity of water, and conduct it into a bottle of the capacity of about $1\frac{1}{2}$ liters, containing 1 liter of water. When the gas is no longer absorbed, transfer the solution to small, dark amber-colored bottles, to be filled nearly to the top, pass a stream of hydrogen sulphide for a few minutes through each, and then at once stopper them tightly, and preserve them afterwards in a cool and dark place. Before putting them aside, introduce into one of these bottles a few drops of pure hydrochloric acid, and keep it in a warm place during twenty-four hours, after which time no precipitate should be found in it (absence of *arsenic*). Before any of the solution is used, it should be ascertained that it retains a strong odor of hydrogen sulphide, and that, when it is added to an equal volume of ferric chloride T.S., a copious precipitate of sulphur is formed at once.

Indicators for Acidimetry, Alkalimetry, etc.

(Nos. 49-59.)

NOTE.—Each test-solution used as *indicator* should be examined as soon as prepared, and afterwards from time to time, as to its neutrality. If necessary, it should be brought, by the cautious addition of diluted sulphuric acid, or of a dilute solution of an alkali, to such a point that, when a few drops of it are added to 25 C.c. of water, a single drop of a centinormal acid or alkali V.S., respectively, will distinctly develop the corresponding tints.

Since many of the colored test-solutions are injured by exposure to light, it is best to preserve them in dark amber-colored vials. Papers prepared with them should be kept in dark bottles or paper boxes.

49. **Brazil-Wood Test-Solution.**—Boil 50 Gm. of finely cut Brazil-wood [the heart-wood of *Peltophorum dubium* (Sprengel) Britton, nat. ord. *Leguminosæ*] with 100 C.c. of water during half an hour, replacing the water from time to time. Allow the mixture to cool, strain, wash the contents of the strainer with water until 100 C.c. of strained liquid are obtained, add 25 C.c. of alcohol, and filter. This solution turns purplish-red with alkalis, and yellow with acids.

50. **Cochineal Test-Solution.**—Macerate 1 Gm. of unbroken cochineal [*Coccus*, U. S. P.] during four days, with 20 C.c. of alcohol and 60 C.c. of water. Then filter. The color of this test-solution turns violet with alkalis, and yellowish-red with acids. As an indicator it is used chiefly when ammonia or alkaline earths are present.

51. Corallin Test-Solution.—Dissolve 1 Gm. of corallin (a coloring matter derived from coal-tar, and containing rosolic and pararosolic acids) in 10 C.c. of alcohol and enough water to make 100 C.c.

52. Diphenylamine, (C_6H_5)₂NH—168.65, is in form of grayish-white or colorless crystals, of a peculiar, aromatic odor, melting at $54^\circ C.$ ($129.2^\circ F.$), slightly soluble in water, more soluble in acids. It is used either in the dry state, or in solution in dilute sulphuric acid, as a test for nitric acid (in sulphuric acid, water, etc.), or for chlorine (in hydrochloric acid). To test a solution for the presence of nitric acid, a small portion of it is mixed with 1 or 2 drops of diphenylamine T.S., and then concentrated sulphuric acid, *free from nitrore*, is poured in so as to form a layer beneath the solution. The presence of nitric acid is shown by a deep blue color at the zone of contact.

Diphenylamine test-solution is prepared by dissolving 0.1 Gm. of diphenylamine in 60 C.c. of diluted sulphuric acid. The solution should be colorless.

53. Eosin Test-Solution.—Dissolve 1 Gm. of commercial "yellowish" eosin [$K_2C_{20}H_6Br_2O_{11}$] in 80 C.c. of water. This solution is red by transmitted light, and shows a strong green fluorescence by reflected light. Acids destroy the fluorescence, and alkalis restore it.

54. Fluorescein Test-Solution.—Agitate 1 Gm. of fluorescein [$C_{20}H_{12}O_5$] with 100 C.c. of diluted alcohol, until the latter is saturated; then filter. This solution shows a strong green fluorescence, by reflected light, in the presence of the least excess of an alkali.

55. Litmus Paper and Test-Solution.—Exhaust coarsely powdered litmus with boiling alcohol (which removes a peculiar, red coloring matter, erythrolitmin), and digest the residue with about an equal weight of cold water, so as to dissolve the excess of alkali present. The blue solution thus obtained, after being acidulated, may be used to make *red litmus paper*. Finally extract the residue with about 5 times its weight of boiling water, and filter. Preserve the filtrate, as *test-solution*, in wide-mouthed bottles stoppered with loose plugs of cotton to exclude dust but to admit air.

Litmus Paper, Blue.—Impregnate, with the test-solution just described, strips of white, unsized paper, free from wood-pulp, but not too porous, and dry them by suspending them on strings of clean twine.

Litmus Paper, Red.—Prepare this with the same kind of paper and in the same manner as described in the preceding paragraph. To impregnate the paper, either use the blue solution obtained from litmus, by treating the mass, after extraction by alcohol, with cold water, acidulating the same with just enough hydrochloric acid to impart to it a distinctly red tint; or, use the regular test-solution, after acidulating it in the same manner.

Neither blue nor red litmus paper should have a very intense color.

Preserve the test paper in paper boxes or bottles, so as to exclude dust and acid or ammoniacal vapors.

56. Methyl-Orange Test-Solution.—Dissolve 1 Gm. of methyl-orange [the sodium or ammonium salt of dimethylamidoazobenzolsulphonic acid, $HC_{14}H_{11}N_2SO_3$, = 304.47; also known as helianthin, or tropæolin D, or Poirrier's Orange 8 P] in 1000 C.c. of water. Add to it, carefully, diluted sulphuric acid, in drops, until the liquid turns red and just ceases to be transparent. Then filter.

The solution acquires a yellow color when brought in contact with alkali hydrates, carbonates, or bicarbonates. Carbonic acid does not affect it, but sulphuric, hydrochloric, and other acids change its color to crimson. It is not suited for use with organic acids.

57. Phenolphthalein Test-Solution.—Dissolve 1 Gm. of phenolphthalein [$C_{20}H_{14}O_4$] in 100 C.c. of diluted alcohol. The solution is colored deep purplish-red by alkali hydrates or carbonates; bicarbonates and most other salts do not produce such color; acids render the reddened solution colorless. It is not suitable as an indicator for ammonia or bicarbonates.

Phenolphthalein Paper is prepared by impregnating white, unsized paper with the test-solution and drying it.

58. Rosolic Acid Test-Solution.—Dissolve 1 Gm. of commercial rosolic acid [chiefly methylaurin, $C_{20}H_{10}O_5$, = 303.28] in 10 C.c. of diluted alcohol, and add enough water to make 100 C.c. The solution turns violet-red with alkalis, yellow with acids. In place of rosolic acid, commercial pæonin (also known as aurin R) [chiefly $C_{19}H_{14}O_5$, = 289.81] may be employed.

59. Turmeric Tincture.—Digest any convenient quantity of ground curcuma root [from *Curcuma longa* Linné, nat. ord. *Scitamineæ*] repeatedly with small quantities

of water, and throw this liquid away. Then digest the dried residue for several days with six times its weight of alcohol, and filter.

Turmeric Paper.—Impregnate white, unsized paper with the tincture, and dry it. The tincture, as well as the paper, turns brown with alkalis, and the yellow color is restored by acids. Boric acid, however, even in presence of hydrochloric acid, turns the color to reddish-brown, and this is changed to bluish-black by ammonia.

60. Indigo Test-Solution.—Place 6 Gm. (3.3 C.c.) of fuming sulphuric acid into a beaker well cooled by immersion in water, and stir into it, very gradually, 1 Gm. of finely powdered Bengal indigo. Set the mixture aside for two days, then pour it into 20 C.c. of water, and decant. Or, dissolve 1 Gm. of commercial indigo-carmin (the sodium or potassium salt of sulphindigotic acid) in 150 C.c. of water.

61. Iodine Test-Solution.—For preparing the ordinary test-solution (as a reagent for starch, alcohol by iodoform test, etc.), iodine, $I = 126.53$, fulfilling the requirements of the Pharmacopœia [see *Iodum*, U. S. P.], is sufficiently pure. For this purpose dissolve 1 Gm. of iodine and 8 Gm. of potassium iodide in 60 C.c. of water.

For use in volumetric analysis, or in other cases where the ordinary impurities present in official iodine are objectionable, *Purified Iodine* must be employed. See under No. 120.

62. Iron, Metallic, $Fe = 55.88$.—Bright and perfectly clean iron in the form of wire, sheet, or filings, according to the uses to be made of it. For making solutions of pure iron salts, fine, thin, bright wire (so-called florists' wire) should be used. For detecting copper, bright pieces of sheet iron or knitting-needles are used; for detecting nitric acid, by reduction to ammonia, iron-filings are preferable.

63. Lead Acetate Test-Solution.—Dissolve 10 Gm. of clear, transparent crystals of lead acetate, $Pb(C_2H_3O_2)_2 + 8H_2O = 378.0$ [*Plumbi Acetas*, U. S. P.], free from adhering lead carbonate, in enough water to make 100 C.c. Preserve the solution in well-stoppered bottles.

64. Basic Lead Acetate Test-Solution.—Use the official solution of lead subacetate [*Liquor Plumbi Subacetatis*].

65. Litmus Paper and Test-Solution.—See under *Indicators* (No. 55).

66. Magnesia Mixture.—Dissolve 10 Gm. of magnesium sulphate [*Magnesi Sulphas*, U. S. P.], and 20 Gm. of ammonium chloride [*Ammonii Chloridum*, U. S. P.], in 80 C.c. of water, add 42 C.c. of ammonia water, set the mixture aside for a few days in a well-stoppered vessel, and filter. It should never be used freshly made.

67. Magnesium Sulphate Test-Solution.—Dissolve 10 Gm. of magnesium sulphate, $MgSO_4 + 7H_2O = 245.84$ [*Magnesi Sulphas*, U. S. P.], in enough water to make 100 C.c.

68. Mercuric Chloride Test-Solution.—Dissolve 5 Gm. of mercuric chloride, $HgCl_2 = 270.54$ [*Hydrargyri Chloridum Corrosivum*, U. S. P.], in enough water to make 100 C.c.

69. Mercuric Potassium Iodide Test-Solution.—Use the decinormal mercuric potassium iodide volumetric solution (No. 121).

70. Alkaline Mercuric Potassium Iodide Test-Solution. (Nessler's Solution.)—Dissolve 5 Gm. of potassium iodide [*Potassii Iodidum*, U. S. P.] in 5 C.c. of hot water, and add to this a hot solution of 2.5 Gm. of mercuric chloride [*Hydrargyri Chloridum Corrosivum*, U. S. P.] in 10 C.c. of water. To the turbid, red mixture add 16 Gm. of potassium hydrate [*Potassa*, U. S. P.], dissolved in 40 C.c. of water, and finally make up the volume to 100 C.c. A surplus of red mercuric iodide deposits on cooling, and may be left in the bottle, the clear solution being decanted as needed.

71. Mercurous Nitrate Test-Solution, $Hg_2(NO_3)_2 + 2H_2O = 559.8$.—Into a porcelain capsule put 1 Gm. of pure mercury with 0.5 C.c. of pure nitric acid and 0.5 C.c. of distilled water, and place it for 24 hours into a cool, dark room. Separate and drain the crystals, and dissolve them in 100 C.c. of water. Preserve the solution in a dark amber-colored bottle, into which a small globule of mercury has been placed.

72. Methyl Alcohol, $CH_3OH = 81.98$.—For the identification of salicylic acid, the rectified, commercial wood-alcohol, having a specific gravity of about 0.820, is sufficiently pure, if it forms a clear, transparent mixture with an equal volume of distilled water.

73. Methyl-Orange Test-Solution.—See under *Indicators* (No. 56).

74. Nitric Acid, Pure, for Tests, $HNO_3 = 62.89$.—In addition to the tests prescribed for this acid in the text of the Pharmacopœia, it is required to conform to the

following more rigorous test before it can be used as a reagent: On supersaturating 0.5 C.c. of the acid with pure potassium hydrate T.S., and testing a portion of this solution by Fleitmann's method (see under No. 18), no color should be imparted to the silver nitrate within two hours (absence of *arsenic*).

75. **Fuming Nitric Acid (Red Fuming Nitric Acid).**—The commercial acid will answer, if it is of specific gravity 1.450 or over. It should be carefully kept in glass-stoppered bottles in a cool place.

76. **Oxalic Acid Test-Solution.**—Use the decinormal volumetric solution (No. 123).

77. **Phenolphthalein Test-Solution.**—See under *Indicators* (No. 57).

78. **Picric Acid Test-Solution.**—Dissolve 1 Gm. of pure, distinctly crystalline picric acid (trinitrophenol), $C_6H_3(NO_3)_3OH = 228.57$, in 100 C.c. of water, cool the solution, and filter, if necessary.

79. **Platinic Chloride Test-Solution.**—Heat 1 Gm. of pure platinum, in chips, with 6 C.c. of concentrated hydrochloric acid to $80^\circ C.$ ($186^\circ F.$), and very gradually add 1 C.c. of strong nitric acid (sp. gr. 1.414) until very nearly all the platinum is dissolved. Evaporate the solution to dryness on a water-bath, moisten the residue with a few drops of hydrochloric acid, and again evaporate to expel the excess of acid. Dissolve the residue in 20 C.c. of water. The *test-solution* may also be prepared by dissolving 1.7 Gm. of neutral platinic chloride, $PtCl_4 = 385.78$, or 2.6 Gm. of chloroplatinic acid, $H_2PtCl_6 + 6H_2O = 516.28$, in 20 C.c. of water. On evaporating a small portion of the solution to dryness and igniting the residue, pure, metallic platinum should be left behind, which should yield nothing soluble to nitric acid.

80. **Potassium Carbonate Test-Solution.**—Dissolve 10 Gm. of anhydrous potassium carbonate, $K_2CO_3 = 137.91$ [prepared from *Potassii Carbonas*, U. S. P.], in enough water to make 100 C.c.

81. **Potassium Chromate Test-Solution.**—Dissolve 1 Gm. of potassium chromate, $K_2CrO_4 = 193.9$, in enough water to make 10 C.c. On adding silver nitrate T.S. to a little of the solution, a red precipitate is produced which should be completely dissolved by nitric acid (absence of *chloride*). Another portion of the solution, mixed with an equal volume of diluted hydrochloric acid, should yield no precipitate with barium chloride T.S. (absence of *sulphate*).

82. **Potassium Cyanide Test-Solution.**—This should be freshly prepared, when required, by dissolving 1 Gm. of potassium cyanide, $KCN = 65.01$ [*Potassii Cyanidum*, U. S. P.], in 4 parts of water.

83. **Potassium Dichromate.**—Use the official potassium bichromate, $K_2Cr_2O_7 = 298.78$ [*Potassii Bichromas*].

84. **Potassium Dichromate Test-Solution.**—Dissolve 10 Gm. of potassium dichromate [*Potassii Bichromas*, U. S. P.] in enough water to make 100 C.c.

85. **Potassium Ferricyanide Test-Solution.**—Dissolve 1 part of potassium ferricyanide, $K_3Fe(CN)_6 = 657.7$, in about 10 parts of water. This solution should be made freshly when required, as it is rapidly decomposed by light. A freshly prepared, aqueous solution, when mixed with some ferric chloride T.S. and diluted with water, should show a brown tint, free from turbidity or a shade of green.

86. **Potassium Ferrocyanide Test-Solution.**—Dissolve 10 Gm. of potassium ferrocyanide, $K_4Fe(CN)_6 + 8H_2O = 421.76$, in enough water to make 100 C.c.

87. **Potassium Hydrate Test-Solution,** $KOH = 55.99$.—Use the official solution of potassa [*Liquor Potassae*]. For use in Fleitmann's test for arsenic (see above, No. 18), it should have previously been subjected, by itself, to this test, for at least two hours, with negative result (absence of *arsenic*).

88. **Potassium Iodide Test-Solution.**—Dissolve 16.556 Gm. of potassium iodide, $KI = 165.56$ [*Potassii Iodidum*, U. S. P.], in enough water to make 100 C.c., and keep the solution in dark amber-colored, well-stoppered bottles to prevent the formation of iodate. The solution should be frequently renewed, or freshly prepared when required. (This solution is of normal strength $= \frac{N}{1}$ V.S., so as to permit of its use for volumetric and gasometric purposes also.)

89. **Potassium Nitrate.**—The dry salt, $KNO_3 = 100.92$ [*Potassii Nitras*, U. S. P.], responding to the tests of purity required by the Pharmacopœia, particularly to those for absence of chloride and sulphate.

90. **Potassium Permanganate,** $KMnO_4 = 157.67$.—See below, under No. 127.

91. **Potassium Sulphate Test-Solution.**—Dissolve 1 Gm. of potassium sulphate, $K_2SO_4 = 178.88$ [*Potassii Sulphas*, U. S. P.], in enough water to make 115 C.c. (This solution is of decinormal strength $= \frac{N}{10}$ V.S., so as to permit of its use for volu-

metric purposes also, as a substitute for decinormal sulphuric acid, when it is desired not to disturb the neutrality of a liquid.)

92. Potassium Sulphocyanate Test-Solution, $\text{KSCN} = 96.99$.—Use the decinormal volumetric solution (No. 129).

93. Pyrogallol.—Use the official pyrogallol, $\text{C}_6\text{H}_3(\text{OH})_3 = 125.7$ [*Pyrogallol*].

94. Rosolic Acid.—See under *Indicators* (No. 58).

95. Silver Ammonium Nitrate Test-Solution.—Dissolve 1 Gm. of silver nitrate [*Argentum Nitras*, U. S. P.] in 20 C.c. of water, and add ammonia water, drop by drop, until the precipitate first produced is almost, but not entirely, redissolved. Filter the solution, and preserve it in dark amber-colored and well-stoppered bottles.

96. Silver Nitrate Test-Solution, $\text{AgNO}_3 = 169.55$.—For ordinary purposes, use the decinormal volumetric solution (see No. 180). For Gutzeit's test (No. 14), use a saturated solution of silver nitrate in water acidulated with about 1 per cent. of nitric acid.

97. Silver Sulphate Test-Solution.—Dissolve 1 Gm. of silver nitrate [*Argentum Nitras*, U. S. P.] in 0.5 C.c. of warm water, and add 1.5 C.c. of pure, concentrated sulphuric acid. On cooling, small transparent crystals of silver sulphate, $\text{Ag}_2\text{SO}_4 = 311.14$, separate. Carefully pour off the acid liquid, wash the crystals repeatedly, by decantation, with cold water, transfer them to a bottle, add 100 C.c. of water, and agitate so as to produce a saturated solution. For use, decant a sufficient quantity of the latter.

98. Sodium Acetate Test-Solution.—Dissolve 10 Gm. of sodium acetate [*Sodium Acetas*, U. S. P.] in enough water to make 100 C.c.

99. Sodium Bitartrate Test Solution.—Dissolve 150 Gm. of tartaric acid [*Acidum Tartaricum*, U. S. P.] in 100 C.c. of hot water, and divide the solution into two equal portions. Neutralize one of these accurately with sodium bicarbonate (which will require about 84 Gm. of this salt), and then add the other portion of the acid solution. On cooling, crystals of sodium bitartrate, $\text{NaHC}_4\text{H}_4\text{O}_6 + \text{H}_2\text{O} = 189.6$, will separate. Remove these, dry them, and keep them in well-stoppered bottles. The test-solution is freshly prepared, when required, by dissolving 1 Gm. of the salt in 4 C.c. of water.

100. Sodium Carbonate.—The anhydrous salt, $\text{Na}_2\text{CO}_3 = 105.85$, conforming to the tests of purity prescribed by the Pharmacopœia for *Sodium Carbonas*, but absolutely free from chloride or sulphate.

101. Sodium Carbonate Test-Solution.—Dissolve 10.6 Gm. of anhydrous sodium carbonate [No. 100; $\text{Na}_2\text{CO}_3 = 105.85$] in enough water to make 100 C.c. (This solution is of double normal strength $= \frac{2}{N}$ V.S., so as to permit of its use for volumetric purposes also.)

102. Sodium Cobaltic Nitrite Test-Solution.— $\text{Co}_3(\text{NO})_2 \cdot 6\text{NaNO}_2 + \text{H}_2\text{O} = 824.82$. Dissolve 4 Gm. of cobaltous nitrate, $\text{Co}(\text{NO})_2 + 6\text{H}_2\text{O} = 290.14$, and 10 Gm. of sodium nitrite, $\text{NaNO}_2 = 68.98$, in about 50 C.c. of water, add 2 C.c. of acetic acid, and dilute with enough water to make 100 C.c. Should any of the nitrous acid be lost by keeping the solution, a few drops of acetic acid may be added.

103. Sodium Hydrate Test-Solution, $\text{NaOH} = 39.96$.—Use the official solution of sodium hydrate [*Liquor Sodæ*, U. S. P.].

104. Sodium Hyposulphite, or Thiosulphate, $\text{Na}_2\text{S}_2\text{O}_3 + 5\text{H}_2\text{O} = 247.64$.—See below, under No. 188.

105. Sodium Nitrite, $\text{NaNO}_2 = 68.98$.—The purest commercial salt, generally in form of pencils, is sufficiently pure.

106. Sodium Nitroprusside Test-Solution.—Dissolve 1 part of sodium nitroprusside, $\text{Na}_2\text{Fe}(\text{NO})(\text{CN})_5 + 2\text{H}_2\text{O} = 297.67$, in 10 parts of water immediately before using.

107. Sodium Phosphate Test-Solution.—Dissolve 10 Gm. of sodium phosphate, $\text{Na}_2\text{HPO}_4 + 12\text{H}_2\text{O} = 357.32$ [*Sodium Phosphas*, U. S. P.], in enough water to make 100 C.c.

108. Stannous Chloride Test-Solution.—Heat pure tin (see No. 118), in form of foil or granules, with concentrated hydrochloric acid, taking care that the metal be in excess. When the acid is saturated, crystals of stannous chloride, $\text{SnCl}_2 + 2\text{H}_2\text{O} = 225.46$, begin to form. Remove and drain these, dissolve them in 10 parts of water, and preserve the solution in well-stoppered bottles, into each of which a granule of pure tin, or a piece of pure tin-foil, has previously been introduced.

For Bettendorff's test (see above, No. 12), pure concentrated hydrochloric acid is saturated with the freshly prepared crystals.

109. Starch Test-Solution.—Mix 1 Gm. of starch with 10 C.c. of cold water, and then add enough boiling water, under constant stirring, to make about 200 C.c.

of a thin, transparent jelly. If it is desired to preserve this test-solution for any length of time, 10 Gm. of zinc chloride, $\text{ZnCl}_2 = 135.84$ [*Zinci Chloridum*, U. S. P.], should be added to it, and the solution transferred to small bottles, which should be well stoppered.

110. Sulphuric Acid, Pure, for Tests, $\text{H}_2\text{SO}_4 = 97.82$.—The sulphuric acid of the Pharmacopœia, which may have a specific gravity as low as 1.835, will answer as a reagent for most purposes, provided it is of the required degree of purity. But when "concentrated" sulphuric acid is specially directed in a test, it is intended that the strongest obtainable, pure acid, of a specific gravity of not less than 1.840, be employed.

In addition to the tests prescribed for this acid in the text of the Pharmacopœia, it is required to conform to the following more rigorous tests before it can be employed as a reagent. If 1 C.c. of diphenylamine T.S. (see No. 52) be carefully poured, as a separate layer, upon 5 C.c. of sulphuric acid, contained in a test-tube, no distinct blue color should appear in the zone of contact (absence of *nitric acid*). If a few crystals of pyrogallol [*Pyrogallol*, U. S. P.] be dissolved in about 1 C.c. of pure water, and this solution be carefully poured, as a separate layer, upon some of the sulphuric acid, contained in a test-tube, no brown color should appear in the zone of contact (absence of *nitric* or *nitrous acid*). If a small portion of the acid be subjected to Gutzeit's test, as described under No. 14, no color should be imparted to the silver nitrate within two hours (absence of *arsenic*, etc.).

If it is impossible to obtain any sulphuric acid which will comply with each of these requirements, two kinds of the acid may be kept, one absolutely free from arsenic, for making the arsenic tests; the other free from nitrose (nitric and nitrous acids), for the detection of nitric acid.

111. Tannic Acid Test-Solution.—Dissolve 1 Gm. of tannic acid, $\text{HC}_7\text{H}_5\text{O}_5 = 821.22$ [*Acidum Tannicum*, U. S. P.], in 1 C.c. of alcohol and enough water to make 10 C.c., immediately before use.

112. Tartaric Acid Test-Solution.—Dissolve 1 part of tartaric acid, $\text{H}_2\text{C}_4\text{H}_4\text{O}_6 = 149.64$ [*Acidum Tartaricum*, U. S. P.], in 8 parts of water. In the volumetric estimation of soda in potassa, directed by the preceding text of the Pharmacopœia, the tartaric acid test-solution employed for precipitating the potassa should contain 8 Gm. of the acid in 20 C.c. Since fungous growths rapidly destroy the solution of tartaric acid, it should be prepared only as wanted.

113. Tin.—Pure metallic tin, $\text{Sn} = 118.8$, in form of granules. Its solution in hydrochloric acid should not be precipitated by potassium sulphate T.S. (absence of *lead*), and, when examined by Gutzeit's test, as described under No. 14, it should not cause silver nitrate to become colored within two hours (absence of *arsenic*).

114. Turmeric Paper and Tincture.—See under *Indicators* (No. 59).

115. Zinc.—Metallic zinc, $\text{Zn} = 65.1$, preferably in the form of thin pencils about 5 Mm. in diameter, prepared by fusing the metal and casting it in moulds, or in form of thin sheets. It should respond to all the tests required by the text of the Pharmacopœia, and in addition, when examined by Gutzeit's test, as described under No. 14, it should not cause the silver nitrate to become colored within two hours (absence of *arsenic*).

116. Zinc-Iodide-Starch Test-Solution.—To 100 C.c. of freshly prepared starch test-solution (see No. 109) add 5 Gm. of zinc chloride [*Zinci Chloridum*, U. S. P.] and 8 Gm. of zinc iodide [*Zinci Iodidum*, U. S. P.]. Preserve the colorless solution carefully in small, dark amber-colored and well-stoppered vials.

III.—VOLUMETRIC SOLUTIONS.

Note.—Since most of the volumetric instruments (burettes, pipettes, mixing cylinders, flasks, etc.) which are for sale in the market are graduated to hold the number of cubic centimeters indicated by weighing into them the corresponding number of grammes of water at the temperature of 15.556°C. (60°F.), or 15°C. (59°F.), it is necessary not to deviate materially from this temperature in making the volumetric solutions, or in using them in testing.

All measuring vessels employed for volumetric determinations should agree among themselves in accuracy of graduation.

All bottles in which volumetric solutions are to be kept, as well as the burettes or pipettes in which they are to be measured, should, prior to use, be rinsed with a small quantity of the solution they are to contain.

Volumetric solutions are designated as normal ($\frac{N}{1}$) when they contain in 1 liter the molecular weight of the active reagent, expressed in grammes, and reduced to the valency corresponding to one atom of replaceable hydrogen or its equivalent.

Thus, hydrochloric acid, $\text{HCl} = 36.87$, having but one H atom replaceable by a basic element, has 36.87 Gm. of HCl in 1000 C.c. of the normal volumetric solution; while sulphuric acid, $\text{H}_2\text{SO}_4 = 97.82$, having two replaceable H atoms, contains only one-half this number, or 48.91 grammes of H_2SO_4 in 1000 C.c. of its normal solution. Potassium hydrate, $\text{KOH} = 56.99$, has but one K to replace one H in acids, hence its normal solution contains 56.99 grammes of KOH in one liter. Two molecules of potassium permanganate, $2\text{KMnO}_4 = 815.84$, in oxidation, give off five atoms of O, which are equivalent to ten atoms of H; hence its normal solution should contain $\frac{815.84}{10}$ or 81.584 Gm. in 1 liter.

Solutions containing in 1 liter one-tenth of the quantity of the active reagent in the normal solution are called decinormal ($\frac{N}{10}$); those containing one one-hundredth, centinormal ($\frac{N}{100}$); those containing twice the amount, double-normal ($\frac{2}{N}$); half the amount, seminormal ($\frac{N}{2}$).

Solutions containing quantities of the active reagent having no simple relation to the molecular weight are called empirical.

In the following list full decimals are given, which, however (especially when delicate balances and weights are not at hand), are in practice frequently abbreviated or rounded off, as, for instance, oxalic acid: 62.85 Gm. to 63 Gm.

When weighing out portions of a substance which is to be tested volumetrically, it will, in most cases, be advantageous to weigh out such a multiple of the amount required as will suffice for several repetitions of the test, and will, at the same time, bring the amount to be weighed out as near to a whole number of grammes as possible.

117. Alkaline Cupric Tartrate Volumetric Solution.

[FEHLING'S SOLUTION.]

A. The Copper Solution.—Dissolve 34.64 Gm. of carefully selected, small crystals of pure cupric sulphate, showing no trace of efflorescence or of adhering moisture, in a sufficient quantity of water to make the solution measure, at or near 15°C . (59°F .), exactly 500 C.c.

Keep this solution in small, well-stoppered bottles.

B. The Rochelle Salt Solution.—Dissolve 173 Gm. of potassium and sodium tartrate [*Potassii et Sodii Tartras*, U. S. P.], and 125 Gm. of potassium hydrate [*Potassa*, U. S. P.], in a sufficient quantity of water to make the solution measure, at or near 15°C . (59°F .), exactly 500 C.c.

Keep the solution in small, rubber-stoppered bottles.

For use, mix exactly equal volumes of the two solutions at the time required.

One Cubic Centimeter of the mixed solution is the equivalent of :

	Gramme.
Cupric Sulphate, crystallized, $\text{CuSO}_4 + 5\text{H}_2\text{O}$	0.03464
Cupric Tartrate, $\text{CuC}_4\text{H}_4\text{O}_6 + 3\text{H}_2\text{O}$	0.03685
Glucose, anhydrous, $\text{C}_6\text{H}_{12}\text{O}_6$	0.00500

118. Decinormal Bromine Volumetric Solution.

[KOPPESCHAEF'S SOLUTION.]

$\text{Br} = 79.76$. 7.976 Gm. in 1 liter.

($\text{NaBrO}_3 = 150.64$.— $\text{NaBr} = 102.76$.)

($\text{KBrO}_3 = 166.67$.— $\text{KBr} = 118.79$.)

Dissolve 8 Gm. of sodium bromate and 50 Gm. of sodium bromide (or 3.2 Gm. of potassium bromate and 50 Gm. of potassium bromide) in enough water to make, at or near 15°C . (59°F .), 900 C.c. Of this solution transfer 20 C.c., by means of a pipette, into a bottle having a capacity of about 50 C.c. provided with a glass stopper; add 75 C.c. of water, next 5 C.c. of pure hydrochloric acid, and immediately insert the stopper. Shake the bottle a few times, then remove the stopper just sufficiently to quickly introduce 5 C.c. of potassium iodide T.S., taking care that no bromine vapor escape, and immediately stopper the bottle. Agitate the bottle thoroughly, remove the stopper and rinse it and the neck of the bottle with a little water so that the washings flow into the bottle, and then add from a burette decinormal sodium hyposulphite V.S. until the iodine tint is exactly discharged, using towards the end a few drops of starch T.S. as indicator. Note the number of C.c. of the sodium hyposulphite V.S. thus consumed, and then dilute the bromine solution

so that equal volumes of it and of decinormal sodium hyposulphite V.S. will exactly correspond to each other under the conditions mentioned above.

EXAMPLE.—Assuming that the 20 C.c. of the bromine solution have required 25.2 C.c. of the hyposulphite to completely discharge the iodine tint, the bromine solution must be diluted in the proportion of 20 to 25.2. Thus, if 850 C.c. of it are remaining, they must be diluted with water to measure 1071 C.c.

After the solution is thus diluted, a new trial should be made in the manner above described, in which 25 C.c. of the decinormal sodium hyposulphite V.S. should exactly discharge the tint of the iodine liberated by the bromine set free from the 25 C.c. of bromine solution.

Keep the solution in dark amber-colored glass-stoppered bottles.

One Cubic Centimeter of Decinormal Bromine Solution V.S. is the equivalent of :

	Gramme.
Bromine, Br	0.007976
Carbolic Acid C_6H_5OH	0.001563

The following article is tested with this solution :

	Gm. taken.	C.c. re- quired.	Percent of strength indicated.
Acidum Carbolicum	0.039	24	96 of pure phenol.

119. Normal Hydrochloric Acid.

HCl = 36.37. 36.37 Gm. in 1 liter.

Mix 180 C.c. of hydrochloric acid of specific gravity 1.168 with enough water to make it measure, at or near 15° C. (59° F.), 1000 C.c.

Of this liquid (which is still too concentrated) carefully measure 10 C.c. into a flask, add a few drops of phenolphthalein T.S., and gradually add, from a burette, potassium hydrate V.S., until the red tint produced by it no longer disappears on vigorous shaking, but is not deeper than pale pink. Note the number of C.c. of potassium hydrate V.S. consumed, and then dilute the acid solution so that equal volumes of this and of the potassium hydrate V.S. neutralize each other.

EXAMPLE.—Assuming that 10 C.c. of the acid solution first prepared required exactly 11 C.c. of potassium hydrate V.S., each 10 C.c. of the former must be diluted to 11 C.c., or the whole of the remaining acid solution in the same proportion. Thus, if 950 C.c. are remaining, 95 C.c. of water must be added.

After the liquid is thus diluted, a new trial should be made in the manner above described, in which 50 C.c. of the acid solution should require for neutralization exactly 50 C.c. of potassium hydrate V.S. If necessary, a new adjustment should then be made to render the correspondence perfect.

One Cubic Centimeter of Normal Hydrochloric Acid is the equivalent of :

	Gramme.
Hydrochloric Acid, absolute, HCl	0.03637

Note.—Normal hydrochloric acid is in every respect equivalent in neutralizing power to normal sulphuric acid (see below, No. 134), and may be employed, if more convenient, for the same purposes.

120. Decinormal Iodine Volumetric Solution.

I = 126.53. 12.653 Gm.¹ in 1 Liter.

Dissolve 12.653 Gm.¹ of pure iodine (see below) in a solution of 18 Gm. of pure potassium iodide in 800 C.c. of water. Then add enough water to make the solution measure, at or near 15° C. (59° F.), exactly 1000 C.c.

Transfer the solution to small, glass-stoppered vials, which should be kept in a dark place.

Preparation of Pure Iodine.—Heat powdered iodine in a porcelain dish placed over a boiling water-bath, and stir it constantly with a glass rod, so that the adhering moisture, together with any cyanogen iodide and most of the iodine bromide and chloride that may be present, may be vaporized. After twenty minutes transfer the iodine

¹ Instead of taking 12.653 Gm., this figure is often rounded off to 12.65, or even to 12.7. But, whenever a delicate balance is available, the exact amount above directed should be taken.

to a porcelain or other non-metallic mortar, and triturate it with about 5 per cent. of its weight of pure, dry potassium iodide, so as to decompose any remaining iodine bromide and chloride. Then return the mass to the dish, cover it with a clean glass funnel, and heat the dish on a sand-bath. Detach the sublimed, pure iodine, and keep it in well-stoppered bottles, in a cool place.

One Cubic Centimeter of Decinormal Iodine V.S. is the equivalent of :

	Gramme.
Iodine, I	0.012658
Arsenic Trioxide (arsenous acid), As_2O_3	0.004942
Potassium Sulphite, crystallized, $K_2SO_3 + 2H_2O$	0.009692
Sodium Bisulphite, $NaHSO_3$	0.005198
Sodium Hyposulphite (Thiosulphate), crystals, $Na_2S_2O_3 + 5H_2O$	0.024764
Sodium Sulphite, crystallized, $Na_2SO_3 + 7H_2O$	0.012579
Sulphur Dioxide, SO_2	0.003195
Antimony and Potassium Tartrate, cryst., $2K(SbO)C_4H_4O_6 + H_2O$	0.016560

The following articles are tested with this solution :

	Gm. taken.	C.c. re- quired.	Percent. of strength indicated.
Acidum Arsenosum	0.1	20.0	98.8 of As_2O_3 .
Acidum Sulphurosum	2.0	40.0	6.4 of SO_2 .
Antimonii et Potassii Tartaras (cryst.)	0.882	20.0	100 of pure salt.
Liquor Acidi Arsenosi	24.7 C.c.	49.4 to 50	1 of As_2O_3 .
Liquor Potassii Arsenitis	24.7 C.c.	49.4 to 50	1 of As_2O_3 .
Sodii Bisulphis	0.26	45.0	90 of pure salt.
Sodii Hyposulphis	0.25	9.9	98.1 of cryst. salt.
Sodii Sulphis	0.63	48.0	96 of cryst. salt.

121. Decinormal Mercuric Potassium Iodide Volumetric Solution.

[MAYER'S SOLUTION.]

Dissolve 18.546 Gm. of pure mercuric chloride in 600 C.c. of water, and 49.8 Gm. of pure potassium iodide in 100 C.c. of water. Mix the two solutions, and then add enough water to make the mixture measure, at or near 15°C . (59°F .), exactly 1000 C.c.

One Cubic Centimeter of Decinormal Mercuric Potassium Iodide V.S. is the equivalent of :

	Gramme.
Mercuric Potassium Iodide, $HgI_2 + 2KI$	0.0392

122. Normal Oxalic Acid Volumetric Solution.

Dissolve 62.85 Gm.¹ of pure oxalic acid (see below) in enough water to make, at or near 15°C . (59°F .), exactly 1000 C.c.

Pure Oxalic Acid, crystallized, is in form of colorless, transparent, clinorhombic crystals which, on ignition upon platinum-foil, leave no residue. One part of it is completely soluble in 14 parts of water at 15°C . (59°F .). Oxalic acid which leaves a residue on ignition, or on solution in water, must be purified, which may be done as follows: To 1 part of the acid add 10 parts of cold water, and shake until the latter is saturated. Filter off the solution from the undissolved crystals, evaporate the filtrate to about three-fourths of its volume, and set it aside so that the fixed salts which it contains may crystallize out. Carefully decant the liquid from the crystals, concentrate it by evaporation, and set it aside to crystallize, stirring occasionally to prevent the formation of large crystals which might enclose moisture. Drain the crystals in a funnel, dry them carefully on blotting paper, and preserve them in well-stoppered bottles.

Note.—Normal oxalic acid volumetric solution is in every respect equivalent in neutralizing power to normal sulphuric acid (No. 134), or normal hydrochloric acid

¹ This is frequently rounded off to 63 Gm. when a delicate balance and exact weights are not at hand.

(No. 119), and may be employed, if more convenient, for the same purposes. The solution, however, has a tendency to crystallize at the point of the burette.

One Cubic Centimeter of Normal Oxalic Acid V.S. is the equivalent of :

	Gramme.
Oxalic Acid, crystallized, $\text{H}_2\text{C}_2\text{O}_4 + 2\text{H}_2\text{O}$	0.06285
Ammonia Gas, NH_3	0.01701
Sodium Hydrate, NaOH	0.08996
Potassium Hydrate, KOH	0.05599
Potassium Permanganate, KMnO_4	0.08158

123. Decinormal Oxalic Acid Volumetric Solution.

Dissolve 6.285 Gm.¹ of pure oxalic acid (see under No. 122) in enough water to make, at or near 15° C. (59° F.), exactly 1000 C.c.

One Cubic Centimeter of Decinormal Oxalic Acid V.S. is the equivalent of :

	Gramme.
Oxalic Acid, crystallized, $\text{H}_2\text{C}_2\text{O}_4 + 2\text{H}_2\text{O}$	0.006285
Ammonia Gas, NH_3	0.001701
Calcium Hydrate, $\text{Ca}(\text{OH})_2$	0.008691
Potassium Hydrate, KOH	0.005599
Potassium Permanganate, KMnO_4	0.008158
Sodium Hydrate, NaOH	0.008996

The following articles are tested with this solution :

	Gm. taken.	C.c. re- quired.	Percent. of strength indicated.
Liquor Calcis	50.0	±20.0	±0.14 of $\text{Ca}(\text{OH})_2$
Potassii Iodidum (alkalinity, K_2CO_3)	1.0	0.05	0.084 of alkali.
Potassii Permanganas	0.1	81.3	98.70 of pure salt.

124. Decinormal Potassium Dichromate Volumetric Solution.

Dissolve 4.896 Gm.² of pure potassium dichromate (see below) in enough water to make, at or near 15° C. (59° F.), exactly 1000 C.c.

Pure Potassium Dichromate for use in volumetric analysis, besides responding to the tests given in the text of the Pharmacopœia (under *Potassii Bichromas*), must conform to the following tests. In a solution of 0.5 Gm. of the salt in 10 C.c. of water rendered acid by 0.5 C.c. of nitric acid, no visible change should be produced either by barium chloride T.S. (absence of *sulphate*), or by silver nitrate T.S. (absence of *chloride*). In a mixture of 10 C.c. of the aqueous solution (1 in 20) with 1 C.c. of ammonia water, no precipitate should be produced by ammonium oxalate T.S. (absence of *calcium*).

When used with phenolphthalein as indicator, to neutralize alkalies, the volumetric solution of potassium dichromate is decinormal when it contains 14.689 Gm. in 1 liter. It is then the exact equivalent of any decinormal acid, corresponding to the amounts of alkalies quoted, for instance, under Decinormal Oxalic Acid V.S. (No. 123).

When used as an oxidizing agent to convert ferrous into ferric salts, or to liberate iodine from potassium iodide, the solution just mentioned (containing 14.689 Gm. in 1 liter) has the effect of a $\frac{2N}{10}$ volumetric solution, and a solution of one-third of this strength, containing 4.896 Gm. in 1 liter, has the value of a decinormal solution, and is the equivalent of equal volumes of decinormal potassium permanganate V.S., or, in the case of iodine liberated from potassium iodide, it is the equivalent of equal volumes of decinormal sodium hyposulphite V.S. For titrating iron in *ferrous* compounds, it is used in the following manner. Introduce the aqueous solution of the

¹ Generally rounded off to 6.3 Gm., when a delicate balance and exact weights are not available.

² Generally rounded off to 4.9 Gm., when a delicate balance and exact weights are not available.

ferrous salt into a flask, and, if it is not already acid, render it so with sulphuric acid. Now add, gradually, decinormal potassium dichromate V.S. from a burette, until a drop taken out upon a white surface no longer shows a blue color with a drop of freshly prepared potassium ferricyanide T.S.

Decinormal potassium dichromate V.S. may also be used, in conjunction with potassium iodide (from which it liberates iodine) and sulphuric acid, for adjusting the titer of sodium hyposulphite (thiosulphate) V.S., and, by its means, that of the iodine V.S.

One Cubic Centimeter of Decinormal Potassium Dichromate V.S. is the equivalent of:

	Gramme.
Potassium Dichromate, $K_2Cr_2O_7$	0.0048963
Iron, in ferrous compounds	0.005588
Ferrous Carbonate, $FeCO_3$	0.011573
Ferrous Sulphate, anhydrous, $FeSO_4$	0.015170
Ferrous Sulphate, crystallized, $FeSO_4 + 7H_2O$	0.027742
Ferrous Sulphate, dried, $2FeSO_4 + 3H_2O$	0.017864
Potassium Hydrate, KOH	0.001866
Sodium Hyposulphite (Thiosulphate), $Na_2S_2O_3 + 5H_2O$	0.024764

The following articles may be tested with this solution :

	Gm. taken.	C.c. re- quired.	Percent. of strength indicated.
Ferri Carbonas Saccharatus	1.16	*15	* 15 of iron.
Ferri Sulphas	1.8871	50	100 of pure salt.
Ferri Sulphas Granulatus	1.8871	50	100 of pure salt.

125. Normal Potassium Hydrate Volumetric Solution.

KOH = 55.99. 55.99 Gm.¹ in 1 Liter.

Dissolve 75 Gm. of potassium hydrate [*Potassa*, U. S. P.] in enough water to make, at or near 15° C. (59° F.), about 1050 C.c., and fill a burette with a portion of this liquid.

Put 0.6285 Gm.² of pure oxalic acid (see No. 122) into a flask of the capacity of about 100 C.c., and dissolve it with about 10 C.c. of water. Add a few drops of phenolphthalein T.S., and then carefully add, from the burette, the potassium hydrate solution, frequently agitating the flask, and regulating the flow to drops towards the end of the operation, until the red color produced by its influx no longer disappears on shaking, but is not deeper than pale pink. Note the number of C.c. of the potassium hydrate solution consumed, and then dilute the remainder of the solution so that exactly 10 C.c. of the diluted liquid shall be required to neutralize 0.6285 Gm.² of oxalic acid.

EXAMPLE.—Assuming that 8.0 C.c. of the stronger solution of potassium hydrate first prepared had been consumed in the trial, then each 8.0 C.c. must be diluted to 10 C.c., or the whole of the remaining solution in the same proportion. Thus, if 1000 C.c. should be still remaining, this must be diluted with water to 1250 C.c.

After the liquid is thus diluted, a new trial should be made in the manner above described, in which 10 C.c. of the diluted solution should exactly neutralize 0.6285 Gm.² of oxalic acid. If necessary, a new adjustment should then be made to render the correspondence perfect.

Note.—Solutions of caustic alkalies are very prone to absorb carbon dioxide from the atmosphere, and thereby become liable to occasion errors when used with litmus T.S. or phenolphthalein T.S. as indicator (methyl-orange T.S. is not affected by the presence of carbonic acid). Hence the volumetric solutions should be preserved in small vials provided with well-fitting corks or rubber stoppers, or, better still, they should have tubes filled with a mixture of soda and lime attached to their stoppers, so as to absorb the carbon dioxide and prevent its access to the solution.

In place of potassium hydrate V.S., sodium hydrate V.S. (see No. 132) may be used, in the same manner and in the same quantity. Potassium hydrate V.S., however, is preferable, since it foams less, and attacks glass more slowly and less energetically.

¹ This figure is frequently rounded off to 56 Gm.

² This figure may be rounded off to 0.63 Gm., if a delicate balance and exact weights are not available.

One Cubic Centimeter of Normal Potassium Hydrate V.S. is the equivalent of :

	Gramme.
Potassium Hydrate, KOH	0.05509
Sodium Hydrate, NaOH	0.03996

			of acid assumed to be tartaric.

126. Centinormal Potassium Hydrate Volumetric Solution.

KOH = 55.99. 0.5599 Gm. in 1 Liter.

Dilute 10 C.c. of normal potassium hydrate volumetric solution with enough distilled water to make 1000 C.c.

One Cubic Centimeter of Centinormal Potassium Hydrate V.S. is the equivalent of :

	Gramme.
Potassium Hydrate, KOH	0.0005599
Sulphuric Acid, H ₂ SO ₄	0.0004891
Combined Alkaloids of Nux Vomica ¹	0.00364

¹ Assumed to consist of equal parts of strychnine and brucine.—Centinormal potassium hydrate V.S. (In place of which centinormal sodium hydrate V.S., prepared in the same manner, may be employed) is used in the assay of Extract of Nux Vomica, to neutralize the excess of decinormal sulphuric acid employed.

127. Decinormal Potassium Permanganate Volumetric Solution.

 $2\text{KMnO}_4 = 315.84.$
 $8.1534 \text{ Gm.}^1 \text{ in 1 Liter.}$

I. Place 8.5 Gm. of pure, crystallized potassium permanganate in a flask, add 1000 C.c. of boiling water, and boil until the crystals are dissolved. Close the flask, and set it aside for two days, so that any suspended matters may deposit. This is the *stronger solution*. Prepare another, *weaker solution*, in the same manner, using 6.6 Gm. of the salt and 2200 C.c. of water, and set this also aside for two days. After the lapse of this time, pour off the clear portion of each solution into separate vessels provided with glass stoppers, and then proceed to test each separately.

Introduce into a flask 10 C.c. of decinormal oxalic acid V.S., add 1 C.c. of pure, concentrated sulphuric acid, and, before this mixture cools, gradually add from a burette small quantities of the weaker permanganate solution, shaking the flask after each addition and reducing the flow to drops towards the end of the operation. When the last drop of the permanganate solution added is no longer decolorized but imparts a pinkish tint to the liquid, note the number of C.c. consumed. In the same manner ascertain the titer of the stronger solution, and likewise note down the number of C.c. of the latter consumed. Finally mix the two solutions in such proportions that 50 C.c. of the mixture will exactly correspond to an equal volume of decinormal oxalic acid V.S.

Note.—To obtain the accurate proportions for mixing the two solutions, deduct 10 from the number of C.c. of the weaker solution required to decompose 10 C.c. of decinormal oxalic acid V.S. With this difference multiply the number of C.c. of the stronger solution required for the same purpose. The product shows the number of C.c. of the *stronger solution* needed for the mixture.

Next deduct the number of C.c. of the stronger solution required to decompose 10 C.c. of decinormal oxalic acid V.S. from 10, and with the difference multiply the number of C.c. of the weaker solution required for the same purpose. The product shows the number of C.c. of the *weaker solution* needed for the mixture.

Or, designating by S the number of C.c. of the stronger solution, and by W the number of C.c. of the weaker solution required to decompose 10 C.c. of decinormal oxalic acid V.S., the following formula will give the proportions in which the solutions must be mixed:

$$\begin{array}{l} \text{Stronger Solution :} \quad \text{Weaker Solution :} \\ (W - 10) S \quad + \quad (10 - S) W \end{array}$$

Example.—Assuming that 9 C.c. of the stronger (S) and 10.5 of the weaker (W) solution had been required, then, substituting these values in the above given formula, we obtain:

$$\begin{array}{l} (10.5 - 10) 9 + (10 - 9) 10.5 \\ \text{or, } 4.5 \quad \quad \quad + \text{ or, } 10.5 \end{array}$$

making 15 C.c. of final solution.

The bulk of the two solutions is now mixed in the same proportion, 450 C.c. of the stronger and 1050 C.c. of the weaker, or 900 C.c. of the stronger and 2100 C.c. of the weaker solution.

After the mixture is thus prepared, a new trial should be made, when 10 C.c. of the solution should exactly decompose 10 C.c. of the decinormal oxalic acid V.S. If necessary, a new adjustment should be made to render the correspondence perfect.

This solution should be kept in small, dark amber-colored and glass-stoppered bottles (or in bottles provided with tubes, especially designed for the purpose). Thus prepared, this solution will hold its titer for months; yet it should be tested occasionally, and, when it is found reduced, the liquid should be brought back to normal strength by the addition of such an amount of the stronger solution as may be determined in the manner above described.

II. When potassium permanganate V.S. is to be prepared for immediate use, this may be done in the following manner. Dissolve 3.5 Gm. of pure, crystallized potassium permanganate in 1000 C.c. of pure water, recently boiled and cooled. Introduce 10 C.c. of decinormal oxalic acid V.S. into a beaker, add 1 C.c. of pure concentrated sulphuric acid, and proceed as directed above for the weaker permanganate solution. Note the number of C.c. of the solution consumed, and then dilute the remainder with pure water recently boiled and cooled, until 50 C.c. will exactly correspond to 50 C.c. of decinormal oxalic acid V.S.

Example.—Assuming that 9.1 C.c. of the permanganate solution first prepared

¹ This quantity is never directly weighed, but adjusted either by Oxalic Acid or by Iron; in calculations it is often abbreviated.

had been required to produce a permanent pink tint, then every 9.1 C.c. of the solution must be diluted to 10 C.c., or the whole of the remaining solution in the same proportion. A new trial should then be made to verify the agreement.

Note.—Potassium permanganate V.S. thus prepared is liable to deteriorate more readily and quickly than that prepared by the method first given (under I.). It cannot be safely trusted without verification each time it is to be used.

One Cubic Centimeter of Decinormal Potassium Permanganate V.S. is the equivalent of :

128. Centinormal Potassium Permanganate Volumetric Solution.

$2\text{KMnO}_4 = 815.84$. 0.81584 Gm. in 1 Liter.

Dilute 10 C.c. of the decinormal potassium permanganate V.S., after having ascertained that it possesses its exact titer, with enough distilled water strictly complying with the tests given in the text of the Pharmacopœia for *Aqua Destillata*, to make 100 C.c.

This solution should be freshly made when required.

One Cubic Centimeter of Centinormal Potassium Permanganate V.S. is the equivalent of :

	Gramme.
Potassium Permanganate, KMnO_4	0.00031534
Oxalic Acid, crystallized, $\text{H}_2\text{C}_2\text{O}_4 + 2\text{H}_2\text{O}$	0.0006285
Oxygen (derived from the permanganate) available for oxidation	0.0000798

129. Decinormal Potassium Sulphocyanate Volumetric Solution.

[VOLHARD'S SOLUTION.]

$\text{KSCN} = 96.99$. 9.699 Gm. in 1 Liter.

Dissolve 10 Gm. of crystals of pure potassium sulphocyanate in 1000 C.c. of water.

This solution is yet too concentrated, and has to be adjusted so as to correspond in strength exactly with decinormal silver nitrate V.S. For this purpose, introduce into

a flask 10 C.c. of decinormal silver nitrate V.S. together with 0.5 C.c. of ferric ammonium sulphate T.S. and 5 C.c. of diluted nitric acid. To this mixture add, from a burette, in small portions at a time, the sulphocyanate solution. At first a white precipitate of silver sulphocyanate appears, then every drop falling from the burette is surrounded by a deep brownish-red color of ferric sulphocyanate which disappears on vigorous shaking of the flask as long as any of the silver nitrate remains unchanged. When all the silver has been converted into sulphocyanate, a single additional drop of the potassium sulphocyanate solution produces a brownish-red color which no longer disappears on shaking, but communicates a perceptible pale brownish or reddish tint to the contents of the flask. Note the number of C.c. of the potassium sulphocyanate solution used, and dilute the whole of the remaining solution so that equal volumes of this and of the decinormal silver nitrate V.S. will be required to produce the permanent brownish or reddish tint. (The same depth of pale brownish or reddish tint to which the volumetric solution is adjusted must be attained when the solution is used for volumetric assays.)

After the dilution, a new trial should be made, in which 50 C.c. of decinormal silver nitrate V.S., 2.5 C.c. of ferric ammonium sulphate T.S., and 25 C.c. of diluted nitric acid are used, and there should be required exactly 50 C.c. of the sulphocyanate solution to produce the same depth of a permanent pale brownish or reddish tint.

If necessary, a new adjustment should be made, to render the correspondence perfect.

One Cubic Centimeter of Decinormal Potassium Sulphocyanate V.S. is the equivalent of:

	Gramme.
Potassium Sulphocyanate, KSCN	0.009899
Silver, Ag	0.010768
Silver Nitrate, AgNO ₃	0.016955

The following articles are tested with this solution:

Ferri Iodidum Saccharatum	} Determined by residual titration with decinormal silver nitrate V.S., and decinormal potassium sulphocyanate V.S.
Syrupus Ferri Iodidi	

130. Decinormal Silver Nitrate Volumetric Solution.

AgNO₃ = 169.55. 16.955 Gm.¹ in 1 Liter.

Dissolve 16.955 Gm.¹ of pure silver nitrate in enough water to make, at or near 15° C. (59° F.), exactly 1000 C.c.

Keep the solution in small, dark amber-colored, glass-stoppered vials, carefully protected from dust.

Note.—Titration by decinormal silver nitrate V.S. may be managed in various ways, adapted to the special preparation to be tested:

a. In most cases it is directed by the U. S. P. to be used in presence of a small quantity of potassium chromate T.S., which serves to indicate the end of the reaction by the appearance of the red color of silver chromate.

b. In some cases (potassium cyanide, hydrocyanic acid) it is added until the first appearance of a permanent precipitate.

c. It may be used in *all* cases without indicator by observing the exact point when no further precipitate occurs. This may be practised in the case of ferrous iodide, where the addition of potassium chromate would be improper, but it consumes much time in waiting for the precipitate to subside so as to render the liquid sufficiently clear to recognize whether a further precipitate is produced by addition of the silver solution.

d. It may be added in definite amount, known to be in excess of the quantity required, and the excess of the decinormal silver solution measured back by the addition of decinormal potassium sulphocyanate V.S. (residual titration).

¹ Frequently rounded off to 16.96 Gm., when a delicate balance and exact weights are not available.

Note.—The articles marked with † are determined by residual titration with decinormal silver nitrate V.S. and decinormal potassium sulphocyanate V.S.

131. Decinormal Sodium Chloride Volumetric Solution.

$\text{NaCl} = 58.37$. 5.837 Gm.¹ in 1 Liter.

Dissolve 5.837 Gm.¹ of pure sodium chloride (see below) in enough water to make, at or near 15° C. (59° F.), exactly 1000 C.c.

Pure Sodium Chloride may be prepared by passing a current of dry hydrochloric acid gas into a saturated aqueous solution of the purest commercial sodium chloride, separating the crystalline precipitate, and drying it at a temperature sufficiently high to expel all traces of free acid.

In place of this, transparent crystals of pure rock-salt may be employed.

¹ Frequently rounded off to 5.84 Gm., when a delicate balance and exact weights are not available.

One Cubic Centimeter of Decinormal Sodium Chloride V.S. is the equivalent of:

	Gramme.
Sodium Chloride, NaCl	0.005837
Silver, Ag	0.010768
Silver Nitrate, AgNO ₃	0.016955
Silver Oxide, Ag ₂ O	0.011564

The following articles are tested with this solution:

	Gm. taken.	G.c. required.	Percent of strength indicated.
Argenti Nitras	0.84	20.0	99.97 of silver nitrate.
Argenti Nitras Dilutus	1.0	19.5	88.14 of silver nitrate.
Argenti Nitras Fusus	0.84	19.0	95 of silver nitrate.

132. Normal Sodium Hydrate Volumetric Solution.

NaOH = 39.96. 39.96 Gm.¹ in 1 Liter.

Dissolve 54 Gm. of sodium hydrate (Soda, U. S. P.) in enough water to make, at or near 15° C. (59° F.), about 1050 C.c., and fill a burette with a portion of this liquid.

Put 0.6285 Gm.² of pure oxalic acid (see under No. 122) into a flask of the capacity of about 100 C.c., and dissolve it with about 10 C.c. of water. Add a few drops of phenolphthalein T.S., and then carefully add, from the burette, the sodium hydrate solution, frequently agitating the flask, and regulating the flow to drops towards the end of the operation, until the red color produced by its influx no longer disappears on shaking, but is not deeper than pale pink. Note the number of C.c. of the sodium hydrate solution consumed, and then dilute the remainder of it so that exactly 10 C.c. of the diluted liquid will be required to neutralize 0.6285 Gm.² of oxalic acid.

EXAMPLE.—Assuming that 7.8 C.c. of the stronger solution of sodium hydrate first prepared had been consumed in the trial, then each 7.8 C.c. must be diluted to 10 C.c., or the whole of the remaining solution in the same proportion. Thus, if 980 C.c. should be still remaining, this must be diluted with water to 1258 C.c.

After the liquid is thus diluted, a new trial should be made in the manner above described, in which 10 C.c. of the diluted solution should exactly neutralize 0.6285 Gm. of oxalic acid. If necessary, a new adjustment should then be made, to render the correspondence perfect.

Note.—The same precautions should be taken for protecting this solution from the carbon dioxide of the air, as are prescribed for normal potassium hydrate V.S. (see No. 125).

This solution may be employed in place of the normal potassium hydrate V.S., volume for volume.

133. Decinormal Sodium Hyposulphite Volumetric Solution.

Na₂S₂O₃ + 5H₂O = 247.64. 24.764 Gm. in 1 Liter.

Dissolve 30 Gm. of selected crystals of sodium hyposulphite (sodium thiosulphate) in enough water to make, at or near 15° C. (59° F.), 1100 C.c. Of this solution transfer 10 C.c. into a flask, add a few drops of starch T.S., and then gradually add, from a burette, decinormal iodine V.S. in small portions at a time, shaking the flask after each addition, and regulating the flow to drops towards the end of the operation. As soon as the color produced by the influx of the iodine solution no longer disappears on shaking, but is not deeper than very pale blue, note the number of C.c. of the iodine solution consumed. Then dilute the sodium hyposulphite solution so that equal volumes of it and of decinormal iodine V.S. will exactly correspond to each other under the conditions mentioned above.

EXAMPLE.—Assuming that 10 C.c. of the stronger sodium hyposulphite solution first prepared had required 10.7 C.c. of decinormal iodine V.S. to produce a faint reaction with starch, the hyposulphite solution must be diluted in the proportion of 10 C.c. to 10.7 C.c., or 1000 C.c. to 1070 C.c.

After the solution is thus diluted, a new trial should be made in the manner above described, in which 50 C.c. of the decinormal sodium hyposulphite V.S. should require exactly 50 C.c. of decinormal iodine V.S. to produce a faint reaction with starch. If necessary, a new adjustment should then be made to render the correspondence perfect.

¹ Frequently rounded off to 40 Gm.

² This may be rounded off to 0.63 Gm., when a delicate balance and exact weights are not available.

Keep the solution in small, dark amber-colored, glass-stoppered bottles, carefully protected from dust.

Note.—When this solution is to be used, fill a burette with it, place the liquid to be tested either for the free iodine it already contains, or for that which it liberates from an excess of potassium iodide added to it, into a flask, and gradually add small portions of the solution from the burette, shaking after each addition, and regulating the flow to drops towards the end of the operation, until the brown color of the iodine has nearly disappeared. Now add a few drops of starch T.S., which will produce a blue color, and then continue to add the hyposulphite solution in drops until the blue tint is exactly discharged.

One Cubic Centimeter of Decinormal Sodium Hyposulphite V.S. is the equivalent of:

	Gramme.
Sodium Hyposulphite (Thiosulphate), $\text{Na}_2\text{S}_2\text{O}_3 + 5\text{H}_2\text{O}$	0.024764

Tinctura Iodi	6.8 C.c.	*85.0	* 7 Gm. of I in 100 C.c.

134. Normal Sulphuric Acid.

$\text{H}_2\text{SO}_4 = 97.82$. 48.91 Gm. in 1 Liter.

Carefully mix 30 C.c. of pure, concentrated sulphuric acid (of specific gravity 1.835) with enough water to make about 1050 C.c., and allow the liquid to cool to about 15° C. (59° F.). Place 10 C.c. of this liquid (which is yet too concentrated) into a flask, add a few drops of phenolphthalein T.S., and afterwards, from a burette, normal potassium hydrate V.S., shaking after each addition, and regulating the flow to drops towards the end of the operation, until the red color produced by its influx no longer disappears on shaking, but is not deeper than pale pink. Note the number of C.c. of potassium hydrate consumed. Then dilute the sulphuric acid solution so that equal volumes of this and of normal potassium hydrate V.S. exactly neutralize each other.

EXAMPLE.—Assuming that 10 C.c. of the acid solution first prepared had required exactly 11.2 C.c. of normal potassium hydrate V.S., each 10 C.c. of the former must be diluted to 11.2 C.c., or each 1000 C.c. to 1120 C.c.

After the liquid is thus diluted, a new trial should be made in the manner above described, in which 50 C.c. of the acid solution should require for neutralization exactly 50 C.c. of potassium hydrate V.S. If necessary, a new adjustment should be made to render the correspondence perfect.

Note.—It is recommended that, in alkalimetric determinations, when an acid of normal strength is required, normal sulphuric acid be employed, in place of normal oxalic acid V.S. (see note under No. 122).

One Cubic Centimeter of Normal Sulphuric Acid is the equivalent of :

	Gramme.

V. ALKALOIDAL ASSAY BY IMMISCIBLE SOLVENTS.

It is a property of many alkaloids that they are soluble in certain liquids in which their salts are insoluble, while in other liquids the case is reversed. When such liquids are not miscible, the conditions are favorable to what has been called the "shaking-out" process of separation. In many cases the extraction or separation may be effected by shaking together the concentrated aqueous extract, to which a suitable alkaline precipitant has been added, and some solvent, such as chloroform, ether, benzine, benzol, amyl alcohol, etc. The precipitated alkaloid is thus washed out of the aqueous solution, and is dissolved by the chloroform or other immiscible liquid employed. From the solution of the alkaloid thus obtained, the latter may again be abstracted by a dilute acid. In this Pharmacopoeia the only liquid which is directed as solvent for alkaloids in such assays is *chloroform*. The extraction is directed to be performed in a glass separator or separatory funnel, which consists of an elongated (globular, cylindrical, or conical) glass vessel, provided with a well-fitting stopper and an outlet-tube containing a well-ground glass stop-cock.

When the solution of an alkaloid, suitably prepared, is introduced into this vessel, and chloroform subsequently added, the latter, owing to its higher specific gravity, will form the lower layer. If the two layers are violently shaken together, there will often result an emulsion, which will separate only slowly, and often imperfectly. This is particularly liable to happen when the aqueous liquid containing the alkaloid either in suspension or in solution is strongly alkaline, and when it has a high specific gravity. To avoid the formation of an emulsion, the extraction should be accomplished rather by rapid rotation and frequent inversion of the separator than by violent shaking. When an emulsion has formed, its separation may be promoted by the addition of more of the solvent, preferably somewhat heated, aided, if necessary, by the external application of a gentle heat (the stopper being removed for the time being), or by the introduction of a small quantity of alcohol or of hot water. The separation of the two layers may also be promoted by stirring the lower, chloroformic layer with a glass rod and detaching from the walls of the separator the adhering drops of emulsion.

On withdrawing the chloroform solution of an alkaloid from the separator, a small amount of the solution will generally be retained in the outlet-tube by capillary attraction. If this were lost, the results of the assay would be seriously vitiated. To avoid this loss, several successive, small portions of chloroform should be poured into the separator without agitation, and drawn off through the stop-cock to wash out the outlet-tube.

Another source of loss is the pressure sometimes generated in the separator by the rise of temperature caused when an alkaline and an acid liquid are shaken together. On loosening the stopper, the liquid which adheres to the juncture of the latter with the neck is liable to be ejected. This is best avoided by mixing the liquids at first by rotation (avoiding contact of the contents with the stopper), and allowing them to become cold before stoppering the separator.

¹ To be determined to at least two decimals by titrating the uncombined acid with centinormal potassium hydrate V.S. .

The same precautions should be observed when an alkali carbonate has been used, in place of a caustic alkali, for setting free the alkaloid. In this case the liquids should be cautiously and gradually mixed by rotation, and the separator should be left unstoppered until gas is no longer given off.

If a regular glass separator is not available, an ordinary burette, stoppered with a sound cork, may be employed in its place. In this case the quantities of the alkaloidal solution and of the volatile solvent must be adjusted to the size of the burette.

PART V.

MAGISTRAL PHARMACY.¹

UNDER the head of Magistral or Extemporaneous Pharmacy will be considered the preparation and dispensing of medicines intended *to meet the occasion* and which are to be compounded at once. The subject of official or galenical pharmacy has been considered in the previous pages, the distinction being that in the latter the preparations are intended to be permanent, and are generally made in advance and kept on hand ready for use, whilst those which are magistral are mostly intended to last during the occasion which calls them into existence.

There are several classes of official medicines in which permanent and extemporaneous preparations are both embraced: it has been deemed most practical to consider such under the above head. Examples are found in plasters, powders, ointments, etc. Some of these are generally kept on hand ready for use. If they are not called for soon, they become stale or deteriorated, and experience soon demonstrates that the best plan is rapidly to improve the apparatus and facilities of the store to the highest point, so that all extemporaneous preparations may be quickly and skilfully compounded on call, and thus a reputation is soon acquired for always dispensing those which are fresh. For this reason, most ointments should not be made in larger quantities than are necessary to supply the demand of the moment.

Magistral Pharmacy is unquestionably the most important division of the whole subject. It embraces the principal amount of the labor in the store, and calls for the exercise of more tact, knowledge, and ability than any other branch. Owing to the fact that the ability to practise extemporaneous pharmacy successfully depends largely upon the personal qualities of the pharmacist, very little can be written upon the subject which would be generally useful. Good training under the watchful eye of a skilled preceptor and practical experience will alone give the confidence and knowledge of details that assure success. All that will be attempted under this head will be to collect and arrange such points as the author has found useful in his own experience, in the hope that at least some of them may be of service to others. A chapter on the arrangement of the store, with a description of the facilities for practising extemporaneous pharmacy, will properly introduce the subject.

¹ The word magistral is derived from *magister*, a master, and is defined as "a term applied to medicines prescribed for the occasion, by a competent person, in distinction from such as are official, or kept prepared in the shops. As the latter are prepared according to a certain formula, an intelligent apprentice is generally equal to the task; but the knowledge of a master is needed to give directions for an original preparation."—*Thomas*.

CHAPTER LXIII.

DISPENSING.

Arrangement of the Store, Laboratory, and Cellar.

Selecting a Location for a Dispensing Store.—The selection of a proper location for establishing a pharmacy is in some respects the most important and responsible of all the duties of the pharmacist. As it is largely a question depending upon the personal qualifications, attainments, and financial ability of the individual or firm, it would be useless to offer anything more than a general observation upon this subject. Every pharmacist should select the location in which he will be most likely to achieve the greatest amount of *success*. The foregoing sentence will probably be construed by most readers to mean the field which will yield the largest pecuniary return; yet he is wisest whose expectations are tempered with moderation, and who looks for his reward to the happiness and satisfaction derived from a life filled with those daily deeds of service to his fellow-men, which from long custom or lack of appreciation fail to be classed as merchantable commodities. The general practice in America is to select a prominent place for a pharmacy at the intersection of principal streets, and the "corner drug-store" is a well-known phrase. Aside from the business view concerned in this selection, there is a great advantage derived from the presence of better light and ventilation in a corner location. At the same time, there are the disadvantages of double the amount of dust and exposure from the streets, with the necessary depreciation of the stock, as well as others of minor importance.

Apportioning Space.¹—The room should be at least twice as long as it is broad, in order that a suitable division of the space may be secured, so that about two-thirds may be devoted to dispensing and one-third to compounding. A high ceiling is a great desideratum. The doors should be ample, with movable transoms to secure ventilation and permit the escape of the heated air and vapors which accumulate from the lights at night and from other sources. The transoms may be suspended in the middle, and during the day, even in winter, if they are kept partly opened, the condensation of moisture upon the glass bulk-windows, due to evaporating operations going on in the store or laboratory, will be largely avoided. If a chimney-breast is available in the room, it will be found a desirable acquisition in aiding in ventilation and the escape of noxious vapors arising from chemical operations.

¹ For some excellent suggestions as to the arrangement of fixtures, etc., see a paper by J. F. Hancock, Proc. Amer. Pharm. Association, 1872, p. 192.

The dispensing department is used principally for displaying the stock and for conducting the business with the customers, the prescription department for compounding prescriptions and making preparations. Much diversity of opinion exists among good pharmacists with regard to the proper method of division between these two departments. Some hold that they should be entirely separated from each other, the prescriptions being compounded in a separate room; others, that nothing but a low counter should mark the dividing-line. Probably the most satisfactory arrangement to adopt is to place across the store a prescription counter having a large glass plate in the centre, which will permit the customer to see into the prescription department if he desires to, but which will not be a standing invitation to inquisitive persons to walk in and annoy by conversation those who are engaged in compounding prescriptions.

FIG. 366.

Plan of store.

Fig. 366 shows the plan of a corner pharmacy adapted for a moderate business. It provides for two windows, C C, and two doors. A B represents the space devoted to upright fixtures and shelving,—A, the former, for the bottles, drawers, cans, drawer-cans, etc.; B, closets for holding finished packages ready for sale. In front of A the long main counter is shown, whilst D represents the second counter. The spaces E and F are apportioned for the prescription counter, and the adjoining desks, G and H, show spaces devoted to working counters for pharmaceutical operations, while I represents the sink.¹

Window-Fixtures.—Plate-glass, although expensive, is now so generally in use, and so satisfactory, that it is usually true economy to select it for bulk-windows.

The principal adornments of the pharmacist's window are those ancient emblems of his art,—the show-bottles. These should never be exhibited if they cannot be made to present a creditable appearance. They need not be of elaborately cut glass, but the colored liquids should be bright and transparent and the bottles clean and free from dirt and dust. (Formulas for show-bottle colors are given in Part VI.)

¹ Estimates, plans with illustrations, etc., are now freely furnished by druggists' outfitters. (See advertisements in the pharmaceutical journals.)

Arrangement of Objects.—One of the most difficult subjects to treat is the proper arrangement of a pharmacist's window. In the general stores of our large cities, window-dressing, as it is termed, is in the hands of trained men, who earn a comfortable livelihood by the "profession." It is far easier to note the objects which should not be exposed than to indicate those which are suitable. *Legitimate and proper objects are always found in the products of the pharmacist's own skill and labor.* Many chemical salts can be crystallized in thin glass dishes, and these, if the salt is colorless or white, can be shown to advantage on a background of black velvet; if the salt is dark-colored, like chrome alum, a white background should be chosen. Masses of crystals of various colors, alum, copper sulphate, potassium ferrocyanide, etc., form attractive objects, if they are novelties. These may be obtained from the manufacturing chemists. Chemical or pharmaceutical apparatus, tastefully displayed, rarely fails to excite the admiration of the passers-by, whilst if some simple pharmaceutical process is shown in automatic operation, such as the distillation of water or colored liquids in glass retorts, with a glass Liebig condenser, two objects are gained: a supply of the distillate is secured, and the reason for possessing the window is legitimately realized. Growing plants of the materia medica can often be obtained by applying to conservatories, or, with the exercise of a little patience and care, some of these may be grown at home. If these plants be rare, or of foreign origin, the interest will be greatly enhanced. This point, however, should always be kept in view: the objects should have some connection with pharmacy. Appropriate labels should accompany the objects exhibited, or the annoyance of having to answer trivial questions many times in the day will be experienced. An instructive series of pharmaceutical exhibitions may be devised, the series to extend through many months. To illustrate: an empty ceroon which has held cinchona bark should be obtained, and a reproduction made, through the aid of some friend clever with the pencil, of some of the prints to be found in the books, of natives gathering cinchona bark, and also of the cinchona-tree. Some large, handsome pieces of the bark should be selected, showing the different grades and qualities. Then there should be exhibited, in appropriate bottles, a series of all the *home-made* pharmaceutical preparations of cinchona bark, and, for the centre-piece, choice specimens of all the cinchona alkaloids; then the pharmaceutical preparations of the alkaloids in the background, etc. A clearly-written statement should be shown in the window, giving interesting details of each object. When the interest in this subject has waned, the same method may be applied to nux vomica, coca, rhubarb, opium, eucalyptus, senna, etc., and other similar subjects. It will be readily seen that the purpose of exhibitions of this character is to impress the community with the fact that the proprietor of the store is not only a merchant and dealer in the products of the skill of others, but is also a manufacturer himself.

Exhibitions of a more elaborate and valuable character will readily suggest themselves to the minds of many; but want of space prevents any further hints on our part. It must be clear, however, that

displays of the above character are more in keeping with the professional status of the pharmacist in the community than the heterogeneous and often vulgar exhibitions of objects usually seen in druggists' show-windows.

Shelving and Wall-Fixtures.—The character of the permanent fixtures of the store has much to do with the comfort and convenience of conducting a pharmacy. The selection of the kind of wood to be used will depend upon the amount of light in the store, the location, and the climate. *Hard wood* is always the cheapest in the end, although the most expensive at first. If the room is exposed to a great deal of light, black walnut is to be preferred, because it shows discolorations less than any other hard wood; but if the tone of the room is dark, a more cheerful appearance must be given to the store, and oak, ash, cherry, or mahogany will be preferable: oak and ash, however, are not so serviceable as the others, because of their tendency to show stains. The wall-fixtures generally consist of a long row of drawers four feet high, with shelves above for holding the shop-bottles, cans, etc., on one side, and of a series of closets below, with shelves having glass fronts above, for the other side. Most crude drugs and chemicals, herbs, etc., are kept in wooden drawers arranged in sections. The objections to wooden drawers for this purpose are several. If the drug is odorous, like valerian, sassafras, asafetida, etc., it will surely communicate its peculiarities to its less-pronounced neighbors, like arrowroot, bicarbonate of soda, etc. Again, rats and mice have strong likings for some of the articles of the materia medica, and a wooden drawer offers no impediment to their sharp teeth. Japanned and lacquered tin or tinned-copper cans appropriately labelled have come into use as substitutes, and when properly made are perfectly satisfactory. Fig. 367 shows a can which is intended to take the place of a drawer. The lid is so arranged that the drawer must be pulled out nearly half-way before it can be raised,—the advantage being that the bad habit of leaving the drawers partly open, thus permitting the admission of foreign substances, vermin, etc., is obviated, there being but two possible positions for this drawer-can: one with the lid raised and the mouth of the can wide open, the other with the lid down close. The label-case in the corner is the suggestion of Charles A. Heinitsh, of Lancaster. It has the

FIG. 367.

Drawer-can.

merit of keeping the label for each drug in its appropriate container. Instead of the unbroken and monotonous array of drawers so frequently seen, a more convenient arrangement, presenting a better appearance, will be found to consist in alternating the sections of drawers or drawer-cans with closets, as shown in Fig. 368. These closets should be used for packages and articles which are generally in active demand and which must be dispensed quickly. In this connection it may be stated that a stock of small packages of regular articles of the materia

medica, like flowers of sulphur, cream of tartar, bicarbonate of sodium, in the quantities frequently demanded by customers, should be kept in a box or compartment of the drawers or drawer-cans. This plan greatly facilitates quick dispensing, economizes time and labor, and leads the assistant to make neat packages, by training him in that duty thoroughly at times when he is not otherwise engaged. If there is not room in the proper receptacle for these labelled packages, they may be kept in glass furniture-jars in some accessible place.

Fig. 368 also illustrates the arrangement of two sections of fixtures, one for bottles and the other for cans. Each section should be independent, or joined to its neighbor with dowel-pins, so that at any time

they may be separated, rearranged, if necessary, or taken down entirely. The design shown is unpretentious, and intended for a store doing a moderate business. If the fixtures are made of mahogany, oak, or walnut, the effect is much better than if soft wood, painted or stained, is used. It will be observed that the proportionate height of the fixtures is such that a short ladder is necessary to reach the top row of bottles and cans. This arrangement is a matter of necessity

FIG. 368.

Section of wall-fixtures.

in stores located in large cities and towns, where space is very valuable; but whenever it can be avoided it is desirable that it should be; and if the shelves are carried to just such a height as will permit the bottles to be reached without using a ladder, much inconvenience will be obviated. The careless habit of pulling out a drawer as a step to reach a bottle on an upper shelf is broken up by the use of the drawer-cans and closets, as shown in the illustration. The shallow drawers above these are not intended for holding drugs, but serve to contain small articles in constant demand, like camel's-hair pencils, gelatin pearls, seidlitz powders, etc. There should be sufficient difference between the depth of the shelves for the bottles and cans and that of the closets below to permit an eight-inch counter-top to be made above the closets. This will be almost indispensable, as affording a place for retaining packages to be sent out and of temporary lodgment for articles re-

ceived. This counter should be cleared and all articles distributed every morning before the busy hours arrive.

Fig. 369 shows one of these shallow drawers. The label is the principal feature. It was devised by the author some years ago, to replace the labelled drawer-pulls furnished by the dealers in druggists' furniture, which were in use at that time and were objectionable in several respects. The simplicity and durability of this label are its prominent advantages. It is made of plate-glass, with bevelled edges; the background is of pure gold-leaf, and the letters are black and in plain Egyptian style, or black letter, without shading. They are painted upon the back of the glass, and covered with a coat of varnish.

The glass label is let into the front of the door by chiselling out a depression, as deep as the glass is thick, slightly larger than the label. The back of the glass label is then covered with a thick paste of red lead in boiled linseed oil and pressed into place, the edges being finished with colored putty. The lower edge of the drawer has a projection which serves as a pull.

Dispensing Counter.—The arrangement of the dispensing counter will depend upon whether it is to serve also as a prescription counter. A combination counter should always be avoided, if possible, as the operations involved in compounding prescriptions require the closest attention, and should always be performed where the greatest freedom from interruption can be secured. This can never be had behind the dispensing counter. The plans shown on page 988 do not, therefore, embrace a combined dispensing and prescription counter; but, if one is absolutely necessary, the main features of each can be easily merged into one. The top of the dispensing counter should be of marble or hard wood. Where space is valuable, the top of the front of the counter may overhang four inches, and room thus be obtained for a row of shelving covered with glass doors: these are shown also in front of the prescription counter (see Fig. 378). If the shelves are filled with attractive objects, particularly with special preparations made by the proprietor, they serve the excellent purpose of keeping them continually before the eye of those who frequent the store, and they may justly be called "silent salesmen." If a triangular base four inches high is placed at the bottom, no danger need be apprehended of customers breaking the glass. The case in the author's possession has been in daily use ten years without a single fracture occurring through the carelessness of a customer. The glass should be one-eighth-inch plate. If space is not particularly valuable, the counter front may be embellished with pilasters or panels, according to the taste of the owner, and the preparations shown in glass cases. A hard-wood counter will, however, prove to be much the cheaper in the end, as the front is subjected to a great deal of wear and tear and will require frequent painting if made of soft wood. The back of the counter should be utilized for containing drawers for heavy, unsightly goods, supplies

FIG. 369.

of paper, corks, twine, sponges, glue, sand-paper, plaster, labels for articles to be dispensed, etc. A sink at one end will often prove a convenience: it will, indeed, be necessary if soda-water is dispensed at this counter.

Store Furniture.—This term generally denotes the containers used to hold the medicinal substances which are to be dispensed. The furniture may consist of wide-mouth or salt-mouth bottles, wooden drawers, drawer-cans, and cans or counter-urns, for the solid articles of the *materia medica*, whilst the liquids are universally dispensed from bottles and cans. The furniture other than that made from glass has been already considered under the head of fixtures. The subject of the selection of the glass-ware in such sizes and shapes as shall be adapted to the wants of the store is an important one. Very little assistance, however, can be rendered in a work of this kind, because a list suitable for a store in one location would be useless for one differently situated. Practice has been materially modified of late years, particularly in arranging the sizes of the shop-bottles for liquids. Formerly, when tinctures were made by maceration, gallon, two-gallon, and even three-gallon bottles were to be seen upon the lowest shelf, but now it is rare to see larger than half-gallon bottles; indeed, there seems to be very little necessity for bottles larger than quart. The stock of liquid preparations being generally kept in the cellar, the shop-bottles are easily replenished from time to time as need arises. In selecting the sizes for the containers, whether of glass, tinned iron, or wood, the space to be devoted to them should first be decided upon, and then the number of bottles, cans, or drawers to occupy the space is easily determined. Having ascertained the number required of each, the selection of the proper-sized receptacle for each article should next claim attention. The following points may serve as a guide in selecting the kind of container:

1. Solid substances which are subject to *injury by exposure to light* should not be placed in glass, like salts of the alkaloids, scaled-iron salts, powdered savin, digitalis leaves, etc.
2. Odorous drugs, like hedeoma, asafoetida, valerian, serpentaria, etc., should not be placed in wooden drawers, but should be put into the shop-cans.
3. Volatile oils should not be placed in the pharmacist's shop-furniture at all: small quantities only are dispensed, and the oils should be kept in small amber-glass bottles, away from exposure to light, preferably in a close closet.
4. Corrosive or deliquescent salts should not be placed in tinned-iron cans: glass vessels are properly used for these.

Glass Furniture.—Shop-bottles are generally of four kinds,—*wide-mouth* or *salt-mouth*, *tincture* or *narrow-mouth*, *syrup*, and *oil* bottles. Amber and blue glass are sometimes used,—the former for substances which are injured by light, the latter for very active poisons. Figs. 370 and 371 show cuts of the wide-mouth and other shop-bottles supplied by Whitall, Tatum & Co., of Philadelphia. A difference of opinion exists among pharmacists as to the advantage of fitting out with bottles of extra-heavy glass or with those of ordinary weight: a certain number have to be replaced every year through breakage from careless handling, but it would seem to be most economical to select the

extra-heavy bottles for liquids, notwithstanding that the percentage of loss is greater with these when the practice of suddenly pouring hot liquids into them is indulged in.

FIG. 370.

Wide-mouth furniture-bottle.

FIG. 371.

Narrow-mouth furniture-bottle.

FIG. 372.

Oil-bottle.

FIG. 373.

Syrup-bottle.

The *oil-bottle* (see Fig. 372) has a cap, which protects the liquid from dust; the neck of the bottle is stopped by a tube which has a lip, whilst the base of the tube is grooved on one side, to permit the oil adhering to it to flow back into the bottle.

The *syrup-bottle* (see Fig. 373) does not have a ground, close-fitting stopper as do the other bottles holding liquids, but the stopper is purposely made to enter the neck loosely; the flat lower surface of the stopper lies in contact with the upper surface of the lip of the bottle, and this forms a sufficiently tight connection to prevent loss by evaporation, exclude dust, and obviate the great inconvenience and loss of time which frequently occur when the ground-glass stopper of the syrup-bottle is found tightly cemented in the neck and a restive customer is waiting: the loose-stoppered syrup-bottle may at such times be justly regarded as a moral help, leaving no excuse for the use of smothered, but none the less intense, expressions of internal feeling. In dispensing the liquid, care should be taken to pour from the bottle with the label uppermost, so as to avoid soiling the label. The habit should be cultivated of catching the last drop from the lip on the end of the stopper, to prevent its trickling down the side of the bottle: if this is not done, a syrup-bottle may present the appearance shown in Fig. 374.

FIG. 374.

Last-drop effect.

In placing the bottles upon the shelves, an alphabetical arrangement

is undoubtedly the best: it is well, however, to group the strong acids in one place, and the very poisonous liquids in another. The labelling should be distinct and easily read, and the abbreviations not so short as to allow of any misunderstanding; there should be no shading of the letters; the plain black Egyptian letter on a plain gold ground is the best on this account, whilst the combined effect in a row of bottles so labelled is richer than where some obscure or composite style of label is adopted. The glass or mica label is universally used now for bottles,—being cemented on with a cement consisting of three parts of rosin and one part of wax,—paper labels having almost gone out of use. These glass labels are subject to the disadvantage of being easily cracked and chipped, but they can be replaced so cheaply that this cannot be considered a serious objection. The recessed label has an advantage in this respect, the octagonal depression in the bottle enabling the glass label to be cemented in its place without exposing the edges, thus giving it protection. Fig. 375 shows a profile view of this label.

The following directions for attaching the glass labels are furnished by Whitall, Tatum & Co.:

Cement.—To one part of best yellow wax add three parts of rosin; melt together in an open pan or kettle, with a gentle heat, to the consistency of syrup.

Directions.—Place the bottle on a table in a nearly horizontal position in front of you; the bottle must be perfectly free from moisture. Pour the cement on the hollow side of the label with a spoon; then apply the label to the bottle with a gentle pressure. While the cement is soft, run the point of a knife around the label, so as to form a groove in the cement: this will save labor in chipping off the cement. The cement will harden in about ten minutes, when, with a putty-knife such as glaziers use, the surplus is to be removed. Clean the bottle and label with a little kerosene oil, and wipe off with a damp towel.

Fig. 376 shows a method of systematically storing little odd packages which are troublesome to place. This is a modification of the plan first seen by the author in Samuel A. D. Sheppard's store in Boston. A section back of the prescription counter is chosen, and a number of small drawers are arranged to hold five or six bottles in an upright

position. Fig. 377 shows an enlarged view of one of these drawers. A portion of one of the sides and of the back is cut away, to facilitate the handling of the bottles. The fronts of the drawers are of hard wood, and the drawers are numbered distinctly and consecutively. Upon the side of the section an index to the contents of the drawers is placed: this consists of a complete alphabetical list of all the odd packages in the section, and opposite each article is placed the number of the drawer in which it is contained. In practice, the bottles which are in frequent request are easily found, after once being located, without referring to the index. The advantages of this method are plain: pill-bottles, rare chemical salts, odd-sized packages which cannot be easily disposed of, are thus classified and arranged so that they can be quickly found, whilst they are protected from the effects of light, dust, and air.

Odd-package drawer.

The Prescription Counter.—This will probably require more care and thought to secure the most advantageous arrangement than any other feature of the store. Good light and a convenient water-supply are absolute essentials. A corner location will generally afford a side window, from which plenty of light from the side and back may be had, whilst the sink should be close at hand. The counter should be of the same kind—hard wood—as the fixtures; or, if hard wood has not been used for the fixtures, the counter top at least should be of walnut, mahogany, oak, ash, or cherry.

Fig. 378 shows the front of a prescription counter used by the author. The upper portion is divided into three spaces, of which the middle one is covered with a single sheet of plate-glass, while the other two are occupied by plate-mirrors; the lower portion is divided into closets, which are protected by glass doors, and suitable articles are displayed on the shelves in the closets; these, like the closets under the dispensing counter, are very useful as receptacles for many small articles which are attractive to persons who are waiting for prescriptions.

The arrangement of the back of the prescription counter is probably of more importance than that of any other part of the fixtures. The fact that the customer never sees this part of the store is one of the reasons why it should not be neglected. The best reason for devoting thought and care to planning the arrangement of the prescription counter is that here, more than in any other place, the fate of a human life is often decided: hence system, order, and cleanliness should be the guiding rule. Fig. 379 shows the back view of the prescription counter. The upper portion presents a series of open shelves, containing rows of japanned tin cans, uniform in color and in style of label with the shop-cans. The lower shelf, in each section, is devoted to the volatile oils. These are contained in glass-stoppered bottles, which are placed in the cans; or, if preferred, the original bottles in which the oils are bought

are placed in the cans. The oils are thus protected from light, air, and dust, and in the latter case the label of the dealer is constantly before the dispenser, and the quality of the oil under surveillance. The

FIG. 378.

Prescription counter, front view.

second, third, and fourth rows are used to hold the chemicals and dry pharmaceutical non-poisonous products which are constantly in use. In compounding prescriptions, some of these cans are filled directly from

FIG. 379.

Prescription counter, back view.

the larger shop-bottles, and the substance, if without action on the tin, is not first put into smaller bottles, but is placed at once in the can. Substances like bromide of sodium, chloral, citrate of potassium, etc.,

are placed in bottles, and these then put into the proper tin cans. Fig. 380 shows one of these cans. The upper row is devoted to extracts,

Fig. 380.

Can for prescription counter.

these being contained in jars, as shown in Fig. 381. The cans should be thoroughly japanned, and the label may be painted in large, black, distinct letters upon a gold ground. The substances should be arranged alphabetically, so that they can be readily found when wanted.

This arrangement enables the dispenser to exclude the light, air, and dust from the substances, and to use the original bottles in which the manufacturer has sold the chemical, thus enabling the make to be at once identified, besides lessening the danger of errors; whilst another advantage is that the unsightly display of bottles of all sizes and shapes containing chemicals, with the labels more or less worn, soiled, and fly-specked, is avoided. The poisons, alkaloids, and very powerful substances should be kept in a separate closet, and the bottles marked with a poison-mark; for, although the pharmacist should early learn to place no absolute dependence upon any *special system* of preventing errors, but always to realize that constant, unremitting vigilance is the only

Fig. 381.

Extract-can for prescription counter.

safeguard, the adoption of some expedient which will aid in calling attention to poisonous compounds serves to impress upon all, particularly the junior assistants, the fact that safety can be secured only at the expense of the most scrupulous care. Fig. 382 shows Holbe's poison closet. The arrangement shows three closets in one: to each is assigned separate apparatus with lock and key. The top of the prescription counter should be made of hard wood, and at least one and a half inches thick if durability is desired. The slides shown just under the edge of the counter are very convenient. They can be relied upon, when they are pulled out, in an emergency to double the capacity of the counter. One of the slides may have a sheet of ground glass set into it by chiselling out sufficient of the wood on the face to allow the glass to be set in flush with the surface of the slide upon a bed of label-cement (three parts rosin and one part yellow wax). This forms a convenient ointment-slab, particularly for making up a rather large quantity of ointment. It is easily cleaned and kept in order. Two of the slides should be appropriated to folding powders and kept exclusively for this purpose, and one reserved for holding the pill-machine when in use, whilst one may have three circular bevelled holes of different diameters countersunk upon the front of the slide. If a strip equal in width to one-half the diameter of these depressions is sawed out, as shown in Fig. 383, and then connected by two screw-bolts which project entirely through the strip, it will be possible, by attaching thumb-screws to the

ends of the bolts, to clamp the mortar securely. The depressions should be wider in diameter at the bottom than at the top, so that the "bite"

FIG. 382.

Poison closet.

of the clamp will be stronger when the mortar is securely clamped. It is useful in working tough pill masses, or in making emulsions quickly. The drawers

FIG. 383.

Device for holding mortars.

in the counter are appropriated to various purposes. Those on the left are partitioned off, and contain pill, powder, and suppository boxes, each in its proper division. Ointment-jars of various sizes occupy another set in the next row; the top drawer and the one immediately below it contain the pill-

machines; lozenge-cutters, cachet-machines, suppository-moulds, etc., are in another drawer, spatulas, stirring-rods, etc., in another. Pre-

scription-bottles of all sizes (cleaned and dried, and, if preferred, corked) are in the next section, whilst cut labels, capping-paper and scissors, and corks, in partitioned drawers, find places in the succeeding row. One of the upper drawers in the middle of the counter should be set apart for towels, whilst the open space below is convenient for holding the box to collect the scraps of paper and light waste which accumulate during the day. The closets hold the mortars and pestles, ointment-slabs, etc.

Arrangement of Laboratory and Cellar.—The suggestions that are to be made upon the above subject must necessarily be of a very general character, as the circumstances of pharmacists vary greatly: the apparatus employed in the making of the various preparations has been already considered under the heads devoted to the subjects, hence the general arrangement must now receive attention.

The Laboratory.—This very important room in the pharmacy should be fitted with every facility for carrying on the various operations required, with ease, rapidity, and comfort. In most establishments but one room is available for this purpose, and this directly in the rear of the dispensing-room. The manufacturing pharmacist, who makes preparations on the large scale, is compelled to devote much time and thought to the most advantageous arrangement of space, and he generally selects a location in an unfrequented portion of the town or city, or in the suburbs, where property is cheaper and railway facilities are abundant, whilst the retail pharmacist is fortunate indeed if he can set apart a special room on the first floor adjoining the dispensing-room for a laboratory. The essential features of this room are a good light, an unfailing supply of cold and hot water, a good flue for carrying off vapors, and sufficient room for counters, closets, shelving, etc.

If steam can be introduced, so that steam kettles, evaporators, etc., can be used, it will be a great convenience. The boiler may be most suitably located upon the first floor or in the cellar. In those cases where the space for a permanent boiler cannot be spared, Prof. Patch's small steam boiler may be used (see Fig. 106). This will permit the use of steam without requiring much room, and, when an operation is concluded, the expense of keeping up the fire, as is the case in the use of coal, will be saved. A drying closet (Fig. 188) for desiccating drugs, herbs, lozenges, etc., on trays, is preferably located here, whilst furnaces, gas stoves, etc., must be suitably placed. Closets, arranged to hold stills, condensers, dishes, kettles, funnels, measures, etc., must be provided, whilst working counters, having either wooden tops covered with sheet-lead, or slate tops, must be arranged so as to obtain the greatest number of advantages. Care should be exercised to have the floor, whether of stone or of brick, laid in cement, and slant gradually, so that when it is washed the water will naturally run towards the waste-pipe, which should be located in one corner. If a stone or brick floor is inadmissible, an ordinary board floor, covered with sheet-zinc in those portions likely to become wet, can be made to answer. The following illustrations will serve to give some idea of the general plan of a pharmacist's small working laboratory. The special apparatus is, of course, not figured, as it would interfere with the view of the general arrange-

ment of the counters, etc. For a detailed description of the apparatus the reader is referred to the illustrations in the previous chapters and to the descriptions of the various processes of Operative Pharmacy.

The illustrations represent the counter and apparatus for the four sides of the room. Fig. 384 represents the northern side. This is

FIG. 384.

Northern side of laboratory.

devoted to the larger operations of evaporation, distillation, etc. The steam boiler, copper kettles, still, sink, etc., being here, a steam-pipe from the boiler may be run into the store for heating purposes or to supply steam for small kettles, water-baths, etc., there. Fig. 385 repre-

FIG. 385.

Eastern side of laboratory.

sents the eastern side, the most prominent object being a work-table, with gas and steam attachments. The retort-stand, shown in Fig. 164, may be used in either of the three holes in the counter, or it may be unscrewed and put away in pieces. Four large drawers and slides are seen in this counter. An adjustable vise might occupy space at one

end, and at least one of the drawers should be set apart for tools of general utility, as hatchet, hammer, saw, plane, chisel, etc. The other drawers may contain corks, bladder, twine, spatulas, scoops, glass

FIG. 386.

Southern side of laboratory.

tubing, cork-cutters, etc., and other articles employed in flask operations, small distillations, etc., since this counter will be used for purposes of this kind. Fig. 386 is the counter, with a sheet-lead top, used for chemical work, testing, etc. It should be on the south side, so that the

FIG. 387.

Western side of laboratory.

northern light shall fall directly on it. A small sink at one end will be a convenience. Appropriate drawers, slides, and a closet for holding chemical apparatus are also provided. Fig. 387 represents the phar-

maceutical counter, with the percolating stand (see Fig. 332) above it: two large closets to hold the percolators when not in use, and six drawers, with slides, will complete the arrangement of this counter.

The Cellar.—This usually-neglected locality should receive as much attention as the more favored portions of the store: it should be placed in charge of one or more of the assistants, and the responsibility for keeping it in good order definitely fixed. Good light is generally difficult to obtain, and care is necessary in the use of gas-lights, lanterns, etc. The floor should be of cement, stone, or brick, and, above all, the cellar should be thoroughly drained. Good facilities for lowering and hauling heavy boxes, barrels, and packages should be provided, whilst the stock of prescription-bottles should be kept in covered bins arranged on deep shelves, the doors being hinged from below, and each bin being distinctly labelled with the size of the bottles contained in it. In most stores the heating apparatus, whether it be a furnace or a portable heater, is located in the cellar; and the position of the heater in the cellar will largely determine the proper arrangement of the stock which is kept there. Undoubtedly the most useful feature about the cellar of a pharmacy is the fact that it affords a suitable place for keeping surplus stock, heavy or bulky articles, and those which are perishable if exposed to heat, light, or the too dry atmosphere of the upper rooms.

The stock of mineral waters, or of liquids which are capable of freezing, should be kept near enough to the heater to prevent an accident arising from too low a temperature in winter, whilst ointments, cerates, volatile oils, ethereal and alcoholic liquids, etc., should be placed in the cooler portions of the cellar. If a fire-proof vault made of stone or brick can be provided, it will be found a great convenience for keeping the latter class of preparations. The capacities of the cellar should be made an object of study, and a particularly cool spot should be selected in which to keep the ointments. If this should happen to be in an inconvenient place, or too far away from the steps leading from the store, one of the stock closets in the store may be converted into a dumb-waiter and lowered into a pit dug in the cellar: when an ointment is needed, the dumb-waiter can be easily hauled up, secured, and, after the object is accomplished, lowered into the cooler atmosphere.

The carboys containing acids, etc., are generally regarded as cumbersome and unwieldy objects: they may be stored on skids in the least valuable portion of the cellar. The method of pouring from a carboy is by the use of Stevenson's carboy-rocker (see page 473).

The custom of dispensing carbonated beverages has an advantage which is frequently overlooked,—namely, the fact that the fountains are efficient fire-extinguishers. A line of gas-pipe extending the whole length of the cellar, with suitable outlets, would not be an expensive investment, and yet in case of fire in the cellar it would be easy to form an attachment with a fountain of "soda-water" and thus convey a stream to the locality of the fire. The small portable steel fountains now in use would in many cases do away with the necessity for the length of gas-pipe, for they could be dragged to the fire, and their contents would prove very effective if used in time.

One rule should be rigidly insisted upon in the care of the stock in

the cellar, and that is that when a box of empty bottles or mineral water, or any boxed package, is opened, the contents should be distributed to the bins or places assigned for them, and the empty box and litter immediately removed.

Dampness and mould, which are generally so destructive to the stock kept in the cellar, may be avoided by ventilation. A change of air can always be secured by opening windows in the opposite ends of the cellar, and the musty odors so frequently noticed will rapidly disappear if attention is paid to ventilation.

The stock of liquids is usually kept in demijohns and large green-glass bottles: these should be arranged on shelves, the larger packages on the lower shelves. The wooden-covered glass demijohns and tinned-iron cans, known as transportation cans and demijohns, are very useful in this connection (see Fig. 388). *Great care must be taken, however, in the use of tinned-iron cans for pharmaceutical liquids: it is not safe to store acid, alkaline, or corrosive liquids in them, nor those containing tannin, on account of their injurious action on the tinned iron.* The safest plan is to limit the use of cans to oils, glycerin, fatty bodies, and syrups, which contain nothing capable of acting on the tinned iron. The large containers should be labelled in two ways: the official name should be stencilled plainly upon the wooden side which is most prominent, and in addition there should be a tag properly labelled and tied to the handle; upon the reverse side of this tag the date showing when the contents were made, with any other useful notes or data, should be placed. The half-gallon and smaller stock-bottles should be labelled distinctly with large letters: a serviceable label is made by using heavy manilla paper, and instead of an ordinary pen a camel's-hair brush or a piece of pine wood whittled to a flat, stub point like a German-text pen, dipped into black asphalt varnish, may be used to make the letters.

FIG. 388.

Container for stock liquids.

CHAPTER LXIV.

PRESCRIPTIONS.

THE word prescription is derived from the Latin word *præscriptio* (*præ*, "before," and *scribo*, "I write"). It may be defined as the formula which a physician writes, specifying the substances he intends to be administered to a patient.

The Latin language is preferred here in writing prescriptions, as it is also in Great Britain, Germany, and other European countries. The advantages of the use of Latin in designating the ingredients of the prescription are obvious: 1. It is the language of science, and is understood, to a greater or less extent, throughout the civilized world; in addition, it is a dead language, and therefore not subject to the changes that are common to all living forms of speech. 2. The Latin names for medicines are distinctive, and very nearly the same in all countries. 3. It is frequently necessary, and always advisable, to withhold from a patient the names and properties of the medicinal agents administered: this can usually be effected by the use of the Latin technical terms.

The Parts of a Prescription.—For the purpose of examination or study a model prescription may be divided into six parts: 1. *The superscription, or heading.* 2. *The name of the patient.* 3. *The inscription, or the names and quantities of the ingredients.* 4. *The subscription, or the directions to the compounder.* 5. *The signa (mark), or the directions for the patient.* 6. *The name or initials of the physician, with the date.*

1. **The Superscription, or Heading.**—This invariably consists, in Latin prescriptions, of the symbol *R*, which is an abbreviation of the word *recipe* ("take"), the imperative of the Latin verb *recipio*. In French prescriptions the letter *P*, the initial letter of the word *prenez* ("take"), is used.

The use of the inclined stroke upon the tail of the *R* is traced to a custom, common in the ancient days of superstition, of placing at the top of the prescription an abbreviation, called an invocation, which represented a prayer to a favorite deity. The sign of Jupiter (⚡), the chief mythological divinity of the ancient Romans, was usually employed. This was gradually replaced by the letter *R*; but the last stroke of the symbol of the all-powerful Jove has not yet been surrendered, and it remains as an ornament to the superscription to the present day.

2. **The Name of the Patient.**—This is frequently omitted from the prescription through inattention. It should always be placed at the top of the prescription, and should be transferred to the label by the com-

pounder. Serious accidents have sometimes occurred through neglect of this direction, as when an adult dose of a medicine has been given to a child, owing to the similarity of the appearance of an adult's and a child's medicine, and the name of the patient not appearing on either label.

3. The *Inscription*, or the *Names and Quantities of the Ingredients*.—This part of the prescription is undoubtedly the most important of all, and requires the greatest amount of care. The official names (see page 28) of the ingredients should always be used for designating those which are official. A model prescription, if it is of the compound class, is presumed to embrace the following: 1. The *basis*, or chief active ingredient. 2. The *adjuvant*, or aid to the basis, to assist its action. 3. The *corrective*, which is intended to qualify the action of the basis and adjuvant. 4. The *vehicle*, the ingredient which serves to "carry all," or hold them together, dilute them, and give to the whole the proper consistence, form, and color. This is sometimes called the *diluent*.

The ingredients are sometimes written down by the physician in the order given above; but this rule is frequently deviated from, and they follow in the order of their importance. This is a matter of small moment to the pharmacist, however, for he always has to consider solubility, compatibility, and other necessary considerations which determine the order, if the prescription is to be compounded properly.

Many prescriptions contain but one or two ingredients, there being no especial need of a corrective, vehicle, or diluent, the tendency of modern therapeutics being against polypharmacy and in the direction of simple and concentrated remedies, or those having positive effects. There are many advantages to be derived, however, from the combination of ingredients, even when these have similar medicinal action.

The name of each ingredient, and the quantity attached to it, should occupy but one line, and great care should be observed in abbreviating, to see that the abbreviation is distinctive and not liable to be mistaken for an article not intended by the writer. The cabalistic characters in present use, designating the quantities in a Latin prescription, must be very plainly written, if serious errors are to be avoided.

The method of ascertaining the quantities of each of the ingredients generally followed by physicians, is first to write down the names of the ingredients in the proper order, each on a separate line, without affixing the quantities; then having decided upon the total number of doses that are to be given, or the total number of pills, lozenges, capsules, suppositories, etc., by multiplying this by the amount proper to give for the single dose the quantity of the ingredient is obtained.

METHOD OF ALLOTING QUANTITIES.

Parts in Order.	Ingredients.	No. of Doses.	Multiplied by	Single Dose.	Quantity of each Ingredient.
Basis	Chloralis	16	×	7½ gr.	3ij
Adjuvant	Potassii Bromidi . .	16	×	15 gr.	ʒiv
Corrective	Syrupi Zingiberis . .	16	×	ʒss	ʒi
Vehicle	Syrupi	16	×	ʒiiss	ʒiij

Symbolic Characters used in Latin Prescriptions.—Although the subject of weights and measures is treated in the earlier chapters of this work, the special characters used in prescriptions, with their values attached, may be appropriately recalled in this connection: they are as follows:

- m., *Minim*, $\frac{1}{60}$ of a fluidrachm.
- gtt., *Gutta*, a drop; plural, *guttae*, drops.
- ʒ, *Scrupleus*, a scruple (20 grains).¹
- ʒ, *Drachma*, a drachm (60 grains).
- ℥, *Fluidrachma*, a fluidrachm (60 minims).
- ℥, *Uncia*, a troyounce (480 grains).
- ℥, *Fluiduncia*, a fluidounce (8 fluidrachms).
- lb, *Libra*, a pound, rarely used (in prescriptions, 5760 grains).
- ℥, *Octarius*, a pint (16 fluidounces).
- gr., *Granum*, a grain; plural *grana*, grains.
- ss., *Semis*, a half.

The Roman numerals are used to designate quantities,—i, ij, iij, iv, v, vi, vij, viij, ix, x, xx, xxx, xl, l, lx, lxx, lxxx, xc, c, etc. These are always written after the ingredient, as *Sacchari ʒiv*. Care should be taken to dot the i's in each case, to avoid possible errors.

4. *The Subscription, or the Directions to the Compounder.*—The progress made in pharmacy is well shown by the present custom of omitting specific directions to the compounder. In the vast majority of prescriptions the subscription is contracted to a single letter or word, as *M.*, or *misce*, *S.*, or *solve*, *F.*, *fiat*, etc. The physician relies upon the skill of the pharmacist, and generally gives no specific directions.

5. *The Signa, or Directions for the Patient*, sometimes called *Signatura*, is usually abbreviated *Sig.* or *S.* Formerly these directions were written in Latin, but this is rarely the case now, except in Great Britain. There is, indeed, no good reason for writing them in Latin. The Latin which is in common use in prescription-writing is idiomatic, and, although the ordinary rules of Latin grammar are generally applicable to it, many of the terms have a special meaning, and it differs in several respects from classical Latin, and hence has to be a special object of study. The directions should be known to the patient, and should be written in the vernacular on the label in a clear, distinct hand. The careless habit of not specifying the directions, by writing "As dir." for "as directed" or "use as directed," is greatly to be deprecated. Frequently the patient forgets the verbal directions, or misunderstands them, and asks the pharmacist, "How is this medicine to be taken?" The answer must of necessity be as worthless as the direction, unless the pharmacist by skilful questioning can cause the directions to be recalled by the patient. Then, again, the dose of the prescription gives the only clue to its safety. Without knowing it, the pharmacist cannot be held responsible for not detecting an error. The patient, even if he remembers at the time the verbal directions, may soon forget them, and afterwards take a double dose by mistake. The directions for the patient should be written in full, explicitly, and in plain English.

¹ This weight is rapidly passing out of use. It is quite as convenient to write gr. xx, and this is not likely to be mistaken for ʒ, as ʒ is.

6. **The Name or Initials of the Physician, with Date.**—The name of the prescriber is rarely signed in full, particularly since the very general use of printed prescription-blanks, which contain not only the full name and address of the physician but also his office-hours. It is very necessary sometimes to communicate quickly with the physician in case of error or ambiguity, and, when printed blanks are not used, the name and address of the prescriber should be written in full.

Unusual Doses in Prescriptions.—It is to be regretted that some uniform system of indicating unusual doses has not been adopted by physicians. Occasions frequently arise where the patient, either from becoming habituated to its use, or from some other cause, will tolerate an excessive or ordinarily poisonous dose of a remedy. A careful pharmacist always hesitates to compound such a prescription if the dose is not especially marked as unusual, and delays necessarily occur. The most satisfactory method of indicating such a dose is that of underscoring the quantity deemed unusual, as shown in the following:

R Morph. Sulph. gr. vi;
Syrup. Limonis fʒij;
Aquæ q. s. ft. fʒi.

Sig. A teaspoonful every two hours until relieved.

Other marks are sometimes used,—the exclamation-mark (!), for instance, or Q. R. (*quantum rectum*). These are not so distinctive as underscoring, and are open to the objection that in handwriting, which is very apt to be defective, they are likely to puzzle or mislead the pharmacist by being mistaken for some other parts of the prescription. A heavy black line under the unusual dose cannot be mistaken.

One of the best works recently published upon prescription Latin is the Latin Grammar of Pharmacy, by Joseph Ince, London. The student will be well repaid by a careful perusal. The following Latin prescription from Whitt's Elements, with the grammatical analysis, is so thoroughly illustrative that it is inserted in its entirety.

R	Pot. Acet. ʒv.	SUPERScription.
(Base.)	Tinct. Digitalis ʒj.	} INSCRIPTION.
(Adjuvant.)	Syr. Aurantii ʒj.	
(Corrective.)	Decoct. Scoparii ad ʒviiij.	
(Vehicle.)	M., ft. mist.	SUBSCRIPTION.
Opt. cochl. mag. ii. 4ta q. q. hora ex paul. aquæ.		SIGNA.

Without abbreviations or contractions it would read thus :

Recipe

Potassæ Acetatis drachmas quinque.
Tincturæ Digitalis drachmam unam.
Syrupi Aurantii unciam unam.
Decocti Scoparii ad uncias octo.

Misce, fiat mistura. Capiat cochlearia duo magna quarta quæque horæ ex paulula aquæ.

The student will find benefit from a careful study of the following page, in which the Latin of the above prescription is arranged according to the English idiom, and each word parsed and translated.

Recipe Potassæ Acetatis drachmas quinque.

R (Recipe).	{ v. irr. tr. imp. m. 2d per. s., to agree with its nom. Tu—"thou" (understood). Receptum, receptum, recipere. From re and capio. }	Take thou
v (quinque).	num. adj. indec. ac. pl. qual. and agreeing with drachmas.	five
3 (drachmas).	n. f. ac. pl. Drachma, -æ.	drachms.

Ad.	prep. used adverbially.	up to
viii (octo).	num. adj. indec. qual. uncias.	eight
3 (uncias).	n. f. ac. pl. gov. by recipe. Uncia, -æ.	ounces
Decoct. ¹ (decocti).	n. neut. gen. s. qual. uncias. Decoctum, -i.	of the decoction
Scop. (scoparii).	n. masc. gen. s. qual. decocti. Scoparius, -ii.	of broom.

Misce, fiat mistura.

M. (misce).	{ v. trans. imp. m. p. t., agreeing with and governed by Tu (understood). Misceo, -ui, mixtum or mixtum, miscere. }	Mix you, or mix.
Mist. (mistura).	n. f. nom. s., governing fiat. Mistura, -æ.	Let the mixture
Ft. (fiat).	{ v. used as passive of facio, pres. sub. 3d s. Used as imp. gov. by and agreeing with mistura. Fio, factus sum, fieri; to be made or become. }	be made.

Capiat cochlearia duo magna quarta quæque horâ ex paululo aquæ.

Cpt. (capiat).	{ irr. v. tr. sub. m. pr. t. 3d per. s., agreeing with and gov. by Is—"he" (understood). Capio, cepi, captum, capere, the present subjunctive used as an imperative. }	He may take, or let him take,
ij (duo).	num. adj. ac. pl. neut. qual. and agreeing with cochlearia. Duo, -æ, -o.	two
Mag. (magna).	adj. ac. pl. neut. qual. and agreeing with cochlearia. Magnus, -a, -um.	large
Coch. (cochlearia).	n. ac. pl. neut., gov. by capiat. Cochleare, -is.	tablespoonfuls
q. q. (quæque).	{ pron. indef. abl. s., qualifying and agreeing with horâ. Quisque, quæque, quodque. }	at each
4ta (quarta).	{ num. adj. abl. s., qualifying and agreeing with horâ. Quartus, -a, -um. }	fourth
Horâ.	n. f. abl. s. Hora, -æ.	hour
Ex.	prep.	out of
Paul. (paululo).	{ adj. abl. s. Used as a noun, gov. by ex. Paululus, -a, -um. }	a little
Aq. (Aquæ).	n. f. gen. s. qual. paululo. Aqua, -æ.	of water.

¹ Some authorities would put Decoct. in the accusative, governed by recipe. In the same way, where the student meets Aquæ ad 3 in the different prescriptions and formulæ throughout this work, he may substitute Aquam ad 3; but this latter is by no means so idiomatic as Aquæ ad 3.

Abbreviations are necessary in writing prescriptions, and they are universally employed. Great care must be taken, however, to avoid ambiguities, which may mean death to the patient. Usually, the careful pharmacist gathers from the directions and the quantities the information which guides him into safety. A few examples of defective abbreviations are appended, a number of which are taken from Pareira's Physician's Prescription-Book.

Acid. Hydros.	May mean Acidum Hydrochloricum or Acidum Hydrocyanicum.				Hydrargyrum (mercury).
Aconit.	Aconitine.	Hydr.			Hydras (hydrate).
	Aconiti Radix.				Hydriodas (hydriodate).
	Aconiti Folia.				Hydrochloras (hydrochlorate).
Ammon.	Ammonia (alkali).				Hydrocyanas (hydrocyanate).
	Ammoniac (gum-resin).	Hydr. Perox.			Hydrogen Peroxide.
Aq. Chlор.	Aqua Chlор.				Hydrargyri Peroxidum.
	Aqua Chloroformi.	Mist. Ammon.			Ammonia Mixture.
Aq. Fontis.	May often be read Aqua Fortis.				Mixture of Ammoniac (gum-resin).
Calc. Chlор.	Calcium Chloride.	Potass. Hyd.			Potassium Hydrate (caustic potassa).
	Chlorinated Lime.				Potassium Hydriodate (iodide of potassium).
	Chlorine.	Sod. Hypo.			Sodium Hyposulphite.
Chlор.	Chloroform.				Sodium Hypophosphite.
	Chloral.	Sod. Sulph.			Sodium Sulphate.
	Emp. Lytharg. (lead plaster,—old name).				Sodium Sulphite.
Emp. Lyt.	Emp. Lyttas (blistering plaster).	Sulph.			Sulphur.
	Extractum Colehici.				Sulphide.
Ext. Col.	Extractum Colocynthis.				Sulphate.
	Calomel.	Zinci Phosph.			Sulphite.
Hyd. Chlор.	Corrosive Sublimate.				Zinc Phosphate.
	Chloral Hydrate.				Zinc Phosphide.

The above list might be indefinitely prolonged. Sufficient has been clearly shown, however, to convince even the most sceptical practitioner of the grave danger of careless abbreviation. The following table of abbreviations, terms, etc., used in prescriptions will be of service to the pharmacist, by enabling him to translate some of the technical phrases used in writing prescriptions :

Word or Phrase.	Contraction.	Meaning.	Word or Phrase.	Contraction.	Meaning.
A, Æ		Of each.	Adjacens	Adjac.	Adjacent.
Abdomen	Abdom.	The belly.	Ad libitum	Ad lib.	At pleasure.
Absente febre	Abs. febr.	In the absence of fever.	Admove, admoveatur	Admov.	Apply, let it be applied, let them be applied.
Accurate		Accurately.	Adstante febre	Adst. febre.	When the fever is on.
Ad	Ad	To, up to.	Adversum febre	Adv.	Against.
Ad duas vices	Ad 2 vic.	At twice taking.	Aggrediente febre	Aggred. febra.	While the fever is coming on.
Ad secundum vicem		To the second time.	Agitato vase		The vial being shaken.
Ad tertiam vicem		For three times.	Aliquot		Some.
Adde, or addantur, addendus, addendo	Ad. or add.	Add, or let them be added, to be added, by adding.	Alter		The other.
Ad defectiōnem animi	Ad def. animi.	To fainting.	Alternis horis		Every other hour.
Ad gratam aciditatem	Ad grat. acid.	To an agreeable sourness.	Aluta		Leather.
Adhibendus		To be administered.	Alvo adstricta	Alv. adst.	The bowels being confined.
			Alvus		The belly.
			Amplus		Large.

Word or Phrase.	Contraction.	Meaning.	Word or Phrase.	Contraction.	Meaning.

AUTOGRAPH AND QUESTIONABLE PRESCRIPTIONS.

In the following pages will be found fac-similes of prescriptions taken from the author's collection. One of the most important duties of the pharmacist is the unravelling of prescriptions, and upon his cleverness in accurately divining the intention of the physician will often depend his reputation for skill and ability. It may be found that as one's experience in the art of interpreting increases, that there will be ample justification and respect for the philologist who dignified the art of writing prescriptions by such a massive word as "Pharmacocatagphologia." It is not to be supposed that all of the prescriptions which

follow are of a character which would prove stumbling-blocks to those having had experience in this difficult art; indeed, the author has the highest regard for the rare sagacity possessed by the American pharmacist, who has an international reputation for acuteness, and his only apology for presenting them is that he has some hope of aiding the younger members by some useful practice.

It should be noted that the fac-simile prescriptions in the following pages, whilst faithful reproductions, are really clearer and are usually easier to read than the originals, because it has been found impossible to reproduce blurred lead-pencil marks, greasy spots, finger marks, and the crumpled paper, which are such important aids in obscuring the legibility of every-day prescriptions.

The succeeding illustrations are all that we have space for: they show the importance of writing prescriptions upon regularly printed or engraved blanks, on which the name of the physician is clearly shown, with his office hours and address, in order that the pharmacist in case of necessity may confer with him speedily and have all doubts removed about the interpretation of the prescription.

Omissions and Errors.—If an *obvious* error or omission is detected by the pharmacist, or an unusually large or poisonous dose has been prescribed, it is generally easy to gain the requisite delay, upon the plea that the prescription will require considerable time to compound, or for some other reason which will not excite the suspicions of the patient, and in the mean time the physician may be consulted and the difficulty removed. Good judgment is necessary at all times, and where delay is entirely inadmissible there is nothing left for the pharmacist but to assume the responsibility of making the dose safe, or of supplying the omission according to his best judgment. In this case a written explanation should be sent immediately to the physician.

In the case of omissions or errors on the part of the pharmacist, so much judgment is needed which must depend upon the circumstances surrounding each case, that it would be unsafe to offer any suggestions: generally the physician must be appealed to, and upon his skill and tact reliance must be placed. In such cases it is not often that he is found unwilling to exercise his good offices. One instance is on record showing rare tact on the part of an apothecary: it occurred before the practice of checking prescriptions became common. After renewing a mixture, he realized, just as he was in the act of handing the bottle to the nervous and suspicious old gentleman for whom it was intended, that he had omitted one of the principal ingredients: to hand it to him and permit his departure would have been professional suicide, to hesitate and take it back after the patient had watched the process of compounding, and had seen the bottle labelled and wrapped, would have excited unpleasant suspicions and have been equally disastrous. At once grasping the situation, he dropped the bottle upon the counter, allowing it to break to pieces, whilst in the act of handing it to the patient, then, with an apology for the accident, he quickly proceeded to compound the mixture over again, this time with every ingredient in it. He fully believed that any proper sacrifice should be cheerfully made to avoid loss of confidence.

Fig. 889 is a good representation of a class of prescriptions far too common in every-day practice. If taken by a patient to a pharmacy where the habit and handwriting of the physician are not known it would prove a veritable puzzle. The first thought of the compounder will naturally be solution of magnesia; then the absence of directions will cause him to stop and consider. He may then run over in his mind the numerous solutions of magnesia with which he is familiar and possibly select one of the most harmless; then, choosing the best course, he asks the patient, in a matter-of-fact way, whether the doctor left any directions how the medicine was to be used. "Oh, yes, with a syringe." More puzzled now than ever, but not showing to the patient the slightest embarrassment, he suddenly catches the idea that Magendie's solution of morphine is to be used hypodermically. A few more skilful questions remove all doubt, and the patient hastens away convinced that the apothecary is careful, and never suspects that faulty abbreviation and a worse fault in writing the directions on the part of the physician have given the pharmacist one more reason to lament his serious want of care.

Questionable prescription.

The writer displays a lack of education by prescription 890, although there are no particular difficulties in compounding it. "Tr. digital purp" would be easily rendered by an experienced compounder tincture of digitalis. "Eather nitr. alcoh" would become spirit of nitrous ether. The next ingredient would be apt to puzzle the uninitiated, but any one familiar with German prescriptions would have no difficulty in selecting syrup of liquorice as the article wanted, "Syr. Liquiritiæ" being the common term for it. The bad habit of using a dash to signify "the same," in

Carelessly-written prescription.

place of a ditto-mark, is not thoroughly established in this country, although there would be no great difficulty in guessing at the prescriber's meaning. The use of either ditto-marks or dashes in prescription-writing is a practice more honored in the breach than in the observance by careful prescribers. The unusual order in which the quantity in the "Signa" appears betrays the nationality of the writer,—"Every 2 hours a 1/2 table spoon,"—although it would be easily understood to mean, Take a dessertspoonful every two hours.

Prescription 891 has proved a puzzle to many expert pharmacists. The bad habit of running the quantities into one another, the equally bad taste shown in using

both English and Latin in the same prescription, and the exhibition of gross carelessness about the whole composition, make it a unique specimen. The original in the author's possession was written with a very soft lead-pencil, and is considerably blurred. One drachm of chlorate of potassium is to be dissolved in one ounce of boiling water, one ounce of solution of morphine, and two ounces of syrup of tolu. The dots which should be over the numerals representing 1's have so strayed from

however, as one to be followed by the pharmacist, except in rare emergencies, and the physician should be notified at once of the facts.

Fig. 398 is an exact reproduction of a prescription presented in the ordinary course of business. It was written by a young physician who had become enamoured of

their legitimate use as to have lost their identity entirely, and the third line is almost unrecognizable. One would suppose that its dangerous character would have saved it from such a fate.

Prescription 392 illustrates a common fault,—an omitted quantity. It has evidently been written for a patient suffering some pain, and has been designed for immediate use. Of course such a prescription should be instantly returned to the prescriber, the pharmacist gaining time by stating to the patient that it will take some time to compound it. If, however, there is great urgency, the physician not being accessible, and the pharmacist is prepared to assume the risks which such a course entails, one grain of morphine sulphate may be used if the patient is an adult and able to bear it, as it is strongly probable that the intention of the prescriber was to give one-sixth of a grain as a dose. This course is not recommended,

European methods, but had not sufficiently mastered the intricacies of the metric system to be sure of his doses. A dose of six centigrammes (about nine-tenths of a grain) of atropine sulphate was ninety times larger than he intended to give to

the patient. In this case the prescription was held until amended, and the proverbial caution of the pharmacist saved the patient's life and probably the physician's reputation.

Prescription 394 is a fac-simile of one written by a celebrated physician of Philadelphia. In all probability no greater difficulty was experienced in compounding the prescription than was found by the patient in taking it. It is rather unusual to duplicate the signs, however, and the high character of the physician precludes the possibility of there being any truth in the suggestion of the cause of the duplication, that the prescription had been previously compounded and tested by the prescriber himself.

M et Sig. Take a full teaspoon
ful if unable to sleep in water

Involved prescription.

Prescription 395 would probably offer some difficulty in compounding on account of the deficiency of water, particularly in cold weather, potassium bromide being much more soluble in warm than in cold water. But the chief interest in this prescription centres in the directions to the patient, who, if so unfortunate as to be "unable to sleep in water," is required to take a "full" teaspoonful.

In prescription 396, which was written by a German physician of the old school, we have an illustration of a peculiarly involved and cramped style; the difficulty in deciphering the original being greatly enhanced by the doctor's selection of a narrow, soiled piece of paper and a soft black lead-pencil as the means of communicating his ideas of the patient's needs. The fac-simile gives the style and the construction of the letters correctly, but fails to reproduce the imperfections of the lead-pencil and coarse paper. Three and a half drachms of cascarrilla bark, two drachms of asarum root, two grains of ipecac root, six drachms of bruised juniper berries, are to be infused with sufficient hot water to make the strained infusion measure six ounces, in which are to be dissolved fifteen grains of extract of lactucarium; it is then mixed with six drachms of camphor water, one and a half drachms of cherry laurel water, twelve drops of simple tincture of opium, and ten drachms of syrup of orange peel. A tablespoonful every three hours.

The prescription shown in Fig. 397 is a type of a style familiar to all who have occasion to read prescriptions. No attention whatever has been paid to reserving a line for each ingredient, and faulty abbreviation and careless writing have made a

FIG. 397.

prescription not easy to decipher with any degree of certainty. If physicians would endeavor to use the officinal names for the preparations they prescribe, much labor would be saved and the liability to err would be greatly lessened. Half a fluidrachm of nitric and muriatic acid with three and a half fluidounces of water is the translation, and it is known in this case that the official nitro-hydrochloric acid was wanted.

Fig. 398 affords another illustration of want of care in writing a prescription. Some of the letters show an ability on the part of the writer to form letters properly, which would indicate that he could write a legible prescription if he wished to; but the illegibility increases as the end of the prescription is approached, and hurry is plainly indicated. It happened that the medicine was intended for a poor dispensary patient; but one might suppose that

poverty and sickness are heavy enough burdens to carry without having the additional and unnecessary one of the risk of losing life. One scruple of potassium bromide, one scruple of chloral hydrate (not chloride of mercury, calomel, or corrosive sublimate), one-quarter of a grain of morphine sulphate, are dissolved in one fluidounce of syrup of ginger. One-half is taken in water. Repeated if required.

There is no lack of legibility in prescription 399; it is presented as showing a custom which some physicians practise,—i.e., the employment of an unusual name. The object of using an out-of-the-way name may be a laudable one, although the physician usually is given the credit of trying to cover up some secret arrangement with an initiated and favored pharmacist. In this case the word "bardane" appears in the Dispensatory, and no intelligent pharmacist would have any difficulty in understanding that tincture of burdock seed was wanted. This being unofficial, it would be desirable to know from the physician what strength of tincture might be preferred.

At first glance it would seem that prescription 400 is ordinarily well written and free from fault. When the cautious dispenser looks it over carefully, however, he will observe that half a fluidounce of tincture of opium in a four-ounce mixture, with a teaspoonful dose, would be a large quantity for "Baby May," and in all probability would permanently end her pain. A thorough examination indicates an abortive attempt at forming the letter "c" after the "opii," and if the ingredient is rendered "camphorated tincture of opium," a popular cough-mixture is revealed, which is really what was intended by the prescriber.

ough examination indicates an abortive attempt at forming the letter "c" after the "opii," and if the ingredient is rendered "camphorated tincture of opium," a popular cough-mixture is revealed, which is really what was intended by the prescriber.

Fig. 401 illustrates the effects of the loose methods that dispensary physicians are apt to acquire through the great haste usually practised in "getting through a clinic on time." Abbreviations, mixed Latin and English, and general lack of finish characterize this style. Five drachms and one scruple of potassium bromide and four scruples of chloral hydrate are to be dissolved in one fluidounce each of peppermint water and syrup; the quantity of bromide is excessive, and if the peppermint water is of full strength, a cloudy mixture results, due to throwing the volatile oil dissolved in the peppermint water out of solution. "A teaspoonful at bedtime in wineglass of water" should surely give the needed rest to the patient.

Odd prescription.

The prescription shown in Fig. 402 was written by a well-educated German physician, and is presented as showing unusual care in designating the quantity of the dangerous ingredient. It certainly is rare to see upon American prescription-files the quantity of any ingredient spelled out in full, either in Latin or in English; indeed, the whole prescription gives evidence of careful thought. One grain of red mercuric iodide and two drachms of potassium iodide are to be dissolved in six ounces of compound syrup of sarsaparilla.

Fig. 403 shows a style now fortunately extinct in Philadelphia,—the worthy author having been "gathered to his fathers." He was a physician of excellent character, large practice, and unusual sagacity, but, alas! of execrable memory in prescription-writing. Several of his prescriptions will be shown in this series, but the one now under consideration exhibits "one of his best." Two drachms of Goulard's extract, three grains of morphine sulphate, and two ounces of prepared lard (not lord) are to be rubbed together.

prescriptions are common, however, in large cities. It will be noticed that the quantities are those for one dose. The abbreviated subscription is in full, "Dentur tales doses No. IV,"—let four such doses be given. The absence of any further direction to the apothecary might raise the question, Are powders or pills intended? But as

the ingredients themselves are in the form of crystalline powders, and as pills are not specified, it would be proper to dispense four powders.

Prescription 405 is a fac-simile of one penned by a noted Philadelphia physician. Although not written in the clearest style, still it is legible, and no one would hesitate about preparing the ointment by taking one drachm of calomel, half an ounce of ointment of zinc oxide, half an ounce of simple cerate, and sufficient olive oil and oil of rose to make a smooth and sweet-smelling

ointment; but just here the apothecary will halt,—for, notwithstanding the attractiveness of the “unguent” and the delicious savor exhaled by it, it would not be judicious to label the box as the doctor has directed: “Two teaspoonfuls with water half an hour before each meal.” It is clearly a case of “lapsus calami,” and no harm would ensue if the apothecary were to shelter himself behind that convenient barrier provided for all such cases, and simply write on the label, “Use as directed,”—for it is hardly likely that the doctor made the same error when giving the patient verbal directions that he has done in writing the prescription. In handing the ointment to the patient, any undignified tendency that the dispenser may have to relieve his feelings must be rigidly suppressed.

Prescription 406 exhibits ignorance of the laws of chemical incompatibility, coupled

with a careless style of writing; yet abundant evidence of ability to write better is furnished in the formation of many of the letters. Three grains of morphine sulphate are to be dissolved in half an ounce of aromatic spirit of ammonia and two and a half ounces of syrup of ginger. The directions are, “a teaspoonful every two or three hours when pain is severe.” The incompatibility belongs to the class illustrated in Chapter LXXV., and is due to the fact that alkalies precipitate alkaloids from alkaloidal salts. The danger here would be apt to arise from the alkaloid morphine precipitating out and collecting in the bottom of the bottle, and the liability of the patient swallowing a poisonous quantity if the last dose be taken.

Fig. 407 shows a mixed style. The writing is legible, but “Iodide Pot,” an abbreviation of the English name, and “Hydrarg Bichloridi,” a partial abbreviation of the Latin name, with the lack of knowledge of correct terminology or abbreviation shown in writing out the other ingredients, quite prepare one for the writer

ignoring the fact that the potassio-mercuric iodide formed by dissolving corrosive sublimate in solution of potassium iodide will be apt to precipitate the cinchona alkaloids in the elixir of calisaya (see page 1081), for it is now the most useful and the most delicate reagent for alkaloids that has ever been discovered. One thing may, however, prevent this danger,—i.e., the use of one of the very agreeable but worthless elixirs of calisaya that contains no alkaloids.

Prescription.

In the case of prescription 408 no serious fault can be found with the manner of writing it; the interest in it simply lies in the fact that the druggist to whom it was presented had forgotten his Latin, the school-master being needed. The second article proved a poser to him, and, after searching through the dispensatories and text-books, and finding no substance in the *materia medica* bearing the title of "Ejusdem," he concluded that it was one of those "new-fangled proprietaries" that doctors are always writing for, and, with an air of injured dignity and superiority, he informed the patient that one of the ingredients he did not keep, and, returning the prescription, sent him away. The patient succeeded easily in having the prescription compounded by a neighboring pharmacist, and the story leaked out. The translation is, one fluidounce of fluid extract of ergot, one fluidounce of wine of the same (ergot), and half a drachm of white sugar.

Prescription 409 is a fac-simile of one written by a well-known physician. It is legible, and free from serious fault, with one exception,—the quantities have been inadvertently transposed. Sixteen grains of compound tincture of cardamom and one ounce of quinine sulphate are so far away from reasonable expectations that there should be no difficulty in "diagnosing this case" and deciding it to be one of transposition of quantities. It would be fortunate indeed if all instances of transposition were as glaring as this. It is a fault that often goes undetected, and its frequency arises from the habit which many good physicians have of deciding upon the ingredients that they wish to give their patient and filling in the quantities afterward, not in consecutive order. An interruption or slight "lapse" will be very apt to cause transposition.

Erroneous prescription.

In prescription 410 an illustration is given of the use of a specially-coined term to designate a well-known substance, the intention being to calm the fears of a patient who has a perhaps unreasonable prejudice against a remedy which the physician believes to be necessary to alleviate the malady. Circumstances arise in the practice of every physician when patients need a remedy which they will refuse to take if they are aware of it, and hence the alleged necessity for the use of an unusual term which they will not understand when written on the prescription. "Sulphatis Americani Australis," South American Sulphate, is, in plain English, sulphate of quinine. The stilted Latin by which the first ingredient is designated is in strong contrast with the plain English of the third ingredient,—“Syrup of Rock Candy.” The last line may cause a little studying, but it is soon translated Aqua q. s. ft. $\frac{3}{4}$ vi.

German prescription.

Fig. 411 is a fac-simile of a prescription written by a German physician, which at first appears curiously involved, but really presents no great difficulty in deciphering when carefully scanned. One grain of morphine sulphate, two drachms of potassium iodide, three drachms of potassium bromide, half a drachm of ethereal extract of digitalis, one and a half ounces of spirit of juniper, half an ounce of spirit of nitrous ether, two ounces of distilled water, and two ounces of syrup of tolu, are the ingredients; whilst the signa, or the

Prescription 413 has defied the efforts of all experts in calligraphy up to the present time. The author has shown the original and the fac simile to more than one hundred skilled pharmacists without receiving a correct solution from one of them. It was written by a Cleveland physician in the ordinary course of business, and was

FIG. 412.

R Potus Permang di
Glycerine 3j
Use as directed

Explosive prescription.

presented to the author by a brother pharmacist. The principal difficulty in deciphering it arises from the fact that two ingredients are unofficial and rather out of the way, and, in addition, their titles are run together and obscured almost beyond recognition. The full translation is as follows: "Dec. 14, 88. 97789. Quinia Sulph. $\frac{3}{4}$ j; Elix. et Syr. Glycyrrhiza Co. aa $\frac{3}{4}$ j. M.—Tablespoonful 3 times a day." The author

was informed by a pharmacist who was familiar with the doctor's method of writing prescriptions that the above specimen was not unusually obscure.

Fig. 414 is a fac-simile of a prescription for an eye-wash. The original was written with a hard lead-pencil upon a rough bit of paper. Any one familiar with the doctor's style would have little difficulty in solving the obscurity by dissolving four grains of zinc sulphate and ten grains of sodium borate in two ounces of rose-water. Incidentally, it may be remarked that precipitation frequently occurs in prescriptions of this character, due to precipitation of hydrated zinc oxide by the alkali in the sodium borate. It is better to filter the mixture than to add a little

FIG. 413.

Flourishing prescription.

sulphuric acid to clear the solution, because the slightest excess of the latter might prove irritating.

The habit of making one letter look exactly like some other letter is one of the worst faults that a writer can have, and it is usually only a question of time for a prescriber with such a habit to make a serious error. It will be observed that in the fac-simile (Fig. 415) the fault is that the doctor's small "a's" are always "o's." He writes "Tonnici" for "Tannici." "Inoke" is intended for "make." The next word is not "mte," but "into." The words "six suppositories" are, fortunately, plain enough, and the directions, "One night and morning," present no difficulty to a good guesser. The writer is an intelligent and unusually able physician, and force

and character are indicated by the general style of the writing, marred, however, by the one serious fault.

FIG. 414.

Mrs Jor Edmnd Kae
only
 Obscure prescription.

affirmed to be correct. The difficulty about the acceptance of this guess centres around the word which is rendered "sweetened." The other words may or may not be correctly deciphered. Doubt and confusion reign supreme.

The use of chemical symbols in writing prescriptions is not a common custom, and although there can be no serious fault found with the prescription shown in facsimile in Fig. 417, there are objections to the custom notwithstanding some advantages. To begin with the latter, symbols are usually brief, distinctive, and capable of being written in unmistakable characters, but a physician who attempts to use them altogether must have a circumscribed list of remedies to prescribe from, for symbols have not been contrived for elixirs, syrups, or any galenical preparation; then, again, the symbols for alkalis and some of the new antipyretics would be complicated and not so easily nor so clearly made out as the usual Latin abbreviations. In the example shown it is plain that the prescriber wants four drachms of sodium bromide and half a drachm of potassium iodide dissolved in two ounces of water.

six such pills are to be sent." A little more magnesia, a trace of water, and possibly a little powdered soap are needed to give the mass sufficient adhesiveness and firmness.

A study of the prescription illustrated in Fig. 416 will thoroughly justify the verdict that no extenuation can be fairly accorded to the writer. The fac-simile cannot show the crumpled piece of manilla-paper, nor reproduce the indistinct lead-pencil marks, which are prominent characteristics of the original,—yet it was written by a noted physician "in a hurry." Who would guess that the first line is "Tinct. Iron"? and if any one should be so fortunate as to get so far, could he by any possibility translate the remainder?—"Take a teaspoonful mixed with (8) tablespoonsful of warm water sweetened, an hour before eating and at bedtime;" and yet this is the translation which was given by the friend who sent it to enrich the author's collection and

Faulty prescription.

Fig. 418 is a type of prescription which is very frequently seen in practice. It is impossible to expect any physician to retain in his memory the solubilities or exact physical properties of all the substances that he desires to prescribe. As pharmacy has advanced prescribers have grown into the habit of depending upon pharmacists to use their art in supplying the needed knowledge; and it follows, as a matter of course, that those who make a profession of handling the substances that enter into prescriptions every day should have this information at their "finger-tips." In this prescription two minims of oil of copaiba, two grains of magnesia, and one grain of powdered acacia are the ingredients for one pill, and the directions are that "thirty-

A prescription like the one shown in Fig. 419 bears evidence of error on its face. The subscription directs a mixture to be made, and seventy-five per cent. of the mixture is composed of solids. On the other hand, the dispenser is unable to guess whether the prescriber made an error in directing a mixture, or whether, unable to class the compound as an ointment, he has concluded to call it a mixture, and that the quantities of the ingredients are just what he intended to write. Probably most pharmacists would mix the powders thoroughly, rub in the petrolatum and lime-water, and dispense the mixture in a box, labelling it, in the absence of directions, "Use as directed." If the physician could not be seen, this would be the course

to pursue; but in the above case the quantity "ʒiv" after the "Liq. Calcis ad" happens to be a mistake: it should have been "ʒij," and it was intended for an external application to an inflamed surface. There are, however, many instances on record where similar errors which were never corrected have occurred and the prescription dispensed as written, the patient subsequently returning to have the apparently absurd prescription renewed and ultimately praising the doctor for the speedy cure which had been effected.

In prescription 420 physical incompatibility is illustrated. Extract of opium is an

aqueous extract, the greater bulk of it being insoluble in olive oil. The mixture is evidently intended for an external application, and all that is expected is a reasonably smooth mixture. The proper method of compounding this would be to rub the extract of opium with sufficient water to make a smooth paste. Now, having poured the oil into the bottle in which the mixture is to be dispensed, add the carbolic acid, shaking it well until solution is effected, then gradually add the thick aqueous mixture of extract of opium, shaking after each addition. Do not filter the mixture, but dispense with a shake-label.

phate divided into four powders; take one powder at night. He really wanted one grain divided into four powders, and this was given to him. In cases of this kind a pharmacist could not be justly condemned for refusing to compound the prescription; and, indeed, it should be the rule always to decline to furnish morphine or other poisonous remedies to any intoxicated person. In this particular instance the physician had friends with him who made themselves responsible for his safety.

Prescription 428 is another illustration of a badly-written prescription, and one which defies the laws of both chemical and physical incompatibility. One scruple of quinine sulphate, six grains of morphine acetate, two drops of oil of sassafras, and five and a half ounces of simple syrup are to be mixed, and a teaspoonful administered every three hours. The insertion of the curious character, which resembles a capital letter A reversed, is an illustration of a careless and reprehensible method of correcting an error. The quantity originally attached to the "Syr. Simple" was $\mathfrak{z}\text{ss}$; this would yield a poisonous quantity of morphine, the mixture being given in teaspoonful doses. The addition of ∇ over the "ss" was intended to make the dose of morphine a proper one; but it would in most cases fail signally to accomplish the intention of the prescriber, for it would not be so interpreted. When strong solutions of quinine sulphate and morphine acetate are brought together, decomposition results, with the production of the insoluble acetate of quinine (see page 1067); in addition to this, the oil of sassafras would not dissolve entirely in the syrup, and it would consume a great deal of time to filter so thick a mixture. The only way out of such a combination of errors for the pharmacist, in the absence of the physician, is to paste a shake-label on the bottle and dispense it.

Carelessly-written prescription.

In prescription 424, which is reasonably well written, is afforded an example of intentional incompatibility. Fifteen grains of zinc sulphate, half a drachm of lead acetate, and one drachm each of tincture of catechu and wine of opium are to be mixed with six ounces of rose water. This mixture should not be filtered, of course. The unusually elaborate character for recipe at the top of the prescription might reasonably be accused of indicating a relapse to the habit of former ages, when prescriptions were decorated with mystic signs. These were supposed to possess supernatural powers. The patient who needed such a prescription as 424, however, probably required a special invocation.

FIG. 425.

 M

Incompatible prescription.

In 425, precipitation, due to decomposition between the potassium iodide and the quinine sulphate, will take place here and quinine iodide will separate. The addition of mucilage as a retarding agent has been recommended in such cases, but it is very ineffective, and the best course is to depend upon a shake-label pasted on the bottle, with verbal directions to the patient to call attention to the necessity for shaking the mixture before taking a dose. Iodides and bromides should never be given in combination with alkaloidal salts. (See page 1176.)

There can be no difficulty in reading this prescription. The translation is—Three grains of potassium iodide, one grain of quinine sulphate, half a drachm of syrup of orange, with sufficient water to make two drachms.

Fig. 426 is a copy of a prescription which was written by a physician in Canada.

It represents modern therapeutics in more senses than one: the use of a patented and copyrighted medicine (a growing evil), and the comparatively new method of treating pyrexia by using an agent which distinctly lowers the temperature. An emerald-green coloration is apt to be produced when antipyrin is brought in contact with nitrous compounds. This cannot be avoided. Investigation seems to indicate, however, that no dangerous poison is developed through this decomposition; yet it would be better to avoid prescribing antipyrin with spirit of nitrous ether until the action is clearly determined. The substitution of antifebrin or any other antipyretic for the one ordered, without the physician's knowledge or consent, as sometimes practised, is entirely without justification.

Badly-written prescription.

Prescription 430 shows illiteracy and general deficiency. Seven grains of zinc sulphate, one drachm of tincture of opium, and eight ounces of water are to be made into a lotion, and the direction is "To use as a wash." The letter "Z" is very far from being the ordinary form, and much more resembles the letter "T," whilst the other letters of this word are not recognizable as "inci;" "opi," in the second line, is more like "api," and, since preparations of celery and parsley, both "apiums," are now prescribed, there might be some danger of confusion if the construction of the letters were alone depended upon. The evident intention of the prescriber is a very important element, however, in guiding the pharmacist, who is expected to unravel the mysteries of compounding prescriptions.

FIG. 431.

R Sugar gr. xij
Jellymint gr. xv
Theriac gr. iij
M. f-

Misleading prescription.

Prescription 431 must not be read with the Pharmacopœia as a guide; but it is best to have a layman read the prescription hastily, and then judge by the sound how near such sounds resemble those of the names of familiar substances and which might be used in pronouncing "sugar of lead," "sulphate of zinc," "morphine." The object of writing such a prescription is concealment; and it is far safer for the pharmacist to decline to become a party to a questionable procedure, particularly one which involves the sale of a poisonous dose of morphine unauthorized by a physician. The intention is to add water to the mixture and thus complete the lotion. The temptation to overcome difficulties or to increase the number on the prescription-file and to meet all possible contingencies should not be allowed to warp the pharmacist's judgment. Improper prescriptions should be declined politely but unconditionally.

Prescription 432 has been hastily written, but it is reasonably clear. The quantity attached to the first ingredient is somewhat ambiguous. Should gr. xxx or gr. xxv be dispensed? The upper part of the last x has been imperfectly made, so that an inverted v is the result. It is impossible that such a character as an inverted v would be used intentionally. Hence the conclusion is reached that thirty

darkening in color which eventually results in the formation of a blackish deposit takes place and the odor of oil of wintergreen is observed. The annoyance to the dispenser in a case of this kind is apt to be considerable; the patient noticing a change in the appearance of the medicine, and at once suspecting that some mistake has been made, takes it to the pharmacist, and no matter how complete the defence may be, nor how earnest the latter may be in his protestations that no mistake has been made, it is only with great difficulty that an unfavorable opinion of the pharmacist's ability can be averted. Previous knowledge on the part of the dispenser that such combinations produce such mixtures would lead to the return of the prescription to the physician, with the request that it may be modified so that the two offending substances may be given separately. If this cannot be done, the prescriber should be notified as soon after the delivery of the prescription as possible, so that the medicine for the patient may be changed at the next visit.

Incompatible prescription.

Deficient prescription.

Fig. 436 shows a fac-simile prescription in which the quantity of one of the ingredients is omitted. It is presumed that the physician intended to write "gr. i" after "Morph. Sulph.," but it would not be proper for the pharmacist to insert the quantity upon his own judgment, except in case of an extreme emergency which would require prompt action without the advice of the prescriber.

No fault can be found with the legibility of prescription 437. The first line could only be translated "Magnesii Sulph.," the termination to "Senna" is, however, incorrect, as it should have the genitive termination "æ" instead of "a." "Two drachms of sulphate of magnesia, one drachm of tincture of senna, and sufficient compound infusion of gentian to make half a fluidounce. Send twelve doses." Although the additional word "tales" is omitted in the directions, it is a fair inference that the prescriber wants the patient to take half a fluidounce for a dose; but the quantity of liquid is insufficient, and a portion of the sulphate will not dissolve. If the mixture is heated the excess will disappear, only to return on cooling in the form of a gelatinous precipitate. The usual course of notifying the physician should be followed if there is time, and if there is not, there would be no impropriety in this case of adding just sufficient water to hold the sulphate in solution, making each dose a little larger, and then sending word to the physician of the fact.

Faulty prescription.

Prescription 438 is a fac-simile of one which is ambiguous in two particulars: "Hyd. Chlor." may mean chloral hydrate, calomel, or corrosive sublimate (see page

1118), and "Aq. Menth" may mean peppermint water or spearmint water. "Obvious intention" in this case is the deciding factor, and this apparently points to the conclusion that a soothing draught is intended of chloral hydrate and mint water. The directions, "Take as directed," should cause the pharmacist to pause. In this case, however, a dose of calomel was intended, with mint water as the vehicle. These

FIG. 438.

R
R Hyd Chlor gr X

 M / Take as directed
 82112
 FL

Amiguous prescription.

would give the pharmacist an undoubted right to use either. In every case like this a marginal note should be made on the prescription, so that in case of renewal the same mint water may be used that was employed at first.

In prescription 439 there is an opportunity for the dispenser to utilize his knowledge and skill. Forty grains of chloral hydrate, ten grains of powdered camphor, and two fluidrachms of syrup of ginger are to be made into a solution, with sufficient water to make two fluidounces. Chloral hydrate and camphor, when rubbed together, form a liquid (see "Chloral Camphoratum," Part VI.). If advantage is

Incomplete prescription.

facts were developed only by a few questions which were asked the patient, who happened to present the prescription personally and who without much provocation said that he was "that bilious" that the doctor had given him "the same medicine as before, for it did him so much good." Further inquiry developed the fact that this was "obvious intention" on the part of the prescriber, and it would have been a very poor conjecture to use chloral hydrate. The incident points clearly to the necessity for the possession of wisdom and caution almost supernatural if errors in judgment are always to be avoided. The use of spearmint or peppermint water when "Aq. Menth." is prescribed is largely a matter of local habit; in some sections mint water always means peppermint water; in other parts of the country spearmint water is preferred. Where local preference does not exist, the fact of the kind of mint not being specified

taken by the dispenser of this knowledge, and if the two substances are rubbed in a mortar until a smooth mixture results, and if half a drachm of powdered acacia be added, with sufficient water to make a smooth mixture, and followed with the remainder of the water and syrup, it will be found that the camphor can be uniformly distributed in the mixture with no tendency to separate. The directions to "make a solution" are faulty, because a solution cannot be made with the ingredients named; but the pharmacist is justified in adding acacia to make a mixture, for otherwise the camphor will separate and cannot be combined uniformly.

Prescription 440 exhibits chemical incompatibility. Iron and quinine citrate

should never be prescribed with alkaline salts; an excess of the latter will surely decompose the quinine salt, causing precipitation of the alkaloid. The prescriber evidently intends in this prescription to get the tonic effects of the quinine and iron, the sedative properties of the tincture of opium, and the correcting and stimulating influence of the compounds containing ammonia; but in attempting to get all of them bottled up in one mixture he has defeated his purpose,—the alkaloidal salt should either be made into pills or given in a separate preparation. One drachm each of citrate of iron and quinine and carbonate of ammonium is dissolved in water, aromatic spirit of ammonia, and tincture of opium, with sufficient water to make an eight-ounce mixture.

Prescription 441 is another illustration of incorrect abbreviation. "Obvious intention" cannot be used here to aid in the interpretation, because the intention is not

obvious by any means. A prescriber might want corrosive sublimate, calomel, or chloral hydrate. Most pharmacists would probably guess that corrosive sublimate was intended, particularly since its use in collyria is not uncommon. But the physician in this case wanted calomel, as he had conceived the idea of replacing the practice of blowing calomel into the eyes (which is sometimes resorted to) by the more refined method of making a lotion and dropping a portion of it into the eyes. One grain of calomel and half a grain of extract of opium are to be made into a lotion with one ounce of distilled water, care being taken to paste a shake-label upon the bottle. As a matter of practice it is very doubtful whether the heavy powder calomel could be distributed so uniformly through the lotion that one drop would contain the same proportion that another would.

In prescription 442 the prescriber intends that a solution should be made,—for he has written "ft. solutio;" but he is no doubt ignorant of the fact that iodine is not soluble either in tincture of opium or in oil of turpentine. If the prescription is compounded as written, considerable irritation will be produced from the contact of the undissolved particles of iodine with the skin. If four drachms of the oil of turpentine be replaced by strong alcohol, and as much of the iodine dissolved in this as can be, and if the moist residue be then rubbed into a smooth paste and the oil of turpentine and tincture of opium added gradually and alternately, a mixture will result in which the undissolved iodine will be in a very fine state of division. The best course to pursue would be to get the physician to use extract of opium, iodine, potassium iodide, and water as a substitute, or a mixture of tincture of iodine and tincture of opium. Incidentally,

it may be mentioned that the legibility of a prescription is often seriously impaired by the careless habit of folding it before the ink is dry. This one has been blotted, though not very seriously.

Fig. 443 shows a fac-simile of a prescription written by a German physician. It is shown for the sake of practice for those unaccustomed to this kind. One-twentieth of a grain of powdered belladonna root, one grain each of benzoic acid and pure tannin, and sufficient white sugar. Make into a powder. Send twenty such powders. Every morning and evening one powder to be given.

FIG. 444.

German prescription.

sembles a capital script letter "L," or the one used to designate the British pound sterling, £. Whether to make six pills or six powders might cause the pharmacist a moment's hesitation, as the directions, "M. ft. pulv. vi," are a little ambiguous. But the first line is an aid here. No prescriber would be likely to direct powdered mercurial mass if pills were intended, and it is therefore clear that six powders are wanted. The signa is not difficult for an experienced compounder to interpret: the flourish after "1" would be guessed to mean "every," and that after "2" to mean "hours."

Fig. 446 is a dangerous prescription. The absence of any directions and the use of the abbreviation "Dr." before the initials would lead a cautious pharmacist to suspect that this is a forged prescription, written by an opium-eater for the purpose of obtaining his dose without difficulty or questioning. There are a few physicians who use their abbreviated title "Dr." before their initials, but it is not common except in certain localities, and an opium-eater wanting his dose would be very likely to put "Dr." before the initials, imagining that such an act would lull the suspicions of the pharmacist and thus his object be more readily accomplished; but a trick like this is very apt to overshoot the mark. Advantage may be taken of the fact that no directions have been given with the prescription, and if it is returned to the alleged patient with the request that the doctor write the directions upon it the difficulty can be easily met, or an offer may be made to send to the doctor for the information. If it is a forgery, the behavior of the patient will be apt to reveal it: he will probably take the prescription away and never return. On the other hand, if it is an honest prescription, both doctor and patient can but commend the caution and discretion of the pharmacist.

FIG. 446.

R. Pulv. Op. 92715
Dr. J. H. H.

Forged prescription.

Prescription 447 is an illustration of one written by a dispensary physician "on the jump." To a pharmacist accustomed to such scrawls they present no terrors, but the uninitiated are often sadly mistaken in their interpretations. This prescription is not so illegible as some others of its class in the author's collection, but it has

Fig. 444 is a fac-simile of another German prescription. This one is metric, and is to be compounded according to the German method, by weighing the liquids (see page 1156). It is badly written, the last ingredient being very indistinct. Thirty-five centigrammes of quinine sulphate, sixty centigrammes of hydrochloric acid, four grammes of acetic ether, one hundred and forty grammes of water, and forty grammes of syrup of orange flowers (fl. naphæ).

Fig. 445 is a fac-simile of another German prescription. This one is metric, and is to be compounded according to the German method, by weighing the liquids (see page 1156). It is badly written, the last ingredient being very indistinct. Thirty-five centigrammes of quinine sulphate, sixty centigrammes of hydrochloric acid, four grammes of acetic ether, one hundred and forty grammes of water, and forty grammes of syrup of orange flowers (fl. naphæ).

Prescription 445 shows peculiarities of composition that are strongly marked, the character selected for "gr." being unusually bad,—the habit of starting the "g" above the line and slurring the "r" making a character which resembles a capital script letter "L," or the one used to designate the British pound sterling, £. Whether to make six pills or six powders might cause the pharmacist a moment's hesitation, as the directions, "M. ft. pulv. vi," are a little ambiguous. But the first line is an aid here. No prescriber would be likely to direct powdered mercurial mass if pills were intended, and it is therefore clear that six powders are wanted. The signa is not difficult for an experienced compounder to interpret: the flourish after "1" would be guessed to mean "every," and that after "2" to mean "hours."

Badly-written prescription.

been selected to show that dangerous poisons are sometimes prescribed in this very reckless fashion. Poor "Sarah McM." is expected to obtain relief for her "cough" by taking "two drachms" of a mixture made of one grain of morphine sulphate, one drachm of "muriate of ammonia," and four ounces of brown mixture (Mist. Fuscæ).

In prescription 448 will be seen an illustration of an almost hopeless case of incompatibility. There are no difficulties about making a solution of the quinine sulphate in sufficient water with the aid of the large quantity of citric acid ordered. If the potassium iodide, syrup of ferrous iodide, and tincture of iodine are now added, a reddish precipitate occurs, which probably consists largely of insoluble quinine iodide. The addition of two ounces of mucilage will not only be admissible, but even beneficial as an aid in holding up the precipitate and in blunting the edge of the excess of acid. Quinine sulphate should never be prescribed in combination with iodides, and particularly with excess of iodine; and the physician should be asked to revise such a prescription.

Fig. 449 is a fac-simile of a prescription which should at once arouse the cautionary instinct of the compounder. It reads, "One grain of quinine sulphate, eight grains of morphine sulphate; make into ten pills. One pill every three hours." Through a lapsus the prescriber has written the quantity intended for the quinine sulphate after the morphine sulphate, and *vice versa*. The usual rule should be followed: gain time, if possible, and notify the physician; if this cannot be done, take the risk, use safe quantities, and inform the prescriber.

In Fig. 450 there is shown a prescription which affords an illustration of chemical incompatibility. Quinine salicylate is not a very soluble salt, and when strong solutions of quinine sulphate and sodium salicylate are mixed, quinine salicylate precipitates. The prescriber has evidently added diluted sulphuric acid with the view of dissolving the quinine salt, but the excess of acid will decompose the sodium salicylate,

producing sodium sulphate and throwing out the salicylic acid, which is not very soluble in aqueous liquids. The directions of the prescriber—"ft. solutio," make a solution—cannot be complied with literally. Of course he should be consulted; but, if this is not possible, it would be a fair inference that the diluted sulphuric

acid was intended solely for its action on the quinine sulphate to increase its solubility; but, as it acts as an impediment by decomposing the sodium salicylate, it might be omitted. If this course is not permissible, the mixture should be made in a mortar and the clear liquid then separated from the precipitate; the latter may be rubbed into a smooth paste with the aid of some mucilage of acacia and mixed with the rest of the liquid. This will make a mixture, and it should be dispensed with a shake-label.

Toxic prescription.

Prescription 451 is a fac-simile of one written by a medical student. The ingredients are distinctly indicated; but the dose of the poisonous alkaloids is so heroic and the prescription itself so unusual that very little risk is incurred of the patient being poisoned. No dispenser who would be likely to compound such a prescription would have such alkaloids in stock. The only course to pursue here is to gain time and return the prescription to the prescriber for correction. Ten grains each of colchicine, aconitine, emetine, and calcium sulphate are to be made into ten capsules, and one given every three hours.

Fig. 452 is a type of a prescription not uncommon. Care and good judgment are required to pilot the compounder through safely. It might be surmised that the first ingredient was intended for "compound infusion of digitalis," but this is

Questionable prescription.

not the case,—the "compound mixture" being a preparation devised by the physician and the formula not published, the intention being to send the patient to a special drug-store to have it compounded, the druggist of course having been previously supplied with the private formula. This practice is common in some localities; it does not follow, however, that the physician always derives a pecuniary consideration through the method, although where the practice prevails both prescriber and compounder are soon suspected of pocketing some special profit. If the physician makes the private formula public or gives the patient the opportunity of going to a large number of pharmacists to whom he has given the formula, he is relieved of what is prob-

ably an unjust suspicion. The dose of morphine sulphate is a large one, but the underscoring of the line indicates that the prescriber has considered the likelihood of the compounder's questioning it, and he has underscored the words so that the compounder knows that the prescriber intended to give an unusually large dose. Under the circumstances there is no impropriety in dispensing it. Some careful pharmacists would prefer to decline such a prescription on the ground that they did not have the formula of the private preparation, the real reason being their unwillingness to incur the risk of dispensing so large a dose of morphine sulphate. Formulas for private preparations may often be secured through professional courtesy by applying to the pharmacist known to have them.

The fac-simile Fig. 453 shows the prescription of a physician who at one time had an extensive practice, but whose early education had been seriously neglected. The ingredients are—Two drachms of nitro-muriatic acid, one and a half ounces each of compound tincture of gentian and compound tincture of cinchona, one ounce of Curaçoa cordial, one drachm of extract of taraxacum, two drachms of fluid extract of rhubarb ("rehi"), one ounce of tincture of cardamom. Dose, two teaspoonfuls, three times a day, after meals a half-hour, in water.

Prescription 454 illustrates two kinds of incompatibility. Two drachms of potassium iodide, half a fluidounce of syrup of ferrous iodide, and one and a half fluidounces of compound tincture of cinchona are to be made into a mixture. Take half a teaspoonful in water, after each meal. Potassium iodide is usually crystallized by the manufacturer from an alkaline solution, and traces of the potassium hydrate which is present in the mother liquor are retained by the crystals. The hydrate, by contact with the air, containing carbonic acid, becomes potassium carbonate, and hence commercial potassium iodide always contains traces of carbonate, and the Pharmacopœia permits the presence of 0.1 per cent. of alkali. Hence it follows that when a solution of potassium iodide is brought in contact with syrup of ferrous iodide a greenish flocculent precipitate is produced which is ferrous carbonate. This may be filtered out without detriment to the prescription. The other instance of incompatibility is inexcusable. Iron salts produce with preparations of cinchona bark blackish, inky precipitates, due to the reaction between the tannin in the cinchona and the ferrous iodide. Filtration will not remedy this fault, and there is usually no recourse but to dispense the prescription with a shake-label.

In prescription 455 the principal interest centres in the directions to the patient. One grain of yellow mercuric oxide, two grains of atropine sulphate, and one

drachm of lard are to be made into an ointment. The prescriber intends that the patient should "put a lump as large as a pin's head in the eye once daily." If the label had been written according to the first reading of the compounder,—i. e., put a lump as large as a *peanut* in the eye, etc.,—there would undoubtedly have been a serious time for all,—patient, physician, and pharmacist.

Chemical incompatibility is illustrated in Fig. 456; and whilst the compounder may believe that the prescriber has erred, through ignorance of the fact that sulphates are delicate reagents for lead salts, the absence of directions for use makes

It impossible for him to obtain any clue. The presence of lead sulphate may have been expected and desired by the physician. In such cases the only course is to compound the prescription exactly as it is written and dispense it, without filtering, with a shake-label. Fifteen grains each of lead acetate and zinc acetate, ten grains of copper sulphate, and three grains of morphine acetate are to be dissolved in eight fluidounces of distilled water. Use as directed.

Fig. 457 shows peculiarity and brevity. It is expected that Mrs. Z. will receive four fluidounces of cod-liver oil and that the bottle will be labelled the same. Oleum

Jecoris Aselli is one of the synonyms for Oleum Morrhuæ, and the Latin word "Ejusdem," used in this connection, is a short but peculiar way of directing the compounder how he is to label the bottle.

Although prescription 458 is rather flourishing in its style, no fault can be found with its legibility. Half an ounce of potassium bromide, five fluidrachms of tincture of cannabis indica, half a fluidounce of wine of ergot, two fluidounces of aromatic spirit of ammonia, and sufficient water to make eight fluidounces. The chief interest in it is due to the presence of the tincture of cannabis indica. If the prescription be compounded without this, and if a drachm of granulated acacia be placed in a mortar and rubbed with sufficient of

the liquid to form a thick paste and the tincture then gradually and slowly added, it will be found that the resinous matter in the cannabis can be uniformly suspended, and when this is mixed with the rest of the liquid a very satisfactory preparation will have been produced. It should of course be dispensed with a shake-label.

Fig. 459 is a fac-simile of a prescription written by an old practitioner. Hydrar-

gyri subchloridum is rather an old name for calomel, but not uncommon. Six grains each of calomel and powdered ipecac are to be made into either twelve pills or twelve powders, and the question is, which? A little study of the prescriber's method shows that he has fortunately acquired the habit of dotting his "i's," and it is fair to presume that if pills were intended he would have dotted the "i" in the word. M. ft. pul. No. xii. is undoubtedly the correct reading. A few suggestive questions to the patient, such as—"Did the doctor direct you to take water with these?" or, "Were these to be taken after meals?" will be apt to elicit such a reply as this: "Yes, he said that I should take one powder three times a day, just before meals."

Faulty prescription.

Prescription 460 belongs to a class fortunately rare. The intention of the prescriber is undoubtedly to give phosphorus in a fine state of division, suspended in the mixture. This may be accomplished by dissolving the phosphorus in the benzol (not petroleum benzin), and, having made a thick mucilage of acacia from one drachm of gum, the solution of phosphorus may be gradually added with stirring, followed by the tincture of ginger and the chloride of calcium, dissolved in a little water. The directions to the compounder—Misce, ft. mist. sec. art. (make a mixture according to art)—indicates that the prescriber offers the pharmacist an opportunity to exercise his skill in making a good mixture. The directions for the patient are in Latin, the translation being,—“Let him take half a fluidounce, two or three times daily, in a cup of water, with brandy.”

Fig. 461 is a fac-simile of a prescription written by a prescriber of large experience. Sixteen grains of mercurial mass, and one grain of podophyllin, with four drops each of fluid extract of nux vomica and fluid extract of belladonna (Squibb's), are to be made into four pills. As blue mass is usually soft in consistence, it will be necessary to evaporate the fluid extracts. This may be easily done by heating a small mortar, and, after dropping the fluid extracts into it and stirring them a short time with the pestle, the blue mass and podophyllin can be subsequently added and four pills made from the mass. The reason for prescribing fluid extracts when extracts are available is not apparent.

Fig. 462 shows a prescription which is faulty in several respects. In the second line the abbreviation is questionable. Is diluted hydrochloric or diluted hydrocyanic acid desired? It would be fair to assume that diluted hydrocyanic acid is wanted, because of its action as a sedative; and this is undoubtedly a cough mix-

ture and the prescriber desires to reinforce the action of the syrup of wild cherry. The style of writing is anything but legible, and the use of an unusual term for "opium" in the fourth line adds to the difficulties. Two ounces of syrup of wild cherry, half a drachm of diluted hydrocyanic acid, one ounce of syrup of squill, and one drachm of tincture of opium (tinctura thebaica). Teaspoonful three times daily.

Prescription 463 brings up an interesting question about which there may be more than one opinion. One drachm of iron and ammonium citrate and fifteen grains

phate in the water with a trace of acid (citric acid, if preferred), and then dissolving the iron and ammonium citrate in the solution. The practice of adding acids or alkalis to prescriptions generally and upon very little provocation is a bad one, and the author would not be understood as encouraging the habit; but occasions occur when there should be no hesitation about employing a trace of acid or alkali when the compounder is satisfied that the intention of the prescriber will not be frustrated. Of course the risk of making an error in judgment must be taken; but "first be sure that you are right, and then—do right."

Fig. 464 is a fac-simile of a prescription for pills. Sixteen grains of silver oxide, one grain of strychnine, twenty-four grains of powdered capsicum, and forty grains of extract of gentian are to be made into thirty-two pills. If these pills are made in the ordinary way, with an excipient of syrup, glucose, or similar liquid, the pills will be very apt to explode, owing to the decom-

position of the silver salt. The directions are not very legible, but it is not difficult to read,—Sig. on box the contents of each pill. One after each meal. The prescriber would probably be satisfied if the contents of one pill were written on the label; he certainly does not intend that the contents of thirty-two pills be so written, although this is what he directs.

Prescription 465 is a strange mixture, thrown together in opposition to the laws of chemical combination and compatibility. The quinine will be precipitated through

the formation of a double bismuth and potassium iodide,—a precipitant for alkaloïds, sometimes used as a reagent. The presence of the hydrobromic acid aids in the precipitation, instead of dissolving the precipitate. The translation is,—One drachm of potassium iodide, half a drachm of diluted hydrocyanic acid, three drachms of solution of bismuth and ammonium citrate, twelve grains of quinine sulphate, one and a half drachms of hydrobromic acid, and sufficient water to make two ounces. The only course to pursue is to dissolve the quinine salt in four drachms of water containing the hydrobromic acid, dissolve the potassium iodide in the remainder of the water, and add the other ingredients.

Prescription 466. Pills made from bismuth subnitrate and sodium bicarbonate have been known to explode, owing to decomposition in the sodium bicarbonate from acid in the bismuth salt, carbonic acid being liberated. Of course no explosion can take place if the pills are not dispensed in a tightly-corked vial or other container which will not permit of the escape of the liberated gas. Risk of explosion may be obviated by piercing the lid of the pill-box with a few holes; but the pills may swell to an enormous size, due to the non-escape of the gas.

Prescription 467 is a fac-simile of one written by a noted physician. One other specimen of his handiwork may be seen on page 1152. The translation is,—Two drachms of powdered gum guaiacum. Make twelve powders. One taken at night.

In concluding these comments it may truly be said that the necessity for more care in writing prescriptions has been unquestionably proved by abundant evidence. Physicians have in many cases grown careless in this respect, often relying upon the proverbial caution and self-interest of the pharmacist to correct errors or supply deficiencies, and whilst the additional responsibility thus thrust on the compounder has a tendency to develop his faculties, it does not lighten his cares, nor is it labor which is appreciated by the prescriber, who usually regards the service as quite within the routine of the pharmacist's duties, and the latter is expected, as a matter of course, to check errors and decipher scrawls with ease, and, on the other hand, there are often occasions when great haste must be exercised in writing a prescription; and, in addition, it should be remembered that it frequently happens that the physician is harassed by many annoyances and interruptions whilst writing the prescription. These circumstances, coupled with the gentlemanly instincts which all true pharmacists are credited with possessing, should exercise their proper restraining influences upon the latter whilst undertaking the mission of interviewing the physician upon a subject which is often mortifying to him. It is impossible to conduct an active business without encountering occasions which require the exercise of much forbearance and tact, and the reflection that both physician and pharmacist are at all times human, and hence liable to err, should prevent either from indulging in expressions detrimental to the good name of the other. In the unusual instance of a physician taking umbrage when a judicious course has been followed by the pharmacist in correcting his mistake, a firm and dignified defence should be at once made by the latter, and maintained with spirit, but not in the presence of the patient if it can possibly be avoided.

The prescriptions upon the following pages are submitted without comment, with the view of affording the reader an opportunity for individual practice.

METRIC PRESCRIPTIONS.

The growth of the metric system has made it necessary for every pharmacist to be acquainted with the methods employed in writing metric prescriptions.

There are two distinct methods employed in this country, which may be termed respectively the *gravimetric* and the *volumetric* method.

1. **Gravimetric Prescriptions.**—The gravimetric principle of weighing liquids is used in Germany and some other Continental countries almost exclusively. It was adopted by the U. S. Pharmacopœia of 1880, and given the name of “parts by weight;” but, although weighing liquids may be practised with advantage in the laboratory in making large quantities of preparations, and is preferable in the case of thick or adhesive liquids, it is far less convenient in compounding prescriptions than the plan of measuring the liquid ingredients. The advantage in supposed greater accuracy of weighing over measuring is more imaginary than real. A careful pharmacist will compound prescriptions just as accurately by measuring the liquids as he will by weighing them, whilst a slovenly one will be just as careless in using weights as he is in measuring liquids. The question of accuracy becomes then, practically, a “personal equation.”

Several conveniences have been proposed in weighing liquids, which deserve notice. The Germans use a “tare-can” (see Fig. 492) for the purpose of quickly taring a bottle. It is a small metallic can having a shallow funnel-mouthed opening, with two spouts, one on each side. The bottle, or vessel, is placed on one of the scale-pans, and the tare-can, containing sufficient shot or clean dry sand to balance it, is placed upon the other. It is better, however, to use two tare-cans and pour from one to the other, the one not in use on the scale-pan either receiving the excess of shot or supplying the deficiency.

2. **Volumetric Prescriptions.**—In these the gramme is replaced by the cubic centimetre, which has been very appropriately termed *fluigramme* by Mr. A. B. Taylor. The principal reason for preferring the volumetric method is that the physician has the means of more readily calculating and apportioning the number of doses in the prescription. *Liquid medicines are never administered by weight*, but always by teaspoonfuls, tablespoonfuls, or other convenient measure. In some liquids there is a wide difference between their weight and their volume, as the specific-gravity tables abundantly show. A teaspoonful of ether weighs forty-one grains, whilst a teaspoonful of chloroform weighs eighty-five grains (more than twice as much): hence the physician cannot disregard specific gravity. In prescribing gravimetrically and administering volumetrically he must constantly bear in mind these differences, at least approximately. Mistakes are very likely to arise in making these calculations, mentally, at the bedside of a patient: hence it is far better to avoid them by *prescribing the medicines by the same method as that by which they are dispensed and administered, namely, volumetrically*, and thus preserving that harmony of relation which is

conductive to safety. If volumetric analysis is preferred to stathmetic or gravimetric analysis in the U. S. Pharmacopœia because of its greater convenience and at least equal accuracy, why should not liquids be measured rather than weighed in pharmaceutical operations in which extreme accuracy is comparatively of less importance?

The following examples illustrate the forms of metric prescriptions most frequently used. Form A is preferable, for the reasons stated :

Form A.	Form B.	Form C.
R (Volumetric.)	R (Gravimetric.)	R (Volumetric.)
Gm. and Cc.		
Quininæ Sulph. 1	Quininæ Sulph. 1.	Quininæ Sulph. 1. Gm.
Strych. Sulph. 016	Strych. Sulph.016	Strych. Sulph. . .016 Gm.
Ext. Glycyrrh. Fld. 4	Ext. Glycyrrh. Fld. . 4.	Ext. Glycyrrh. Fld. 4. Cc.
Syrupi 60	Syrupi 60.	Syrupi 60. Cc.
A teaspoonful three times a day.	A teaspoonful three times a day.	A teaspoonful three times a day.
R (Gravimetric.)	R (Gravimetric.)	R (Gravimetric.)
Hydrarg. Chlor. Mit. 5	Hydrarg. Chlor. Mit. .5	Hydrarg. Chlor. Mit. .5 Gm.
Pulv. Aloes 2	Pulv. Aloes 2.	Pulv. Aloes 2. Gm.
Pulv. Rhei 1 5	Pulv. Rhei 1.5	Pulv. Rhei 1.5 Gm.
Make twenty pills.	Make twenty pills.	
The advantages of the decimal line are that the decimal dot is abolished, with its dangerous complications, for a spot or a fly-speck on the prescription-paper may increase or decrease the quantity of an ingredient <i>ten times</i> , and the use of the decimal line is familiar to all who use a dollar and cents column.	This form is used frequently, because of the familiarity with the arithmetical method of using a dot to denote a decimal fraction; and where metric prescriptions are altogether in use, as in Continental Europe, there is no necessity for indicating the denomination, gramme being always understood.	This form is an improvement on Form B, and would be far superior to it for use in this country, where prescriptions written in the old systems will long continue to be used; for next to writing out in full the word <i>gramme</i> , the indication of the unusual quantity by underscoring will prevent its being mistaken for <i>grain</i> .

The Art of Dispensing and Compounding.

The practical work embraced in the ever-varying labors of dispensing and compounding constitutes a more searching test of the adaptability and qualifications of the pharmacist than any other duty that he is called upon to perform. Careful training, tact, and much experience are needed to meet the requirements of this branch of the profession.

Receiving the Prescription or Order.—This apparently simple matter, if not carefully considered, is frequently the source of embarrassing mistakes. Very few customers, even if they are intelligent, realize the necessity of forethought or care in calling for any articles that they wish: hence it is an excellent practice for the dispenser to *repeat the order* interrogatively at the time that it is given, and obtain from the customer a clearly-expressed assent before delivering the article, lest the wrong one be dispensed. If it is a poisonous substance, the use that is to be made of it should be carefully inquired into, and in all cases a written order, properly dated and signed, should be required. The best plan is to have a regular poison book, in which the record is made. Poisonous or dangerous substances should never be dispensed to children or minors without a written order, and even then the receiver should be cautioned about the contents.

The following prescription memorandum, which is similar to one suggested by Andrew Blair, has been in use several years by the author with excellent results. These blanks are put up in tablet form, and are filled in in the presence of the customer, or the back of the prescription may be used for noting the points when it is handed in.

MEMORANDUM.

Name.
Address.
Is it paid for?
Is it to be charged?
Is it to be called for?
Is it to be sent?
Received by
Compounded by
Number of ℥ and Price.

It is the custom in some pharmacies, when a number of prescriptions are being compounded at one time, to use what is known as the check system. Brass or nickel-plated checks or disks, numbered or lettered, are used: the customer upon handing the prescription is given a check, which he holds until the prescription is ready; the receiver marks the corresponding number or letter upon the prescription, and when he delivers the bottle or package receives back from the customer the original check containing the same number or letter. This system is not without faults; indeed, unceasing vigilance is absolutely necessary, and it is not safe to place faith in any system.

The prescription should be received with becoming dignity by the compounder, and questions answered with cheerful politeness, especial care being taken to do or say nothing that would impair confidence. Unseemly jesting, loud conversation, or boisterous mirth is entirely out of place here, whilst especial regard should be paid to the feelings of those who may have just left the sick-chamber or the bedside of one who is dear to them. In such cases every word and movement of the dispenser is often carefully watched, and, whilst ordinarily the customer may be disposed to judge seeming slowness or indifference leniently, at such times these faults become unbearable to the impatient and anxious messenger.

Reading the Prescription.—The prescription should be read over carefully, and judgment mentally pronounced, first upon the safety of the doses of the respective ingredients, and then upon their compatibility. If this reading be done in the presence of the patient, especial care should be taken that the countenance reveal nothing whatever of what may be going on in the mind of the receiver: a shrug of the shoulders, an elevation of the eyebrows, a contemptuous toss of the scrap of paper on the prescription desk, may convey to the mind of the patient a more lasting impression of the opinion of the receiver as to the merits of the prescription than open criticism. Questions are frequently asked by patients and requests made for opinions: these should always be skilfully parried. An apothecary has no right to reveal to a patient the character or the medicinal effect of the ingredients which enter into a prescription. When the names of the ingredients in the prescription are persistently demanded by the patient, the dispenser can fall back upon the expedient of frankly stating that it is a breach of etiquette to reveal the character of the ingredients, and intimating that

it shows a lack of confidence in the prescriber on the part of the patient; but, if further insisted upon, the offer to send to the physician a written request to get his permission to disclose the ingredients is generally answered by the patient with a gracious "no matter." The pharmacist, as a co-worker with the physician in the healing art, is ethically bound to sustain him and cheerfully co-operate with him, and there should be at all times a spirit of mutual respect between the members of both professions, and a feeling that each is in duty bound to protect the other from unjust censure.

In order to gain time in case of doubtful procedure, it is often good practice to write the label for the prescription as soon as it is received, and this will usually afford an opportunity to study the prescription whilst reading it. The only objection to this is that the patient very frequently misunderstands this manœuvre, and imagines that the dispenser is neglecting him and not proceeding at once to compound his prescription.

Compounding the Prescription.—The greater part of the succeeding chapter will be devoted to the details of this very important duty; in this place it is merely necessary to consider the general features. After thoroughly understanding the prescription and clearly deciphering it, a method must be quickly formulated for compounding it. In this connection, if there is any doubt about safety, the well-known aphorism, "When you do not know what to do, do nothing," has great force. The work of compounding must not go on in any feeling of uncertainty; the chance of causing death or serious consequences is too great to warrant the running of risks, and there is nearly always more safety in delay than in pushing forward doubtfully.

When a clearly-outlined plan of procedure is decided upon, the ingredients should be carefully weighed or measured and the process witnessed by a colleague. *The system of double checking prescriptions should be invariably followed wherever possible:* over-confidence and an indisposition to recognize the possibility of making a mistake have probably occasioned more loss of life in this responsible work than any other cause. Not only should the junior assistant cheerfully submit to having his work witnessed, but even the *preceptor* should insist upon one of his assistants checking off the ingredients and quantities which he has weighed or measured out himself, as a matter of principle and method. If this is not always possible, on account of there being but one present in the store, the system of single checking should be invariably practised: this is, briefly, to arrange upon the counter the shop-bottles or packages from which were taken the ingredients which entered into the prescription, and place the weights which were used immediately in front, then, when the preparation is finished, to check off from the prescription each ingredient in order, noting the weight or measure. Before permitting a prescription which is at all complicated to advance further in the process of compounding, each ingredient should be numbered in lead-pencil on the margin in the order in which it has been added. This memorandum becomes valuable when the prescription is to be renewed, because there will then be no likelihood of the renewed prescription differing from the original.

Additions or Alterations to Prescriptions by the Pharmacist.—

At the present time it is the custom among physicians to hold the pharmacist responsible for the proper compounding of prescriptions intrusted to his care, and to depend upon him. Such details as the choice of the excipient, method of straining or filtering, etc., are usually not specified: indeed, with many it is a frequent practice simply to direct a solution or mixture of definite strength and rely upon the pharmacist to make it palatable. In all cases of this kind, care must be taken to make a note upon the prescription of each addition, so that in the event of renewal there may be no difference between the preparation then obtained and the original. The confidence which physicians place in pharmacists in this respect should be most sedulously guarded and every effort made to deserve and retain it. This can be done only by adhering strictly to the rule of *not permitting an alteration or addition to be made to a prescription which would affect or vitiate its proper medicinal action or interfere with the obvious intention of the prescriber.*

Numbering the Prescription.—It is the universal practice to number the prescription, and to place a corresponding number upon the label, the object being to identify the bottle or package in case of renewal and connect it with the original prescription. This apparently simple matter requires upon the part of the compounder concentration of thought to avoid errors,—one of the most frequent lapses being that of duplicating the number of the last prescription, instead of numbering it consecutively: this, in case of renewal, may lead to serious consequences, particularly if one prescription happens to be a four-ounce aconite liniment and the other a four-ounce solution for internal use of similar appearance. The duplication of the numbers is particularly liable to occur when several prescriptions are being compounded at the same time by two or more assistants. Various expedients have been

FIG. 493.

NUMBERING TABLET.			
1089	1029	1019	1009
1088	1028	1018	1008
1087	1027	1017	1007
1086	1026	1016	1006
1085	1025	1015	1005
1084	1024	1014	1004
1083	1023	1013	1003
1082	1022	1012	1002
1081	1021	1011	1001
1080	1020	1010	1000

Numbering tablet.

proposed to obviate mistakes of duplication: one is to have a strip of paper about an inch wide numbered consecutively, rolled with the highest number inside, and placed in a round tin ointment-box which has a slit in the side to permit the end of the strip to appear; this may be hung in a convenient place and the number cut off and pasted on the prescription, or, if the location is one having a dry atmosphere, a gummed strip may be used. Another method is to arrange the numbers upon gummed sheets and bind them in book form, or glue the edges and use as tablets (see Fig. 493); in the latter case the numbers are printed in perpendicular columns, and the margins are perforated so that the outer strip from 1000 to 1009 may be torn nearly off, and each number then cut off with scissors or gently torn off as it is wanted.

Consecutive Numbering Machines are also used; these are very convenient, and serve excellent purposes if they are properly and durably constructed. The best machine

known to the author is shown in Fig. 494: it is made in Vienna, and can be adjusted to number *automatically* either consecutively, repeatedly, in duplicate or in triplicate.

The usefulness of this machine to the pharmacist consists largely in the fact that it can be made to number *consecutively in duplicate* (13428, 13428; 13429, 13429, etc.), so that if a proper-sized machine is chosen (letter *b* is preferred) the number may be clearly and neatly printed upon *both prescription and label*; the machine may then be locked and set, so that there is not the slightest danger of variation or change in the method of numbering whilst in use. The value of a mechanical contrivance of this kind consists in its absolute freedom from mistakes, and in the entire elimination of chances of error from defective handwriting, the figures being printed from hardened steel disks, invariably producing clear and distinct impressions.

FIG. 494.

Numbering machine.

The Davis Novelty Company have placed upon the market the "Shaw Numbering Machine" (Fig. 494a). This is not so expensive as the Vienna machine, and is not automatic, but it is very ingenious. The figures are raised and cast upon six rubber bands, which revolve separately except when it is necessary for more than one to be moved; the machine is

FIG. 494a.

Shaw numbering machine.

FIG. 494b.

easily set at any number up to 999,999, and by holding it as shown in Fig. 494b, moving the lever towards the handle, and pressing the handle down, the rubber band is caused to revolve so as to print upon the paper the consecutive number. The inking is automatic.

Rubber Numbering Stamps are also in use: these are cheaper than the consecutive numbering machines, and are very convenient. Fig. 495 shows one which combines with it a dater. These machines are not automatic, however: the numbers are cast upon endless rubber strips.

Fig. 496 shows a very simple and practical apparatus for numbering prescriptions and checking mistakes in numbering. It may be obtained from E. T. Ellis, Philadelphia, and consists of a rolled strip of paper (gummed or ungummed), fastened at one end upon an axis which is free to revolve in a cylindrical box. A double row of consecutive numbers is printed on the strip, and a slit in the edge of the box permits the unrolling of the strip over a knife-edge fastened on the outside.

Dating.—This also serves to fix the identity of a prescription, and it should never be omitted. The physician usually appends the date,

FIG. 495.

Rubber numbering stamp.

but the prescription is frequently held by the patient and not presented for compounding upon the day on which it is written. As in the case of

FIG. 496.

Safety prescription-numerator.

numbering, the date is most frequently written upon the face of the prescription by the pharmacist; and this should not be omitted, even though the date written by the physician be visible. The habit of dating should be firmly established, because it may prove of vital importance in case of a subsequent discussion or difference of opinion. *Rubber daters* are largely used now. Fig. 497 shows one furnished by Wm. H. Dietz, of Chicago. It is inexpensive, not liable to get out of order, and so convenient for prescription work that it soon pays for itself.

FIG. 497.

Rubber dating machine.

Pricing.—The price of the prescription must always be marked upon it: this is necessary in order to fix the sum in case of renewal. The price is usually not subject to variation, except in the case of a patient ordering a larger or smaller quantity of the prescription. In renewals, in all cases the increase or decrease should be noted distinctly, if future annoyance is to be avoided. Few occurrences are apt to create more distrust in the mind of the patient than a neglect of this precaution, the reasoning being that if the pharmacist is so careless as to have two prices for the same prescription, he probably has been careless in compounding it. The greatest objection arises, however, when the price asked is *greater*

than that originally demanded.

It is usual for the pharmacist to adopt a cipher to show the price of the prescription, some word or combination of characters being selected

and memorized. If a word is selected, it should have ten letters, and there should be no duplicate letters, thus :

V O L U M E T R I C
1 2 3 4 5 6 7 8 9 0

V.CC—\$1.00; OM—25 cents, etc.

The following words or phrases may be used as price-marks : Behaviour, chemistry, complaints, no mistake, come and buy, duplicates, republican, democrats, epistolary. A word with nine letters requires an odd letter, usually X. Sometimes a repeater, like X, is employed ; thus, in volumetric, \$1.00 would be V.CX.

It frequently happens that physicians desire to indicate that a patient is poor and is a proper subject for charity : this is usually done by writing the letter P in the lower corner, or, if very poor, PP. It is customary and humane to regard these marks, if assured of their genuineness.

Filing, Binding, and Preserving.—There is very little uniformity of practice among pharmacists in the particulars of filing, binding, and preserving prescriptions. The usual practice is one which is most inconvenient,—i.e., that of simply filing them away upon a long brass wire yearly, half-yearly, or quarterly. By this plan they are sure to become in time torn, dirty, dusty, and fly-specked, and the pile is very unsightly. The method of pasting them daily into a large invoice-book is an improvement : the objection to this plan is, however, that the backs of the prescriptions cannot be examined readily, and in an active business the unwieldy books soon accumulate so as to be an inconvenience. A ready method of binding prescriptions is furnished by the use of Mann's binder : this consists of two durable stiff covers having a wrought-iron strip riveted to the edge of each ; two long screws are fastened to one of the strips ; these pass through two screw-holes in the other strip, and the covers are kept in place by two adjustable brass cylinders split longitudinally in the centre, having a solid disk at the top with a screw-hole in the centre, and at the bottom the same kind of disk cut in two. The split cylinders are flared somewhat at the bottom, and are made to approach each other by a ring ; by slipping this ring down, the edges of the bisected disks are brought together, and these can then be screwed down so as to hold securely ; they can be instantly released, however, by pushing the ring up. The advantage of this binder is that it can be so readily converted into a temporary or a permanent binder. One month's prescriptions can be placed upon one screw by punching out a hole in the side of the prescription with a circular punch, and another month's upon the other screw ; then, if the solid disks are screwed to the ends of the screws projecting from the screw-holes, the brass cylinders can be broken off, and the volume for two months is completely bound ; a stout piece of muslin should now be glued to the backs, and a finish given to the binding by gluing upon this a strip of red leather, labelled distinctly with the first and the last number of the prescriptions.

Many pharmacists copy their prescriptions into a book kept for the purpose. This plan is not always a judicious one : the chances of making errors are increased, and, in case of dispute, proof of the correctness of the copy would have to be produced.

Fig. 498 shows a box for holding cases containing numbered prescriptions made by J. F. Lawrence, of Chicago. The cases are numbered on the edge so that their contents can be easily referred to.

FIG. 498.

Lawrence's prescription-box.

movable iron bar may be screwed down upon the pile, and they are thus kept in place. When a prescription is to be renewed and access to one of those in the pile is desired, the bar is raised by means of the

Fig. 499 represents a prescription-file devised by R. H. T. Nesbitt, of Leavenworth, Kansas. The prescriptions are retained in place by the movable flat iron bar which is represented upon the top of the file. A pointed wire passes upward from the bottom of the frame, and the prescriptions are filed upon it in the ordinary way; the

FIG. 499.

Nesbitt's prescription-file.

screw and the prescription turned sideways and read. The hole seen in the frame near the top of the side is for hanging the file on a nail.

Anderson's prescription-file, box-file, and cabinet are shown in Figs. 500, 501, and 502. The object of this invention is to provide a means for collecting, protecting, and preserving prescriptions. In Fig. 500 the

file-holder is shown ; this is intended to serve for the collection of the prescriptions as they are received. It is represented as partly filled with prescriptions. The bottom of the slide is of wood and is securely fastened to the tin front and side. In the corner is placed a hollow pin, on which the prescriptions are filed. Each file is supplied with ten index cards,

FIG. 500.

Anderson's file-holder.

FIG. 501.

Anderson's box-file.

numbered from "100" to "1000." These cards are intended to be placed between each hundred prescriptions, to facilitate the finding of a prescription when it is to be refilled. If it should be desirable to remove a prescription from the file, it may be readily done by inserting the transfer wire into the hollow pin and removing on the wire all prescriptions from above the one desired, which can then be removed by itself. When a prescription is to be renewed, it is turned to the left, as shown in the illustration, thus exposing it thoroughly for reading. The case is preferably made of tin in order to protect the prescriptions from dust, moisture, mice, and insects.

Fig. 501 represents a front and side view of the file. A punch is used to cut a clean round hole in each prescription. A perforation without ragged edges constitutes one of the most important details in filing prescriptions, for it permits the prescriptions to lie flat upon each other, thus taking up less room, and the prescriptions are not likely to be mutilated if they are free to slip easily around the filing wire. A place is provided upon the top of the cover for the punch, so that it may always be kept within reach.

FIG. 502.

Anderson's filing cabinet.

Fig. 502 shows a cabinet which is designed to permanently store the prescriptions after the box-files are full. Upon the front of each box-file there are two depressions, intended to hold blank cards to be used for the numbers of the first and last prescription.

The cabinet will accommodate fifteen box-files; and as each file is capable of holding 1000 prescriptions, it will be seen that the capacity of the cabinet is 15,000 prescriptions. The drawers are of wood, and are of the same design as the slide in the single file.

FIG. 502a.

Naulty's prescription-file.

Naulty's Prescription-File is shown in Fig. 502a. The prescriptions are held securely upon two needles in such a position that for reference they can be found quickly and an unobstructed view obtained whilst compounding, the band shown in the cut being used for holding the succeeding prescriptions up. When a month's prescriptions, or any desirable number, have been filed, the needles are threaded with strong twine, and the pile pulled carefully off, the twine passing through the holes; the ends of the twine are now secured and a piece of thick muslin glued upon the back, and the back dated and numbered: the books are then placed in boxes, which are likewise numbered and dated distinctly. The

cut also illustrates the method of keeping the bound book open whilst compounding a prescription.

LABELS.

It should be an invariable rule, in dispensing, that *every medicinal substance* sent out from the store *must have* a neat and distinct label upon it. It is necessary to establish this rule as a fixed custom or habit, for neglect of this precaution will often result in serious consequences. In addition, every package *should be labelled at once*, particularly in the case of prescriptions: the habit of permitting unlabelled packages to remain about, liable to substitution, will inevitably cause doubt, and give rise to some grave mistake, sooner or later. A very great diversity of opinion and taste is apt to prevail with regard to the most suitable style of label to select for general use: formerly the home printer was exclusively depended upon, but the principle of division of labor has led to the establishment of "druggists' printing-houses" in several sections of the country; this has resulted in cheapening labels, and the labor seems to have been largely expended in this direction, and towards elaborating gaudy designs, very few attempts having been made as yet towards attaining that simplicity and elegance in design which the principles of good taste clearly dictate. Lithographed labels are sought for principally because the designs more closely approach those of engraved labels; but engraved labels cannot be used generally, because of their costliness.

Bronze-, green-, and red-bordered labels are seen in label catalogues

in great profusion, and in one a sentimental moonlight Venetian scene in colors is conspicuously displayed on one end of a castor oil label! One leading principle will probably be of service in this connection, and that is to avoid loud, striking designs of all kinds: the appetite of

FIG. 503.

Fancy, obscure, and pretentious label.

all, patient, pharmacist, and physician, soon becomes satiated with such, and the notion that they influence business in any good way is soon proved to be a delusion. The almost universal tendency of printers in selecting type for a label is to choose the largest that can possibly be used to get the subject-matter inside the border: the effect is exactly

FIG. 504.

Plain, old-fashioned, and inexpensive label.

opposite to that which is usually desired, for it adds nothing to the neatness of the label, certainly sacrifices distinctness, and the general impression conveyed is that of a confused mass of letters, which is more difficult to decipher than letters of the proper size and breadth of face appropriately set off by *sufficient blank space*. Plain black letters on a white ground are preferable. (See Figs. 503 and 504.)

Neatness, distinctness, and simplicity are cardinal principles in de

signing labels, and the reputation of many establishments is frequently judged from the character of the outward signs of neatness and care. For this reason particular attention should be paid to prescription labels, not only to have the printed address plain, clear, and neat, but to have the handwriting to correspond. In these important particulars patients are exceedingly apt to form an estimate of the qualifications of the compounder of a prescription from the style of his penmanship, reasoning that if he is careful, clean, and neat in the *one particular* of which they are competent to judge,—i.e., the handwriting on the label,—the compounder must exercise similar qualifications in the more vital operations involved in compounding and dispensing, for upon the technicalities of the latter they cannot hope to pass judgment.

Labelling Poisonous Substances.—Whenever a poison is dispensed to customers upon an order, without being prescribed by a physician, the word poison should be distinctly written upon the label: if solid, and wrapped in paper, it should have two wrappers upon it, and both should be labelled poison. In the case of prescriptions, the word poison *should not appear upon the package or bottle unless the physician has so directed*. A careful pharmacist will be sorely tempted to prevent possible accident by pasting a poison label upon the package, but he is relieved entirely of responsibility if the dose is not excessive and if the physician has not directed it, because there is usually a special reason *for omitting it* from the label,—namely, that of avoiding the possibility of frightening the patient and thus defeating the object of the prescription. When a poison label is to be used upon a bottle it should be pasted on above the prescription label, so that it will be more likely to be seen, without possibility of failure through being covered by the hand holding the bottle.

FIG. 505.

Sabin's mucilage-can.

Pasting Labels.—Few of the minor operations in dispensing are more important than this. Although frequently the subject of remark and criticism, there have been comparatively few real improvements in this direction. Sabin's mucilage-can is a convenience which many appreciate, particularly the advantages of the simple device for avoiding an excess of paste on the brush. The label is laid upon the back of the lid of the can, which is thrown back for the purpose, and held in position. The can should be closed when not in use. (See Fig. 505.) The best paste

for prescription use is made from flour by the following process:

FLOUR PASTE.

Flour (wheat)	4 oz. (troy).
Water	16 fl. oz.
Nitric Acid	1 fl. dr.
Oil of Cloves	5 minims.
Boric Acid	10 grains.

Thoroughly mix the flour, boric acid, and water, and strain the mixture through a sieve; add the nitric acid; apply heat, with constant stirring, until the mixture has thickened; when nearly cold, add the oil; strain it through coarse muslin if not perfectly smooth. This paste keeps well, and is much superior to tragacanth mucilage and ordinary paste. When it is required for pasting labels on tinned surfaces, the addition of 10 per cent. of glycerin will prevent the labels from falling off after drying.

In applying a label which has been pasted, to a box, bottle, or can, care should be used not to touch with the fingers the portion of the label which has been recently written upon, even if it has the appearance of being dry. A piece of blotting-pad or filtering-paper, slightly larger than the label, should be laid upon it, and pressed gently, smoothly, and evenly, so that the excess of paste which has exuded upon the edges may be absorbed. If a label has had too much paste applied, and the excess has not been pressed out as described, it will have a wrinkled appearance. Labels should be neatly trimmed, showing a very slight but uniform margin around the border. They should be pasted upon bottles just above the centre, and never over the seams or mould-marks, but half-way between them.

Gummed Labels, or labels printed on paper coated with a solution of dextrin, or gum, on one side, are used largely in some sections of the country. They appear to answer a good purpose in some localities where there is a dry atmosphere, but when used on the seaboard or in damp atmospheres considerable loss is often experienced from their sticking together. Fig. 506 shows a label-dampener which was obtained from the Pictorial Printing Company of Chicago. It is a brass cylinder, having a tightly-fitting screw-cap, with a slightly perforated bottom covered with felt. The cylinder is filled with water, sufficient of which oozes through the perforation to keep the felt moist.

Label-dampener.

Arranging and Preserving Labels.—A method of classifying labels must be adopted by each pharmacist which will be suited to his own requirements. The general rule is to arrange them in label drawers in the most convenient place in the store. The label drawers are preferably shallow, made of wood, and having compartments to receive the labels. Considerable space may be saved by having the compartments made of tinned iron instead of wood. The bottom of the drawer may be lined with cotton-flannel, to prevent the labels from slipping underneath the tin divisions and becoming mixed by the continuous opening and closing of the drawer. It will be found convenient to separate the plain labels required constantly for articles in daily request from those of larger size or special design; and the former may be classified into labels for solids and labels for liquids. These may be arranged alphabetically in each drawer, so that they shall be quickly found. *A regular system should be adopted and rigidly carried out; and when a place has been once fixed for a label, it should never be changed, as few trifles give more annoyance than inability to find a label in a pressing rush of business.*

The upright label cabinets which have been contrived answer an excellent purpose where upright space can be spared.

QUESTIONS ON CHAPTERS LXIII. AND LXIV.

DISPENSING AND PRESCRIPTIONS.

In the arrangement of the drug store, how should solid substances which are subject to injury from exposure to light be kept?

How should odorous drugs, such as valerian, be kept?

How should volatile oils be kept?

How should corrosive or deliquescent salts be kept?

How should poisons, alkaloids, and powerful substances be kept?

What is the definition of the word "prescription"?

From what Latin word is it derived?

What are the advantages of using Latin in writing prescriptions?

What is meant by "the superscription" of a prescription, and of what does it consist?

What is used in French prescriptions?

Is it desirable to have the name of the patient written on the prescription?

Why?

What is meant by the inscription?

Of what parts should a model compound prescription be composed?

Give the meanings of these various parts.

How does the physician usually ascertain the quantities desired of the various ingredients in writing a prescription?

Give the various characters used in Latin prescriptions, and write out their names in full in Latin.

What sort of numerals are used, and what position do they occupy in reference to the ingredients?

What is meant by "the subscription" to a prescription?

What is meant by "the signa" to a prescription?

What is the use of having the name of the physician attached to a prescription?

How should unusual doses in prescriptions be marked or designated?

What would be understood by the following abbreviations occurring in prescriptions?—Acid. hydroc.; aconit.; ammon.; aq. chlor.; calc. chlor.; chlor.; emp. lyt.; ext. col.; hyd. chlor.; hydr.; mist. ammon.; potass. hyd.; sod. hypo.; sod. sulph.; sulph.; zinc. phos.

Translate the following prescriptions, and also the accompanying directions:

Recipe Liquoris Ammonii Acetatis, drachmas tres cum semisse;
Vini Antimonii, drachmas duas;
Tincturæ Cardamomi Compositæ, drachmas tres;
Aque Menthæ Piperitæ, uncias quatuor.

Fiat mistura, cujus uncie duæ omni horâ quadrante calefactæ sumendæ, durante frigore.

Recipe Rosæ Gallicæ, unciam dimidiam;
Aque ferventis, uncias octo.

Stent per horam; colaturæ adde Succî Limonum, Sacchari, ana, quantum sufficit, ad gratam acerbitatem dulcedinemque.

Recipe Extracti Colocynthis Compositi, drachmam unam;
Pulveris Scammonii, scrupulum unum;
Pulveris Cambogiæ, grana quinque.

Misce.—Fiant pilulæ viginti, quarum duæ deglutiantur horâ decubitûs; diluculo, ut infra.

Recipe Infusi Sennæ, unciam unam.

Recipe Potassii et Sodii Tartratis, sesquidrachmam;
Crete Præparatæ, semidrachmam.

Misce.—Fiat pulvis in jusculo tenuissimo sumendus.

Recipe Ammonii Carbonatis, grana sex;
Syrupi Aurantii, drachmas duas;
Aquæ, drachmas decem.

Misce.—Fiat haustus, cui, tempore capiendi, adde Succii Limonis recentis cochleare medium unum, et in effervescentiâ sumatur.

Recipe Tincturæ Opii, semidrachmam;
Spiritus Chloroformi, drachmam;
Misturæ Cretæ,
Aquæ Menthæ Piperitæ, ana, uncias tres.

Misce.—Fiat mistura, cujus sumantur cochlearia duo magna post unamquamque sedem mollem, phialâ prius concussâ.

Recipe Misturæ Ammoniaci, uncias sex;
Tincturæ Opii, drachmam.

Misce.—Capiat cochlearia duo magna statim; iterentur post horam, si tussis accreverit.

Recipe Extracti Belladonnæ Fluidi, drachmam cum semisse;
Lini Farinæ, uncias duodecim;
Aquæ bullientis, quantum sufficit ut fiat cataplasma admoventum calidè loco adfecto.

Recipe Cetrariæ, unciam;
Aquæ frigidæ, octarium.

Coque ad uncias duodenas; stet ut geletur, et utatur æger gelatinâ ad libitum.

CHAPTER LXV.

EXTEMPORANEOUS LIQUID PREPARATIONS.

Solutions, Mixtures, and Emulsions.

OFFICIAL liquid preparations have been treated of in Part II. They will therefore not be considered in the present chapter, which will be confined to the extemporaneous compounding of liquids. It will soon be realized by the student that this branch of practical pharmacy involves some of the most intricate questions of physical and chemical science: the knowledge which he has heretofore acquired of the solubilities of solids in various solvents, simple and compound, the solubility of liquids with one another, chemical decompositions, reactions between acid and alkaline salts, precipitation through single and double decomposition, etc., will often be of great service. This, coupled with practical experience, together with the exercise of original ingenuity, must be depended upon to meet the perplexing questions which continually arise. See autograph and fac-simile prescriptions, pages 1125 to 1155.

Extemporaneous liquid preparations may be classified as follows: 1. *Solutions*, by which are meant liquid preparations containing dissolved solid substances. 2. *Mixtures*, liquids in which the solution is but partial, insoluble particles being held in suspension. 3. *Emulsions*, preparations containing oily or resinous substances mixed with water so as to form homogeneous liquids. These will be considered *seriatim*.

1. *Solutions*.—The methods generally employed in making solutions have been treated of in the preceding chapters, and it must be presumed that the reader is familiar with them. Most of the difficulties encountered in effecting solutions required by prescriptions arise from the want of knowledge on the part of prescribers of the solubilities and of the physical and chemical characteristics of the medicinal agents which they order to be compounded. It is necessary, therefore, for the pharmacist to be well grounded in these particulars, whilst therapeutical knowledge must not be neglected either, lest the addition of some apparently inert substance, intended to improve the preparation pharmaceutically, be injurious therapeutically. The subject of incompatibility must be thoroughly comprehended.

INCOMPATIBILITY.

Incompatibility may be defined as a term used to express the effects produced in pharmaceutical mixtures by chemical decomposition, physical dissociation, or therapeutical opposition. There are, therefore,

three kinds of incompatibility,—Chemical, Physical, and Therapeutical.

Chemical Incompatibility invariably results in the decomposition of one or more of the ingredients entering into the prescription: it must not be assumed, however, that this decomposition is always unintentional on the part of the prescriber. The most frequently occurring forms of chemical incompatibility are indicated as follows:

1. Through the precipitation of an insoluble salt, produced by the addition of one solution or salt to another.

2. By the decomposition of a salt (in solution) containing a base united with a weak or volatile acid, by the addition of a strong acid.

3. Through the decomposition of a salt (in solution) containing an acid united with a weak or volatile base by the addition of a strong alkali.

4. By the precipitation of alkaloidal salts by the addition to their solutions of alkalies, alkaline salts, or salts which produce insoluble compounds.

5. By the unsightly discoloration or precipitation due to the formation of inky compounds, produced by bringing astringent solutions containing tannin or similar substances in contact with ferric salts.

6. By the decomposition of a solid substance without precipitation, because of the formation of products which are soluble in the liquid.

1. *Through the precipitation of an insoluble salt, produced by the addition of one solution or salt to another.*

Incompatibility in this case may be either Intentional or Unintentional.

Chemical incompatibility is a condition which is very likely to be misunderstood. It does not follow that because precipitation ensues when two transparent liquids are mixed, or in any other way, the decomposition was not intended. Cases of this kind demand good judgment on the part of the pharmacist: this may probably be best illustrated by the following examples:

R Plumbi Acetat., ℥ss;
Zinci Sulphat., gr. xv;
Aq. Rosæ, f℥iv. M.
Sig.—Use as an injection.

The novice would be very apt to imagine that the doctor had made a mistake in writing this, or was sadly deficient in chemical knowledge not to be aware that decomposition would take place here, that the insoluble lead sulphate would be formed, and that the astringency of the salts would be destroyed; but the experienced pharmacist would know at once that he must not filter this prescription, but dispense it with a "shake" label, because the precipitated lead sulphate is the really important agent. A very different case is presented in the following, which may be cited as an illustration of chemical incompatibility arising from lack of knowledge of the solubilities of the salts on the part of the prescriber:

R Quinina Sulph., gr. x;
Potassii Acet., gr. xx;
Acid. Sulph. Dil., gtt. v;
Aque Cinnamomi, f℥i.
Sig.—A tablespoonful every three hours.

The usual procedure would be either to dissolve the quinine salt in the cinnamon water with the aid of the diluted sulphuric acid, and then add the potassium acetate, or to make separate solutions of each, and then mix them. In either case the result would be the formation of a voluminous precipitate of quinine acetate, preventing the possibility of carrying out the directions to the patient of taking a tablespoonful, because it could not be poured. Although this precipitate could be dissolved in acetic acid or alcohol, so much would be required of either that the character of the prescription would be materially altered: hence quinine sulphate and potassium acetate should never be prescribed together in solution. Many other illustrations of chemical incompatibility could be given, but want of space will prevent giving more than one example of each class.

2. *By the decomposition of a salt (in solution) containing a base united with a weak or volatile acid, by the addition of a strong acid.*

It would appear at first sight that cases in which this condition is present must be rare: the intentional decomposition of an alkaline carbonate by citric, tartaric, or acetic acid is very common, however, and most agreeable and successful febrifuge solutions are made in this way. Unlooked-for decomposition most frequently arises from the use of the vinegars or syrups containing acetic acid in the same prescription with alkaline carbonates, the presence of the acid being generally lost sight of by the prescriber. The following is a good example:

R Ammon. Carb., gr. xx;
Ammon. Chlor., gr. xxx;
Syr. Allii, fʒi;
Aqua, q. s. ft. fʒij.

Sig.—A half-teaspoonful as required.

Explosions have occurred in compounding this prescription, when the syrup of garlic has been placed in the bottle and the solutions of the ammonium salts added, and the cork inserted securely. The only way to compound it safely would be to mix the solution of the ammonium salts with the syrup of garlic in a mortar, and to allow all the carbonic acid gas, produced by the action of the acetic acid in the syrup on the ammonium carbonate, to escape, assisting the evolution by stirring with the pestle.

3. *Through the decomposition of a salt (in solution) containing an acid united with a weak or volatile base by the addition of a strong alkali.*

Instances are less frequent where this condition exists, although it is sometimes seen; as when ammonia-alum is directed to be mixed with potassium hydrate to form an astringent caustic, gaseous ammonia being liberated through decomposition.

4. *By the precipitation of alkaloidal salts by the addition to their solutions of alkalis, alkaline salts, or salts which produce insoluble compounds.*

This form of incompatibility is one of the most dangerous that are likely to be encountered. The alkaloids are very largely used, and are nearly all violent poisons; they are usually combined with acids in order to present them in forms which are soluble: strychnine sulphate, for instance, is soluble in about 10 parts of water, whilst strychnine requires 6700 parts of water to dissolve it; the combination of an alkali

or an alkaline salt with the strychnine sulphate would throw the strychnine out of solution.

R Strychnine Sulph., gr. i;
Potassii Bromid., ℥viij;
Aque, q. s. ft. f℥viij.

An inexperienced pharmacist would unhesitatingly proceed to compound the above prescription. A transparent solution would be obtained without difficulty, which would be dispensed without the slightest misgiving, but which in all probability would produce disastrous results. This solution deposits in a few hours the greater part of the strychnine salt as an insoluble bromide, which quickly subsides in transparent crystals. A lady in England lost her life by taking a similar mixture. She carefully refrained from shaking the bottle, the strychnine precipitate formed in the bottom, and in taking the last dose she swallowed nearly all of it. A similar case of dangerous chemical incompatibility occurred in the author's personal experience, the following having been prescribed by a physician who had overlooked the fact that the salts of most alkaloids are decomposed by alkaline solutions, and the alkaloids, being less soluble than the salts, are precipitated :

R Morph. Sulph., gr. ij;
Potass. Bicarb., gr. xc;
Aque, q. s. ft. f℥ij.

Sig.—Take a teaspoonful mixed with half a teaspoonful of lemon-juice.

The morphine was precipitated by the alkaline carbonate ; and if the bottle had not been shaken before pouring out the teaspoonful which was mixed with the lemon-juice, the last dose would have contained nearly all of the morphine.

5. *By the unsightly discoloration or precipitation due to the formation of inky compounds, produced by bringing astringent solutions containing tannin or similar substances in contact with ferric salts.*

The frequent occurrence of incompatibility of this kind is accounted for by the extensive employment of liquids containing tannin with iron salts. Preparations of cinchona bark with iron are probably the best illustrations of this class :

R Ferri Sulph., gr. xx;
Tinct. Cinch. Comp., f℥ij.
Sig.—A teaspoonful before meals.

6. *By the decomposition of a solid substance without precipitation, because of the formation of products which are soluble in the liquid.*

Prescriptions containing syrup of lactucarium and alkaline solutions often lose their sedative effect through the action of the alkali. Syrup of chloral when mixed with alkalies is injured through the elimination and subsequent evaporation of chloroform. The importance of a knowledge of the physical properties of chemical substances is realized very frequently in cases of this class.

Physical Incompatibility may be defined as the condition arising from the admixture of pharmaceutical preparations which results

in the *physical* dissociation of one or more constituents. It differs from chemical incompatibility by the absence of *chemical* action, and is generally produced by adding one liquid or substance to another, which results in the precipitation of solid matter or the separation of a portion of liquid: hence the solubilities of substances in liquids and the relative solubilities of various liquids with one another determine to a very great extent the condition of physical incompatibility. The illustrations of this condition are so numerous that it would be idle to select more than a few which are prominent or typical. Two classes may be distinguished, and it is often important to recognize quickly the difference between them: 1, Physical incompatibility resulting in the separation of *active* or *important* constituents, and, 2, Physical incompatibility resulting in the separation of *inert* constituents.

1. *Physical incompatibility resulting in the separation of active or important constituents.*

This condition is one which usually demands skilful treatment. It is seen most frequently in the precipitation produced by mixing resinous tinctures or oily liquids with aqueous liquids, or alcoholic solutions containing volatile oils, chloroform, ether, or similar substances with aqueous liquids, or by the addition of acids to solutions containing quinine with a preparation of liquorice. The addition of acacia, so as to form an emulsion with the resinous tincture and the aqueous liquid, is necessary in the first case, and will be considered under the head of emulsions. Aqueous liquids mixed with alcoholic solutions containing volatile oils can usually be made transparent by filtering them through an absorbent powder like magnesium carbonate, as in the case of the medicated waters or elixirs. A frequent source of doubt arises in the case of prescriptions like the following:

For Willie.

R Quinina Sulph., gr. xxx;
Acid. Sulph. Dil., q. s.;
Ext. Glycyrrh. Fld., fʒij;
Syrupi, fʒiv.

Sig.—Give a teaspoonful three times a day.

The indications are clear that this is a quinine mixture intended for a child, and that the prescriber has directed the fluid extract of liquorice with the view of making it more palatable. The habit of ordering acid in connection with quinine clings to him still, and in all probability he is not aware of the fact that the sweet principle of liquorice, glycyrrhizin, is precipitated by the acid, so that the object of using the preparation of liquorice is entirely defeated by the addition of the acid. Solutions of quinine should be administered either as transparent liquids when the presence of acid is relied upon to effect the solution, or as mixtures with syrups or with thick liquids containing liquorice; in the latter case the object is to *prevent* solution as much as possible, and frequently a trace of solution of potassa is added with this end in view,—the principle being, that the smaller the quantity of *dissolved* quinine present in the liquid the less bitter will be the taste. The mixture should be thoroughly shaken before administration.

2. *Physical incompatibility resulting in the separation of inert constituents.*

This condition is most frequently seen when fluid extracts are diluted with liquids which differ in composition from those used in making the fluid extract, such as alcohol, diluted alcohol, syrup, aqueous liquids, etc.: the gummy, albuminous, resinous, or mucilaginous constituents are often thrown out of solution. After proving that the precipitate is inert, the remedy is simple in such cases, and filtration is all that is necessary.

Therapeutical Incompatibility may be defined as the condition arising from the combination of remedies which are mutually opposed to one another in therapeutical effect. This form of incompatibility does not require the aid of the pharmacist: it results from an injudicious combination of remedial agents, and the correction of the fault lies solely within the province of the physician.

COMPOUNDING EXTEMPORANEOUS SOLUTIONS.

Use of Heat.—As a general rule, it is not advantageous to aid the solution of a solid by heating it in contact with the solvent, except where the quantity of liquid is known to be in excess of what is required to form a solution; and such a liquid should never be dispensed until it has become cool. If the solid be crystalline, the excess will surely separate in crystals when the liquid cools, and the patient will become uneasy and suspicious, fearing lest some mistake has occurred. It frequently happens that more of a solid has been prescribed than can be dissolved in the amount of liquid desired; indeed, it is entirely too much to expect that every practitioner should carry in his mind the exact solubilities of all the solids that he prescribes in the respective liquids in which he may wish to dissolve them. This gives the pharmacist another opportunity to use his knowledge and judgment, and the problem

When to Filter is oftentimes perplexing, although one simple rule should govern the practice: *A solution may be filtered and dispensed as a transparent liquid when the removal of the excess does not interfere with the medicinal properties and action of the medicine, nor conflict with the obvious intention of the prescriber.*

Solutions of potassium chlorate, to be used as gargles, are good illustrations:

R Potassii Chlorat., ℥iv;
Aqueæ Acidi Carbolici, fʒij;
Infus. Salvie, fʒiv.
Sig.—Use as a gargle.

The quantity of the salt here is about twice too much, and, as the solution is intended as a gargle to inflamed surfaces, the undissolved particles of chlorate of potassium would probably act as irritants. They can be of no use in the solution, and in this case filtration is perfectly admissible. The following prescription should not be filtered, and the pharmacist is compelled to rely solely upon his judgment and knowledge of the therapeutical action and properties of the ingredients:

R Magnesiæ Pond., ʒiiss;
 Massæ Hydrarg., ʒss;
 Sacch. Alb., ʒi;
 Spt. Ammon. Arom., ʒij;
 Aq. Ment. Pip., fʒij;
 Aq. Calcis, fʒij.

Sig.—A tablespoonful every two hours.

The reasoning here would be direct and simple. The prescriber evidently intends this to be an alkaline cholagogue mixture, although the directions to “shake the bottle” have been omitted. Heavy magnesia and blue mass are both practically insoluble in the liquids, and if they are filtered or strained out the mixture is deprived of its most important constituents. It should be dispensed as a mixture, and a “shake” label used.

Aids in Effecting Solution.—The use of solvents which are not directed in the prescription, for the purpose of effecting the complete solution of the ingredients, requires probably the greatest amount of good judgment. The practice is one which is liable to great abuse, and a strict rule should be enforced that no addition is admissible under any circumstances except one which is absolutely demanded by necessity and which will in no wise impair the therapeutical effect. The prescriber should have reason to place implicit reliance upon the compounder and feel satisfied that he has received exactly what was ordered. The following is a good illustration of a case requiring an addition; a physician prescribed it as an application for dry, excoriated nipples:

R Acidi Carbolici, gr. xl;
 Aquæ, fʒss.

Sig.—Solution Carbolic Acid. Use with a camel's-hair brush.

DR. W.

Commercial carbolic acid is not soluble in water in the proportions named, only about 1 part dissolving in 20 parts of water. The pharmacist dispensed the prescription just as it was written, with the excess of carbolic acid in the bottom of the bottle. The patient inserted the camel's-hair brush and permitted it to remain in the bottle, so that it reached the bottom and became saturated with the undissolved carbolic acid. The application produced severe pain and alleged serious injury, and became the ground for a civil suit for damages against the pharmacist, brought by the patient. If the pharmacist had added a small quantity of glycerin, all difficulty would have been avoided, and he could then have dispensed a perfect solution. It is hardly necessary to say that the physician should not have omitted prescribing the glycerin; but, as he failed to do so, it was the duty of a careful pharmacist to inform him of the facts, or, failing to find him, to supply the deficiency and subsequently notify him of the addition.

The Order to be followed in **Mixing the Ingredients** is frequently very important, and many prescriptions which at first sight appear to contain incompatibles will be easily compounded by observing the proper order in mixing. As has been shown, precipitation frequently takes place when one liquid or solution is added to another, and this annoyance is much more apt to occur when concentrated solutions are

brought together : hence the dilution of the solution is recommended as one method of avoiding precipitation. An illustration is afforded in the following :

R Liq. Ammon. Acet., ℥iv ;
 Acidi Acetici, ℥i ;
 Tinct. Ferri Chloridi, ℥ss ;
 Glycerini, ℥ss ;
 Mucilaginis Acaciæ, ad ℥viij.
 Sig.—A teaspoonful every three hours.

If the tincture of ferric chloride be mixed with the acetic acid and glycerin, and then added to the solution of ammonium acetate, and this solution mixed with the mucilage of acacia, no gelatinization will occur ; but if the tincture of ferric chloride be added to the mucilage, undiluted, a gelatinous precipitate will form, and, although the subsequent addition of the other ingredients will, in time, dissolve the precipitate, this time could be saved by following the proper order. Then, again, in the following :

R Hydrarg. Chlor. Corros., gr. iij ;
 Mucilag. Acaciæ, ℥i ;
 Aquæ,
 Aquæ Calcis, aa ℥ij :

If the corrosive mercuric chloride be dissolved in the water and then mixed with the mucilage, and the lime water added subsequently, no precipitation will occur ; but if the corrosive mercuric chloride be added to the lime water and then to the other ingredients, the yellowish-red mercuric oxide will be formed, which is insoluble in the liquid.

The following rule should be insisted upon : *Whenever a difference in the appearance of a liquid is produced by a variation in the order of mixing, a memorandum noting the order should be made upon the prescription at the time it is compounded, so that in case of renewal the same order may be followed.*

MIXTURES.

Mixtures, properly speaking, are aqueous preparations intended for internal administration, containing some insoluble substances, with frequently viscid or sweet liquids to aid in suspending them. The official mixtures have been already noticed (see page 316). The term mixture, however, is indiscriminately applied in extemporaneous pharmacy and in prescriptions to aqueous solutions of all kinds : for instance, solution of potassium citrate is frequently termed fever mixture, although it is a perfectly transparent solution.

Most of the remarks made upon solutions will be found to apply to the preparation of mixtures. Especial care must be taken to obtain the precipitate in as light a form as possible, so as to avoid impaction and partial solidification in the bottle : this may be best done by avoiding the mixing of concentrated solutions.

EMULSIONS.

Emulsions are aqueous liquid preparations in which oily or resinous liquids are suspended by the agency of gummy or viscid substances. They may be conveniently divided into two classes : 1. Natural emul-

sions. 2. Manufactured emulsions. They are opaque liquids, generally of a thick consistence. (See *Emulsa*, page 315.)

1. **Natural Emulsions** are those which are found in nature, ready formed, as the milky juices of plants, the milk of animals, yolk of egg, etc.

2. **Manufactured Emulsions** are those which are made artificially by various processes: the art of producing them is termed *emulsification*.

Manufactured emulsions are usually made from two classes of substances: 1. Those which contain an oily or a resinous compound associated *naturally* with either gum or some other emulsifying agent.

2. Oils, fatty and resinous bodies containing no emulsifying substance.

Gum-resin emulsions and seed emulsions are included in the first class. These are usually made by simple trituration in contact with water.

Gum-resin emulsions are made by reducing to a coarse powder, selected pieces of the gum-resin in a mortar, triturating with a small quantity of water so as to form a smooth, uniform paste, and then adding the remainder of the water, finally straining the mixture through a cloth strainer or a plug of absorbent cotton contained in a funnel. (See *Emulsum Asafoetidæ*, page 316.) Powdered gum-resin should never be used for making emulsions, because of the loss or deterioration of the volatile constituents which always takes place when the substance is dried so that it may be powdered.

Seed emulsions are so termed because they are made by rubbing seeds or the kernels of fruits which contain fixed oils with water, the emulsifying agent being a gummy or albuminous substance found naturally in the seed or kernel associated with the oil. Emulsions of almond, castor-oil bean, croton-oil bean, etc., are examples of this kind. (See *Emulsum Amygdalæ*, page 316.)

The Theory of Emulsification is based upon a study of the best type of a natural emulsion,—namely, milk. This liquid is found, on examination, to consist of innumerable globules of a fatty substance (butter) enveloped in a thin membrane of viscid matter (casein) suspended in water. The object sought by the pharmacist in making emulsions is first to thoroughly divide the oily or resinous liquid into minute globules, and then to surround each globule with an adhesive envelope (mucilage of acacia, yolk of egg, etc.). The globules, when completely enveloped, are suspended in water; and if the emulsion is properly made, there will be no tendency on the part of the oily or resinous liquid to recombine. Several methods are employed in making emulsions, the most important of which, however, may be grouped under *two* typical methods, named from the geographical locations where they are used most frequently: 1. The English method. 2. The Continental method. Both are equally useful, and should be employed according to circumstances.

1. **The English Method.**—In this mode of making emulsions the emulsifying agent, consisting of mucilage, yolk of egg, etc., is first placed in a dry mortar, and small quantities of the oil and water are gradually and alternately added at intervals. The pestle is rapidly and

lightly rotated in the direction of the arrows (see Fig. 507), with the effect of dashing the oil into globules, which are at once enveloped by the viscid emulsifying agent. If the oil or water is added too rapidly at the beginning, or the mucilage has not been thick enough, the accident of "*cracking*" the emulsion occurs. This may be known by the "pearly" appearance assumed by the mixture, and on close examination the globules of unenveloped oil may be seen floating about. If each stage of the process is successful, the emulsion presents, upon thorough mixing after each addition, a smooth, opaque, glistening appearance like cream. Success depends largely upon the care exercised in forming the nucleus at the beginning; and this, therefore, should not be too hastily made. When an emulsion is "*cracked*," it need not be thrown away. It may be restored by placing an additional quantity of mucilage in the mortar and gradually adding the "*cracked*" emulsion to it, triturating after each addition, when finally the satisfaction of seeing the uncombined globules disappear will generally be experienced.

The English method of making emulsions is the best to use in general prescription practice, where the proportions of gum, oily, or resinous liquids and water must necessarily vary. A typical formula is appended:

R Olei Morrhuae, ℥ij;
Pulv. Acaciae, ℥ss;
Aque, q. s. ft. ℥iv.

Place the acacia, which should not be finely powdered, but granulated, in a mortar with one fluidounce of water: this should be triturated until the mucilage is perfectly smooth and free from lumps. The oil should be added at first in quantities not greater than half a fluidrachm at a time, stirring rapidly with the pestle after each application, care being taken not to add a fresh portion of oil until the last has been thoroughly emulsified. When the liquid becomes too thick to be easily stirred, a fluidrachm of water should be mixed with it, and the gradual additions of oil continued until the whole quantity has been used: the larger quantity of water may be added rapidly after the nucleus is once properly formed, without risk.

2. The Continental Method has the great merit of never failing to produce a good emulsion if the proper proportions are used to form the nucleus, and if the directions are strictly followed. The most satisfactory proportions for the nucleus may be easily remembered: half as much water is taken as of oil, and half as much gum as of water; or it may be expressed as oil, 4; water, 2; gum, 1. The four parts of oil must be placed in a dry mortar and one part of finely-

FIG. 507.

Emulsion mortar and pestle.

powdered gum added to it, stirring with the pestle; when a uniform mixture is made, two parts of water are added, not gradually, but all at once, when, upon stirring, the emulsion is quickly made: an additional quantity of water may be added to this nucleus without risk. The explanation of making an emulsion by this method is, that the

FIG. 508.

Hunter's emulsion apparatus.

particles of gum, being insoluble in the oil and surrounded by it, are prevented from separating and dissolving in the water so as to form lumps; by stirring the mixture actively the water *gradually* dissolves the gum, the oil becomes incorporated at the same time, and a homogeneous mixture is produced, the quantities of oil, gum, and water being in exactly the right proportions to form an emulsion.

In making large quantities of emulsions some mechanical device must be used to facilitate the rapid stirring and agitation necessary to form the nucleus. Fig. 508 represents Hunter's emulsion apparatus, or egg-beater. The principle of

action is so well shown here that a description is unnecessary. If emulsions are to be made in still larger quantities, the sifter and mixer shown in Fig. 216 can be used by taking out the sieves and lining the receiving-box with tinned copper or otherwise making it water-proof, thus using only the mixer.

The Sparrow mixer is shown in Fig. 509: in this ingenious apparatus two stirrers are made to revolve by turning the gear-wheel, and a very rapid and effective motion may be imparted.

Casein Emulsions.—The use of casein as an emulsifier has been developed by Léger, a Parisian pharmacist. He recommends the preparation of *saccharated casein*, a fine white powder, which is used for emulsifying just as is powdered acacia. The advantages claimed for casein are that its emulsions are more readily retained by the stomach, and that greater stability and perfection are secured through its use.

Saccharated casein is prepared by heating one gallon of cow's milk to 104° F., adding two fluidounces of ammonia water, allowing the whole to stand a day, and separating the lower milky liquid from the oily liquid on top. The milky liquid (*lactoserum*) is treated with acetic acid until the casein is precipitated. After washing the precipitate thoroughly with water at 104° F. it is collected on a muslin strainer,

FIG. 509.

Sparrow mixer.

pressed, and dried; a weighed portion of the casein is dried and the percentage of moisture ascertained; the damp cake of casein is then triturated with three and a half ounces of powdered sugar and eight parts of sodium bicarbonate for every one hundred parts of casein (dry).

Prolonged trituration and the addition of more powdered sugar, until it amounts to nine parts in one hundred, result in the formation of a paste, which must now be dried by a gentle heat not above 86° F. to 90° F. After complete drying, it is powdered and sifted. To make a casein emulsion of a fixed oil fifteen parts of the oil are gradually incorporated with a mucilage previously made with fifteen parts of saccharated casein and five parts of water. When a perfect emulsion is formed the other ingredients are added.

Chondrus Emulsions.—Since acacia has advanced in price of late years various substitutes have appeared which have been tried as emulsifying agents, one of the most successful being the gelatinous substance obtained from chondrus or Irish moss. (See page 798.)

In the Formulary, Part VI., under the heads of *Gelatinum Chondri*, *Mucilago Chondri*, and *Emulsio Olei Morrhue* full information as to the methods of using it will be found. In this place it will only be necessary to say that a gummy substance in scales is produced by evaporating and desiccating a decoction of chondrus, and that a mucilage may be made from this Irish moss gelatin by heating eight grains of it in contact with one ounce of boiling water until it is completely dissolved. The mucilage, after being cooled, is then used for preparing emulsions exactly as is mucilage of acacia.

Quillaia Emulsions.—*Quillaia*, or *quillaja bark* (see page 948) contains the principle saponin, a glucoside which is capable of emulsifying oils. Senega contains an analogous principle. The property which both possess, of causing frothing in aqueous solutions, suggested the use of quillaia as an emulsifier. It has not come into extensive use, and care is necessary in employing it, as it is not without irritating properties. One of the essentials of a good emulsifier is that it should be inert. Quillaia has been adopted in the National Formulary. (See *Emulsio Olei Morrhue*, Part VI., which illustrates the method of using it.) Where an active medicine is to be made into an emulsion, and its properties are not antagonized by the quillaia, it may be judicious to employ it. Another disadvantage that it possesses is that a large quantity of tincture is required to be effective.

Compound Emulsions.—As a general rule, the addition of alcoholic liquids to emulsions destroys their homogeneity: when it is necessary to add them in compounding prescriptions, they should be diluted, if possible, with a portion of the water, and added after the emulsion is nearly finished. Alkaline solutions generally aid emulsification, by forming soaps with the resinous or oily liquids; volatile oils make better emulsions if they are first mixed with an equal volume of fixed oil.

THE DISPENSING OF LIQUIDS.

Every convenience should be adopted to facilitate quick and accurate dispensing. The sink should be close to the prescription counter. A good draining surface for graduates to rest upon is made by fastening

sheets of corrugated rubber (a piece of rubber matting) to the slightly-inclined shelves above the sink (see Fig. 125); and a brush for quickly cleaning graduates should be accessible (see Fig. 510). In addition to the

FIG. 510.

Graduate-brush.

FIG. 511.

Funnel-holder.

FIG. 512.

Funnel-board.

retort-stand already referred to, the very convenient little funnel-support figured in *New Remedies* a few years ago may find a place upon the prescription counter (see Fig. 511): the long screw permits the ring to be adjusted to any desired height. For larger filtering operations the funnel-board (Fig. 512) will prove useful.

Bottles.—The size and shape of the bottles used in dispensing liquids are largely matters of individual taste. The tendency at present is towards oval bottles for prescriptions, because they afford proportionally more space for the label than either round or square bottles: this is noticeable to a greater extent in the smaller sizes than in the larger ones. In addition to this, oval bottles are more convenient to carry in the pocket than those of any other shape. Fig. 513 shows an oval metric bottle.

FIG. 513.

Oval metric bottle.

FIG. 514.

Poison-bottle.

FIG. 515.

Poison-bottle.

Prescription-bottles are now frequently made of amber glass, to protect the contents from the effects of the actinic rays of light. For poisonous liquids, or for liquids intended for external application, blue bottles studded at regular intervals with pyramidal points are used: these are

designed to attract attention through their peculiar color and shape, and thus prevent errors; the points render them easily distinguishable

FIG. 516.

Pouring from shop-bottle.

from ordinary bottles by the sense of touch, so that the patient can recognize a poisonous liquid in the dark. Fig. 514 and Fig. 515 show two sides of this bottle.

In pouring liquids from the dispensing-bottles it is well to establish the habit of extracting the stopper

with the left hand, holding it with the little finger; the graduate is held between the forefinger and thumb of the left hand, the bottle is grasped by the right hand with the label uppermost (see page 1102), and the liquid should be poured down the side of the graduate, to avoid splashing (see Fig. 516). Fig. 517 shows the method of dropping liquids from a dispensing-bottle: the stopper is loosened, prevented from dropping out by holding it with the finger, and the bottle inclined so that the rate of dropping may

FIG. 517.

Dropping from shop-bottle.

be controlled. Fig. 518 shows a very convenient bottle for dispensing liquids which are to be administered by drops: it is made in Germany. The glass stopper has a deep conical depression extending nearly half-way up the side, whilst the neck of the bottle is furnished with an aperture having a slightly projecting lip: when the stopper is turned so that the upper part of the depression is opposite the little aperture in the side, the liquid may be dropped very uniformly. A corresponding depression on the opposite side of the stopper communicates with a little channel running down from the lip upon the opposite side of the bottle, so that air is supplied during the dropping: by turning the stopper half-way around, both apertures in the neck of the bottle are closed.

FIG. 518.

German dropping-bottle.

Corks are indispensable for stoppering bottles. They should be selected with great care. There is a wide difference in price between the best quality and the common grades, but it is true economy to use only the best. Short corks, which, when inserted tightly, so as to secure the contents from leakage, do not project above the lip sufficiently to furnish a good grasp for the fingers when extracting them, should never

be used for prescription-bottles. Brittle, hard, or dry corks, which break off when the attempt is made to remove them, are an especial annoyance. To avoid this, corks should not be kept in a warm, dry place, and before inserting them they should be well pressed. "Taper" corks are now invariably preferred to the "straight" form. Fig. 519 shows a modern form of cork-press which is largely used. The motion by which the pressure is effected is direct and simple. Pharmacists who incline to the grotesque in their tastes may prefer the kind shown in Fig. 520; but the practical dispenser will generally choose Lochman's cork-press (see Fig. 521), because the process of pressing the

FIG. 519.

Cork-press.

FIG. 520.

French cork-press.

cork is more effectual, and there is less likelihood of breaking it or cracking the surface in this press than in any other, for the cork is revolved whilst the pressure is gradually increased. The press consists of a cast-iron base, the upper portion of which is hemispherical, with the upper surface slightly corrugated; a corrugated cast-iron wheel is placed upon an axle slightly out of the centre of the curve of the base, so as to

FIG. 521.

Lochman's cork-press.

afford a gradually diminishing space between the curved surfaces. The wheel has a handle, which is raised when the tapered end of the cork is inserted between the surfaces; the handle is lowered, and the cork revolves whilst being pressed. A finish may be given to corks by the use of "gummed cork-tops."

These are circular in form, made

of paper, and the name of the pharmacist, or his monogram, is generally printed upon them in colors. These tops have largely supplanted the sealing-wax finish so much used a few years ago.

Capping Bottles.—The practice of capping bottles with paper, kid, baudruche, or other material is a good one, principally because of the

feeling of security it gives to the patient that the contents of the bottle have not been tampered with after being dispensed. Hunt's bottle-caps are largely employed. These consist of fluted caps of colored paper, of various sizes, which are used by adjusting the proper-sized

FIG. 522.

Capping bottles.

cap to the corked bottle and tying it on. An equally neat effect may be secured, with a little practice, by capping a bottle with a piece of fancy paper, as shown in Figs. 522 and 523. The paper is held in the centre upon the cork by the forefinger of the left hand, whilst the

FIG. 523.

Capping bottles.

flutes are made by "plaiting" them in with the forefinger and thumb of the right hand: it is then secured by tying with twine, a knot with short ends being preferred, because it is less likely to be interfered with by a messenger, on account of the difficulty of retying it.

QUESTIONS ON CHAPTER LXV.

EXTEMPORANEOUS LIQUID PREPARATIONS.

What is meant by incompatibility?

What is meant by chemical incompatibility?

Give examples of chemical incompatibility,—

1st. Through the precipitation of an insoluble salt, produced by the addition of one solution or salt to another.

Is such an incompatibility always unintentional?

2d. By the decomposition of a salt (in solution) containing a base united with a weak or volatile acid, by the addition of a strong acid.

3d. Through the decomposition of a salt (in solution) containing an acid united with a weak or volatile base, by the addition of a strong alkali.

4th. By the precipitation of alkaloidal salts by the addition to their solutions of alkalies, alkaline salts, or salts which produce insoluble compounds.

5th. By the unsightly discoloration or precipitation due to the formation of inky compounds, produced by bringing astringent solutions containing tannin or similar substances in contact with ferric salts.

6th. By the decomposition of a solid substance without precipitation, because of the formation of products which are soluble in the liquid.

What is meant by pharmaceutical incompatibility?

Give an example,—the result being the separation of active or important constituents.

Give an example,—the result being the separation of inert constituents.

What is meant by therapeutical incompatibility?

In compounding prescriptions, as a general rule, should heat be used in making solutions of solid substances? Why?

When may mixtures which contain more solid material than can be dissolved be filtered before being dispensed?

Give an example.

Give an example where such a mixture should not be filtered.

Is the apothecary justified in using solvents not directed in a prescription, for the purpose of effecting complete solution of the ingredients?

Is the order to be followed in mixing the ingredients of a prescription of any special importance? Why?

Where a difference results from a variation in the order of mixing the ingredients, what rule should be adopted to secure uniform results?

What are mixtures, properly so called?

Is this definition adhered to in extemporaneous pharmacy?

What are emulsions?

What are natural emulsions?

From what are manufactured emulsions usually made?

How are gum-resin emulsions made?

Should powdered gum resins be used in making these? Why?

What is meant by seed emulsions?

What is the object sought by the pharmacist in making emulsions?

What is the English method of making emulsions?

What is meant by "cracking" an emulsion?

How may a cracked emulsion be restored?

What is the Continental method?

What are the most satisfactory proportions of the ingredients to be used?

How are casein emulsions formed?

How is saccharated casein prepared?

What are chondrus emulsions?

How is chondrus prepared for use as an emulsifying agent?

Explain the use of quillaia as an emulsifier.

When it becomes necessary to add alcoholic liquids to emulsions, what precautions are necessary to make a nice, smooth emulsion?

How may emulsions of volatile oils be rendered more stable?

CHAPTER LXVI

SOLID EXTEMPORANEOUS PREPARATIONS.

Powders, Cachets, Troches, Pills, and Suppositories.

Pulveres. Powders.

POWDERS often furnish a convenient and agreeable mode of administering medicines which are not bitter, nauseous, or otherwise offensive to the taste, are not corrosive, nor deliquescent, nor given in large doses. Pulverization facilitates the solution or the extraction of the soluble principles of a substance by extending the surface exposed to the action of the solvent. (See Comminution, page 179.) With the view of establishing a standard and encouraging uniform practice in prescribing certain forms of powders which have become well known, a limited number of compound powders have been admitted to the Pharmacopœia. They are as follows :

PULVIS ANTIMONIALIS. U.S. Antimonial Powder. [JAMES' POWDER.]

	Metric.	Old form.
Antimony Oxide	33 Gm.	145 grains.
Precipitated Calcium Phosphate	67 Gm.	293 grains.
To make	100 Gm.	1 oz. av.

Mix them intimately.

PULVIS AROMATICUS. U.S. Aromatic Powder.

	Metric.	Old form.
Ceylon Cinnamon, in No. 60 powder	35 Gm.	7 oz. av.
Ginger, in No. 60 powder	35 Gm.	7 oz. av.
Cardamom, deprived of the capsules and crushed	15 Gm.	8 oz. av.
Nutmeg, in No. 20 powder	15 Gm.	8 oz. av.
To make	100 Gm.	20 oz. av.

Triturate the Cardamom and Nutmeg with a portion of the Ceylon Cinnamon, until they are reduced to a fine powder; then add the remainder of the Cinnamon and the Ginger, and rub them together until they are thoroughly mixed. This powder is used in making Aromatic Fluid Extract (see page 395).

PULVIS CRETÆ COMPOSITUS. U.S. Compound Chalk Powder.

	Metric.	Old form.
Prepared Chalk	30 Gm.	1½ oz. av.
Acacia, in fine powder	20 Gm.	1 oz. av.
Sugar, in fine powder	50 Gm.	2½ oz. av.
To make	100 Gm.	5 oz. av.

Mix them intimately. This powder is used in making Chalk Mixture (see page 317).

PULVIS EFFERVESCENS COMPOSITUS. U.S. Compound Effervescing Powder. [SEIDLITZ POWDER.]

	Metric.	Old form.
Sodium Bicarbonate, in fine powder	31 Gm.	480 grains.
Potassium and Sodium Tartrate, in fine powder	93 Gm.	1440 grains.
Tartaric Acid, in fine powder	27 Gm.	420 grains.

Mix the Sodium Bicarbonate intimately with the Potassium and Sodium Tartrate, divide the mixture into 12 equal parts, and wrap each part in a separate paper of some pronounced color, as *blue*.

Then divide the Tartaric Acid also into 12 equal parts, and wrap each part in a separate paper of a color distinctly different from that used for wrapping the mixture, as *white*.

PULVIS GLYCYRRHIZÆ COMPOSITUS. U.S. Compound Powder of Glycyrrhiza.

	Metric.	Old form.
Senna, in No. 80 powder	180 Gm.	815 grains.
Glycyrrhiza, in No. 80 powder	236 Gm.	418 grains.
Washed Sulphur	80 Gm.	140 grains.
Oil of Fennel	4 Gm.	5 minims.
Sugar, in fine powder	500 Gm.	875 grains.
To make	1000 Gm.	4 oz. av.

Mix the Oil of Fennel thoroughly with about one-half of the Sugar, then add the remainder of the Sugar and the other ingredients, and mix thoroughly. Finally pass the powder through a No. 60 sieve, and keep it in well-closed vessels.

PULVIS IPECACUANHÆ ET OPII. U.S. Powder of Ipecac and Opium. [DOVER'S POWDER.]

	Metric.	Old form.
Ipecac, in No. 60 powder	10 Gm.	175 grains.
Powdered Opium	10 Gm.	175 grains.
Sugar of Milk, in No. 80 powder	80 Gm.	1400 grains.
To make	100 Gm.	4 oz. av.

Rub them together into a very fine powder.

PULVIS JALAPÆ COMPOSITUS. U.S. Compound Powder of Jalap. [PULVIS PURGANS.]

	Metric.	Old form.
Jalap, in No. 60 powder	35 Gm.	618 grains.
Potassium Bitartrate, in fine powder	65 Gm.	1187 grains.
To make	100 Gm.	4 oz. av.

Rub them together until they are thoroughly mixed.

PULVIS MORPHINÆ COMPOSITUS. U.S. Compound Powder of Morphine. [TULLY'S POWDER.]

	Metric.	Old form.
Morphine Sulphate	1 Gm.	7½ grains.
Camphor	19 Gm.	188 grains.
Glycyrrhiza, in No. 60 powder	20 Gm.	146 grains.
Precipitated Calcium Carbonate	20 Gm.	146 grains.
Alcohol, a sufficient quantity,		
To make	60 Gm.	1 oz. av.

Rub the Camphor with a little Alcohol, and afterwards with the Glycyrrhiza and Precipitated Calcium Carbonate, until a uniform powder is produced. Then rub the Morphine Sulphate with this powder, gradually added, until the whole is thoroughly mixed. Finally, pass the powder through a No. 40 sieve, and transfer it to well-stoppered bottles.

PULVIS RHEI COMPOSITUS. U. S. Compound Powder of Rhubarb.

	Metric.	Old form.
Rhubarb, in No. 60 powder	25 Gm.	438 grains.
Magnesia	65 Gm.	1187 grains.
Ginger, in No. 60 powder	10 Gm.	175 grains.
To make	100 Gm.	4 oz. av.

Rub them together until they are thoroughly mixed.

Triturationes. Triturations.

Triturations constitute a very small class of powders recognized by the Pharmacopeia, but one trituration being official. The intention of forming them into a distinct class is to fix a definite relation between the active ingredient and the diluent. Unless otherwise directed, triturations are to be prepared by the following formula :

Take of	Metric.	Old form.
The Substance	10 Gm.	6 grains.
Sugar of Milk, in moderately fine powder	90 Gm.	54 grains.
To make	100 Gm.	60 grains.

Weigh the Substance and the Sugar of Milk, separately ; then place the Substance, previously reduced, if necessary, to a moderately fine powder, in a mortar ; add about an equal measure of Sugar of Milk, mix well by means of a spatula, and triturate them thoroughly together. Then add fresh portions of the Sugar of Milk, from time to time, until the whole is added, and continue the trituration until the Substance is intimately mixed with the Sugar of Milk and reduced to a fine powder.

TRITURATIO ELATERINI. U. S. Trituration of Elaterin.

	Metric.	Old form.
Elaterin	10 Gm.	6 grains.
Sugar of Milk, in moderately fine powder	90 Gm.	54 grains.
To make	100 Gm.	60 grains.

Mix them thoroughly by trituration.

Dispensing of Powders and Solids.

Many of the manipulations required in dispensing powders and solids, such as weighing, measuring, labelling, etc., have been described in previous chapters : therefore only those operations which are peculiar to them, or which have not been considered, will be treated in this chapter.

Folding Packages.—This is one of the first operations taught to the tyro. White paper, of good quality, should be used : it is most economical to buy the paper in quantity (several reams) and have it cut by the

dealer into such sizes as the demands of the business require. The edges of paper which is cut by a machine are much neater than those

Gauge for cutting paper.

of hand-cut paper. The size of the sheet of white wrapping-paper is about 36×24 inches; this may be cut into halves, quarters, sixths, eighths, and twelfths, or a definite size suited to the bottles and packages adopted may be employed. Jacoby's gauge is useful in this connection: it is illustrated by Figs. 524 and 525. The rectangular lines in Fig. 524 represent the sizes of paper which are

suitable for wrapping packages of the sizes indicated,—viz.: 8 oz., 10×9 in.; 6 oz., 9×8 in.; 4 oz., $8 \times 7\frac{1}{2}$ in.; 3 oz., $7\frac{1}{2} \times 6\frac{1}{2}$ in.; 2 oz., 7×6 in.; 1 oz., $6 \times 4\frac{1}{4}$ in.; $\frac{1}{2}$ oz., 5×4 in. In Fig. 525 the numbers indicate the method of cutting a sheet of paper without waste; the figures 8, 6, 4, 3, 2, etc., refer to the sizes in Fig. 524, and represent papers for 8 oz., 6 oz., 4 oz., 3 oz., etc., packages; the small pieces being used for wrapping pill-boxes.

Gauge for cutting paper.

In folding a package, the proper-sized paper is selected and laid upon a flat surface, the substance is deposited in the centre, and the edge nearest the operator is laid against the opposite edge, and a fold made with the thumb and forefinger: the width of the package will depend upon the width of this fold. The end of the partly-formed package on the left hand is now temporarily tucked in, so that the contents shall not fall out, and the package is lifted into an upright position, with the

fold towards the operator; the open upper end is then neatly creased and folded into a wedge-shaped flap. The package is now reversed, and the first partly-formed tuck is loosened and folded into a flap of the same size and shape as the one just made at the other end; the edges of the package are squared and gently pinched into shape, the label is pasted on so that the edge coincides with the edge of the fold, and the package is tied, as shown in Fig. 526.

Fig. 527 shows a very convenient twine-reel. Where large quantities of powders having a uniform weight are needed, the powder-measure shown in Fig. 528 may be used. This is made of hard wood, and consists

FIG. 527.

Twine-reel.

is evenly filled. The powder will usually have enough cohesive and adhesive properties to cause it to remain in the measure in any position in which it is held. The edge of the cup is then placed upon the powder-paper and slightly tapped, when the contents readily drop out. The weight should be noted, and the operation repeated several times, until the average weight is correctly determined. It will soon be possible, with a little judicious practice, so to regulate the pressure and height of the powder that the variation from the proper weight will practically amount to nothing. This method should not be employed where great accuracy is necessary, and the measure should be repeatedly tested. By use, the edge wears off and the measure holds less: it may be enlarged, however, in the inside by sand-papering it. With due precautions, excellent results may be had by measuring powders, and valuable time saved.

Folding Powders.—This operation is a frequent one, and the practice of accurately dividing powders is one which must be quickly acquired. The best method of attaining proficiency in this respect is to weigh out a definite quantity of a powder (120 grains), and, after dividing it into twelve equal portions, to weigh each portion separately and note the weight, so that any deviation from the proper weight (10 grains) will be discovered. Through practice it will soon be realized that very accurate division may be secured. All the powder-papers

FIG. 526.

Paper package.

FIG. 528.

Seidlitz-powder measure.

should be creased at once, by folding down a margin on the side, so that they shall be uniform. They should be placed regularly and as

FIG. 529.

Arrangement of powder-papers.

close to one another as is convenient. In Fig. 529 the usual arrangement is shown. Where the operator has not sufficient practice to trust to his judgment of the quantity for each powder, the whole quantity may be collected upon a smooth card, flattened into a rectangular shape, and divided with a spatula into the exact number of equal portions required for the number of powder-papers, as shown in Fig. 408. Each portion may

then be transferred to its appropriate paper from the card by the spatula.

Figs. 530, 531, and 532 illustrate a very simple and ingenious apparatus for dividing powders. It was devised by Jacob C. Michael, and consists of a metallic cup, shaped like a wineglass, into which the powder that is to be divided is dropped. The cup is in two parts, the base C and the body B, these being joined together by a bayonet joint, which permits a ready separation or connection.

A central stem A is firmly attached to the base C; the divider D consists of a heavy metallic cone, the sides having the same angle as

FIG. 530.

Michael's powder divider.

FIG. 531.

Divider.

FIG. 532.

Cover.

that of the body of the cup. There are several dividers accompanying the apparatus; the one shown in the cut has twelve wings, making twelve partitions; the other dividers have respectively ten and eight partitions. The cover to the cup is represented by E, and there is a little sliding door F to this cover. The powder having been thoroughly mixed, is dropped into the cup B, and the divider is placed on top by inserting the end of the stem A into the narrow end of the divider through the circular orifice which traverses the whole length

and allowing it to work its way down to the bottom of the cup; this operation is promoted by slowly rotating the divider, when it will be found that the powder in the cup has been equally divided into twelve parts. The cover E is now placed upon the cup, care being taken to have the edge of one of the partitions of the divider correspond with the side of the door F. The whole apparatus is now turned upside-down, and the stem A is removed by turning the base C and sliding it out of the orifice in the divider. The powder will be deposited upon the cover, and by holding the cover over the powder-paper and opening the little door F over the centre of the paper the powder which was in one of the sections (one-twelfth of the whole) will drop out; the apparatus is then carried to the next paper, the divider rotated again until the contents of another section drop on the paper, and the process is repeated until twelve equal portions are upon as many papers. If eight or ten powders are wanted instead of twelve, the eight or ten divider is used, whilst if a smaller or greater number than eight, ten, or twelve be required, that divider is chosen which is a multiple of the number desired.

The operation of folding the powder is illustrated in Figs. 533, 534, 535, and 536. The uncreased edge of the paper is brought over so

FIG. 533.

Folding the powder.

that it lies exactly in the crease, and the fold turned down and folded over towards the operator, the depth of the fold determining the width of the powder.

FIG. 534.

Making the end-creases.

FIG. 535.

Creasing with the spatula.

When a number of powders are called for, it is best to dispense them in a shallow powder-box (see Fig. 534). It is customary to use the sides

of the box as a gauge. In the hands of an experienced operator neat results are easily obtained in this way, although the use of the powder-

FIG. 536.

Flattening the powder.

folders shown in Figs. 537 and 538 gives a more uniform edge to the powders. A cheap gauge may be made by tacking a piece of

FIG. 537.

Powder-folder.

FIG. 538.

Powder-folder.

tinned iron underneath a convenient shelf, so that a portion having a width slightly less than that of the powder-box will project. A very true edge may be made by folding the powder over a spatula, as shown in Fig. 535, whilst a smooth, flat appearance is given to the powder by pressing down the folds with the blade of the spatula, as shown in Fig. 536. The paper used for folding powders should be thin, glazed cap paper, and for deliquescent substances waxed or paraffin paper should be employed.

Cachets, or Wafer Capsules.

The credit of bringing the *cachet*, or, as it is sometimes termed, *cachet de pain*, into use belongs to Limousin, of Paris. Wafers have been in use many years. Wafer-sheet is made by pouring a mixture of flour and water upon hot greased plates, or between two hot polished cylinders separated at a proper distance, so that the water is evaporated and a sheet of wafer produced. The properties of wafer-sheet admirably fit it for administering nauseous powders. When dry, it is in non-adhesive, stiff, somewhat brittle sheets, slightly thicker than ordinary cardboard. It is tasteless, and harmless when taken into the stomach. When moistened with water, its character is entirely changed: it becomes soft, elastic, and slippery. Powders may be administered by Kollme's method, by floating a piece of wafer-sheet upon water, and, when thoroughly softened, passing a tablespoon underneath and lifting it out, then depositing the powder in the centre and folding over the corners so as thoroughly to enclose it; if water is then poured into the spoon, the concealed powder may be swallowed without any disagreeable taste being perceived.

The cachet is an improvement on the above, because no more wafer-sheet is used than is absolutely necessary to enclose the powder, and thus the bulk is diminished. Cachets are lenticular or spoon-shaped disks of wafer-sheet, of various sizes. The powder is deposited in the dry cachet, and the margin is moistened with water. An empty cachet of

exactly the same size is placed on top, with the convexity upward, and pressure is made upon the margin, with the effect of tightly sealing the cachet and enveloping the powder. Elaborate apparatus—the necessity for which, however, is not apparent—has been devised to effect the sealing of the cachets. The simplest method upon the small scale is as fol-

FIG. 539.

Bottles for sealing cachets.

FIG. 540.

Limousin's cachet-board.

lows: two bottles are provided (a morphine-bottle for the middle size answers very well), and, one of the cachets being placed upon the lip of one bottle, the powder is carefully deposited in the centre without soiling the outside edge; the margin of an empty cachet of the same size is then

FIG. 541.

Cachet-wetter and funnel.

FIG. 542.

Sealing the cachet.

moistened by quickly passing it over a piece of wet felt, and is laid upon the cachet containing the powder; the lip of the other bottle is now applied to the cachet with sufficient pressure to seal it effectually. The position of the bottles is shown in Fig. 539. Limousin's improved method is similar in principle, although, of course, more finished. A

board, with depressed perforations for three sizes, is shown in Fig. 540. Empty cachets are placed upon the depressions, and the powder is deposited in the centre with the aid of the small powder-funnel (see Fig. 541). The "wetter and presser" is shown to the left of the funnel; this is of two kinds of wood, joined in the middle,—one end being hard, light-colored, and highly polished, the other being dark-colored and somewhat absorbent. The end of the latter is used to moisten the margin of the cachet, by first placing it upon a piece of moist felt and then applying it to the cachet; an empty cachet is now laid upon the one containing the powder, and the "presser" end is applied with some force, so as to seal the cachet (see Fig. 542): the sealed cachet is pushed up from below, as shown in Fig. 540.

A less expensive apparatus for filling and sealing cachets than that made by Limousin may be obtained from the German importing houses. A rectangular sheet of thick rubber cloth is perforated with twelve circular holes, each large enough to hold an empty cachet; the powder is deposited in the centre of the cachet through a small funnel; the inner edge of an empty cachet is dampened by rubbing it for a moment upon a piece of cotton flannel moistened with water, the moistened cachet is laid upon the one containing the powder so as to enclose it, and the presser, which is armed at its base with three needles and has a spring in the handle, is applied so that the cachet is sealed, and when the spring is released the needles penetrate the edge of the finished cachet sufficiently so that it can be lifted and dropped into the box without handling it.

"Konseal" apparatus.

FIG. 542b.

The above cuts represent the exact size.

"Konseals."

J. M. Grosvenor & Co., of Boston, have introduced an excellent apparatus for dispensing cachets. It is made in a very substantial manner, and consists of three nickered metal plates hinged together as shown in Fig. 542a. The cachets, which are termed "konseals," are made of thinner material than ordinary cachets, and the finished cachet is less bulky and neater in appearance.

The saucer-shaped cachets are pressed with the fingers into the inner circles of the bottom plate, and also into those on the left-hand plate; the right-hand plate is then laid on the bottom plate, and the medicated powder dropped through the funnel into the cachet. Large doses may be pressed with a thimble furnished for the purpose, and thus smaller cachets may be used than are possible in ordinary apparatus.

When the cachets are filled, the filling-plate is lifted and a dampening-roller passed over the edges of the empty capsules in the left-hand plate; the latter is then closed over the bottom plate, and a slight pressure seals the cachet. On opening the apparatus the filled cachets may be easily removed by pushing each one gently out with the finger.

Fig. 542*b* shows the exact sizes of the wafer konseals. No. 000 permits the administration of a cachet not larger than a large-sized pill.

The name "konseals" was adopted by J. M. Grosvenor & Co. as shorter and better adapted for prescription use than "Morstadt's cachets," which was their original name. They were contrived by Karl Morstadt, of Prague, Austria.

It is greatly to be regretted that wafer-capsules are not more frequently prescribed. They have many substantial advantages; the substance is rendered tasteless by their use, and yet is easily liberated in the stomach in a pulverulent condition, and this is well known to be the most favorable solid form for solution in the gastric fluids; the knack of swallowing them is easily acquired; the pharmacist has the great advantage of furnishing preparations which are not ready-made, and the purity of the ingredients can be personally vouched for.

Tabellæ. Tablets, Tablet-triturates.

Tablets, or tablet-triturates, may be defined as minute disk-like masses of medicinal powders, the basis usually consisting of powdered sugar. The powder is held together and the tablet retains its shape through the adhesion of the particles developed by the use of a volatile liquid, thus differing from lozenges, which are usually made from a mass in which tenacity is communicated by a mucilage, adhesive paste, or a similar substance. (See Trochisci.)

Tablet-triturates originated with Dr. Robert M. Fuller, and neither process nor apparatus is patented. Since his first communication on the subject, in 1878, they have been largely manufactured, and pharmacists owe a debt to Dr. Fuller for voluntarily giving them a very neat and ingenious process whereby many medicines can be satisfactorily administered.

The tablet is made by pressing a paste into perforations made in a plate of hard rubber, metal, glass, or other suitable material. These holes are of uniform diameter, and the plate must have a uniform thickness throughout. The number of holes in the plate is determined by their relative size, plates having been made with as many as three hundred perforations. The one shown in Fig. 543 has fifty. The tablets made by the use of various plates weigh from half a grain to four grains.

In order to remove the tablets from the holes in which they are made a plate is used which is studded with an equal number of pegs fastened

securely in a base plate (see the lower plate shown in Fig. 544). These pegs are longer than the thickness of the upper plate, and they are so arranged that they exactly fit the perforations in the upper plate. Two pegs still longer and thicker are placed at the ends, so that when they are inserted in corresponding holes in the upper plate accurate registration is secured.

FIGS. 543, 544.

Tablet machine.

In using the apparatus, the upper plate is placed upon a pill-tile or plate of glass, and the paste is spread upon the upper surface and rubbed into the small holes with a spatula. When all of the holes are filled, the excess of paste is brushed from the surface and the upper plate lifted over the lower plate and laid upon it so that the two long pegs enter the holes. Now, by pressing firmly but gently upon the upper plate the pegs are forced upward slowly until the plates come together and a tablet rests upon the top of each peg; the apparatus is then set aside to permit the tablets to dry sufficiently to be handled, when they are taken off, and the plates, after brushing, are ready for another operation.

It will usually be found desirable to have several sets of plates, so that they may be worked continuously, the tablets drying upon one whilst another is being used for forming the tablets. The paste may be made by adding the medicating ingredient in fine powder to finely powdered sugar or sugar of milk and moistening it with alcohol; in some rare cases a little powdered acacia may be needed, but care must be observed not to get the paste too tenacious nor too soft, as there may be difficulty in forcing the tablets out of the perforations, or they may take a long time to dry. Tablets used for hypodermic medication may be advantageously made by this process. Accurate adjustment of the ingredients and prolonged trituration, so that each tablet shall contain its due proportion of activity and thorough desiccation, are the important details in the manufacture of tablet-triturations.

Tablet-triturations have been made "in blank,"—that is, without medication,—from powdered sugar of milk, a little acacia, and 85 per cent.

alcohol, or with water alone; the object here is to medicate the blank tablets subsequently by dropping upon each a concentrated liquid medicine in definite quantity. Such tablets have been termed by Dr. Fuller *tablet-saturates*. The mode employed in medicating tablet-saturates is to arrange a number of blank tablets upon a glass plate, either in contact or separated. In the former case the concentrated liquid or fluid extract is poured upon the tablets in the proper proportion, and by permitting the liquid to remain in contact under cover long enough for each tablet to become saturated uniformly, and then exposing the tablets to the air until they are dry, they may be rapidly medicated; or if the tablets are arranged separately upon the plate, the proper quantity of the fluid extract may be dropped from a pipette upon each tablet.

Trochisci. Troches.

Troches, or lozenges, are solid, discoid or cylindrical masses, consisting chiefly of medicinal powders, sugar, and mucilage. They are intended to be used by placing them in the mouth and permitting them to remain until, through slow solution or disintegration, their purpose of mild medication is effected. It is obvious that very powerful or disagreeable remedies cannot be administered in this way. The formation of the "lozenge mass" is the most important part of the operation: the dry powders must be made into a tenacious mass which shall possess sufficient plasticity to enable it to be rolled into a flat cake without crumbling: it must not retain moisture so long as to occasion too much delay in drying the troches, and the troches must not be brittle through want of sufficient adhesiveness. Mucilage of tragacanth has been found best to serve the purpose of causing the adhesion of the powders.

Making the Mass.—The best method of making the mass is first to prepare the mucilage according to the formula, and, having mixed and sifted the powders, add sufficient mucilage to make a mass of the proper consistence: the quantity always depends upon the character of the powder: if the latter is absorbent, more mucilage is required than if the powder is made up largely of extracts. The usual method of mixing powdered tragacanth or acacia with the dry powders, and then trusting to the addition of the right proportion of water, is generally disappointing in the hands of the inexperienced, almost invariably producing too moist a mass. Upon the large scale the manufacturer employs a mixing-machine to form the mass; upon the small scale the pharmacist uses the mortar and pestle. The mortar-clamp shown in Fig. 383 is very useful in this connection and in working tough masses. Hahn's pestle-cap will save blistering the hands of the inexperienced: this device, shown in Fig. 545, consists of a brass cup-shaped cap, A, perforated in the centre, and screwed to the top of the pestle H at S, so as to permit of the slow revolution of the cap when the pestle is tightly grasped in the hand.

FIG. 545.

Rolling the Mass.—When the mass is made, it must be formed into a flat cake by placing it upon a hard, level, dusted surface and rolling

FIG. 546.

Slocum's lozenge-board.

it with a cylindrical roller: the thickness of the cake determines the weight of the lozenge, and hence it is more exact to have some means

FIG. 547.

Harrison's lozenge-board.

of adjusting the thickness. In Slocum's lozenge-board (see Fig. 546) this is ingeniously effected by the use of tapering oak strips, C, which

FIG. 548.

Sectional view of Harrison's lozenge-board.

slide in inclined furrows; the handles of the strips are graduated, having saw-kerfs at regular intervals; the brass plate B permits these to be

accurately adjusted and held, so that both strips project uniformly above the board. By pushing both strips forward, greater thickness of the lozenge-cake is secured.

Harrison's lozenge-board is shown in Fig. 547 and Fig. 548. The

board is surrounded by a frame, and the former can be elevated or depressed uniformly by turning the screw shown in the sectional view in Fig. 548. The handles of the roller form one continuous piece, running through a longitudinal hole through its centre: this permits the handles to be grasped tightly whilst the roller revolves. Lozenge-rollers should be true cylinders, and are generally made of hard wood: steel rollers and glass rollers have been used, however; these are both made hollow, so that hot water can be introduced through the holes made where the handles are screwed in.

Cutting the Troches.—Troches are cut by cylindrical or conical punches, often made of tinned iron, as shown in Fig. 549, but preferably of steel (see the Franciscus lozenge-punch, Fig. 549a). Fig. 550 shows a very good punch, having a hardened steel octagonal cutter, C, soldered to a hollow conical handle, M. Fig. 551 represents a very complete lozenge-cutter with a circular die, which stamps a letter upon the lozenge in addition to cutting it. It was obtained by the author from Chicago. It is made very substantially, and is accom-

panied by a cutter and a die for oval lozenges. Fig. 553 shows an excellent cutter, which accurately cuts six lozenges at once; it was devised by a Western pharmacist. Fig. 554 gives the end-view. The cutter is

FIG. 553.

Lozenge-cutter.

FIG. 554.

End-view of the same.

placed upon the soft mass and pressed down until the edges touch the board; by pressing upon the handle A the lozenges are forced out of the cutters, the springs S causing the pushers to resume their original position.

TROCHISCI ACIDI TANNICI. U. S. Troches of Tannic Acid.

	Metric.	Old form.
Tannic Acid	6 Gm.	98 grains.
Sugar, in fine powder	65 Gm.	2 oz. av. 128 gr.
Tragacanth, in fine powder	2 Gm.	31 grains.

Sugar, in fine powder	50 Gm.	1 oz. av. 834 gr.
Syrup of Tolu, a sufficient quantity,		
To make	100 troches.	100 troches.

Rub the powders together until they are thoroughly mixed; then, with Syrup of Tolu, form a mass, to be divided into 100 troches.

TROCHISCI CATECHU. *U. S.* Troches of Catechu.

	Metric.	Old form.
Catechu, in fine powder	6 Gm.	98 grains.
Sugar, in fine powder	65 Gm.	2 oz. av. 128 gr.
Tragacanth, in fine powder	2 Gm.	31 grains.
Stronger Orange Flower Water, a sufficient quantity,		
To make	100 troches.	100 troches.

Rub the powders together until they are thoroughly mixed; then, with the Stronger Orange Flower Water, form a mass, to be divided into 100 troches.

TROCHISCI CRETÆ. *U. S.* Troches of Chalk.

	Metric.	Old form.
Prepared Chalk	25 Gm.	386 grains.
Acacia, in fine powder	7 Gm.	108 grains.
Spirit of Nutmeg	3 C.c.	48 minims.
Sugar, in fine powder	40 Gm.	1 oz. av. 180 gr.
Water, a sufficient quantity,		
To make	100 troches.	100 troches.

Rub the powders with the Spirit of Nutmeg until they are thoroughly mixed; then, with water, form a mass, to be divided into 100 troches.

TROCHISCI CUBEÆ. *U. S.* Troches of Cubeb.

	Metric.	Old form.
Oleoresin of Cubeb	4 Gm.	61 grains.
Oil of Sassafras	1 C.c.	16 minims.
Extract of Glycyrrhiza, in fine powder	25 Gm.	386 grains.
Acacia, in fine powder	12 Gm.	186 grains.
Syrup of Tolu, a sufficient quantity,		
To make	100 troches.	100 troches.

Rub the powders together until they are thoroughly mixed; then add the Oleoresin and Oil, and incorporate them with the mixture. Lastly, with Syrup of Tolu, form a mass, to be divided into 100 troches.

TROCHISCI FERRI. *U. S.* Troches of Iron.

	Metric.	Old form.
Ferric Hydrate, dried at a temperature not exceeding 80° C. (176° F.)	30 Gm.	468 grains.
Vanilla, cut into slices	1 Gm.	15 grains.
Sugar, in fine powder	100 Gm.	3 oz. av. 280 gr.
Mucilage of Tragacanth, a sufficient quantity,		
To make	100 troches.	100 troches.

Rub the Vanilla, first, with a portion of the Sugar to a uniform powder, and afterwards with the Ferric Hydrate and the remainder of the Sugar, until they are thoroughly mixed. Then, with Mucilage of Tragacanth, form a mass, to be divided into 100 troches.

TROCHISCI GLYCYRRHIZÆ ET OPII. U.S. Troches of Glycyrrhiza and Opium.

	Metric.	Old form.
Extract of Glycyrrhiza, in fine powder	15 Gm.	281 grains.
Powdered Opium	0.5 Gm.	7½ grains.
Acacia, in fine powder	12 Gm.	186 grains.
Sugar, in fine powder	20 Gm.	308 grains.
Oil of Anise	0.2 C.c.	8 minims.
Water, a sufficient quantity,		
To make	100 troches.	100 troches.

Rub the powders together until they are thoroughly mixed; then add the Oil of Anise (equivalent to about 4 drops), and incorporate it with the mixture. Lastly, with Water, form a mass, to be divided into 100 troches.

TROCHISCI IPECACUANHÆ. U.S. Troches of Ipecac.

	Metric.	Old form.
Ipecac, in No. 60 powder	2 Gm.	31 grains.
Tragacanth, in fine powder	2 Gm.	31 grains.
Sugar, in fine powder	65 Gm.	2 oz. av. 128 gr.
Syrup of Orange, a sufficient quantity,		
To make	100 troches.	100 troches.

Rub the powders together until they are thoroughly mixed; then, with Syrup of Orange, form a mass, to be divided into 100 troches.

TROCHISCI KRAMERIÆ. U.S. Troches of Krameria.

	Metric.	Old form.
Extract of Krameria	6 Gm.	98 grains.
Sugar, in fine powder	65 Gm.	2 oz. av. 128 gr.
Tragacanth, in fine powder	2 Gm.	31 grains.
Stronger Orange Flower Water, a sufficient quantity,		
To make	100 troches.	100 troches.

Rub the powders together until they are thoroughly mixed; then, with Stronger Orange Flower Water, form a mass, to be divided into 100 troches.

TROCHISCI MENTHÆ PIPERITÆ. U.S. Troches of Peppermint.

	Metric.	Old form.
Oil of Peppermint	1 C.c.	16 minims.
Sugar, in fine powder	80 Gm.	2 oz. av. 360 gr.
Mucilage of Tragacanth, a sufficient quantity,		
To make	100 troches.	100 troches.

Rub the Oil of Peppermint and the Sugar together until they are thoroughly mixed; then, with Mucilage of Tragacanth, form a mass, to be divided into 100 troches.

TROCHISCI MORPHINÆ ET IPECACUANHÆ. U. S. Troches of Morphine and Ipecac.

	Metric.	Old form.
Morphine Sulphate	0.16 Gm.	2½ grains.
Ipecac, in No. 60 powder	0.50 Gm.	7½ grains.
Sugar, in fine powder	65 Gm.	2 oz. av. 128 gr.
Oil of Gaultheria	0.2 C.c.	8 minims.
Mucilage of Tragacanth, a sufficient quantity,		

To make	100 troches.	100 troches.
-------------------	--------------	--------------

Rub the powders together until they are thoroughly mixed; then add the Oil of Gaultheria (equivalent to about 4 drops), and incorporate it with the mixture. Lastly, with Mucilage of Tragacanth, form a mass, to be divided into 100 troches.

TROCHISCI POTASSII CHLORATIS. U. S. Troches of Potassium Chlorate.

	Metric.	Old form.
Potassium Chlorate, in fine powder	30 Gm.	468 grains.
Sugar, in fine powder	120 Gm.	4 oz. av. 102 gr.
Tragacanth, in fine powder	6 Gm.	98 grains.
Spirit of Lemon	1 C.c.	16 minims.
Water, a sufficient quantity,		

To make	100 troches.	100 troches.
-------------------	--------------	--------------

Mix the Sugar with the Tragacanth and the Spirit of Lemon by trituration, in a mortar; then transfer the mixture to a sheet of paper, and, by means of a bone spatula, mix with it the Potassium Chlorate, being careful, by avoiding trituration or pressure, to prevent the mixture from igniting or exploding. Lastly, with Water, form a mass, to be divided into 100 troches.

TROCHISCI SANTONINI. U. S. Troches of Santonin.

	Metric.	Old form.
Santonin, in fine powder	3 Gm.	46 grains.
Sugar, in fine powder	110 Gm.	8 oz. av. 384 gr.
Tragacanth, in fine powder	3 Gm.	46 grains.
Stronger Orange Flower Water, a sufficient quantity,		

To make	100 troches.	100 troches.
-------------------	--------------	--------------

Rub the powders together until they are thoroughly mixed; then, with Stronger Orange Flower Water, form a mass, to be divided into 100 troches. Troches of Santonin should be kept in dark amber-colored vials.

TROCHISCI SODII BICARBONATIS. U. S. Troches of Sodium Bicarbonate.

	Metric.	Old form.
Sodium Bicarbonate	20 Gm.	308 grains.
Sugar, in fine powder	60 Gm.	2 oz. av. 51 gr.
Nutmeg, bruised	1 Gm.	15 grains.
Mucilage of Tragacanth, a sufficient quantity,		

To make	100 troches.	100 troches.
-------------------	--------------	--------------

Triturate the Nutmeg with the Sugar, gradually added, until they are reduced to a fine powder, and mix this intimately with the Sodium Bicarbonate; then, with Mucilage of Tragacanth, form a mass, to be divided into 100 troches.

TROCHISCI ZINGIBERIS. U. S. Troches of Ginger.

	Metric.	Old form.
Tincture of Ginger	20 C.c.	324 minims.
Tragacanth, in fine powder	4 Gm.	62 grains.
Sugar, in fine powder	130 Gm.	4 oz. av. 256 gr.
Syrup of Ginger, a sufficient quantity,		
To make	100 troches.	100 troches.

Mix the Tincture of Ginger with the Sugar, and, having exposed the mixture to the air until dry, reduce it to a fine powder. To this add the Tragacanth, and mix thoroughly. Lastly, with Syrup of Ginger, form a mass, to be divided into 100 troches.

Confectiones. Confections.

Confections are saccharine, soft solids, in which one or more medicinal substances are incorporated with the object of affording an agreeable form for their administration, and a convenient method for their preservation. Under the old names of *conserves* and *electuaries*, these preparations have been in use for centuries. In the preparation of confections the basis is finely powdered sugar, and the medicinal ingredients must be brought to the condition of a smooth paste or introduced as a fine powder or liquid. Only *two* confections are official.

Official Confections.

Name.	Proportions.
Confectio Rosæ.	80 Gm. Red Rose, in No. 60 powder; 640 Gm. Powdered Sugar; 120 Gm. Clarified Honey; 160 C.c. Rose Water.
Confectio Sennæ.	100 Gm. Senna, in No. 60 powder; 5 Gm. Oil of Coriander; 160 Gm. Cassia Fistula, bruised; 100 Gm. Tamarind; 70 Gm. Prune; 555 Gm. Fig, bruised; 555 Gm. Powdered Sugar; Water, sufficient to make 1000 Gm.

CONFECTIO ROSÆ. U. S. Confection of Rose.

	Metric.	Old form.
Red Rose, in No. 60 powder	80 Gm.	1 oz. av.
Sugar, in fine powder	640 Gm.	8 oz. av.
Clarified Honey	120 Gm.	1½ oz. av.
Stronger Rose Water	160 C.c.	2 fl. oz.
To make	1000 Gm.	12½ oz. av.

Rub the Red Rose with the Stronger Rose Water previously heated to 65° C. (149° F.), then gradually add the Sugar and Honey, and beat the whole together until a uniform mass results.

CONFECTIO SENNAE. U. S. Confection of Senna.

	Metric.	Old form.
Senna, in No. 60 powder	100 Gm.	700 grains.
Cassia Fistula, bruised	160 Gm.	2½ oz. av.
Tamarind	100 Gm.	700 grains.
Prune, sliced	70 Gm.	490 grains.
Fig, bruised	120 Gm.	2 oz. av.
Sugar, in fine powder	555 Gm.	8 oz. av. 885 gr.
Oil of Coriander	5 Gm.	80 minims.
Water, a sufficient quantity,		
To make	1000 Gm.	16 oz. av.

Place the Cassia Fistula, Tamarind, Prune, and Fig in a close vessel with 500 C.c. [old form 8 fl. oz.] of Water, and digest for three hours, by means of a water-bath. Separate the coarser portions with the hand, and rub the pulpy mass, first through a coarse hair sieve, and then through a fine one, or through a muslin cloth. Mix the residue with 150 C.c. [old form 2½ fl. oz.] of Water, and, having digested the mixture for a short time, treat it as before, and add the product to the pulpy mass first obtained. Then, by means of a water-bath, dissolve the Sugar in the pulpy liquid, and evaporate the whole, in a tared vessel, until it weighs 895 Gm. [old form 14 oz. av. 140 gr.]. Lastly, add the Senna and the Oil of Coriander, and incorporate them thoroughly with the other ingredients while they are yet warm.

Massæ. Masses.

Pill masses are official in the U. S. Pharmacopeia under the title of "Massa." As the official preparations are usually kept in bulk by pharmacists, and are permanent preparations, there is a manifest propriety in making a distinct class of them. There are *three* official masses.

Official Masses.

Name.	Proportions.	Preparation.
Massa Copaibæ.	94 Gm. Copaiba; 6 Gm. Magnesia (recently prepared).	Mix them intimately, and set the mixture aside until it concretes into a pilular mass.
Massa Ferri Carbonatis.	100 Gm. Ferrous Sulphate; 100 Gm. Sodium Carbonate; 88 Gm. Clarified Honey; 25 Gm. Sugar, in coarse powder; Syrup and Distilled Water, of each, a sufficient quantity, to make 100 Gm.	Dissolve the Ferrous Sulphate and the Sodium Carbonate separately in boiling Distilled Water, add 20 C.c. Syrup to the Solution of Ferrous Sulphate, and mix the solutions. When cold, pour off the supernatant liquid, and wash the precipitate with a mixture of 1 volume of Syrup to 19 volumes of Water. Drain the precipitate, mix it with the Honey and Sugar, and evaporate it to 100 Gm.
Massa Hydrargyri.	83 Gm. Mercury; 5 Gm. Glycyrrhiza, powdered; 25 Gm. Althæa, powdered; 3 Gm. Glycerin; 84 Gm. Honey of Rose.	Triturate the Mercury with the Honey of Rose and Glycerin until it is extinguished, add gradually the Glycyrrhiza and Althæa, and continue the trituration until globules of Mercury cease to be visible.

MASSA COPAIBÆ. U.S. Mass of Copaiba. [SOLIDIFIED COPAIBA.]

	Metric.	Old form.
Copaiba	94 Gm.	4 oz. av.
Magnesia	6 Gm.	112 grains.

Water, a sufficient quantity.

Triturate the Magnesia with a little Water, in a capsule, until the powder is uniformly dampened throughout. Then gradually incorporate with it the Copaiba, so that a uniform mixture may result, place the capsule on a water-bath, and heat during half an hour, frequently stirring. Lastly, transfer the mixture to a suitable vessel, and set this aside until the mass has acquired a pilular consistence.

MASSA FERRI CARBONATIS. U.S. Mass of Ferrous Carbonate.

[VALLET'S MASS.]

	Metric.	Old form.
Ferrous Sulphate, in clear crystals	100 Gm.	8 oz. av.
Sodium Carbonate	100 Gm.	8 oz. av.
Clarified Honey	38 Gm.	8 oz. av.
Sugar, in coarse powder	25 Gm.	2 oz. av.

Syrup,

Distilled Water, each, a sufficient quantity,

To make	100 Gm.	8 oz. av.
-------------------	---------	-----------

Dissolve the Ferrous Sulphate and the Sodium Carbonate, each separately, in 200 C.c. [old form 1 pint] of boiling Distilled Water, and, having added 20 C.c. [old form 1½ fl. oz.] of Syrup to the solution of the Iron salt, filter both solutions, and allow them to become cold. Introduce the solution of Sodium Carbonate into a bottle having a capacity of about 500 C.c. [old form 2½ pints], and gradually add the solution of the Iron salt, rotating the flask constantly or frequently, until carbonic acid gas no longer escapes. Add a sufficient quantity of Distilled Water to fill the bottle; then cork the bottle and set it aside, so that the ferrous carbonate may subside. Pour off the supernatant liquid, and, having mixed Syrup and Distilled Water in the proportion of 1 volume of Syrup to 10 volumes of Distilled Water, wash the precipitate with the mixture by decantation until the washings no longer have a saline taste. Drain the precipitate on a muslin strainer, and express as much of the Water as possible. Lastly, mix the precipitate at once with the Honey and Sugar, and, by means of a water-bath, evaporate the mixture in a tared capsule, with constant stirring, until it is reduced to 100 Gm. [old form 8 oz. av.].

MASSA HYDRARGYRI. U.S. Mass of Mercury.

[PILULA HYDRARGYRI. BLUE MASS. BLUE PILL.]

	Metric.	Old form.
Mercury	33 Gm.	5 oz. av. 122 gr.
Glycyrrhiza, in No. 60 powder	5 Gm.	850 grains.
Althæa, in No. 60 powder	25 Gm.	4 oz. av.
Glycerin	3 Gm.	8 fl. dr.
Honey of Rose	34 Gm.	4½ fl. oz.

To make	100 Gm.	16 oz. av.
-------------------	---------	------------

Triturate the Mercury with the Honey of Rose and Glycerin until it is extinguished.¹ Then gradually add the Glycyrrhiza and Althæa, and continue the trituration until globules of mercury are no longer visible under a lens magnifying at least ten diameters.

If a portion of the Mass be triturated, in a mortar, with warm acetic acid, the filtrate should not become more than slightly opalescent on the addition of a few drops of hydrochloric acid (limit of *mercurous oxide*).

If another portion of the Mass be digested with warm, diluted hydrochloric acid and a little purified animal charcoal, the filtrate should not be affected by hydrogen sulphide T.S., or by stannous chloride T.S. (absence of *mercuric oxide*).

Apparatus for Kneading Masses.—In making masses upon the large scale it is necessary to use mechanical contrivances to secure a thorough admixture of the various ingredients. One of the simplest forms consists of two smooth iron rollers, geared so that they may be made to approach or recede from each other, revolving in opposite directions and at slightly different rates of speed. The mass roughly mixed is repeatedly passed through the rollers, which may be hollow, so that steam can be introduced inside and thus heated (some masses requiring such treatment), or the rollers can be heated directly on the outside by a row of spirit lamps placed on a table immediately under them. Figs. 555 and 556 illustrate two forms of Day's pill mass mixer. Fig. 555 represents a hand machine having a capacity of three pounds, and Fig. 556 one intended to be run by "power," with a capacity of thirty pounds. They are made of iron and steel, the hoppers are lined with porcelain, and the machine is arranged so that the mass can be discharged when finished, by inclining the machine and revolving the mixers.

FIG. 555.

Day's pill mass mixer.

Day's pill mass mixer.

QUESTIONS ON CHAPTER LXVI.

SOLID EXTEMPORANEOUS PREPARATIONS.

Antimonial powder—Give the Latin official name. Give the synonyme.

How is it made?

Aromatic powder—What are the ingredients?

Compound chalk powder—Give the Latin official name. How is it prepared?

Compound effervescing powder—Give the Latin official name.

Give the synonyme. What are the ingredients?

¹ If the mixture should become so thick that the mercury ceases to disappear, a few drops of water should be added.

Compound powder of glycyrrhiza—Give the Latin official name.

What are the ingredients?

Powder of ipecac and opium—Give the Latin official name.

Give the synonyme. What are its ingredients and their proportions?

Compound powder of jalap—Give the Latin official name.

What are the ingredients?

Compound powder of morphine—Give the Latin official name.

Give the synonyme. What are the ingredients?

What is the proportion of morphine sulphate?

Compound powder of rhubarb—Give the Latin official name.

What are the ingredients?

Give the general formula for triturations.

What trituration is official?

Give its formula.

How may powders of uniform size and weight be divided without having to weigh each powder?

How can powder papers be folded so as to present a uniform appearance?

What is a cachet, or, as sometimes called, "cachet de pain"?

How are cachets used?

How is wafer-sheet prepared?

How is it used for taking powders?

How may bottles be utilized for sealing cachets?

Describe Hahn's pestle-cap.

For what purpose is it used?

What are tablet triturates? How are they made?

What are troches, and how are they used?

How is the mass prepared for making troches?

How are troches cut?

What contrivances are used to give them uniformity?

Give the English official names of the following varieties of troches and the quantity of the medicinal ingredient contained in one of each:

Trochisci acidi tannici.

Trochisci ammonii chloridi.

Trochisci catechu.

Trochisci cretæ.

Trochisci cubebæ.

Trochisci ferri.

Trochisci glycyrrhizæ et opii.

Trochisci ipecacuanhæ.

Trochisci krameriæ.

Trochisci menthæ piperitæ.

Trochisci morphinæ et ipecacuanhæ.

Trochisci potassii chloratis.

Trochisci sodii bicarbonatis.

Trochisci santonini.

Trochisci zingiberis.

What are confections?

By what other names are these preparations known?

What is the basis of confections?

How many confections are official?

Name them.

How is confection of rose prepared?

How is confection of senna prepared?

How many pill masses are official?

How is mass of copaiba prepared?

If mass of copaiba when made does not readily concrete, what is probably the reason?

How may such a difficulty be obviated?

How is mass of ferrous carbonate prepared?

What preparation of iron does the finished mass contain?

What chemical reaction takes place between ingredients of the mass?

Mass of mercury—Give the Latin official name. Give the synonyme.

How is it prepared? What proportion does the mercury bear to the mass?

How long should the ingredients be triturated?

Pilula. Pills.

Pills are small, solid bodies, of a globular, ovoid, or lenticular shape, which are intended to be swallowed and thereby produce medicinal action. Pills are more largely used than any other form of solid preparations: substances which are bitter or unpleasant to the taste, if not corrosive or deliquescent, can be administered in this form if the dose is not too large. The ease and rapidity with which pills can be administered, the length of time during which they retain their original activity, their compact form, and their absence of unpleasant taste when coated, are the principal reasons for their extended use.

In order to give medicinal substances the requisite shape and consistence to form pills, they must be brought into a soft condition and made into a mass, generally through the use of a volatile liquid: the subsequent evaporation of this liquid, or a portion of it, should produce but little change in the form of the pill. As previously stated (page 1210), pill masses are sometimes kept in bulk and made into pills when occasion requires: by far the greatest number, however, are made extemporaneously, and the exercise of the knowledge and perception which are necessary in selecting the proper substance to form the mass constitutes one of the most important duties of the pharmacist. To be able always to select the proper excipient requires a thorough knowledge of the physical properties of all the articles of the *materia medica* which enter into the composition of pill masses.

Forming the Mass.—The mass consists of two parts: 1. The active ingredients. 2. The excipient, or the substance used to form the mass and give it the proper consistence. The essential requirements of a pill mass are that it shall be—1, *adhesive*; 2, *firm*; and, 3, *plastic*.

1. The mass must be sufficiently adhesive to retain its shape and yet be soft enough to be worked by the fingers or suitable apparatus into the desired form: to enable it to possess adhesiveness, a liquid is usually added to the powdered ingredients, and the selection of this liquid must always depend upon the physical character of the ingredients; in many cases the latter possess sufficient adhesiveness in themselves if they are moistened with water, and hence the quality is *only developed*,—not created, as in the case of powders containing extracts; others, again, are totally devoid of adhesiveness, and sticky substances, like gum, sugar, etc., must be added in sufficient quantity to supply the deficiency. Some substances may be made soft and adhesive by simply heating them, and they regain their original condition when allowed to cool.

2. The mass must possess sufficient firmness to permit the pills to retain their shape. The condition of adhesiveness is usually dependent upon the addition of a liquid which dissolves a *small portion* of the solid ingredients, and this solution is adhesive enough to enable the mass to be made; but if too much liquid be added, the quality of firmness will be lost, and the pills either cannot be formed at all, or will subsequently run together in the box. The physical properties of the active ingredients of the pill must be thoroughly understood to

judge of the proper quantity of excipient to be used to give adhesiveness without losing firmness. The following general rule may serve to guide the operator: *Never use an excipient alone which is a perfect solvent for the solid substances*: for instance, water should not be used alone for making pills of the *soluble* scaled-iron salts; for, although the pills may apparently be firm enough when dispensed, they will be very apt in warm weather to run together in the box: if sufficient acacia be used with the water, they can be made to retain their shape.

3. The mass must be plastic.—The condition of plasticity is a natural result of the possession of a proper degree of adhesiveness and firmness: many substances may be formed into a mass which will be either adhesive or firm, but unless these conditions are properly balanced, so that the mass can be quickly and easily formed into pills which will retain their shape without flattening, pills cannot be made successfully. Plasticity can generally be secured by thoroughly working or kneading the mass: in this connection see Fig. 383. The choice of the excipient is usually left entirely to the pharmacist, and in making the selection care should be taken that, whilst the pharmaceutical requisites are fulfilled, the proper solubility or disintegrability of the pill in the stomach is not lost sight of.

Choice of the Excipient.—An examination of the following list of excipients will probably convey a good idea of their uses: they are divided into two classes, liquid and solid. Liquid excipients are generally preferred, because they are more conveniently added to the powders.

List of Excipients.

Liquid.

Water.	Used only when the ingredients of the pill possess sufficient adhesiveness to be developed by the water.
Syrup.	An excellent excipient when more adhesiveness is needed than can be afforded by the use of water.
Syrup of Acacia.	Better than syrup, because it is more adhesive, and can be used in smaller quantity. The objection to its use is that the pills made with it are apt to become very hard, and in some cases they may be practically insoluble in the liquids of the stomach.
Mucilage of Acacia.	More adhesive than any of the preceding, but open to the same objection as syrup of acacia.
Glycerin.	Somewhat adhesive, but very valuable, because its hygroscopic properties prevent the pills made with it from becoming hard. It is rarely advisable to use it alone, however, as the surfaces of the pills often acquire a dampness which attracts the particles of dusting-powder.
Glucose.	A very valuable excipient: it is colorless, very adhesive, and practically non-volatile at ordinary temperatures.
Honey.	May be used in place of glucose for dark-colored masses, but quinine pills are not white when honey is used as the excipient.
Extract of Malt.	Has the advantages of glucose, but the disadvantage of honey in not being colorless.
Glycerite of Starch.	Possesses the merits of glycerin, with the adhesiveness of the starch jelly. Its thick consistence is sometimes an inconvenience (see page 319).
Glycerite of Tragacanth.	Similar to glycerite of starch.
General Excipient.	Suggested by the author as combining the advantages of several of the above (see page 1216).

Solid.

Confection of Rose.	Useful when a small quantity of an active ingredient is to be made into pills and dilution is necessary, as in pills of strychnine, podophyllin, etc. Its bulkiness is its principal disadvantage for general work.
---------------------	---

List of Excipients.—*Continued.*

Crumb of Bread.
Powdered Althaea.
Soap.

Resin Cerate.
Cacao Butter.
Petrolatum.

Valuable for very powerful liquids, like croton oil, volatile oils, etc. Gives adhesiveness, and is useful as an absorbent, but is bulky. A very valuable excipient for resinous substances. It increases their solubility, and forms an unexceptionable mass. Valuable for oxidisable substances, resins, etc. Used for pills of potassium permanganate and similar substances. Used for oxidisable substances like the two preceding excipients.

General Excipient for Pills.

The following excipient is recommended as possessing several advantages. It is a colorless, permanent, very adhesive liquid; the pills made with it are small; and the proportion of glycerin is not large enough to make the surfaces of the pills hygroscopic in an ordinary atmosphere:

Glucose (white, pure)	4 oz. av.
Glycerin	1 oz. av.
Acacia (powdered, best)	90 grains.
Benzoic Acid	1 grain.

Dissolve the Benzoic Acid in the Glycerin contained in a small tared capsule, add the Acacia with stirring, and then the Glucose, and allow the mixture to stand until the Acacia is dissolved: a moderate heat may be applied to hasten solution. The benzoic acid is used as an antiseptic; if the excipient is made in small quantities and frequently, it may be omitted.

In Fig. 557 a simple but effective excipient-bottle is shown: it is made from a plain morphine bottle, C; a piece of sheet-rubber cloth, such as is used for making washers, is cut into a disk, R, slightly larger in diameter than the mouth of the bottle; a hole in the centre permits the introduction of a round, slightly tapering wooden rod, H, or, if preferred, a solid glass rod: it is obvious that as the excipient is used the rod may be slipped down so as always to dip into the excipient a certain distance, and thus the quantity adhering to the end can be easily adjusted. One of the merits of this simple device is that all parts of it can be easily renewed and kept clean.

Dividing the Mass.—Upon the small scale the pill-tille may be used for this operation (see Fig. 558): this is usually made of queen's-ware or porcelain. The objection to this material, however, is that some substances will penetrate through the little fissures in the tile and soil it: these are often very difficult to dislodge, and they usually give the tile a dirty appearance, in spite of the most diligent washing. A few years since, Whitall, Tatum & Co. made, at the author's suggestion, a pill-tille from plate-glass, having the scale graduated by an engraver's wheel, and a little over one-half of its surface ground so

FIG. 557.

Excipient-bottle.

that the pill-cylinder would not slip : this makes an unexceptionable surface. The pill mass is placed upon the tile and rolled into a cylinder, either with a smooth, flat board or a spatula, as shown in Fig. 559 : it

FIG. 558.

Pill-tile.

FIG. 559.

Rolling a pill-cylinder.

is then placed upon the graduated scale and cut with the spatula into the desired number of pieces. The pill-machine is preferred in making larger quantities of pills ; indeed, many pharmacists never use a pill-tile, but divide and cut all their pills with a machine : this consists of two hard-wood boards, one of which is encased in a metal frame (to prevent warping) ; a brass plate having hemispherical grooves is fastened to one end of the lower board (B), and a similar plate is adjusted to the upper board (A), which is furnished with handles at the end ; brass guides are attached to the upper board, to cause the cutting surfaces of the grooves on both boards to correspond (see Fig. 561). The pill mass is

FIGS. 560, 561.

Pill-machine.

rolled into a cylinder and laid upon the grooves of the lower board ; the upper board is then applied so that the cutting surfaces correspond with those of the lower board, and, by a slight backward and forward motion with downward pressure, the mass is divided.

When a smaller number of pills are needed than the full capacity of the cutters indicates, the cylinder is rolled out merely to the length necessary to make the desired quantity. In using the pill-machine in this way a common annoyance is experienced, however, in having either to count off the number of grooves each time, or to deface the board with lines. The simple expedient proposed by the author in 1875, and shown in Fig. 562, obviates this. The lower cutter is removed from the board, and its edge is bevelled off so that sufficient space may be gained to stamp a small figure below each cutting edge. Pill-machines with this addition may be had from A. H. Wirz & Son, of Philadelphia. The Cooper pill-machine is so constructed that but one lower

and one upper board are necessary for making several sizes of pills: this object is effected by making the cutters for the various sizes removable and adjustable.

FIG. 562.

Pill-cutter with numbered edge.

Dusting-Powder.—To prevent the pill-cylinder from sticking to the board or tile, and to lessen the friction, some absorbent powder is dusted upon the surfaces: this may be rice flour, powdered magnesium carbonate, lycopodium, powdered althaea, or powdered liquorice root. Rice flour is preferable for white pills, because its presence is not easily recognized, and because the cylinder does not slip, as it usually does when lycopodium is used.

Finishing the Pills.—Many efforts have been made to supply effective mechanical devices for finishing pills, yet the fact remains that the pharmacist usually prefers to roll and finish them with his fingers. If a finisher is desired, a level surface having a raised rim may be used, and the pills enclosed, and rotated by the adjustable pill-finisher shown in Fig. 563.

When large quantities of pills are made, they are usually dried by rolling them in some absorbent powder, spreading them out, and exposing them to dry air.

Dispensing Pills.—Pills are usually dispensed in flat circular boxes: these should be made so shallow that the pills cannot lie on top of one another. Square pill-boxes are coming into use, and are preferred to round boxes for several reasons, the principal one being that a square label can be used: this can be trimmed more neatly and quickly than a round label, and, in the opinion of many pharmacists of taste, looks better. A small quantity of dusting-powder should be placed in the box, to prevent the adhesion of freshly-made pills.

Official Pills.—The following formulas for pills have been adopted by the U. S. Pharmacopeia with the view of securing uniformity in their preparation:

PILULÆ ALOES. U. S. Pills of Aloes.

	Metric.	Old form.
Purified Aloes, in fine powder	13 Gm.	200 grains.
Soap, in fine powder	13 Gm.	200 grains.
Water, a sufficient quantity,		
To make one hundred pills	100	100

Beat the powders together with Water, so as to form a mass, and divide it into 100 pills.

FIG. 563.

Pill-finisher.

PILULÆ ALOES ET ASAFETIDÆ. U. S. Pills of Aloes and Asafetida.

	Metric.	Old form.
Purified Aloes, in fine powder	9 Gm.	139 grains.
Asafetida	9 Gm.	139 grains.
Soap, in fine powder	9 Gm.	139 grains.
Water, a sufficient quantity,		
To make one hundred pills	100	100

Beat the solids together with Water, so as to form a mass, and divide it into 100 pills.

PILULÆ ALOES ET FERRI. U. S. Pills of Aloes and Iron.

	Metric.	Old form.
Purified Aloes, in fine powder	7 Gm.	106 grains.
Dried Ferrous Sulphate	7 Gm.	106 grains.
Aromatic Powder	7 Gm.	106 grains.
Confection of Rose, a sufficient quantity,		
To make one hundred pills	100	100

Beat the powders together with Confection of Rose, so as to form a mass, and divide it into 100 pills.

PILULÆ ALOES ET MASTICHES. U. S. Pills of Aloes and Mastic.

	Metric.	Old form.
Purified Aloes, in fine powder	13 Gm.	200 grains.
Mastic, in fine powder	4 Gm.	62 grains.
Red Rose, in fine powder	3 Gm.	46 grains.
Water, a sufficient quantity,		
To make one hundred pills	100	100

Beat the powders together with Water, so as to form a mass, and divide it into 100 pills.

PILULÆ ALOES ET MYRRHÆ. U. S. Pills of Aloes and Myrrh.

	Metric.	Old form.
Purified Aloes, in fine powder	13 Gm.	200 grains.
Myrrh, in fine powder	6 Gm.	98 grains.
Aromatic Powder	4 Gm.	62 grains.
Syrup, a sufficient quantity,		
To make one hundred pills	100	100

Beat the powders together with Syrup, so as to form a mass, and divide it into 100 pills.

PILULÆ ANTIMONII COMPOSITÆ. U. S. Compound Pills of Antimony.
[PLUMMER'S PILLS.]

	Metric.	Old form.
Sulphurated Antimony	4 Gm.	62 grains.
Mild Mercurous Chloride	4 Gm.	62 grains.
Guaiac, in fine powder	8 Gm.	124 grains.
Castor Oil, a sufficient quantity,		
To make one hundred pills	100	100

Beat the powders together with Castor Oil, added a few drops at a time, so as to form a mass, and divide it into 100 pills.

PILULÆ ASAFÆTIDÆ. U. S. Pills of Asafetida.

	Metric.	Old form.
Asafetida	20 Gm.	306 grains.
Soap, in fine powder	6 Gm.	92 grains.
Water, a sufficient quantity,		
To make one hundred pills	100	100

Beat the solids together with Water, so as to form a mass, and divide it into 100 pills.

PILULÆ CATHARTICÆ COMPOSITÆ. U. S. Compound Cathartic Pills.

	Metric.	Old form.
Compound Extract of Colocynth	80 Gm.	2 oz. av. 360 gr.
Mild Mercurous Chloride	60 Gm.	2 oz. av. 50 gr.
Extract of Jalap	30 Gm.	1 oz. av. 25 gr.
Gamboge, in fine powder	15 Gm.	281 grains.
Water, a sufficient quantity,		
To make one thousand pills	1000	1000

Mix the powders intimately; then gradually incorporate them with the Extract of Jalap and a sufficient quantity of Water to form a mass, to be divided into 1000 pills.

PILULÆ CATHARTICÆ VEGETABILES. U. S. Vegetable Cathartic Pills.

	Metric.	Old form.
Compound Extract of Colocynth	60 Gm.	2 oz. av. 50 gr.
Extract of Hyoscyamus	30 Gm.	1 oz. av. 25 gr.
Extract of Jalap	30 Gm.	1 oz. av. 25 gr.
Extract of Leptandra	15 Gm.	281 grains.
Resin of Podophyllum	15 Gm.	281 grains.
Oil of Peppermint	8 C.c.	180 minims.
Water, a sufficient quantity,		
To make one thousand pills	1000	1000

Mix the Compound Extract of Colocynth intimately with the Resin of Podophyllum and incorporate the Oil of Peppermint. Rub the Extracts of Hyoscyamus, Jalap, and Leptandra with enough Water to render them plastic, then beat them together with the mixture first prepared, using a sufficient quantity of Water to form a mass, to be divided into 1000 pills.

PILULÆ FERRI CARBONATIS. U.S. Pills of Ferrous Carbonate.

[FERRUGINOUS PILLS. CHALYBEATE PILLS. BLAUD'S PILLS.]

	Metric.	Old form.
Ferrous Sulphate, in clear crystals	16 Gm.	247 grains.
Potassium Carbonate	8 Gm.	124 grains.
Sugar	4 Gm.	62 grains.
Tragacanth, in fine powder	1 Gm.	15 grains.
Althæa, in No. 60 powder	1 Gm.	15 grains.
Glycerin,		
Water, each, a sufficient quantity,		
To make one hundred pills	100	100

Rub the Potassium Carbonate, in a mortar, with a sufficient quantity (about 10 drops each) of Glycerin and Water, then add the Ferrous Sulphate and Sugar, previously triturated together to a uniform powder, and beat the mass thoroughly, until it assumes a greenish color. When the reaction appears to have terminated, incorporate the Tragacanth and Althæa, and, if necessary, add a little more Water, so as to obtain a mass of a pilular consistence. Divide this into 100 pills. These pills should be freshly prepared, when wanted.

PILULÆ FERRI IODIDI. U.S. Pills of Ferrous Iodide.

	Metric.	Old form.
Reduced Iron	4 Gm.	62 grains.
Iodine	5 Gm.	77 grains.
Glycyrrhiza, in No. 60 powder	4 Gm.	62 grains.
Sugar, in fine powder	4 Gm.	62 grains.
Extract of Glycyrrhiza, in fine powder	1 Gm.	15 grains.
Acacia, in fine powder	1 Gm.	15 grains.
Water,		
Balsam of Tolu,		
Ether, each, a sufficient quantity,		
To make one hundred pills	100	100

To the Reduced Iron, contained in a small mortar, add 6 C.c. [old form 100 minims] of Water, and then, gradually, the Iodine, constantly triturating, until the mixture ceases to have a reddish tint. Then add the remaining powders, previously well mixed together, and mix the whole thoroughly. Transfer the mass to a porcelain capsule,

and evaporate the excess of moisture, on a water-bath, with constant stirring, until the mass has acquired a pilular consistence. Then divide it into 100 pills.

Dissolve 10 Gm. [old form 154 grains] of Balsam of Tolu in 15 C.c. [old form 243 minims] of Ether, shake the pills with a sufficient quantity of this solution until they are uniformly coated, and put them on a plate to dry, occasionally rolling them about until the drying is completed. Keep the pills in a well-stoppered bottle.

Pills of Ferrous Iodide should be devoid of the smell of iodine. If a few of the pills be triturated with water, the filtrate should not assume more than a light blue tint on the addition of starch T.S. (absence of more than traces of *free iodine*).

PILULÆ OPII. U.S. Pills of Opium.

	Metric.	Old form.
Powdered Opium	6.5 Gm.	100 grains.
Soap, in fine powder	2.0 Gm.	81 grains.
Water, a sufficient quantity,		
To make one hundred pills	100	100

Beat the powders together with Water, so as to form a mass, and divide it into 100 pills.

PILULÆ PHOSPHORI. U.S. Pills of Phosphorus.

	Metric.	Old form.
Phosphorus	0.06 Gm.	1 grain.
Althæa, in No. 60 powder	6.00 Gm.	92 grains.
Acacia, in fine powder	6.00 Gm.	92 grains.
Chloroform,		
Glycerin,		
Water,		
Balsam of Tolu,		
Ether, each, a sufficient quantity,		
To make one hundred pills	100	100

Dissolve the Phosphorus, in a test-tube, in 5 C.c. [old form 81 minims] of Chloroform, with the aid of a very gentle heat, replacing from time to time any of the Chloroform which may be lost by evaporation. Mix the Althæa and Acacia in a mortar, next add the solution of Phosphorus, then immediately afterwards a sufficient quantity (about 4 C.c.) [old form 65 minims] of a mixture of 2 volumes of Glycerin and 1 volume of Water, and quickly form a mass, to be divided into 100 pills.

Dissolve 10 Gm. [old form 154 grains] of Balsam of Tolu in 15 C.c. [old form 243 minims] of Ether, shake the pills with a sufficient quantity of this solution until they are uniformly coated, and put them

on a plate to dry, occasionally rolling them about until the drying is completed. Keep the pills in a well-stoppered bottle.

PILULÆ RHEI. U. S. Pills of Rhubarb.

	Metric.	Old form.
Rhubarb, in No. 60 powder	20 Gm.	308 grains.
Soap, in fine powder.	6 Gm.	92 grains.
Water, a sufficient quantity,		
To make one hundred pills	100	100

Beat the powders together with Water, so as to form a mass, to be divided into 100 pills.

PILULÆ RHEI COMPOSITÆ. U. S. Compound Pills of Rhubarb.

	Metric.	Old form.
Rhubarb, in No. 60 powder	13 Gm.	200 grains.
Purified Aloes, in fine powder	10 Gm.	154 grains.
Myrrh, in fine powder	6 Gm.	92 grains.
Oil of Peppermint	0.5 C.c.	8 minims.
Water, a sufficient quantity,		
To make one hundred pills	100	100

Mix the Oil of Peppermint with the powders, then beat the mixture with Water so as to form a mass, to be divided into 100 pills.

Coating Pills.—Pills are coated with sugar, gelatin, silver leaf, gold leaf, or French chalk, with the view of masking their taste. The sugar-coating of pills is carried on upon a very large scale in this country. The pills are carefully dried, placed in a round-bottomed copper pan, a mixture of syrup and starch added, the whole heated, and the pan kept moving constantly, so that a rotary motion is imparted. Whilst evaporation takes place, additions of syrup are made from time to time, so that a crust of sugar gradually forms upon the surface of each pill. Fig. 564 shows the form of pill-coater used by Allaire, Woodward & Co., of Peoria, Illinois. The rotary motion and heating of the copper pan are effected by the use of steam. A polish is given to the pills by agitating them in a bag or rolling them in a shaker in contact with a piece of wax or paraffin.

Pills cannot be satisfactorily coated with sugar in the small way

FIG. 564.

Machine for sugar-coating pills.

without much labor. This is not the case with gelatin coating. It is quite possible for the pharmacist to coat pills with gelatin and be able to dispense them in fifteen minutes. The coating of pills with gelatin is an old process. Formerly each pill was impaled upon a long needle, dipped into a solution of gelatin, and the end of the needle stuck into a cork to permit the coating to dry. This slow process was improved by Chas. B. Allaire, who devised a machine for dipping a number of pills at once, and also one for stripping the needle-bar. Since then many machines have been introduced for coating pills with gelatin, and

FIG. 565.

Prof. Patch's gelatin-coater.

since the introduction of sugar, gum, or saccharin in small quantities to the gelatin mass their use is likely to increase. Prof. Patch's coater is shown in Fig. 565. The dried pills, which must not be made with glycerin, roll down the inclined grooves, shown in the tray in the drawing, until each of the hemispherical depressions at the end of the groove contains a pill. A wooden strip armed with sixteen needles is inverted over the sixteen pills in the depressions, and the points of the needles are pressed into them until every one is impaled; the adjustable handle is now attached, and the pills are dipped into a hot solution of pure gelatin (page 1058), and then gently

twirled until the coating has set, when the strip is transferred to the catch in the wheel. This wheel is made to rotate, first in one direction and then in the opposite, by alternately pulling and relaxing the string attached to the axle: this rapidly dries the coating. The needles are stripped of the pills by engaging them in the comb, as shown in the cut. In Franciscus's pill-coater the needles are set in a brass bar, and the rotation is in a different direction. Other machines are favorably known: in the larger-sized Porcupine pill-coater the revolution of the cylinder to which the needle-bars are attached is effected by clock-work.

Maynard's pill-coater is illustrated by Figs. 566, 567, 568, 569, 570, and 571. It is operated by first placing the flat metallic ring F around the feeding-plate E, and pouring the pills into the cup which is thus formed; the conical indentations in E are filled, and the excess of pills remaining on the top of the plate is permitted to roll off into a box. The dipper or needle-holder D is then placed in position immediately over the pills on the feeding-plate, the guide-pins on the sides securing accuracy in centering the pills with the needle-points; the handle of the needle-holder is then pressed downward until the points of the needles enter the pills nearly to their centres. The pills, after they are im-

paled, as seen at C, are dipped into the melted gelatin solution; the needle-holder is then slowly revolved in the air in order to facilitate the even distribution of the gelatin film on the surface of the pills.

When the film becomes thoroughly cold, it should be solid enough to permit the pills to be stripped from the needles. It is well to have two needle-holders, so that whilst the gelatin on the pills on one is solidifying the other may be started on the coating; in this way the process is rendered continuous. When the coating on the pills is sufficiently hard, the pills are stripped from the needles by grasping the circular plate on the needle-holder

with one hand and pulling the handle of the needle-holder upward; the pills drop off, and should be deposited on the tray of wire gauze B to dry. The circular plate through which the needles pass should be slightly greased with cosmoline to prevent the pills from adhering to it. The gelatin solution is heated in an agate-ironware dish, set in a copper water-bath having a cover.

This arrangement prevents a film from forming on the surface and aids in retaining the uniformity of the gelatin solution. When the pills are not being dipped, the cover should be kept on the dish.

A valuable invention in coating pills with gelatin has been made by J. B. Russell, of Detroit: needles for impaling the pills before dipping have been discarded and the pills are held firmly upon the ends of tubes by suction, the tubes being connected with a box from which the air has been exhausted. A little over one-half of each pill is dipped in the gelatin solution; this is rapidly dried. Subsequently the pill is reversed, and the uncoated portion is then dipped, thus completing the coating. The process is used in the laboratory of Parke, Davis & Co.

Pills may be coated with gelatin by cutting the pill-cylinder to its centre, placing in the cleft a piece of sewing-silk, rolling it, dividing it into pills, dipping in gelatin solution, drying, and cutting apart.

Maynard's pill-coater.

FIGS. 569, 570, 571.

Maynard's pill-coater.

Gelatin-Coating Solution.

(Prof. Patch.)

Gelatin (French, gold label)	2½ oz. (av.).
Powdered Boric Acid	120 gr.
Mucilage of Acacia	2 fl. oz.
Distilled Water	7 fl. oz.

Macerate the Gelatin with the Water until it softens, dissolve it by heating in a water-bath, and add the Boric Acid; then slowly add the Mucilage of Acacia, and strain the mixture.

Pills may be coated with gold or silver leaf by first placing a drop of syrup of acacia in a mortar, and, after carefully spreading it over the surface with the end of the finger, dropping in the pills, rotating them so that they shall be uniformly coated with a very thin layer of mucilage, and then dropping them into the gold or silver leaf contained in the coater. This is merely a smooth, globular box, opening in the middle (see Fig. 572). When the pills are rotated, they soon become coated with the leaf, and are then ready to dispense. In the absence of a globular box a large-sized pill-box may be used.

FIG. 572.

Silver-coater.

FIG. 573.

Compressed-pill-machine.

Compressed Pills and Troches are made by subjecting dry powders to a sufficient degree of pressure in suitable machines to cause them to cohere: the pressure may be effected by a blow from a mallet, or by means of a lever or combination of levers. To enable the pharmacist to prepare his own compressed pills the author devised, in 1875, the machine shown in Fig. 573 for making them. It is made of cast steel: the base has two countersunk depressions with a short post in the centre of each; a lenticular depression is made in the upper surface of each post. A steel cylinder having a central aperture of the diameter of the post is placed in the depression, the proper quantity of powder is introduced, and the plunger, which has a corresponding lenticular depression on its lower surface, is placed on the powder and is struck a quick blow with a mallet; the powder is compressed, and the pill adheres to the cylinder; by removing the cylinder and holding it over a box and tapping the plunger again lightly, the pill is forced out, and falls into a

box. Brockedon, of England, was the first manufacturer who introduced this form of pill. In this country, Jacob Duntun, of Philadelphia, was the first to extend the process to a long line of pills, but subsequently John Wyeth & Bro. prepared compressed pills upon an enormous scale.

In one of the compressed-pill-machines in use by this firm a circular steel disk, which is perforated with a number of holes, is made to revolve slowly; at regular intervals its motion is stopped long enough to deposit the proper weight of powder and to permit a plunger having a moulded end, as in Fig. 573, moving from above, almost to meet a similar one rising from below the plate; the powder is caught between the two moulds, is compressed, and the pill finds its way out through the spout into the box below. The advantages of compressed pills are that no excipient is used in their preparation, they are easily disintegrated or dissolved in the liquids of the stomach, and their lenticular shape is favorable to their being easily swallowed. Machines for making compressed pills and troches which are adapted for either hand- or steam-power are now made extensively. Fig. 575 shows the Crown tablet machine, made by H. K. Mulford & Co, of Philadelphia. The material which is to be compressed is fed into the funnel; in the lower part of this funnel there is a sieve, to prevent large lumps from passing through and clogging the feeder. By means of simple yet ingenious mechanism the powder finds its way to the die-plate, the feeder being shaken constantly in order to keep the powder in motion, so that uniformity in feeding is secured while it is being delivered. When the chamber in the die-plate has received its charge, the feeder moves out of the way to make room for the compressor, which then forms the tablet in the die; the ejector follows the compressor after it has moved out of the die-plate, and the tablet is knocked off and into the pan underneath by the feeder. The same motions are repeated continuously. When everything is in order and the machine is properly operated, compressed tablets may be made very rapidly. The weight of the tablet may be adjusted with simplicity and accuracy.

Fig. 575.

Crown tablet machine.

Fig. 576 represents the McFerran machine for compressing powders. The plate which carries the die is reciprocating, and the dies are capable of being changed quickly when tablets of different sizes are to be made. The feed-cup D has a stirrer in it, and the material is thus kept in uniform motion while the machine is in operation. The weight of the tablet is adjusted by turning the side screw. The pressure is regulated by a worm wheel, A, on the crank pin, and it is possible to make tablets which are hard or fragile at will. One of the advantages of this

machine is the comparative absence of noise in running it. With practice an operator can make from forty to sixty tablets in a minute. In making compressed pills and lozenges it must not be supposed that the various powders which are to be compressed need no previous treatment. Both experience and knowledge are necessary to always achieve

FIG. 576.

McFerran compressed-tablet machine.

success. Some powders are too dry, and need moisture before they can be compressed; others are too damp, and need drying; others have so little cohesive property that even the application of a powerful press is insufficient to keep them from splitting or breaking; others again possess too great a tendency to adhere to anything that they come in contact with. The manufacture of compressed pills and powders has developed a special knowledge of the properties of medicinal substances which is very valuable to those who operate these machines largely. A few illustrations of the methods used for overcoming the difficulties alluded to will be appended. Tablets of potassium chlorate are made without trouble, the slightly moist, finely granulated salt being preferred, because it will feed more regularly than that which is in fine powder. Sodium bicarbonate is compressed very frequently, and it is used in making the so-called soda-mint tablets; its powers of cohesion are not good, but if five per cent. of powdered acacia be added and the whole moistened with water, sifted through a coarse sieve, and dried, there will be no difficulty. The oil of peppermint should be added after it is dried, from one to one and a half per cent. being the usual quantity. Powders which consist mainly of sugar of milk need damp-

ening with a mixture of one part of simple syrup and two parts of water. The damp powder should be sifted through a coarse sieve and dried; just before compression a little powdered talcum is often sifted in to prevent the tablet from adhering to the die. White cosmoline or vaseline in small quantity is sometimes incorporated with a dry powder to facilitate compression and improve the appearance of the pill or lozenge. Two per cent. of cosmoline dissolved in sufficient ether to permit of its thorough diffusion through the powder is sufficient. Of course the powder should be sifted and dried. When troches or pills are to be made of such dry and apparently incompressible powders as quinine sulphate, charcoal, salicylic acid, or sodium salicylate, compression can be accomplished by moistening the powder with a solution of gelatin, sifting, drying, and using a little talcum. If a trace of the ethereal solution of cosmoline or finely powdered arrowroot is added to the quinine sulphate, instead of the talcum, the pills will disintegrate more readily, but pills of quinine bisulphate are more easily made and are more soluble. Very frequently the dampening of the powder with a little ether or alcohol is all that is necessary to secure compression. On the large scale it may be found more advantageous to replace acacia with white dextrin. Hypodermic tablets may be made with a base of purified sugar of milk; although perfectly neutral dried sodium sulphate and purified sodium chloride are probably better.

A number of compressed pill machines have been placed upon the market within a few years. Robert Shoemaker, Jr., of Philadel-

FIG. 576a.

Witzel tablet machine.

phia, manufactures machines of various sizes of excellent workmanship; these are well adapted for use with steam-power. The Jordan

Tablet Machine (made in Tacony, Pa.) and the Keystone Tablet Machine (A. Leggoe & Co., Philadelphia), are machines largely used by pharmacists for making tablets when hand-power is available. The Witzel Machine (Tacony, Pa.) differs so radically in its mechanical construction from the others that an illustration is appended to show its peculiarities. Instead of the dies being operated in a perpendicular position, they are arranged horizontally, the compressing chamber (4) is immediately under the immovable hopper (5), and the powder easily enters by its own gravity; after the tablet is formed, a mechanical finger pushes it off the die into the box. The frame is one solid casting, occupying a counter space of 10 by 17 inches. The capacity can be increased by adding plungers. The pressure is easily regulated, and is imparted by cams to the sliding-blocks. Ample provision is made for taking up lost motion due to the wear of the moving parts. The dies and moulds can be readily changed from one size to another, and the adjustments, being few and simple in construction, are easily understood and quickly manipulated. Tablets are formed by the following motions: When the plungers are below the hopper they receive the proper amount of material, which is conveyed under cover to the mould; one plunger is held stationary while the other advances and compresses the material, then both dies recede, thus loosening the tablet, which is then ejected. The machine is well adapted for pharmacists' use.

GELATIN CAPSULES AND PEARLS.

The gelatin-coated pill is not the only form in which nauseous or bitter medicines may be administered with their taste concealed, gelatin capsules having been in use for many years.

Gelatin Capsules are of three kinds, designated as hard, soft, and empty: the first two are used in administering liquids. Empty capsules may be used for liquids, but they are generally employed in concealing the taste of bitter solids. The principle upon which they are all made is that of dipping a smooth mould, usually of bone or ivory, into a thick, hot solution of gelatin, allowing the film to become cold, removing it at the proper time, filling it with the liquid, and then sealing it.

Figs. 578, 579, 580, 581, and 582 show the apparatus used by Parke, Davis & Co., and illustrate the method of making and filling capsules. The process is not new, and the theory is simple, but success in making capsules is not apt to crown the first efforts, considerable experience being necessary.

The material employed for the shells or envelopes of soft elastic capsules is a composition of gelatin and glycerin, the proportions being varied according as a softer or a harder capsule is desired. A sufficient quantity of water is employed in making the composition to produce a fluid which shall be of the proper consistency. No exact formula can be strictly adhered to, because the proportion will vary with different samples of gelatin; but after a little experience the operator learns to adjust it to a nicety. The composition must be kept at a uniform tem-

perature—about 40° C. (104° F.) by means of a water-bath. A wooden mould, having a stem about four inches in length (see Fig. 578), is employed for forming the shell. A number of these moulds are fixed in the perforated wooden disks shown in Fig. 581, and when in use these disks are supported on a simple frame or rack, consisting of two parallel strips of wood about four inches apart (see Fig. 580). The moulds must be slightly oiled, to prevent the composition from

adhering to them ; but excess of oil must be avoided, or they will refuse to take the gelatin. All being now in readiness, the operator takes one of the disks from the rack by its handle, inverts it, and dips the mould carefully into the gelatin composition, then withdraws it slowly with a steady motion, so as not to take up more of the fluid than is required. The moulds are now held in a current of cold air, produced by a fan or other suitable device, being kept in constant motion by the operator to secure an even distribution of the gelatin until it is sufficiently congealed, when the disk is returned to its place, and the operation is repeated with a second disk. The disks are allowed to remain a few minutes on the rack, until the gelatin is hard enough to be handled without sticking to the fingers. They are then taken to a table, and by a smart rap with the hand (the disk being held in a vertical position) the moulds are shaken out of their sockets. An operator provided with an ivory knife next separates the capsule from the superfluous gelatin which has adhered to the stem of the mould, and the soft, elastic shell is then pulled from the mould and placed in an upright position for filling upon the shell-supporter (see Fig. 579). This operation of stripping off the capsules can be best performed by the delicate fingers of a young girl, since any

roughness in the cuticle of the operator will leave its impression indelibly upon the soft gelatin.

The capsules are filled by the skilful use of the syringe (see Fig. 582), great care being taken that none of the oil be allowed to touch the edge of the capsule, since such an accident would render it impossible to seal the capsule. The final operation of sealing is accomplished by passing over the opening a small stick charged with the gelatin composition of which the capsule is made. When the capsules are thus finished, they are allowed to stand a few hours on the supporters to dry, and are then spread out on a sheet of white paper in order to detect any that may be imperfectly sealed. These having been removed, the capsules are ready to be packed in boxes for the market. The hard capsules differ from the elastic ones only in the omission of glycerin from the composition of the envelopes, the manipulation being the same, except that it is necessary to allow the finished capsules to remain several days on the supporters to become completely dry and hard before they are packed.

Empty capsules are not ovoid in shape, but cylindrical (see Fig. 583). They are made of several sizes, and are usually designated by numbers. The smallest size in the illustration is represented with the cap, C, off: these are used by pharmacists for enclosing nauseous or bitter powders or masses. They are filled in several ways: one plan is to make a mass of the powders, divide it into little rolls, as in making pills, insert them in the larger end of the capsule, A, and place the cap, C, tightly upon it. To fill the capsules with powders several devices are employed. Whitfield's capsule-filler is the most elaborate apparatus. Davenport's method is very simple: the filler is shown in Fig. 584. It consists of a funnel, tube, and plunger. The funnel is flattened at one side, to assist in taking up the material, the tube attached to the funnel is of the proper size to be placed in the capsule, and its end is cut off at an angle to permit its ready application in the capsule. The funnel and tube are made from one piece of metal, with-

FIG. 583.

Empty capsules.

FIG. 584.

Davenport's capsule-filler.

out seam or joints. The plunger is of hard wood, and of the proper size for entering the tube. It is supplied with a rubber collar, which admits of the piston's being pressed entirely through the tube to eject the material. Each filler and plunger is numbered to correspond with the number of the capsule. In use, the material is first divided into powders; the capsule is placed on the tube, the flat edge of the funnel held nearest to the operator, and the powder scraped into the funnel; the filler is held in an upright position, and the plunger raised; after the powder has

passed into the tube, the plunger is inserted, the capsule held firmly on the tube, and pressure applied to the plunger, forcing the powder into the capsule, which is then removed and capped in the usual manner.

Raymond's capsule-filler (see Figs. 585 and 586) consists of two blocks of hard wood.

In the lower one in Fig. 585, C, twelve sockets are bored of sufficient depth to enable the capsules to be inserted one-half of their length: these sockets are so shaped at the bottom as to correspond with the lower end of the capsule. A small hole is bored through the bottom of each socket. The upper side of the upper block, B, is provided with twelve funnel-shaped receptacles of sufficient capacity to hold all the powder intended to fill the capsule, the lower end of these receptacles being so shaped that when the two sections are in proper position for use they will project just over the upper edge of the capsule. The under side of this section is provided with twelve holes a trifle larger than those in C, and of sufficient length to cover that portion of the capsule projecting above C. Pegs are inserted in either section to fit into corresponding holes in the other, so as to hold the two together in proper position when the filler is in use (see Fig. 586). A tampon, A, is provided with which to pack the capsule.

FIG. 585.

FIG. 586.

Raymond's capsule-filler.

Suppositories. *Suppositories.*

Suppositories are solid bodies intended to be introduced into the rectum, urethra, or vagina to produce medicinal action. Their form is usually conical, with a rounded apex, and their consistence should be such that, whilst they will retain their shape at ordinary temperatures, they will readily melt or soften at the temperature of the body. Oleum theobromæ, or cacao butter, is the best base for suppositories, because it accurately fulfils both of the above requirements: it was first suggested in this connection in 1852, by Mr. Alfred B. Taylor, of Philadelphia. It is rarely necessary to raise the melting point of cacao butter by the addition of wax, spermaceti, etc., except in the warmest summer weather, or when carbolic acid, camphor, chloral, the volatile oils, or similar substances form the medicating ingredients. Gelatin suppositories are made from a mass containing gelatin and glycerin, by soaking gelatin in water, draining off the excess, adding five parts by weight of glycerin to every twelve parts of soft gelatin, and heating in a water-bath. The medicating substance is rubbed into a smooth paste with a small quantity of water or glycerin and added to the mass. Since the extended use of suppositories the size has been gradually reduced, until fifteen-grain suppositories are now most largely employed. Suppositories are usually of three kinds: 1. Rolled; 2. Moulded; 3. Pressed.

1. **Rolled Suppositories** are made by a very simple method: the cacao butter is scraped or grated and placed in a mortar; the medicating ingredients are reduced to powder, or, if composed of extracts, are softened with water and rubbed until a smooth paste is formed; a mass resembling a pill mass is now made by thoroughly incorporating the ingredients with a pestle, and, having thoroughly dusted a pill-tile with lycopodium, a suppository cylinder is formed by rolling the mass upon the tile with a spatula, after having softened it by partly shaping it with the fingers: if the mass is brittle, it may be softened by thoroughly incorporating a few drops of olive oil with it; the cylinder is rolled out and then cut into the proper number of pieces with a spatula; the conical shape is given by rolling *one end* upon the tile with a spatula, so as to produce a rounded point. In warm weather it is necessary to use lycopodium, powdered elm bark, or a similar absorbent powder freely. With practice, excellent rolled suppositories can be made. This method has the substantial merit of requiring very little apparatus, but considerable skill is needed to produce suppositories equalling in finish those which are moulded. Fig. 587 and Fig. 588

FIG. 587.

Bing's suppository-machine.

show two views of Bing's apparatus for shaping rolled suppositories. The suppository cylinder is placed upon the base-plate and well dusted with lycopodium; it will

FIG. 588.

End-view of the same.

be observed that the plate has the shape of one-half of a suppository divided longitudinally; upon moving the upper plate backward and forward on the suppository cylinder, gradually increasing the pressure, the

suppository assumes the conical form. Three base-plates, for three different sizes of suppositories, are shown.

2. **Moulded Suppositories** are more largely used than any other kind; preference is given to them in the official directions, although the other kinds are permitted: the directions are as follows:

Mix the medicinal portion (previously brought to a proper consistence, if necessary) with a small quantity of Oil of Theobroma, by rubbing them together, and add the mixture to the remainder of the Oil of Theobroma, previously melted and cooled to the temperature of 35° C. (95° F.). Then mix thoroughly, without applying more heat, and immediately pour the mixture into suitable moulds. The moulds must be kept cold by being placed on ice, or by immersion in ice-cold water; and the inner surface of the moulds should be carefully freed from adhering moisture, before the melted mass is poured in. In the absence of suitable moulds, suppositories may be formed by allowing the mixture, prepared as above, to cool, care being taken to keep the ingredients well mixed, and dividing into parts of a definite weight each, which may be made into a conical or other convenient form for a suppository. Unless otherwise specified, suppositories should have the following weights and shapes, corresponding to their several uses: *Rectal Sup-*

positories should be cone-shaped, and of a weight of about one gramme (15 grains). *Urethral Suppositories* should be pencil-shaped, and of a weight of about one gramme (15 grains). *Vaginal Suppositories* should be globular, and of a weight of about three grammes (46 grains).

The only official suppositories are those made with glycerin: the process for these was perfected by the author (Proc. A. P. A. 1892, p. 267). They are preferably dispensed by inserting each in a glass tube with a cork at each end.

SUPPOSITORIA GLYCERINI. U. S. Suppositories of Glycerin.

	Metric.	Old form.
Glycerin	60 Gm.	2 oz. av. 50 gr.
Sodium Carbonate	3 Gm.	46 grains.
Stearic Acid	5 Gm.	46 grains.
To make 10 rectal suppositories.		10 suppositories.

Dissolve the Sodium Carbonate in the Glycerin in a capsule on a water-bath; then add the Stearic Acid, and heat carefully until this is dissolved, and the escape of carbonic acid gas has ceased. Then pour the melted mass into suitable moulds, remove the suppositories when they are cold, and wrap each in tin-foil. These suppositories should be freshly prepared when required.

The principle upon which suppositories are moulded depends upon the fact that the mass after being introduced into the moulds contracts upon cooling; when the limit of contraction is reached, the suppository is a trifle smaller than the mould in which it has been made, and it can be easily extracted: hence the importance of allowing the moulds to become thoroughly cold after the introduction of the melted mass. The novice almost invariably makes the mistake of opening the divided moulds too soon (before the limit of contraction is reached): the suppository sticks to the mould, and splitting ensues. The difficulties encountered in making moulded suppositories generally arise from the use of too much heat in melting the mass. A suppository mass containing an extract bears some analogy to an emulsion, with the proportions of the ingredients reversed: the fatty substance here is in great excess; the extractive matter is the substance to be uniformly suspended, whilst the water is relied upon to effect this object: this can be done by making the extract into a soft paste with the water, and gradually incorporating it with the partly-melted cacao butter by stirring.

Other difficulties in moulding suppositories are easily overcome by the exercise of judgment and knowledge of physical laws. A defect frequently seen in the finished cacao butter suppository is that the surface is not always perfectly smooth. This may arise from several causes. Sometimes ridges are seen traversing the suppository; these are usually produced by overcautiousness, the operator pausing in pouring the melted mass into the mould, then pouring in a little more, then pausing again, and so on: on taking out the suppository, a ridge will be found at each spot where a pause was made. The remedy for this

is to keep on pouring steadily when this part of the process is reached. Other defects are pitting and an imperfection in the formation of the summits of the suppositories. The pitting is caused by drops of water which have been allowed to remain upon the sides of the mould; the imperfect summits are due to water which has not been shaken out of the mould before pouring in the melted mass. Still another defect is a conical hole in the centre of the base of each suppository. This is due to not overflowing the moulds so as to leave an excess of mass upon the top. In all cases there should be a little more mass than will fill the moulds, and after cooling the excess can be cut off.

If *strong heat is used*, the water is evaporated, the extract separates in small masses, and, like a bad emulsion, the mass is "cracked." The remedy is to pour it at once upon an ointment slab or tile, add a little water, and rub it until the original condition is regained.

FIG. 588a.

Wellcome's
suppository.

Henry S. Wellcome, of London, has devised an improvement in the shape of the moulded suppository which prevents the expulsion of the suppository after insertion; this consists in tapering the suppository at the base, and from there gradually expanding its width until near the top, which terminates in a blunt point. (See Fig. 588a.)

Pouring the Mass.—The mass should be poured into the mould from a dipper held in the right hand, a vigorous stirring being maintained with a spatula held in the left hand immediately before the pouring begins; indeed, when heavy powders are directed, the stirring must not cease during the pouring, or the last suppositories will contain a larger proportion of the heavy powder than those which were first made. A porcelain casserole (see Fig. 589) is the best vessel to melt the mass in; and it is much better to dip it into a dish containing hot water than to use direct heat. The use of lycopodium to dust the inside of the moulds is unnecessary.

If proper attention be given to cooling the moulds thoroughly, there will be no difficulty from the adhesion of the suppositories.

Suppository-Moulds.—Many forms are in use. They may be arranged in three classes: 1. Individual moulds. 2. Divided moulds. 3. Hinged moulds.

1. **Individual Moulds** are those which were first employed: in this form an oval metallic dish is furnished with a lid which contains twelve circular perforations (see Fig. 591) for supporting twelve individual moulds made of white metal. To prevent the moulds from slipping through when they are placed in the perforations, they each have a shoulder, which rests upon the lid (see Fig. 590 and Fig. 592). The dish is nearly filled with chopped ice or snow, the lid supporting the moulds is placed in position, and the melted mass is

FIG. 589.

Casserole.

FIG. 590.

Individual suppository-moulds.

FIG. 591.

FIG. 592.

poured in. After the suppositories have become thoroughly cold, they are removed by inverting the mould and tapping it lightly on a hard surface, when they usually drop out. They sometimes fail, however, to answer the summons promptly. This is generally due to the mould's not being perfectly clean. The difficulty of quickly and easily cleaning these small moulds, and the liability of losing or misplacing them, constitute the most serious drawbacks to the use of this form.

Figs. 593, 594.

Divided suppository-mould.

Divided Moulds.—This, at present, is a favorite kind of suppository-mould, one of the advantages being the facility with which it can be cleaned. They are preferably cooled by placing them upon a piece of ice. The simplest form is shown in Fig. 593. The upper mould is represented as closed and ready for use, being

held together by an ordinary rubber band. The open mould is shown below. It is made of brass, and consists of two parts, which are kept

FIG. 595.

Wirz's suppository-mould.

in position by placing the pins A and B in their respective sockets. This form is seen enlarged in the Wirz mould (see Fig. 595). This mould will make twelve suppositories at one time, and it is held together by two brass

rings which are slipped over the handles. The circular forms have the very great advantages of requiring but a small piece of ice and of being almost indestructible. Figs. 596 and 597 show See's mould: the central core is held in position by a set-screw. Fig. 596 represents the closed mould,

FIG. 596.

See's mould (closed).

FIG. 597.

See's mould (open).

FIG. 598.

Blackman's suppository-mould.

and Fig. 597 shows the core when elevated. This mould is made by J. M. Maris & Co., of Philadelphia. The best divided mould is unquestionably that shown in Fig. 598. It was manufactured by L. R.

Blackman, of Newport, R.I. The division of this mould is horizontal instead of perpendicular. It is made of gun-metal, is nickel-plated, contains no small working parts, and is compact and simple in its construction. The relative position of the upper and lower parts is shown in the illustration. When the suppositories have contracted sufficiently to leave the mould easily, it may be known by pressing one of them slightly upon the top. If it can be moved downward slightly, it indicates that they are loose, when the upper part, carrying the suppositories, may be separated by lifting it from the lower part; it is then inverted over a piece of paper, when a light tap will cause the suppositories to drop out.

Hinged Moulds.—This form differs from the divided moulds in being connected with a hinge. They are used in the same way as the divided moulds. One of the simplest forms is seen in Fig. 599. This

FIG. 599.

Hinged mould.

FIG. 601.

English suppository-mould.

FIG. 600.

Benton, Myers & Co.'s suppository-mould.

opens perpendicularly, and is closed in the same way as the mould shown in Fig. 595. Benton, Myers & Co.'s mould (Fig. 600) is constructed so that two different sizes of suppositories may be made in it. It is in addition a double mould, is hinged at one end, and closed by a screw-catch at the other. Figs. 601 and 602 are illustrations of a very serviceable English mould, recommended by Mr. Henry B. Brady, of Newcastle-on-Tyne. It differs from all others in being hinged at the bottom. It is held together by two screw-catches, one at each end. Fig. 602 shows this mould closed, and in position upon a cake of ice.

Compressed Suppositories.—The method of making suppositories by compression has been used to some extent, but the expense of the apparatus required in their production constitutes a serious drawback.

A. M. Knowlson, of Troy, N.Y., is the maker of an effective suppository-machine, which presses the mass through a cylinder into a

FIG. 602.

Suppository-mould on ice.

mould, and finally discharges the well-finished suppository, without the use of any heat whatever. Efforts are now being made to perfect a simple, effective, and cheap machine upon this principle. In Archibald's suppository-machine the compression is effected by a lever working perpendicularly in a cylinder containing the suppository mass. This apparatus is shown in Fig. 603. The suppository mass may be made in the usual way (see page 1123), or the medicating ingredient, if in powder, may be mixed with the grated cacao butter and thoroughly distributed through it. The proper mould (7) having been introduced in the swing-bed (4), the latter is moved accurately into position under the hopper (3), and the plunger (1) having been elevated by moving the hand-lever (2), the mass is introduced into the hopper (3). By pressing the hand-lever (2) down the mass is forced into the mould; without raising the lever the swing-bed is then pushed around to the right, as shown in Fig. 603, and the mould lifted out by the handle (7). The suppository may be removed from the mould by gently sliding one of the halves over the other, for this gradually forces it out of the mould without the necessity of touching the suppository with the fingers. If the suppository adheres to the mould, it may often be forced out by a slight pressure of the thumb upon the apex. In warm weather the moulds should be cooled before using them by laying them upon ice or by immersion in ice-water. Soap liniment, glycerin, or powdered French chalk have been used as

FIG. 603.

Archibald's suppository-machine.

applications to the inside of the moulds when the mass has a tendency to adhere. Moulds accompany the apparatus for making rectal, vaginal, nasal, and urethral suppositories, and any special size can be furnished by the manufacturer.

FIG. 603a.

FIG. 603b.

Compressed suppository machine.

For making larger quantities of suppositories the same inventor has devised the machine figured in illustrations 603a and 603b. This is made by Fox, Foulitz & Webster. It consists of a cylinder (4) swinging in a frame in which the die or mould is placed; the mass previously made is thrown into the open cylinder (4) (see Fig. 603a). The cylinder is then swung back into its place (see Fig. 603b), and screw pressure is applied until all resistance is overcome. Before opening the machine, the screw should be loosened slightly; then, on pulling the bed-plate out and pushing it aside (Fig. 603b), and gently turning the screw, the suppositories drop out. Repeating the operation, it is obvious that the machine will turn out suppositories as long as any mass remains in the cylinder. Brass dies and a tube are furnished to make 15-grain, 30-grain, vaginal, urethral, or nasal suppositories. Urethral or nasal suppositories are made by screwing on a small brass tube at 2 (Fig. 603b) and then pressing the mass through it. A long rod-like suppository is thus forced out, which may be cut into suitable lengths.

Gautier's suppository mould consists of a truncated metallic cone divided longitudinally into two parts, which fit accurately together by grooved surfaces. This cone is bored cylindrically for some distance, the diameter of the hole corresponding at this part with that of the wider end of a suppository, whilst at the upper end of it there is a female screw. Lower down it gradually tapers to a point, assuming the exact shape of a conical suppository. In use, the two parts of the cone are kept in position by an outer jacket of metal, which slips over them. The medicament having been well mixed with the previously grated cacao butter, the exact weight of the mass required in a

suppository is introduced into the cylindro-conical opening through a small funnel. By means of a piston, which exactly fits the cylindrical part, and is constructed with a milled head and screw at the upper end, pressure is then applied, and the finished suppository may be released.

FIG. 604.

Suppositor.

FIG. 605.

Suppositories are sometimes introduced into the rectum with difficulty. Figs. 604 and 605 show a suppositor to aid in their insertion. The tube is made of hard metal, and has a funnel-shaped top (Fig. 605). The suppository is dropped into the tube, point downward, and this is carefully inserted into the rectum. The piston (Fig. 604) is now applied to the end of the suppository, which is gently pushed into the rectum, the tube being then withdrawn.

FIG. 606.

Suppository capsules.

Suppository Capsules.—Dr. F. E. Stewart has suggested the employment of gelatin shells with conical caps, to be used as suppositories. The medicating ingredients are inserted in the lower portion; the upper margin is then moistened with water, and the

cap inserted. Before introducing them into the rectum they should be wet with sufficient water to enable them to slip in easily (see Fig. 606).

Urethral Suppositories, or Bougies, are preferably made of gelatin, owing to the difficulty of introducing into the urethra those made from

FIG. 607.

Mitchell's gelatin-bougie mould.

cacao butter, on account of their brittleness. They may be made by melting together three parts of white gelatin, one part of glycerin, and one part of distilled water, by weight, then adding the desired medicament and drawing the mass into a glass tube of suitable size, which has been

previously oiled by sucking a small quantity of oil into it and allowing it to run out. After cooling, the mass is pushed out by means of

Fig. 607a.

Wellcome's urethral
suppository.

Fig. 608.

Suppository-box.

an oiled rod, and cut into pieces of suitable length. These should be rolled in lycopodium to prevent adhesion. Fig. 607 shows Mitchell's bougie-mould for making them in quantity.

Henry S. Wellcome, of London, has devised an improved form of urethral suppository upon the same plan as the rectal suppository (see Fig. 588a). This, from its peculiar shape, and particularly on account of the elongated bulb near the top, is less likely to be involuntarily expelled after insertion.

Dispensing Suppositories.—In order to prevent injury to the surface of suppositories in handling them with warm fingers, it is advisable to place the fingertips for a few moments upon the ice until they are chilled, before placing the suppositories in the box. The latter is preferably furnished with partitions, as made by the Randolph Paper Box Company, of Richmond, Va. (see Fig. 608). In the absence of this special box, the suppositories should be protected by a layer of cotton.

QUESTIONS ON CHAPTER LXVI.—(Continued.)

SOLID EXTEMPORANEOUS PREPARATIONS.

What are pills?

Of what two parts does a pill mass consist?

What are the essential requirements of a pill mass?

Give the names of some of the more ordinary excipients.

Give the formula for making a convenient, general excipient.

How may pill masses be conveniently divided into pills?

Give the formulas for the following pills, official in the U. S. Pharmacopœia:

Pilulæ aloes.

Pilulæ aloes et asafœtidæ.

Pilulæ aloes et ferri.

Pilulæ aloes et mastiches.

Pilulæ aloes et myrrhæ.

Pilulæ antimonii compositæ. Give the synonyma.

Pilulæ asafœtidæ.

Pilulæ catharticæ compositæ.

Pilulæ ferri compositæ.

Pilulæ ferri iodidi.

Pilulæ galbani compositæ.

Pilulæ opii.

Pilulæ phosphori.

Pilulæ rhei.

Pilulæ rhei compositæ.

With what substances are pills coated?

How are pills coated?

Of what are urethral suppositories or bougies preferably made, and why?

CHAPTER LXVII

SOLID EXTEMPORANEOUS PREPARATIONS USED EXTERNALLY.

Cerates, Ointments, Plasters, and Papers.

Cerata. Cerates.

Cerates are unctuous substances of such consistence that they may be easily spread, at ordinary temperatures, upon muslin or similar material with a spatula, and yet not so soft as to liquefy and run when applied to the skin. They are mostly used as dressings for inflamed surfaces, and are generally made with oil, lard, or petrolatum for a basis, with sufficient wax to give the desired consistence. Owing to the presence of wax (*Cera*), they are called *Cerates*. Paraffin, spermaceti, and resin are also used to raise the melting points of oils and fats.

Cerates are made either by *fusion* or by *incorporation*. In the first method, the ingredients are melted together, and the mixture strained, to separate mechanical impurities, and stirred until cold, to render it homogeneous. By incorporation is meant the process which consists in placing the fatty ingredients upon an ointment-slab or pill-tile, or in a mortar, and gradually mixing in the other ingredients, with a spatula or pestle, until a uniform preparation results.

Six cerates are official.

Official Cerates made by Fusion.

Ceratum.	Made by fusing together 300 Gm. of white wax and 700 Gm. of lard, and stirring until cold.
Ceratum Camphoræ.	Made by mixing 100 Gm. of camphor liniment with 300 Gm. of white wax and 600 Gm. of lard, melted together.
Ceratum Cantharidis.	Made by fusing together 180 Gm. of yellow wax, 180 Gm. of resin, and 220 Gm. of lard, straining, adding 320 Gm. of cantharides, previously macerated with 150 C.c. of oil of turpentine, digesting until the oil of turpentine has evaporated, and stirring until cold.
Ceratum Cetacei.	Made by fusing together 100 Gm. of spermaceti, 350 Gm. of white wax, and 550 Gm. of olive oil, and stirring until cold.
Ceratum Resinæ.	Made by fusing together 350 Gm. of resin, 150 Gm. of yellow wax, and 500 Gm. of lard, straining, and cooling.

Official Cerate made by Incorporation.

Ceratum Plumbi Subacetatis.	Made by incorporating 200 Gm. of solution of lead subacetate with 800 Gm. of camphor cerate.
-----------------------------	--

OFFICIAL PROCESSES FOR CERATES.

CERATUM. U. S. Cerate.

	Metric.	Old form.
White Wax	300 Gm.	4 oz. av. 850 gr.
Lard	700 Gm.	11 oz. av. 88 gr.
To make	1000 Gm.	16 oz. av.

Melt them together, and stir the mixture constantly until it is cool.

CERATUM CAMPHORÆ. U. S. Camphor Cerate.

	Metric.	Old form.
Camphor Liniment	100 Gm.	1 oz. av.
White Wax	300 Gm.	8 oz. av.
Lard	600 Gm.	6 oz. av.
To make	1000 Gm.	10 oz. av.

Melt the White Wax and Lard with the aid of a gentle heat; then add the Camphor Liniment, and stir the mixture occasionally, until it has become cold.

CERATUM CANTHARIDIS. U. S. Cantharides Cerate.

	Metric.	Old form.
Cantharides, in No. 60 powder	320 Gm.	5 oz. av. 52 gr.
Yellow Wax	180 Gm.	2 oz. av. 885 gr.
Resin	180 Gm.	2 oz. av. 885 gr.
Lard	220 Gm.	8 oz. av. 227 gr.
Oil of Turpentine	150 C.c.	2½ fl. oz.
To make	1000 Gm.	16 oz. av.

Moisten the Cantharides with the Oil of Turpentine, and set the mixture aside, well covered, for forty-eight hours. Then add it to the Yellow Wax, Resin, and Lard, previously melted and strained through muslin, and keep the mixture in a liquid condition, by means of a water-bath, stirring occasionally, until its weight has been reduced to 1000 grammes. Then remove it from the bath, and stir it occasionally until it is cool.

CERATUM CETACEI. U. S. Spermaceti Cerate.

	Metric.	Old form.
Spermaceti	100 Gm.	1 oz. av.
White Wax	350 Gm.	8½ oz. av.
Olive Oil	550 Gm.	5½ oz. av.
To make	1000 Gm.	10 oz. av.

Melt together the Spermaceti and White Wax; then add the Olive Oil previously heated, and stir the mixture constantly until it is cool.

CERATUM PLUMBI SUBACETATIS. U.S. Cerate of Lead Subacetate.

[GOULARD'S CERATE.]

	Metric.	Old form.
Solution of Lead Subacetate	200 Gm.	1½ fl. dr.
Camphor Cerate	800 Gm.	1 oz. av.
To make	1000 Gm.	about 1 oz.

Mix them thoroughly. This Cerate should be freshly prepared, when wanted.

CERATUM RESINÆ. U.S. Resin Cerate. [BASILICON OINTMENT.]

	Metric.	Old form.
Resin	350 Gm.	3½ oz. av.
Yellow Wax	150 Gm.	1½ oz. av.
Lard	500 Gm.	5 oz. av.
To make	1000 Gm.	10 oz. av.

Melt them together at a moderate heat, strain the mixture through muslin, and allow it to cool without stirring. In cold weather use the following proportions:

Resin, 350 Gm. [old form 3½ oz. av.]; Yellow Wax, 120 Gm. [old form 1 oz. av. 87 gr.]; Lard, 530 Gm. [old form 5 oz. av. 132 gr.].

Unguenta. Ointments.

Ointments are fatty preparations, of a softer consistence than cerates, intended to be applied to the skin by inunction. The medicating ingredients are combined with a basis of lard, petrolatum, or similar substance. Ointments are made in several ways: 1. By fusion. 2. By incorporation. 3. By chemical reaction.

1. **By Fusion.**—In making ointments in this way, care must be observed not to apply sufficient heat to burn the constituents. Cerates and ointments may be strained through flannel or muslin to separate mechanical impurities, and, if desired, some of them can be filtered through paper. (See Hot Filtration.)

2. **By Incorporation.**—The method of making ointments by incorporation is more frequently used than any other. The medicating ingredients used are nearly always insoluble in the basis, and it is necessary, therefore, to reduce them to a fine state of division in order to facilitate their absorption or medicinal action. The usual mode of procedure is to place the fatty basis upon an ointment-slab, and the medicating substance close by. The latter, if in fine powder, is first mixed with a *small portion* of the basis by rubbing both backward and forward with the blade of a spatula until the mixture is perfectly smooth. It is then a very simple operation to dilute this small quantity of concentrated ointment by incorporating it with the rest of the basis, by using the spatula in the same way. If extracts are to be incorporated, they are softened by adding a little water or diluted alcohol, until a smooth paste is made, which is then mixed with the basis with a spatula. An excellent ointment-slab is made by setting a plate of ground glass in a wooden

frame or slide (see page 1106). Ointments are sometimes made in a mortar with the pestle; but this mode is less convenient. Lard should be benzoinated or otherwise protected from rancidity.

In incorporating ointments containing substances which act on steel, horn spatulas may be used. These may either be a single blade of

FIG. 609.

Spatula (all horn).

horn cut into a suitable shape, or provided with a handle, as shown in Fig. 609; see also Fig. 215, page 193. When large quantities of ointments are required to be made by incorporation, as is sometimes the case in hospitals, dispensaries, etc., an ointment-trowel may be made by cutting a mason's trowel into the shape shown in Figs. 610 and 611, —the former giving the bottom-view, the latter the side-view. This affords a large working surface, and the incorporation can be performed quickly.

FIG. 610.

Ointment-trowel (bottom-view).

3. By Chemical Reaction.—The only official ointment that is made by chemical reaction is the ointment of mercuric nitrate. In

FIG. 611.

Ointment-trowel (side-view).

this, the olein of the oil is converted into elaidin through the action of heat and nitric acid; solution of mercuric nitrate is then incorporated with the elaidin base.

Maxims to be observed in making or dispensing Ointments.—

1. They should never be dispensed if they have the slightest taint of rancidity. 2. They should always be smooth and free from grittiness or irritating particles. 3. Ointments containing free acid, iodine, or tannin should not be rubbed with an iron or steel spatula, on account of the chemical action on the metal.

Official Ointments made by Fusion.

Unguentum.	Made by fusing together 800 Gm. of lard and 200 Gm. of yellow wax.
Unguentum Aquæ Rosæ.	Made by fusing together at a moderate heat 600 C.c. of expressed oil of almond, 125 Gm. of spermaceti, and 125 Gm. of white wax, gradually adding 190 C.c. of rose water, in which 5 Gm. of sodium borate has been dissolved, and stirring until a uniformly soft and creamy mixture is obtained.
Unguentum Diachylon.	Made by fusing together 500 Gm. of lead plaster with 490 Gm. of olive oil, allowing the mass to become cool, and then adding 10 C.c. of oil of lavender flowers, stirring constantly until cold.

Official Ointments made by Fusion.—Continued.

Unguentum Picis Liquidæ. Made by fusing at a moderate heat 375 Gm. of lard and 125 Gm. of yellow wax, then adding 500 Gm. of tar, straining, and stirring constantly until cool.

Official Ointments made by Incorporation.

Unguentum Acidi Carbolici. Made by incorporating thoroughly 5 Gm. of carbolic acid with 95 Gm. of ointment.

Unguentum Acidi Tannici. Made by incorporating thoroughly 20 Gm. of tannic acid with 80 Gm. of benzoinated lard, avoiding the use of an iron spatula.

Unguentum Belladonnæ. Made by rubbing 10 Gm. of alcoholic extract of belladonna with 5 C.c. of diluted alcohol until soft, then incorporating the mixture thoroughly with 85 Gm. of benzoinated lard.

Unguentum Chrysarobini. Made by incorporating thoroughly 5 Gm. of chrysarobin with 95 Gm. of benzoinated lard.

Unguentum Gallæ. Made by incorporating thoroughly 20 Gm. of powdered nutgall with 80 Gm. of benzoinated lard.

Unguentum Hydrargyri. Made by mixing 500 Gm. of mercury with 20 Gm. of oleate of mercury, then adding 250 Gm. of lard and 230 Gm. of suet, previously melted together and partially cooled, continuing the trituration until globules of mercury cease to be visible under a magnifying power of 10 diameters.

Unguentum Hydrargyri Ammoniati. Made by incorporating thoroughly 10 Gm. of ammoniated mercury with 90 Gm. of benzoinated lard.

Unguentum Hydrargyri Oxidi Flavi. Made by incorporating thoroughly 10 Gm. of yellow mercuric oxide with 90 Gm. of ointment.

Unguentum Hydrargyri Oxidi Rubri. Made by rubbing 10 Gm. of red mercuric oxide with 5 Gm. of castor oil, then adding sufficient ointment to make 100 Gm.

Unguentum Iodi. Made by rubbing 4 Gm. of iodine and 1 Gm. of potassium iodide with 2 C.c. of water, and incorporating the mixture thoroughly with 93 Gm. of benzoinated lard.

Unguentum Iodoformi. Made by incorporating thoroughly 10 Gm. of iodoform with 90 Gm. of benzoinated lard.

Unguentum Plumbi Carbonatis. Made by incorporating thoroughly 10 Gm. of lead carbonate with 90 Gm. of benzoinated lard.

Unguentum Plumbi Iodidi. Made by incorporating thoroughly 10 Gm. of lead iodide with 90 Gm. of benzoinated lard.

Unguentum Potassii Iodidi. Made by dissolving 12 Gm. of potassium iodide and 1 Gm. of sodium hyposulphite in 10 C.c. of boiling water, in a warm mortar, then incorporating the mixture thoroughly with 77 Gm. of benzoinated lard.

Unguentum Stramonii. Made by rubbing 10 Gm. of extract of stramonium seed with 5 C.c. of water until soft, then incorporating the mixture thoroughly with 85 Gm. of benzoinated lard.

Unguentum Sulphuris. Made by incorporating thoroughly 300 Gm. of washed sulphur with 700 Gm. of benzoinated lard.

Unguentum Veratrine. Made by rubbing 4 Gm. of veratrine with 6 Gm. of olive oil, and incorporating the mixture thoroughly with 90 Gm. of benzoinated lard.

Unguentum Zinci Oxidi. Made by sifting 200 Gm. of zinc oxide on the surface of 800 Gm. of melted benzoinated lard, then incorporating the mixture thoroughly.

Official Ointment made by Chemical Reaction.

Unguentum Hydrargyri Nitratis. See page 1250.

UNGUENTUM. U. S. Ointment.

	Metric.	Old form.
Lard	800 Gm.	4 oz. av.
Yellow Wax	200 Gm.	1 oz. av.
To make	1000 Gm.	5 oz. av.

Melt the Yellow Wax, and gradually add to it the Lard; then stir the mixture constantly until it is cool.

UNGUENTUM ACIDI CARBOLICI. U.S. Ointment of Carbolic Acid.

	Metric.	Old form.
Carbolic Acid	5 Gm.	22 grains.
Ointment	95 Gm.	416 grains.
To make	100 Gm.	1 oz. av.

Mix them thoroughly.

UNGUENTUM ACIDI TANNICI. U.S. Ointment of Tannic Acid.

	Metric.	Old form.
Tannic Acid, in fine powder	20 Gm.	88 grains.
Benzoinated Lard	80 Gm.	350 grains.
To make	100 Gm.	1 oz. av.

Rub the Tannic Acid with the Benzoinated Lard, gradually added, until they are thoroughly mixed, avoiding the use of iron utensils.

UNGUENTUM AQUÆ ROSÆ. U.S. Ointment of Rose Water.

[COLD CREAM.]

	Metric.	Old form.
Spermaceti	125 Gm.	1 oz. av. 400 gr.
White Wax	120 Gm.	1 oz. av. 370 gr.
Expressed Oil of Almond	600 C.c.	9 fl. oz.
Stronger Rose Water	190 C.c.	8 fl. oz.
Sodium Borate, in fine powder	5 Gm.	88 grains.
To make about	1000 Gm.	about 16 oz. av.

Reduce the Spermaceti and the White Wax to fine shavings, and melt them at a moderate heat. Then add the expressed Oil of Almond, pour the mixture into a warmed, shallow Wedgwood mortar, carefully add, without stirring, the whole of the Stronger Rose Water in which the Sodium Borate had previously been dissolved, and stir rapidly and continuously, until the mixture becomes uniformly soft and creamy.

UNGUENTUM BELLADONNÆ. U.S. Belladonna Ointment.

	Metric.	Old form.
Alcoholic Extract of Belladonna Leaves	10 Gm.	44 grains.
Diluted Alcohol	5 C.c.	$\frac{1}{2}$ fl. dr.
Benzoinated Lard	85 Gm.	374 grains.
To make	100 Gm.	about 1 oz. av.

Rub the Extract with Diluted Alcohol until it is uniformly soft, then gradually add the Lard, and mix thoroughly.

UNGUENTUM CHRYSAROBINI. U.S. Chrysarobin Ointment.

	Metric.	Old form.
Chrysarobin	5 Gm.	22 grains.
Benzoinated Lard	95 Gm.	416 grains.
To make	100 Gm.	1 oz. av.

Rub the Chrysarobin with the Benzoinated Lard, gradually added, until they are thoroughly mixed.

UNGUENTUM DIACHYLON. U. S. Diachylon Ointment.

	Metric.	Old form.
Lead Plaster	500 Gm.	219 grains.
Olive Oil	490 Gm.	214 grains.
Oil of Lavender Flowers	10 C.c.	80 minims.
To make	1000 Gm.	about 1 oz.

Melt together the Lead Plaster and the Olive Oil, on a water-bath; then, having allowed the mixture to become partly cool, add the Oil of Lavender Flowers, and stir constantly, until the Ointment is cold.

UNGUENTUM GALLÆ. U. S. Nutgall Ointment.

	Metric.	Old form.
Nutmeg, in No. 80 powder	20 Gm.	88 grains.
Benzoinated Lard	80 Gm.	350 grains.
To make	100 Gm.	1 oz. av.

Rub the Nutgall with the Benzoinated Lard, gradually added, until they are thoroughly mixed.

UNGUENTUM HYDRARGYRI. U. S. Mercurial Ointment.**[BLUE OINTMENT.]**

	Metric.	Old form.
Mercury	500 Gm.	1 oz. av.
Lard	250 Gm.	$\frac{1}{2}$ oz. av.
Suet	230 Gm.	201 grains.
Oleate of Mercury	20 Gm.	18 grains.
To make	1000 Gm.	2 oz. av.

Triturate the Oleate of Mercury with the Mercury, gradually added, in a mortar, until globules of the metal are no longer visible. Then add the Lard and Suet, previously melted together and partially cooled, and continue the trituration until globules of Mercury are no longer visible under a lens magnifying ten diameters.

UNGUENTUM HYDRARGYRI AMMONIATI. U. S. Ointment of Ammoniated Mercury.

	Metric.	Old form.
Ammoniated Mercury, in very fine powder	10 Gm.	44 grains.
Benzoinated Lard	90 Gm.	394 grains.
To make	100 Gm.	about 1 oz.

Rub the Ammoniated Mercury with the Benzoinated Lard, gradually added, until they are thoroughly mixed.

UNGUENTUM HYDRARGYRI NITRATIS. U. S. Ointment of Mercuric Nitrate. [CITRINE OINTMENT.]

	Metric.	Old form.
Mercury	70 Gm.	80 grains.
Nitric Acid	175 Gm.	1 fl. dr.
Lard Oil	760 Gm.	334 grains.
		about 1 oz. av.

Heat the Lard Oil, in a glass or porcelain vessel, to a temperature of 100° C. (212° F.); then withdraw the heat, gradually add 70 Gm. [old form 24 minims] of Nitric Acid, and, when the reaction moderates, reapply the heat, until effervescence ceases. Then allow the mixture to cool to about 40° C. (104° F.). Having dissolved the Mercury in the remainder of the Nitric Acid with the aid of sufficient heat to prevent the solution from crystallizing, add this solution to the mixture. When the mass has become entirely cold, mix it thoroughly by trituration, avoiding the use of a metallic spatula.

UNGUENTUM HYDRARGYRI OXIDI FLAVI. U.S. Ointment of Yellow Mercuric Oxide.

	Metric.	Old form.
Yellow Mercuric Oxide, in very fine powder	10 Gm.	44 grains.
Ointment	90 Gm.	894 grains.
To make	100 Gm.	1 oz. av.

Rub the Yellow Mercuric Oxide with the Ointment, gradually added, until they are thoroughly mixed.

UNGUENTUM HYDRARGYRI OXIDI RUBRI. U.S. Ointment of Red Mercuric Oxide.

	Metric.	Old form.
Red Mercuric Oxide, in very fine powder	10 Gm.	44 grains.
Castor Oil	5 Gm.	22 grains.
Ointment	85 Gm.	872 grains.
To make	100 Gm.	1 oz. av.

Triturate the Red Mercuric Oxide with the Castor Oil, until a perfectly smooth mixture results; then gradually incorporate the Ointment, and mix thoroughly. This is known commonly as *Red Precipitate Ointment*.

UNGUENTUM IODI. U.S. Iodine Ointment.

	Metric.	Old form.
Iodine	4 Gm.	18 grains.
Potassium Iodide	1 Gm.	4 grains.
Water	2 C.c.	8 minims.
Benzoinated Lard	93 Gm.	418 grains.
To make	100 Gm.	about 1 oz.

Rub the Iodine and the Potassium Iodide, first with the Water, and then with the Benzoinated Lard, gradually added, until they are thoroughly mixed, avoiding the use of a metallic spatula. This preparation should be freshly made, when required.

UNGUENTUM IODOFORMI. U.S. Iodoform Ointment.

	Metric.	Old form.
Iodoform, in very fine powder	10 Gm.	44 grains.
Benzoinated Lard	90 Gm.	394 grains.
To make	100 Gm.	1 oz. av.

Rub the Iodoform with the Benzoinated Lard, gradually added, until they are thoroughly mixed. This preparation should be freshly made, when required.

UNGUENTUM PICIS LIQUIDÆ. U.S. Tar Ointment.

	Metric.	Old form.
Tar	500 Gm.	$\frac{1}{2}$ oz. av.
Yellow Wax	125 Gm.	55 grains.
Lard	375 Gm.	165 grains.
To make	1000 Gm.	1 oz. av.

Melt together the Yellow Wax and the Lard at a moderate heat. Then incorporate the Tar, strain the mixture through muslin, and stir the Ointment constantly until it is cool.

UNGUENTUM PLUMBI CARBONATIS. U.S. Ointment of Lead Carbonate.

	Metric.	Old form.
Lead Carbonate, in very fine powder	10 Gm.	44 grains.
Benzoinated Lard	90 Gm.	394 grains.
To make	100 Gm.	1 oz. av.

Rub the Lead Carbonate with the Benzoinated Lard, gradually added, until they are thoroughly mixed.

UNGUENTUM PLUMBI IODIDI. U.S. Ointment of Lead Iodide.

	Metric.	Old form.
Lead Iodide, in very fine powder	10 Gm.	44 grains.
Benzoinated Lard	90 Gm.	394 grains.
To make	100 Gm.	1 oz. av.

Rub the Lead Iodide with the Benzoinated Lard, gradually added, until they are thoroughly mixed.

UNGUENTUM POTASSII IODIDI. U.S. Ointment of Potassium Iodide.

	Metric.	Old form.
Potassium Iodide	12 Gm.	58 grains.
Sodium Hyposulphite	1 Gm.	5 grains.
Water (hot)	10 C.c.	40 minims.
Benzoinated Lard	77 Gm.	340 grains.
To make	100 Gm.	about 1 oz.

Dissolve the Potassium Iodide and the Sodium Hyposulphite in the hot Water, then mix the solution with the Benzoinated Lard.

UNGUENTUM STRAMONII. U. S. Stramonium Ointment.

	Metric.	Old form.
Extract of Stramonium Seed	10 Gm.	44 grains.
Diluted Alcohol	5 Gm.	20 minims.
Benzoinated Lard	85 Gm.	372 grains.
To make	100 Gm.	about 1 oz.

Rub the Extract with the Diluted Alcohol until it is uniformly soft; then gradually add the Benzoinated Lard, and mix thoroughly.

UNGUENTUM SULPHURIS. U. S. Sulphur Ointment.

	Metric.	Old form.
Washed Sulphur	300 Gm.	132 grains.
Benzoinated Lard	700 Gm.	306 grains.
To make	1000 Gm.	1 oz. av.

Rub the Washed Sulphur with the Benzoinated Lard, gradually added, until they are thoroughly mixed.

UNGUENTUM VERATRINÆ. U. S. Veratrine Ointment.

	Metric.	Old form.
Veratrine	4 Gm.	18 grains.
Olive Oil	6 Gm.	26 grains.
Benzoinated Lard	90 Gm.	394 grains.
To make	100 Gm.	1 oz. av.

Rub the Veratrine with the Olive Oil, in a mortar; then gradually add the Benzoinated Lard, and mix thoroughly.

UNGUENTUM ZINCI OXIDI. U. S. Ointment of Zinc Oxide.

	Metric.	Old form.
Zinc Oxide	200 Gm.	90 grains.
Benzoinated Lard	800 Gm.	360 grains.
To make	1000 Gm.	about 1 oz.

Sift the Zinc Oxide, through a No. 20 sieve, upon the surface of the Benzoinated Lard, previously melted, and incorporate it by stirring, which is to be continued until the Ointment is cool.

Preserving and Dispensing Cerates and Ointments.—As has been already stated, fatty substances may be preserved from rancidity by digesting them with balsamic resins, poplar buds, styrax, etc. To preserve them during hot weather, they require in addition a cool temperature

and freedom from exposure to the air (see page 1045). When a fresh lot of ointment is made to replenish a stock jar, the jar should be thor-

oughly cleaned, and the old ointment remaining thrown away, unless it is certain that the latter is entirely free from rancidity, as otherwise it would soon cause the new ointment to become rancid. Amber glass, stoneware, or porcelain jars are the best receptacles for ointments. Queen's-ware or china jars soon permit the fatty substance to penetrate through the minute fissures which are always present. Fig. 612 shows a German porcelain jar, which is just as useful for preserving ointments as it is for holding a penetrating substance like green soap. Fig. 613 illustrates an amber glass stock

ointment-jar made by Whittall, Tatum & Co. The letters for the label are blown in the glass, and then ground off, so that the label is inde-

structible. The only difficulty is that the label requires a strong light to enable it to be seen clearly. For dispensing ointments the opal glass jar is very useful. One of the best shapes is shown in Fig. 614. The bottom is rounded, so that the patient can easily reach all the ointment with the finger, and the top is metallic, with a screw-cap. There is room for the label on the glass. The jar shown in Fig. 615 is not recommended. The bottom forms an angle with the sides which collects the ointment, the shoulder also catches a portion, whilst the wooden top is very apt to shrink, so that there is difficulty in getting it off without breaking it. The glass box shown in Fig. 616 has a wooden top with a lithographed label. These are certainly the handsomest ointment-boxes and the most expensive. The lids will often contract, however, and give trouble in getting them on and off. Collapsible tubes, made by A. H. Wirz & Co., of Philadelphia, are used in dispensing soft ointments. If the latter contain no acid or corrosive

constituents they answer an admirable purpose as containers for them (see Fig. 617). These soft metal tubes are filled from the bottom with the

FIG. 617.

Collapsible tubes.

ointment melted with just sufficient heat to permit it to be poured, and then closed by folding the ends together, as shown in one of them, and rolling the fold over twice with a pair of pliers. A screw-cap is placed upon the top, and the ointment is perfectly protected from exposure. To obtain a little, the screw-cap is taken off, and the bottom of the tube slightly pressed between the thumb

FIG. 618.

Paper-covered chip box.

and finger, when a portion of the ointment quickly exudes. Of the very cheap boxes, those turned from wood are totally *unfit* for dispensing ointments. The ointment quickly penetrates through the grain of the wooden bottom, and the greasy abomination is exceedingly unwelcome to most housekeepers. A chip-wood box covered with pasteboard is preferable, because it offers more resistance to the passage of the fatty substance (see Fig. 618). The impervious walnut boxes, made by gluing several veneers of hard wood together, are still better.

Finishing Ointments.—Some skill is required to fill a box with ointment neatly and deftly by using a spatula without soiling the exterior of the box. The surface is generally scraped with the edge of the spatula to give it a smooth finish, and this is sometimes held near a hot surface, like a stove-plate, to give it a gloss. Occasionally it will be found that some nervous patients desire to be assured that an ointment or cerate has not been tampered with by a servant, and it may be desirable for other reasons to finish

FIG. 619.

Ointment-finisher.

ment or cerate has not been tampered with by a servant, and it may be desirable for other reasons to finish

FIG. 620.

Finishing ointments.

the surface of an ointment with a distinctive design. This may be done by cutting a piece of tin into a shape similar to that shown in Fig. 619. By placing one of the teeth on the edge of the jar (see Fig. 620),

and slowly rotating it, with alternate pauses, a very neat finish may be given to the surface. The finisher (see Fig. 619) shows four sides, and is of course capable of making four patterns.

Emplastra. Plasters.

Plasters are substances intended for external application, of such consistence that they adhere to the skin, and require the aid of heat in spreading them. The word plaster is applied not only to the solid substance which is used to spread upon the muslin, leather, paper, or other material which serves to hold it, but to the spread plaster itself. The basis of most of the official plasters is either lead plaster, a gum-resin, or Burgundy pitch.

In the preparation of plasters, care is requisite that the heat employed be not sufficiently elevated to produce decomposition, nor so long continued as to drive off any volatile ingredient upon which the virtues of the preparation may in any degree depend. After having been prepared, they are usually shaped into cylindrical rolls, and wrapped in paper to exclude the air. Plasters should be firm at ordinary temperatures, should spread easily when heated, and, after being spread, should remain soft, pliable, and adhesive, without melting, at the heat of the human body. When long kept, they are apt to change color and to become hard and brittle; and, as this alteration is most observable upon their surface, it must depend chiefly upon the action of the air, which should therefore be as much as possible excluded. The defect may usually be remedied by melting the plaster with a moderate heat and adding a sufficient quantity of oil to give it the due consistence. To soften the surface of a spread plaster, it should be brushed with a little tincture of camphor. *Thirteen* plasters are official.

Official Plasters containing Gum-Resins as their Basis.

Emplastrum Ammoniacum Hydrargyro.	Made by triturating 180 Gm. of mercury with 8 Gm. of oleate of mercury until the former is extinguished; then incorporating 720 Gm. of ammoniac, which has previously been digested in 1000 C.c. of diluted acetic acid, until emulsionized; lastly, adding sufficient melted lead plaster to make 1000 Gm.
--	---

Official Plasters containing Lead or Resin Plaster as their Basis.

Emplastrum Arnice.	Made by incorporating thoroughly 330 Gm. of extract of arnica root with 670 Gm. of resin plaster, previously melted by means of a water-bath.
Emplastrum Belladonnæ.	Made by melting together 400 Gm. each of resin plaster and soap plaster, and incorporating 200 Gm. of extract of belladonna leaves.
Emplastrum Ferri.	Made by melting together 720 Gm. of lead plaster, 50 Gm. of olive oil, and 140 Gm. of Burgundy pitch; then adding 90 Gm. of ferrie hydrate, and stirring until cool.
Emplastrum Hydrargyri.	Made by triturating 300 Gm. of mercury with 12 Gm. of oleate of mercury, and adding enough lead plaster to make 1000 Gm.
Emplastrum Opii.	Made by rubbing 60 Gm. of extract of opium with 80 C.c. of water until soft; then adding to it 180 Gm. of Burgundy pitch and 760 Gm. of lead plaster, previously melted together; lastly, heating and stirring until of the proper consistence.
Emplastrum Plumbi.	Made by rubbing gradually 3200 Gm. of lead oxide with 6000 Gm. of olive oil, placing in a suitable vessel, and adding 1000 C.c. of water to the mixture, boiling the whole together, and adding cautiously a little water, from time to time, as it is consumed.

Official Plasters containing Lead or Resin Plaster as their Basis.—Continued.

Emplastrum Resinæ.	Made by adding 140 Gm. of resin to 800 Gm. of lead plaster and 60 Gm. of yellow wax, previously melted; then mixing the whole thoroughly.
Emplastrum Saponis.	Made by rubbing 100 Gm. of soap with sufficient water to form a soft mass; then mixing thoroughly with 900 Gm. of lead plaster previously melted.

Official Plasters containing Burgundy or Canada Pitch as their Basis.

Emplastrum Picis Burgundicæ.	Made by fusing together 800 Gm. of Burgundy pitch and 150 Gm. of yellow wax, incorporating 50 Gm. of olive oil, and stirring constantly until cool.
Emplastrum Picis Cantharidatum.	Made by heating 80 Gm. of cerate of cantharides to about 212° F., straining, and adding to the strained liquid 920 Gm. of Burgundy pitch; lastly, melting them together and stirring until cool.

Official Spread Plasters.

Emplastrum Capsici.	Made by spreading a thin and even layer of melted resin plaster upon muslin, and allowing to cool; then applying a thin coating of oleoresin of capsicum by means of a brush.
Emplastrum Ichthyocolle.	Made by dissolving 10 Gm. of isinglass in sufficient hot water to make the solution weigh 120 Gm.; then spreading one-half of this upon taffeta by means of a brush; then adding 1 Gm. of glycerin and 40 Gm. of alcohol to the remaining solution, and applying in the same manner; lastly, coating the reverse of the taffeta with tincture of benzoin, and allowing to dry.

EMPLASTRUM AMMONIACI CUM HYDRARGYRO. U. S. Ammoniac Plaster with Mercury.

	Metric.	Old form.
Ammoniac	720 Gm.	11 oz. av. 228 gr.
Mercury	180 Gm.	2 oz. av. 385 gr.
Oleate of Mercury	8 Gm.	56 grains.
Diluted Acetic Acid	1000 C.c.	1 pint.
Lead Plaster, a sufficient quantity,		
To make	1000 Gm.	16 oz. av.

Digest the Ammoniac with the Diluted Acetic Acid, in a suitable vessel, avoiding contact with metals, until it is entirely emulsified; then strain, and evaporate the strained liquid by means of a water-bath, stirring constantly, until a small portion, taken from the vessel, hardens on cooling. Triturate the Oleate of Mercury with the Mercury gradually added, until globules of the metal cease to be visible. Next add, gradually, the Ammoniac, while yet hot; and finally, having added enough Lead Plaster, previously melted by means of a water-bath, to make the mixture weigh 1000 Gm. [old form 16 oz. av.], mix the whole thoroughly.

EMPLASTRUM ARNICÆ. U. S. Arnica Plaster.

	Metric.	Old form.
Extract of Arnica Root	330 Gm.	5 oz. av.
Resin Plaster	670 Gm.	11 oz. av.
To make	1000 Gm.	16 oz. av.

Add the Extract to the Plaster, previously melted by means of a water-bath, and mix them thoroughly.

EMPLASTRUM BELLADONNÆ. U. S. Belladonna Plaster.

	Metric.	Old form.
Alcoholic Extract of Belladonna Leaves	200 Gm.	2 oz. av.
Resin Plaster	400 Gm.	4 oz. av.
Soap Plaster	400 Gm.	4 oz. av.
To make	1000 Gm.	10 oz. av.

Melt the Plasters on a water-bath; then add the Extract of Belladonna Leaves, and continue the heat, stirring constantly, until a homogeneous mass results.

EMPLASTRUM CAPSICI. U. S. Capsicum Plaster.

Oleoresin of Capsicum,
Resin Plaster, each, a sufficient quantity.

Melt the Resin Plaster at a gentle heat, spread a thin and even layer of it upon muslin, and allow it to cool. Then, having cut off a piece of the required size, apply a thin coating of Oleoresin of Capsicum, by means of a brush, leaving a narrow, blank margin along the edges.

A space of 10 Centimetres [old form 4 inches] square should contain about 0.25 Gm. [old form 4 grains] of Oleoresin of Capsicum.

EMPLASTRUM FERRI. U. S. Iron Plaster. [STRENGTHENING PLASTER.]

	Metric.	Old form.
Ferric Hydrate, dried at a temperature not exceeding 80° C. (176° F.)	90 Gm.	1 oz. av. 192 gr.
Olive Oil	50 Gm.	350 grains.
Burgundy Pitch	140 Gm.	2 oz. av. 105 gr.
Lead Plaster	720 Gm.	11 oz. av. 228 gr.
To make	1000 Gm.	16 oz. av.

Melt the Lead Plaster and Burgundy Pitch by means of a water-bath, and add the Olive Oil; then add the Ferric Hydrate, and stir constantly until the mixture thickens on cooling.

EMPLASTRUM HYDRARGYRI. U. S. Mercurial Plaster.

	Metric.	Old form.
Mercury	300 Gm.	5 oz. av.
Oleate of Mercury	12 Gm.	84 grains.
Lead Plaster, a sufficient quantity,		
To make	1000 Gm.	16 oz. av.

Triturate the Mercury with the Oleate of Mercury in a tared capsule until globules of metal are no longer visible. Then place the capsule on a water-bath, add enough Lead Plaster, previously melted, to make the contents weigh 1000 Gm. [old form 16 oz. av.], and mix the whole thoroughly.

EMPLASTRUM ICHTHYOCOLLÆ. U. S. Isinglass Plaster.**[COURT PLASTER.]**

	Metric.	Old form.
Isinglass	10 Gm.	155 grains.
Alcohol	40 Gm.	1½ fl. oz.
Glycerin	1 Gm.	12 minims.
Water,		
Tincture of Benzoin, each, a sufficient quantity.		

Dissolve the Isinglass in a sufficient quantity of hot Water to make the solution weigh 120 Gm. [old form or measure 4 fl. oz.]. Spread one-half of this, in successive layers, upon taffeta (stretched on a frame), by means of a brush, waiting after each application until the layer is dry. Mix the second half of the Isinglass solution with the Alcohol and Glycerin, and apply it in the same manner. Then reverse the taffeta, coat it on the back with Tincture of Benzoin, and allow it to become perfectly dry. Cut the plaster in pieces of suitable length and preserve them in well-closed vessels. The above-directed quantities are sufficient to cover a piece of taffeta 38 Centimetres [old form 15 inches] square.

EMPLASTRUM OPII. U.S. Opium Plaster.

	Metric.	Old form.
Extract of Opium	60 Gm.	1 oz. av.
Burgundy Pitch	180 Gm.	8 oz. av.
Lead Plaster	760 Gm.	12½ oz. av.
Water	80 C.c.	1½ fl. oz.
To make	1000 Gm.	17 oz. av.

Rub the Extract of Opium with the Water, until it is uniformly soft, and add it to the Burgundy Pitch and Lead Plaster melted together by means of a water-bath; then continue the heat for a short time, stirring constantly, until the moisture is evaporated.

EMPLASTRUM PICIS BURGUNDICÆ. U.S. Burgundy Pitch Plaster.

	Metric.	Old form.
Burgundy Pitch	800 Gm.	18 oz. av.
Olive Oil	50 Gm.	850 grains.
Yellow Wax	150 Gm.	2 oz. av. 175 gr.
To make	1000 Gm.	about 16 oz. av.

Melt together the Burgundy Pitch and Yellow Wax, then incorporate the Olive Oil, and stir constantly, until the mass thickens on cooling.

EMPLASTRUM PICIS CANTHARIDATUM. U.S. Cantharidal Pitch Plaster. [WARMING PLASTER.]

	Metric.	Old form.
Cerate of Cantharides	80 Gm.	560 grains.
Burgundy Pitch, a sufficient quantity,		
To make	1000 Gm.	16 oz. av.

Melt the Cerate of Cantharides on a water-bath containing boiling water, and continue the heat for fifteen minutes; then strain it through a piece of muslin of close texture so that the Cantharides will be retained on the muslin. To the strained liquid add a sufficient quantity of Burgundy Pitch to make the whole weigh 1000 Gm. [old form 16 oz. av.], render the mixture homogeneous by stirring, remove the heat, and stir the mass until it thickens on cooling.

EMPLASTRUM PLUMBI. U.S. Lead Plaster.

[DIACHYLON PLASTER.]

	Metric.	Old form.
Lead Oxide	3200 Gm.	82 oz. av.
Olive Oil	6000 Gm.	68 fl. oz.
Water, a sufficient quantity.		

Mix the Lead Oxide, previously passed through a No. 80 sieve, intimately with about one-half of the Olive Oil, by trituration, and add the mixture to the remainder of the Oil contained in a bright copper boiler of a capacity equal to at least four times the bulk of the ingredients. Then add 1000 C.c. [old form 10 fl. oz.] of boiling Water, and boil the whole together, over a fire, constantly stirring with a wooden spatula, until a small portion, when dropped into cold water, is found to be pliable and tenacious. From time to time add a little Water to replace that lost by evaporation. When the contents of the boiler have acquired a whitish color and are perfectly homogeneous, transfer them to a vessel containing warm water, and as soon as the mass has sufficiently cooled, knead it well with the Water so as to remove the glycerin, renewing the Water from time to time, as long as it may be necessary. Finally divide the mass into rolls of suitable size.

A yellowish-white, pliable, and tenacious, but not greasy mass, gradually acquiring a brownish tint on the outside.

On treating 5 Gm. of Lead Plaster with 25 C.c. of benzol, a somewhat viscid and slightly turbid solution will result, which will separate into a clear and a gelatinous layer after some time, but which should not deposit any sediment (absence of *uncombined lead oxide*).

EMPLASTRUM RESINÆ. U.S. Resin Plaster.

[ADHESIVE PLASTER.]

	Metric.	Old form.
Resin, in fine powder	140 Gm.	2 oz. av. 105 gr.
Lead Plaster	800 Gm.	18 oz. av.
Yellow Wax	60 Gm.	420 grains.
To make	1000 Gm.	about 16 oz. av.

Melt the Lead Plaster and Yellow Wax together with a gentle heat; then add the Resin, and, when it is melted, mix the mass thoroughly.

EMPLASTRUM SAPONIS. U.S. Soap Plaster.

	Metric.	Old form.
Soap, dried and in coarse powder	100 Gm.	1 oz. av.
Lead Plaster	900 Gm.	9 oz. av.
Water, a sufficient quantity.		

Rub the Soap with enough Water to reduce it to a semi-liquid state; then mix it with the Lead Plaster, previously melted, and evaporate to the proper consistence.

Spreading Plasters.—Since the introduction of machine-spread plasters the preparation of a plaster by a pharmacist upon the prescription of a physician has become almost a "lost art."

Plasters are prepared for use by spreading them upon leather, muslin, or paper, according to the particular purposes they are intended to

answer. Leather is most convenient when the application is made to the sound skin, muslin when the plaster is used as a dressing to ulcerated or abraded surfaces or with the view of bringing and retaining together the sides of wounds. The leather usually preferred is white

FIG. 621.

Cutting plaster-paper.

sheep-skin, or the kind known commercially as "hemlock splits." A margin about a quarter or half an inch broad should usually be left uncovered, in order to facilitate the removal of the plaster and to prevent the clothing in contact with its edges from being soiled. An accurate outline may be obtained by pasting, or fastening with thumb-tacks, upon the leather a piece of paper so cut as to leave in the centre

a vacant space of the required dimensions, and removing the paper when no longer needed. The paper is folded four times. Fig. 621 shows one-fourth of the whole in the act of being cut: the rounded corners give a neater finish than square ones. The same object may often be accomplished by employing two narrow rulers of sheet-tin graduated in inches, and so shaped that each of them will form two sides of a rectangle. These may be applied in such a manner as to

FIG. 622.

Franciscus plaster-board.

enclose within them any given rectangular space, and may be fixed by weights upon the leather, or preferably adjusted by set-screws, while the plaster is spread. The Franciscus machine is constructed on this principle (see Fig. 622).¹ For any

other shape, as in the case of plasters for the breast, pieces of tin may be employed having a space within, corresponding to the required outline. Figs. 623, 624, 625, 626, 627, 628, 629, and 630 show patterns for plasters with margins for various parts of the body. Figs. 623 and 624 are for use behind the ears, the pointed portion of the plasters being used for the top. Care must be observed to have the physician designate whether the plaster is intended for the right ear (Fig. 624) or the left ear (Fig. 623). Chest plasters are sometimes cut in the shape of Fig. 625; those intended for use between the shoulders may have the form of Fig. 626. In Fig. 627 a plaster is shown which is intended for the "small of the back," and in Fig. 628 is one for either the right or the left side. Fig. 629 shows a pattern for fastening to kid, to spread a breast plaster on, and Fig. 630 represents the plaster

¹ The other side of this valuable apparatus can be used as a lozenge-board or pill-machine.

with the margin as spread from such a pattern. The spreading of the plaster is most conveniently accomplished by the use of a spatula or

plaster-iron (see Fig. 632). This may be heated by means of a spirit-lamp. Care must be taken that the instrument be not so hot as to discolor or decompose the plaster; and special care is requisite in the case of those plasters which contain a volatile ingredient. A sufficient portion of the plaster should first be melted by the heated instrument, and, having been received on a piece of coarse stiff paper, or in a shallow tin tray open on one side, should, when nearly cool, be transferred to the leather and applied quickly and evenly over its surface. By this plan the melted plaster is prevented from penetrating the leather, as it would be apt to do if

is poured upon it, and the spatula, having been previously warmed by

applied too hot. Before removing the paper from the edge of the plaster, if this has become so hard as to crack, the iron should be drawn over the line of junction. Fig. 631 shows one method of spreading a small plaster with a spatula. Strips of paper are fastened upon the kid with thumbtacks (such as are used by draughtsmen: one is shown in the cut in profile), a piece of waste paper is fastened at the top to prevent soiling the margin, the melted plaster

passing it through an alcohol flame or that of a Bunsen burner, is used by quickly passing the edge of the blade over the surface; a portion

FIG. 632.

Plaster-iron.

of the melted plaster precedes the blade in its passage, and thus a thin layer is spread upon the leather. Especial care must be observed not to allow very hot plaster to remain upon the leather, or it may pass through and discolor

the back. For large plasters, the plaster-iron (see Fig. 632) may be employed; this is heated, and, owing to the greater weight of metal, it holds the heat much better than the blade of a spatula: it is, however, not so easily nor so quickly used as the latter instrument by those unaccustomed to it. After the plaster has been spread, the strips of paper are carefully removed, and if the plaster is brittle it should be held near the source of heat, so that the strips may be removed without tearing off pieces of the plaster from the leather.

Large quantities of stock plasters may be spread by the apparatus shown below. To an oblong rectangular block of hard wood, slightly convex on its upper surface, is attached by a movable joint a sheet-

FIG. 635.

Plaster-awl.

FIG. 636.

Plaster-dipper.

FIG. 633.

Plaster-block, open.

FIG. 637.

Plaster-pattern.

FIG. 634.

Plaster-block, closed.

FIG. 638.

Plaster-iron (double handle).

iron frame, with an opening of the dimensions of the plaster to be spread, and clasps at the other end, by which this may be fixed to the block (see Fig. 633). Another portion of the apparatus is a sheet-iron or tin frame, by which the leather is cut out and the margin marked (see Fig. 637). The leather thus prepared is laid on the convex surface of the block; the sheet-iron frame is brought down on it evenly, as shown in Fig. 634;

the plaster, previously melted, but not too hot, is poured on the leather in the centre, and, by means of a square iron bar having a wooden handle at each end (see Fig. 638), which has been heated by a spirit-lamp, it is spread uniformly over the surface, the thickness being regulated by the frame against which the iron is pressed. Any excess of plaster is thus pressed over upon the frame. The heated point of an awl (see Fig. 635) is then drawn along the interior edge of the frame so as to separate the plaster from it, after which the clasps are unfastened and the plaster removed.

The dipper shown in Fig. 636 is well adapted for holding suitable quantities for spreading plasters extemporaneously. If a portion of the various roll plasters be melted and run into a number of these, and the dippers labelled, they will be found very convenient as containers.

Blisters do not usually require the application of heat to spread them: they may be spread on adhesive plaster in the same way as plasters are prepared. The spatula shown in Fig. 639 is well fitted for spreading blisters, as it gives room for the fingers and permits a solid grasp of the handle. The practice of using the thumb in spreading blisters, although

FIG. 639.

tolerated by many good pharmacists, should be regarded as more honored in the breach than in the observance: it is an unnecessary and inelegant procedure, the spatula giving a much smoother finish.

Chartæ. Papers.

Papers are preparations intended principally for external application, made either by saturating paper with medicinal substances, or by applying the latter to the surface of the paper by the addition of some adhesive liquid. Only *two* papers are official: they are as follows:

CHARTA POTASSII NITRATIS. U. S. Potassium Nitrate Paper.

	Metric.	Old form.
Potassium Nitrate	200 Gm.	1 oz. av.
Distilled Water	800 C.c.	4 fl. oz.

Dissolve the Potassium Nitrate in the Distilled Water. Immerse strips of white, unsized paper in the solution, and dry them. Keep the paper in well-closed vessels. This paper is used in asthma by burning and inhaling the fumes.

CHARTA SINAPIS. U. S. Mustard Paper.

	Metric.	Old form.
Black Mustard, in No. 60 powder	100 Gm.	10 oz. av.
India-Rubber	10 Gm.	1 oz. av.
Benzin,		
Carbon Disulphide, each, a sufficient quantity.		

Pack the Black Mustard in a conical percolator, and gradually pour Benzin upon it until the percolate ceases to produce a permanent, greasy stain upon blotting paper. Remove the powder from the percolator, and dry it by exposure to the air. Having meanwhile dissolved the India-Rubber in a mixture of 100 C.c. [old form 10 fl. oz.], each, of Benzin and Carbon Disulphide, mix the purified Mustard with a sufficient quantity of the solution to produce a semi-liquid magma, and apply this, by means of a suitable brush, to one side of a piece of rather stiff, well-sized paper, so as to cover it completely, and then allow the surface to dry. A surface of sixty square centimetres [old form 9½ square inches] should contain about 4 Gm. [old form 62 grains] of Black Mustard deprived of oil. Before it is applied to the skin, Mustard Paper should be dipped in warm water for about fifteen seconds.

QUESTIONS ON CHAPTER LXVII.

SOLID EXTEMPORANEOUS PREPARATIONS.

What are cerates? Why are they so called?

How are cerates made?

How many cerates are official?

Give the formulas and official processes for the following cerates, viz.:

Cerate—Give the Latin official name.

Camphor cerate—Give the Latin official name.

Cantharides cerate—Give the Latin official name. Give the synonyme.

Spermaceti cerate—Give the Latin official name.

Cerate of lead subacetate—Give the Latin official name. Give the synonyme.

Resin cerate—Give the Latin official name. Give the synonyme.

What are ointments?

In what different ways are ointments made?

In making ointments by fusion, what precaution is necessary?

How may mechanical impurities be separated?

How are ointments made by incorporation?

What official ointment is made by chemical reaction?

What three maxims should be observed in making or dispensing ointments?

Give the formulas and modes of making the following ointments, viz.:

Ointment of carbolic acid—Give the Latin official name.

Ointment of tannic acid—Give the Latin official name.

Ointment of rose water—Give the Latin official name.

Belladonna ointment—Give the Latin official name.

Chrysarobin ointment—Give the Latin official name.

Diachylon ointment—Give the Latin official name.

Nutgall ointment—Give the Latin official name.

Mercurial ointment—Give the Latin official name. Give the synonyme.

Ointment of ammoniated mercury—Give the Latin official name.

Ointment of mercuric nitrate—Give the Latin official name. Give the synonyme.

Ointment of yellow mercuric oxide—Give the Latin official name.

Ointment of red mercuric oxide—Give the Latin official name.

Iodine ointment—Give the Latin official name.

Iodoform ointment—Give the Latin official name.

Tar ointment—Give the Latin official name.

Ointment of lead carbonate—Give the Latin official name.

Ointment of lead iodide—Give the Latin official name.

Ointment of potassium iodide—Give the Latin official name.

- Stramonium ointment—Give the Latin official name.
Sulphur ointment—Give the Latin official name.
Veratrine ointment—Give the Latin official name.
Ointment of zinc oxide—Give the Latin official name.
How may cerates and ointments be preserved from rancidity?
What kinds of jars are the best receptacles for ointments?
What is the best-shaped jar for dispensing ointments?
How are collapsible tubes used for ointments?
What sort of wooden boxes are best for ointments?
How may a neat finish be given to ointments in boxes?
What are plasters?
What is the basis of most of the official plasters?
How many plasters are official?
Give the formulas and modes of making the following plasters, viz.:
Ammoniac plaster with mercury—Give the Latin official name.
Arnica plaster—Give the Latin official name.
Belladonna plaster—Give the Latin official name.
Capsicum plaster—Give the Latin official name.
Iron plaster—Give the Latin official name. Give the synonyme.
Mercurial plaster—Give the Latin official name.
Isinglass plaster—Give the Latin official name. Give the synonyme.
Opium plaster—Give the Latin official name.
Burgundy pitch plaster—Give the Latin official name.
Cantharidal pitch plaster—Give the Latin official name. Give the synonyme.
Lead plaster—Give the Latin official name—Give the synonyme.
Resin plaster—Give the Latin official name—Give the synonyme.
Soap plaster—Give the Latin official name.
Upon what substances are plasters usually spread?
What is the method of proceeding in spreading a plaster upon leather?
What advantage has a plaster-iron over a spatula for spreading plasters?
What advantage has a spatula over a plaster-iron?
How are blisters spread?
What is a good material upon which to spread them?
What are chartæ or papers?
How many are official?
How is potassium nitrate paper prepared?
How is mustard paper prepared?
How is mustard paper used?
How much mustard does each square inch contain?

PART VI.

FORMULARY OF UNOFFICIAL PREPARATIONS.

THE following formulas have been collected principally with the view of saving the labor and time of the pharmacist, who is often suddenly called upon to prepare some remedy for which he may not have a formula in his recipe-book. The author's name is appended to the formula when it is known, and the selection has been carefully made so as to embrace many which are not easy of access. The subjects are arranged according to the order adopted for the official preparations in Parts III. and IV., and, if desired, they may be consulted in connection with the subjects in those parts. The formulas of the preparations of the U. S. Pharmacopœia, 1880, which were not admitted to the present Pharmacopœia, have been added, because many of them are still in active use. As it is very desirable to secure uniformity in practice throughout the United States in the use of unofficial preparations, the National Formulary has been added, and the formulas for many of the preparations which were inserted in the first edition of this work which conflict with these have been dropped. The National Formulary preparations are distinguished by the letters N. F., and the original number of the preparation in the Formulary will be found before the title.

INORGANIC ACIDS.

Hydrobromic Acid Cough Mixture.

(Dr. J. Milner Fothergill's.)

Spirit of Chloroform, B. P., 40 min.
Hydrobromic Acid (Diluted), 60 min.
Syrup of Squill, 2 fl. dr.
Water, sufficient to make 2 fl. oz.
Mix. Dose for an adult, a tablespoonful.

243. Loto Adstringens. N. F.

Astringent Lotion.

Warren's Styptic.

Sulphuric Acid, 5 fl. dr.
Oil of Turpentine, 4 fl. dr.
Alcohol, 4 fl. dr.

To the Sulphuric Acid, contained in a Wedgwood mortar, slowly add the Oil of Turpentine, in small portions at a time, constantly stirring. Allow the mixture to cool, then add the Alcohol cautiously, in the same manner, and continue stirring until no more fumes arise. When the liquid is cold, pour it into a glass-stoppered bottle.

Note.—In preparing this mixture, caution should be used, so that the temperature may not rise too high. Particular care is to be observed if a larger quantity of this mixture is to be prepared. In this case it is preferable to prepare it in several portions.

265. Mistura Sulphurica Acida. N. F.

Sulphuric Acid Mixture.

Mistura Sulphurica Acida (Germ. Pharm.).
Haller's Acid Elixir.

Sulphuric Acid, 1 part.
Alcohol, enough to make 4 parts.

Add the Acid very gradually to three (3) parts of Alcohol, contained in a flask, agitating after each addition, and taking care that the temperature of the mixture be not allowed to rise above 50° C. (122° F.). When the mixture is cold, add enough Alcohol, if necessary, to make four (4) parts.

Note.—The same product may be obtained, approximately, by carefully and slowly adding 1 volume of Sulphuric Acid to 7 volumes of Alcohol, and this method may be used when small quantities are required for immediate use in a prescription.

4. Acidum Metaphosphoricum Dilutum. *N. F.*

Diluted Metaphosphoric Acid.

Acidum Phosphoricum Glaciale Dilutum. Diluted Glacial Phosphoric Acid.

Glacial Phosphoric Acid, 780 gr.
Distilled Water, enough to make 16 fl. oz.

Dissolve the Acid in the Water, without heat.

This preparation should be kept in a cool and dark place, and should not be prepared in larger quantity than may be consumed within a few months.

Note.—The resulting product contains about 10 per cent. of metaphosphoric acid, provided the glacial acid was free from impurities. That which is sold in form of glassy lumps is usually of sufficient purity. The variety in form of round sticks is more or less impure, containing generally more than 15 per cent. of phosphate of sodium. If this variety is alone available, a proportionately larger quantity must be taken, to be determined, if time permits, by an assay of the free acid present. If no special accuracy is required, about 900 grains of this variety of the acid may be reckoned to be equivalent to the quantity directed in the above given formula.

Whenever Pyrophosphate of Iron (U. S. P.) forms one of the ingredients of a mixture containing Diluted Phosphoric Acid, the official tribasic acid is unsuitable, as it produces with the salt a gelatinous precipitate. If a clear mixture is required, the above preparation is to be used in place of the official. The same may be done when Phosphate of Iron (U. S. P.) is prescribed, though the precipitate caused by the official acid in this case is not as bulky, and under certain conditions may not form at all.

Boric Acid Cotton.

Purified Cotton Wool, sufficient.

Boric Acid, 60 gr.
Water, 9 fl. dr.

Dissolve the Boric Acid in the Water at a temperature of 60° C. (140° F.); saturate the Purified Cotton with this solution, press it, dry it, and preserve in wide-mouth, cork-stoppered vials.

Boric Acid Ointment.

(*Lister's*.)

Boric Acid, 240 gr.
White Wax, 240 gr.
Paraffin, 1 oz. (troy).
Almond Oil, 1 fl. oz.
Mix.

Boric Acid Ointment.

Boroglyceride, 2 fl. dr.
White Wax, 240 gr.
Vaseline, 8 fl. oz.

Heat the Wax and Vaseline together, and while hot add the Glyceride slowly; use constant stirring while cooling.

10. Boroglycerinum. *N. F.*

Boroglycerin.

Glyceryl Borate. Boroglyceride.

Boric Acid, in powder, 62 parts.
Glycerin, 92 parts.

Heat the Glycerin in a tared porcelain capsule to a temperature not exceeding 150° C. (302° F.), and add the Boric Acid in portions, constantly stirring. When all is added and dissolved, continue the heat at the same temperature, frequently stirring, and breaking up the film which forms on the surface. When the mixture has become reduced to a weight of one hundred (100) parts, pour it out on a flat surface previously coated with a very small quantity of petrolatum, let it cool, cut it into pieces and transfer them immediately to bottles or jars, which should be well stoppered.

Note.—When a solution of Boroglycerin is required, it is preferable to prescribe or to dispense the Glycerite of Boroglycerin. (See *Glyceritum Boroglyceris*, No. 184, next formula.)

184. Glyceritum Boroglycerini. *N. F.*

Glycerite of Boroglycerin.

Glycerite of Glyceryl Borate. Solution of Boroglyceride.

Boric Acid, in powder, 62 parts.
Glycerin, enough to make 200 parts.

Heat ninety-two (92) parts of Glycerin in a tared porcelain capsule to a temperature not exceeding 150° C. (302° F.), and add the Boric Acid, in portions, constantly stirring. When all is added and dissolved, continue the heat at the same temperature, frequently stirring, and breaking up the film which forms on the surface. When the mixture has been reduced to the weight of one hundred (100) parts, add to it one hundred (100) parts of Glycerin, mix thoroughly, and transfer it to suitable vessels.

Two parts, by weight, of this preparation represent 1 part of solid Boroglycerin.

Note.—The product, which is a clear, viscous liquid, is more readily soluble in, and miscible with, other liquids than the solid Boroglycerin. (See *Boroglycerinum*.)

It may be found more convenient, if the glycerite is needed immediately, to place one ounce (av.) of boroglyceride in a dish and add one ounce (av.) of glycerin, heating gently and stirring until it is dissolved.

BROMINE.

Antidote to the Poison of the Rattlesnake.

(*Bibron's*.)

Bromine, 150 gr.
Potassium Iodide, 2 gr.
Corrosive Chloride of Mercury, 1 gr.
Diluted Alcohol, 4 fl. oz.

Dissolve. Take 10 drops in a tablespoonful of brandy, repeated as required.

Bromine Inhalation.

(*Netolitsky's*.)

Bromine, 16 gr.
Potassium Bromide, 16 gr.
Distilled Water, 7 fl. oz.

Dissolve. To be poured, a small quantity at a time, upon a sponge or lint for inhalation in croup.

Solution of Bromine.

(Dr. J. Lawrence Smith's.)

Bromine, 240 gr.
Potassium Bromide, 80 gr.
Distilled Water, 2 fl. oz.

Dissolve the Potassium Bromide in about 1 fl. oz. of the Distilled Water, add the Bromine, agitate, and finally add the remainder of the Distilled Water. It should be kept in small, ground-stoppered vials. Dose, 1 to 2 drops.

208. Liquor Bromi. N. F.

Solution of Bromine.

Smith's Solution of Bromine.

Bromine, 1 tr. oz.
Bromide of Potassium, $\frac{1}{2}$ tr. oz.
Water, 4 fl. oz.

Dissolve the Bromide of Potassium in the Water contained in a bottle, add the Bromine, and shake the mixture until this is dissolved. Keep the solution in glass-stoppered vials in a dark place.

Note.—As bromine vapor is very injurious to the respiratory passages and destructive to balances, it is often preferable to take the contents of an original bottle of Bromine—weighing the bottle, both before opening it and after emptying it, in order to ascertain the exact weight of the Bromine contained therein—and then to use a quantity of Bromide of Potassium and of Water proportionate to the quantities above given.

IODINE.

Iodized Glycerin.

Iodized Oil of Bitter Almond, 1 fl. dr.
Glycerin, 7 fl. dr.

Mix. See next formula.

Iodized Oil of Bitter Almond.

Iodine, 20 gr.
Oil of Bitter Almond, 1 fl. dr.

Mix, and shake occasionally for two months.

Unguentum Iodini Compositum. U. S.

1870. COMPOUND IODINE OINTMENT.

Iodine, 15 gr.
Iodide of Potassium, 80 gr.
Water, 30 min.
Lard, 1 oz. (troy).

Dissolve the Iodine and Iodide of Potassium in the Water, then incorporate the solution with the Lard.

Iodinal Collodion.

(J. T. Shinn's.)

Iodine, 120 gr.
Canada Turpentine, 2 fl. dr.
Collodion, 8 fl. oz.

Dissolve the Iodine and Turpentine in the Collodion. Used as a substitute for Iodine Ointment.

196. Linimentum Iodi. N. F.

Iodine Liniment.

Iodine, 900 gr.
Iodide of Potassium, 860 gr.
Glycerin, $\frac{1}{2}$ fl. oz.
Water, 1 fl. oz.
Alcohol, enough to make 16 fl. oz.

Mix *thirteen* (18) fluidounces of Alcohol with the other ingredients, and dissolve the solids by agitation. Then add enough Alcohol to make *sixteen* (16) fluidounces.

Note.—The proportion of the ingredients above given yields a product practically identical with that prescribed by the Br. Pharm.

Iodized Phenol.

(Battey's formula.)

Iodine, 240 gr.
Carbolic Acid, 1 fl. oz.

Mix. It is to be diluted generally with equal parts of Glycerin, and applied twice a day.

Tinctura Iodini Composita. U. S. 1870.

COMPOUND TINCTURE OF IODINE.

Iodine, 240 gr.
Iodide of Potassium, 1 oz. (troy).
Alcohol, 16 fl. oz.

Dissolve the Iodine and Iodide of Potassium in the Alcohol.

Iodine Solution.

(Magendie's.)

Potassium Iodide, 240 gr.
Iodine, 2 gr.
Peppermint Water, 6 fl. oz.
Dissolve. Dose, a teaspoonful.

222. Liquor Iodi Causticus. N. F.

Caustic Solution of Iodine.

Iodine Caustic. Churchill's Iodine Caustic.
Iodine, 1 tr. oz.
Iodide of Potassium, 2 tr. oz.
Water, 4 fl. oz.

Dissolve the Iodide of Potassium and the Iodine in the Water.

350. Syrupus Acidi Hydriodici Decolor. N. F.

Colorless Syrup of Hydriodic Acid.

Iodide of Potassium, 128 gr.
Hypophosphite of Potassium, 8 gr.
Tartaric Acid, 112 gr.
Water, $\frac{1}{2}$ fl. oz.
Diluted Alcohol, 1 fl. oz.

Syrup, enough to make 16 fl. oz.
Dissolve the Iodide and Hypophosphite of Potassium in *one-half* ($\frac{1}{2}$) fluidounce of Water, and the Tartaric Acid in *one-half* ($\frac{1}{2}$) fluidounce of Diluted Alcohol. Mix the two solutions in a vial, cork and shake it well, and then place it in ice-water for about half an hour, or longer, if convenient; again shake it thoroughly, and then pour the mixture upon a small white filter contained in a funnel, the stem of

which dips below the surface of *fourteen* (14) *fluidounces* of Syrup contained in a bottle. When the liquid has run through, wash the vial and filter with *one-half* ($\frac{1}{2}$) *fluidounce* of Diluted Alcohol, added in several portions. Then add enough Syrup to make *sixteen* (16) *fluidounces*. Keep the product in well-stoppered bottles.

Note.—This preparation is of about the same strength, volume for volume, but not weight for weight, as the official *Syrupus Acidi Hydriodici*.

221. *Liquor Iodi Carbolatus. N. F.*

Carbolized Solution of Iodine.

Boulton's Solution. French Mixture.

Compound Solution of Iodine, 110 min.

Carbolic Acid, liquefied by a

gentle heat, 40 min.

Glycerin, 2½ fl. oz.

Water, enough to make 16 fl. oz.

Mix the Glycerin with the Carbolic Acid and Compound Solution of Iodine, add enough Water to make *sixteen* (16) *fluidounces*, and expose the mixture to sunlight until it has become colorless.

357. *Syrupus Calcii Iodidi. N. F.*

Syrup of Iodide of Calcium.

Iodine, 552 gr.

Iron Wire, fine, bright, and

finely cut, 200 gr.

Precipitated Carbonate of Cal-

cium, 250 gr.

Distilled Water, a sufficient quantity.

Sugar, 11 tr. oz.

Syrup, enough to make 16 fl. oz.

Mix the Iron Wire with *four hundred and fourteen* (414) *grains* of the Iodine and *three* (8) *fluidounces* of Distilled Water, and apply a gentle heat, until the Iodine is combined and the liquid has acquired a greenish color. Filter the liquid through a small filter into a flask containing the remainder of the Iodine, wash the filter with *one* (1) *fluidounce* of Distilled Water, and heat the solution gently, taking care that no Iodine is lost by evaporation. Heat *four* (4) *fluidounces* of Distilled Water in a capacious capsule to boiling, and add to it small alternate portions, first of the Precipitated Carbonate of Calcium, and then of the solution of Iodide of Iron, in small portions at a time, stirring briskly and waiting until the violence of the reaction moderates before adding a fresh portion. From time to time add a little Distilled Water, to replace that lost by evaporation. When all the Iron solution has been added, continue heating the mixture until it is quietly boiling, then filter it through a wetted filter, and wash the latter with enough Distilled Water to make the product, when cold, measure *eight* (8) *fluidounces*. In this dissolve the Sugar by agitation, then make up

the volume with Syrup to *sixteen* (16) *fluidounces*, and strain, if necessary.

Each fluidrachm contains about 5 grains of Iodide of Calcium.

Iodine Caustic.

(Riesberg's.)

Iodine, 1 oz. (troy).

Glycerin, 2 fl. oz.

Applied every second day with a brush.

As the preparation is very powerful, its effect must be watched.

Coster's Paste.

Iodine Pigment, 120 gr.

Oil of Cade, 1 oz. (troy).

Mix. For an embrocation. This preparation should not be used until it has stood four weeks. The Iodine Pigment is made by dissolving 60 gr. of Iodine in 1 fl. oz. of Alcohol, and allowing the solution to stand in a glass bottle for several months before use.

Iodized Cotton.

Iodine, 60 gr.

Purified Cotton, 1½ fl. oz.

Enclose the Iodine in filtering-paper, and place it at the bottom of a flask with a wide mouth; then introduce the Cotton, and close the flask by covering the mouth. Place the flask in a moderately warm place until the Cotton appears to be uniformly colored by the Iodine.

400. *Tinctura Iodi, Churchill. N. F.*

Churchill's Tincture of Iodine.

Iodine, 2½ tr. oz.

Iodide of Potassium, ½ tr. oz.

Water, 4 fl. oz.

Alcohol, enough to make 16 fl. oz.

Dissolve the Iodide of Potassium in the Water, then add the Iodine, and, lastly, enough Alcohol to make the Tincture, when completed, measure *sixteen* (16) *fluidounces*.

Note.—Churchill's Tincture of Iodine should not be confounded with Churchill's Iodine Caustic (*Liquor Iodi Causticus*, No. 222, page).

401. *Tinctura Iodi Decolorata. N. F.*

Decolorized Tincture of Iodine.

Iodine, 610 gr.

Hyposulphite of Sodium, 610 gr.

Water, 1½ fl. oz.

Stronger Water of Ammonia

(U. S. P.), 1 fl. oz.

Alcohol, enough to make 16 fl. oz.

Digest the Iodine, Hyposulphite of Sodium, and Water, at a gentle heat, until a perfect solution, of a dark reddish-brown color, is produced. Then add *two* (2) *fluidounces* of Alcohol, and afterwards the Stronger Water of Ammonia. Shake a few minutes until no more bubbles of gas escape and the liquid has become colorless,

with a whitish precipitate (of sulphur) suspended in it. Cool it, if necessary, and add enough Alcohol to make *sixteen* (16) *fluidounces*. Place the bottle containing it in a refrigerator for a few hours, or longer, if convenient, then filter, in a covered funnel, and preserve the liquid for use.

Note.—On prolonged standing a crystalline precipitate of tetrathionate of sodium will usually form in the liquid. This may be removed by filtration.

Ethereal Tincture of Iodine.

(Magendie's.)

Iodine, 32 gr.
Ether, 1 fl. oz.
Dissolve. Used externally.

SULPHUR.

Unguentum Sulphuris Iodidi. U. S.

1870. OINTMENT OF IODIDE OF SULPHUR.

Iodide of Sulphur, 30 gr.
Prepared Lard, 1 oz. (troy).
Triturate the Iodide of Sulphur in a porcelain mortar, and gradually add the Lard, rubbing them together until the ointment is perfectly smooth and free from grittiness.

Viemineck's Solution.

Lime, 240 gr.
Sublimed Sulphur, 1 oz. (troy).
Water, 10 fl. oz.
Boil down to 6 fl. oz. and filter. Used externally in acne.

423. Unguentum Sulphuris Compositum. N. F.

Compound Sulphur Ointment.

Wilkinson's Ointment. Hebra's Itch Ointment.
Precipitated Carbonate of Calcium, 10 parts.
Sublimed Sulphur, 15 parts.
Oil of Cade, 15 parts.
Green Soap, 30 parts.
Lard, 30 parts.

Mix the Lard with the Green Soap and Oil of Cade. Then gradually incorporate the Sublimed Sulphur and Precipitated Carbonate of Calcium.

PHOSPHORUS.

Syrup of the Hypophosphites.

(Parrish's.)

Calcium Hypophosphite, 360 gr.
Sodium Hypophosphite, 120 gr.
Potassium Hypophosphite, 120 gr.
Sugar, 18 oz. (troy).
Hot Water, 10 fl. oz.
Orange Flower Water, 4 fl. dr.

Dissolve the salts in the Hot Water, filter through paper, dissolve the Sugar in the solution by the aid of heat, strain,

and add the Orange-Flower Water. Dose, a teaspoonful, containing nearly 5 gr. of the mixed salts.

Compound Solution of the Hypophosphites of Iron, Soda, Lime, and Magnesium.

Calcium Hypophosphite, 11 oz. 80 gr. av.
Oxalic Acid, 1½ oz. av.
Ferrous Sulphate, 2 oz. av. 260 gr.
Sodium Sulphate, 5 oz. av. 120 gr.
Magnesium Sulphate, 1 oz. av. 420 gr.
Boiling Water, 5 pints.
Water, a sufficient quantity to make 100 fl. oz.

Dissolve the Calcium Hypophosphite in the Boiling Water, add the Oxalic Acid, stirring for a minute, and then the other ingredients in the order given. Agitate for two or three minutes, allow the mixture to become cold, filter into a bottle marked 100 fl. oz., and wash the Calcium Oxalate and Sulphate, which remain on the filter, with Water until 100 fl. oz. of liquid are obtained.

377. Syrupus Phosphatum Compositus.

Compound Syrup of the Phosphates.

Chemical Food.

Precipitated Carbonate of Calcium, 256 gr.
Phosphate of Iron (U. S. P. 1880), 128 gr.
Phosphate of Ammonium, 128 gr.
Bicarbonate of Potassium, 82 gr.
Bicarbonate of Sodium, 82 gr.
Citric Acid, 1 tr. oz.
Glycerin, 1 fl. oz.
Phosphoric Acid (50 per cent.), 2 fl. oz.
Orange-Flower Water, 2 fl. oz.
Tincture of Cudbear (N. F.), 120 min.
Sugar, 8 tr. oz.
Water, enough to make 16 fl. oz.

Triturate the Precipitated Carbonate of Calcium with the Bicarbonates of Potassium and Sodium, the Citric Acid, Glycerin, and Orange-Flower Water, and gradually add the Phosphoric Acid, stirring until solution has been effected. Dissolve the Phosphate of Iron and the Phosphate of Ammonium in four (4) *fluidounces* of hot Water, cool, and add the solution to that previously prepared. Filter the whole through a pellet of absorbent cotton placed in the neck of a funnel, and receive the filtrate in a graduated bottle containing the Sugar. Agitate until the latter is dissolved, then add the Tincture of Cudbear, and, lastly, enough Water to make *sixteen* (16) *fluidounces*.

Each *fluidrachm* contains about 2 grains of Phosphate of Calcium, 1 grain, each, of the Phosphates of Iron and Ammonium, and smaller quantities of the Phosphates of Potassium and Sodium.

Solution of the Hypophosphites.

(Hayes's.)

Calcium Hypophosphite,	128 gr.
Potassium Hypophosphite,	128 gr.
Sodium Hypophosphite,	82 gr.
Quinine Hypophosphite,	82 gr.
Manganese Hypophosphite,	82 gr.
Iron Hypophosphite,	64 gr.
Strychnine Hypophosphite,	1 gr.
Glycerin,	884 min.
Solution of Hypophosphorous Acid,	256 min.
Water, sufficient to make	16 fl. oz.
Dissolve.	

3. Acidum Hypophosphorosum Dilutum. N. F.*Diluted Hypophosphorous Acid.*

Hypophosphite of Potassium,	208 parts.
Tartaric Acid,	800 parts.
Distilled Water,	588 parts.
Diluted Alcohol,	600 parts.

Dissolve the Hypophosphite of Potassium in the Distilled Water, and the Tartaric Acid in the Diluted Alcohol. Mix the two solutions in a flask, cork the latter well, and put it aside in a cold place during twelve hours. Then carefully decant the liquid into a funnel, the neck of which contains a pellet of absorbent cotton, or, if necessary, pass the liquid through a filter, care being taken that it shall not suffer loss by evaporation. Weigh the filtrate, which contains *ten* (10) per cent. of hypophosphorous acid, in a tared capsule, and evaporate the alcohol by means of a water-bath, at a temperature not exceeding 60° C. (140° F.). Then allow the liquid to cool, and add enough Distilled Water to restore the original weight of the filtrate. Preserve the product in well-stoppered bottles.

Note.—Hypophosphorous Acid thus prepared contains 10 per cent. of absolute hypophosphorous acid (H_2PO_3), and has a specific gravity of 1.060 at 15° C. (59° F.). If the acid is required for immediate use, and the presence of alcohol is not objectionable, the mixture of the two solutions need be cooled only a short time, and the filtrate may be used at once. If a 50 per cent. acid is required, the concentration may be cautiously continued until the desired percentage has been attained. A 50 per cent acid has a specific gravity of about 1.406 at 15° C. (59° F.).

76. Elixir Hypophosphitum cum Ferro. N. F.*Elixir of Hypophosphites with Iron.*

Hypophosphite of Calcium,	188 gr.
Hypophosphite of Sodium,	128 gr.
Hypophosphite of Potassium,	64 gr.
Sulphate of Iron, in clear crystals,	96 gr.
Citric Acid,	80 gr.
Water,	4 fl. oz.
Syrup,	4 fl. oz.
Aromatic Elixir, enough to make	16 fl. oz.

Dissolve the Hypophosphites in *three* (3) fluidounces of Water, and add the Syrup. Dissolve the Sulphate of Iron in the remainder of the Water, and mix this with the other solution. Then add *six* (6) fluidounces of Aromatic Elixir, set the mixture aside, in a cold place, for twelve hours, and filter from the deposited sulphate of calcium. Finally, dissolve the Citric Acid in the filtrate, and pass enough Aromatic Elixir through the filter to make *sixteen* (16) fluidounces.

Each fluidrachm contains about ½ grain of Hypophosphite of Iron (ferrous), about 1 grain, each, of the Hypophosphites of Calcium and Sodium, and ½ grain of Hypophosphite of Potassium.

220. Liquor Hypophosphitum. N. F.*Solution of Hypophosphites.*

Hypophosphite of Calcium,	256 gr.
Hypophosphite of Sodium,	160 gr.
Hypophosphite of Potassium,	128 gr.
Citric Acid,	120 gr.

Water, enough to make 16 fl. oz.
Dissolve the salts and the Citric Acid in Water so as to make *sixteen* (16) fluidounces; filter, if necessary, and pass enough Water through the filter to restore the original volume.

Each fluidrachm contains 2 grains of Hypophosphite of Calcium, 1½ grain of Hypophosphite of Sodium, and 1 grain of Hypophosphite of Potassium.

75. Elixir Hypophosphitum. N. F.*Elixir of Hypophosphites.*

Hypophosphite of Calcium,	884 gr.
Hypophosphite of Sodium,	128 gr.
Hypophosphite of Potassium,	128 gr.
Citric Acid,	80 gr.

Water, 4 fl. oz.
Glycerin, ½ fl. oz.
Compound Spirit of Cardamom, ½ fl. oz.
Aromatic Elixir, enough to make 16 fl. oz.

Dissolve the Hypophosphites and the Citric Acid in the Water; then add the Glycerin, Compound Spirit of Cardamom, and enough Aromatic Elixir to make *sixteen* (16) fluidounces. Filter, if necessary.

Each fluidrachm contains 8 grains of Hypophosphite of Calcium and 1 grain, each, of the Hypophosphites of Sodium and Potassium.

Solution of Phosphates.

(Dr. Pepper's.)

Calcium Phosphate,	6 gr.
Magnesium Phosphate,	4 gr.
Potassium Phosphate,	8 gr.
Phosphoric Acid (Concent.),	10 min.
Water, sufficient to make	2 fl. dr.
Make a solution and filter.	

370. Syrupus Hypophosphitum Compositus. N. F.

Compound Syrup of Hypophosphites.
Compound Hypophosphites.

Hypophosphite of Calcium, 256 gr.
Hypophosphite of Potassium, 128 gr.
Hypophosphite of Sodium, 128 gr.
Hypophosphite of Iron, 16 gr.
Hypophosphite of Manganese, 16 gr.
Citrate of Potassium, 40 gr.
Citric Acid, 15 gr.
Hydrochlorate of Quinine, 8 gr.
Tincture of Nux Vomica (U. S. P.), 160 min.
Sugar, 12 tr. oz.
Water, enough to make 16 fl. oz.

Rub the Hypophosphites of Iron and of Manganese with the Citrate of Potassium and Citric Acid to powder, add one (1) fluidounce of Water, and warm the mixture a few minutes until a clear greenish solution is obtained. Introduce the other Hypophosphites and the Hydrochlorate of Quinine, previously triturated together, into a graduated bottle, next add the Sugar, the Iron and Manganese solution first prepared, the Tincture of Nux Vomica, and, lastly, enough Water to make up the volume, as soon as the Sugar is saturated by the liquid, to sixteen (16) fluidounces. Agitate until solution has been effected, and strain, if necessary.

Each fluidrachm contains 2 grains of Hypophosphite of Calcium, 1 grain, each, of the Hypophosphites of Potassium and Sodium, $\frac{1}{2}$ grain, each, of the Hypophosphites of Iron and of Manganese, $\frac{1}{4}$ grain of Hydrochlorate of Quinine, and 1 $\frac{1}{2}$ minims of Tincture of Nux Vomica.

Note.—This Syrup should not be confounded with the official *Syrupus Hypophosphitum* (Syrup of the Hypophosphites).

355. Syrupus Calcii et Sodii Hypophosphitum. N. F.

Syrup of Hypophosphite of Calcium and Sodium.

Syrup of Hypophosphite of Lime and Soda.
Hypophosphite of Calcium, 256 gr.
Hypophosphite of Sodium, 256 gr.
Citric Acid, 10 gr.
Sugar, 12 tr. oz.
Water, enough to make 16 fl. oz.

Dissolve the two Hypophosphites and the Citric Acid in eight (8) fluidounces of Water, filter the solution, add the Sugar to the filtrate, and pass enough Water through the filter to make the product, after the Sugar has been dissolved by agitation, measure sixteen (16) fluidounces.

Each fluidrachm contains 2 grains, each, of Hypophosphite of Calcium and Hypophosphite of Sodium.

101. Elixir Sodii Hypophosphitis. N. F.

Elixir of Hypophosphite of Sodium.

Hypophosphite of Sodium, 256 gr.
Citric Acid, 30 gr.
Aromatic Elixir, enough to make 16 fl. oz.
Dissolve the Hypophosphite of Sodium and the Citric Acid in about twelve (12) fluidounces of Aromatic Elixir, by agitation. Then add enough Aromatic Elixir to make sixteen (16) fluidounces, and filter, if necessary.

Each fluidrachm contains 2 grains of Hypophosphite of Sodium.

356. Syrupus Calcii Hypophosphitis. N. F.

Syrup of Hypophosphite of Calcium.

Syrup of Hypophosphite of Lime.
Hypophosphite of Calcium, 256 gr.
Citric Acid, 10 gr.
Sugar, 12 tr. oz.
Water, enough to make 16 fl. oz.

Dissolve the Hypophosphite of Calcium and the Citric Acid in eight (8) fluidounces of Water, filter the solution, add the Sugar to the filtrate, and pass enough Water through the filter to make the product, after the Sugar has been dissolved by agitation, measure sixteen (16) fluidounces.

Each fluidrachm contains 2 grains of Hypophosphite of Calcium.

228. Liquor Phosphori. N. F.

Solution of Phosphorus.

Thompson's Solution of Phosphorus.

Phosphorus, 1 gr.
Absolute Alcohol, 450 min.
Spirit of Peppermint, 10 min.
Glycerin, 2 fl. oz.

Dissolve the Phosphorus in four hundred (400) minims of Absolute Alcohol, in a stoppered vial or test-tube, by immersion in a water-bath and frequent agitation, taking care that any loss of Alcohol, by evaporation, be made up from time to time. Allow the solution to become nearly cold, and then add to it the remainder of the Absolute Alcohol and the Glycerin, previously mixed and slightly warmed. Finally, add the Spirit of Peppermint. Keep the solution in a well-stoppered bottle, in the dark.

Each fluidrachm contains about $\frac{1}{4}$ grain of Phosphorus.

Note.—This solution must not be confounded with the *Spiritus Phosphori* (No. 344), which is not intended to be administered as such, but is only to be used in compounding the Elixir or other preparations of phosphorus.

The Phosphorus should be perfectly translucent, cut and weighed under water, and quickly dried with filtering paper before being dropped into the alcohol.

Compound Syrup of Hypophosphites.

(Containing Ferric Hypophosphite. Procter's.)

Calcium Hypophosphite,	256 gr.
Sodium Hypophosphite,	192 gr.
Potassium Hypophosphite,	128 gr.
Ferric Hypophosphite,	96 gr.
Hypophosphorous Acid Solution,	240 min.
Sugar,	9 oz. (av.).
Extract of Vanilla,	4 fl. dr.
Water, sufficient.	

Dissolve the salts of Calcium, Sodium, and Potassium in 6 fl. oz. of Water; put the Iron salt in a mortar, and gradually add solution of Hypophosphorous Acid till it is dissolved; to this add the solution of the other salts, after it has been rendered slightly acidulous with the same acid, and then Water, till the whole measures 12 fl. oz. Dissolve in this the Sugar, with heat, and add the Vanilla. Dose, a teaspoonful.

85. Elixir Phosphori. N. F.*Elixir of Phosphorus.*

Spirit of Phosphorus,	3½ fl. oz.
Oil of Star-anise,	16 min.
Glycerin,	9 fl. oz.

Aromatic Elixir, enough to make 16 fl. oz. To the Spirit of Phosphorus add the Oil of Star-anise and Glycerin, and shake gently until they form a clear liquid. Then add the Aromatic Elixir; in small portions at a time, gently agitating after each addition, until a clear mixture results.

Keep the product in dark amber-colored vials, in a cool and dark place. It should not be prepared in quantities larger than will be consumed within a few months.

Each fluidrachm contains ½ grain of Phosphorus.

86. Elixir Phosphori et Nucis Vomicae. N. F.*Elixir of Phosphorus and Nux Vomica.*

Tincture of Nux Vomica,	256 min.
Elixir of Phosphorus,	

enough to make 16 fl. oz.

Mix them. This preparation should be freshly made, when wanted for use.

Each fluidrachm represents 2 minims of Tincture of Nux Vomica and nearly ½ grain of Phosphorus.

344. Spiritus Phosphori. N. F.*Spirit of Phosphorus.*

Tincture of Phosphorus.	
Phosphorus,	10 gr.
Absolute Alcohol, enough to make	
make	15 fl. oz.

To the Absolute Alcohol, contained in a flask, add the Phosphorus, cut into small

pieces, and apply a moderate heat, by means of a water-bath, taking care to prevent, as much as possible, any loss of alcohol by evaporation, or making up any loss by adding, from time to time, a little more Absolute Alcohol. When the Phosphorus is dissolved, allow the liquid to become cold, and add enough Absolute Alcohol, if necessary, to make fifteen (15) fluidounces. Then transfer the Spirit to small, dark amber-colored vials, stopper them securely, and keep them in a cool and dark place.

Each fluidrachm contains ⅙ grain of Phosphorus; or 1¼ minims contain ⅙ grain of Phosphorus.

Note.—The Phosphorus should be perfectly translucent, cut and weighed under water, and quickly dried with filtering paper before being dropped into the Alcohol. The loss of Alcohol, during the heating, may be avoided, and solution effected more expeditiously, by attaching to the flask a well-cooled upright condenser, which will cause the vapor of the alcohol to be condensed, and to flow back into the flask. In the absence of a condenser, a long glass tube, inserted through a tight-fitting cork into the neck of the flask, and maintained in an upright condition, will nearly answer the same purpose.

This preparation is intended for preparing the Elixir of Phosphorus (see No. 85). It is unsuited for internal administration without corrigents. Care should be taken that it be not confounded with Thompson's Solution of Phosphorus. (See *Liquor Phosphori*, No. 223.)

Compound Solution of Phosphates.

Calcium Carbonate,	369 gr.
Magnesia (Calc.),	29 gr.
Potassium Carbonate,	25 gr.
Iron Phosphate,	64 gr.
Phosphoric Acid (60 per cent.),	1705 gr.
Water, sufficient to make	16 fl. oz.

Mix the Acid with half a pint of Water, add the Iron Phosphate, and stir until dissolved; then add gradually the Calcium Carbonate, stirring until effervescence ceases and the freshly-formed Phosphate is dissolved, and finally add the Magnesia and Potassium Carbonate; stir until dissolved, and make up the measure to 1 pint. Used as an acid phosphate.

202. Liquor Acidi Phosphorici Compositus. N. F.*Compound Solution of Phosphoric Acid.*
Solution of Acid Phosphates.

Bone Ash, in fine powder,	100 parts.
Sulphuric Acid,	78 parts.
Water,	400 parts.

Mix the Bone Ash with one hundred (100) parts of Water, add the Sulphuric Acid, diluted with two hundred (200) parts of Water, and mix thoroughly with a porcelain or glass stirrer. Now add the remainder of the Water and set the mixture aside for twenty-four hours, stirring occasionally. Then transfer the mixture

to a strong muslin strainer, and subject this to a gradual pressure (avoiding contact with metals), so as to express as much of the liquid as possible. Lastly, filter this through paper.

The specific gravity of this solution is about 1.118 at 15° C. (59° F.).

Note.—The quantity of product obtained depends on the degree of force used in pressing. By strong pressure, about 350 parts may be obtained. If desired, the magma may also be poured in a glass percolator, the neck of which contains a layer of fine quartz sand or asbestos, previously deprived of matters soluble in sulphuric or phosphoric acid. On cautiously pouring water on top, so as not to mix it with the magma, the acid solution will be displaced. But the percolation must be interrupted as soon as the specific gravity of the percolate begins to fall below 1.113. The Sulphuric Acid used in this preparation may be the commercial variety, provided it is free from arsenic, and of a specific gravity not less than 1.830.

POTASSIUM SALTS.

Effervescing Draught.

Potassium Bicarbonate, 80 gr.
Water, 2 fl. oz.
Make a solution. Take a tablespoonful of lemon-juice diluted with a tablespoonful of Water, and add to it in a tumbler a tablespoonful of this solution, then drink immediately.

Muller's Fluid.

Potassium Bichromate, 200 gr.
Sodium Sulphate, 80 gr.
Water, 16 fl. oz.

Brown-Séquard's Anti-Epileptic Mixture.

Sodium Bromide, 180 gr.
Potassium Bromide, 180 gr.
Ammonium Bromide, 180 gr.
Potassium Iodide, 90 gr.
Ammonium Iodide, 90 gr.
Ammonium Carbonate, 60 gr.
Tincture of Calumba, 1½ fl. oz.
Water, sufficient to make 8 fl. oz.

Mix. Adult dose, 1½ teaspoonfuls before each meal, and 3 teaspoonfuls at bedtime.

Whooping-Cough Remedy.

(Dr. J. J. Caldwell's.)

Ammonium Bromide, 20 gr.
Potassium Bromide, 40 gr.
Fluid Extract of Belladonna, 6 min.
Distilled Water, 2 fl. oz.

Used with steam atomizer for ten to fifteen minutes morning, noon, and bedtime.

Pancoast's Styptic.

Potassium Carbonate, 120 gr.
Soap, 80 gr.
Alcohol, 1 fl. oz.
Mix.

Antidiphtheritic Mixture.

(Warren's.)

Thymol, 4 gr.
Potassium Chlorate, 75 gr.
Quinine Sulphate, 45 gr.
Hydrochloric Acid, 15 min.
Glycerin, 2 fl. oz.
Brandy, 9 fl. oz.

Dose, a teaspoonful every hour for children between two and five years.

Laxative Powder.

(Jeannel's.)

Potassium and Sodium Tartrate, 600 gr.
Sodium Bicarbonate, 240 gr.
Tartaric Acid, 240 gr.
Oil of Lemon, sufficient.
Sugar, 2½ oz. (troy).
Dose, a teaspoonful in sweetened water.

306. Potassii Citras Effervescens.

N. F.

Effervescent Citrate of Potassium.

Citrate of Potassium, 200 parts.
Bicarbonate of Sodium, 600 parts.
Tartaric Acid, 540 parts.
Sugar, in very fine powder, 460 parts.

Triturate the ingredients, previously well dried, to a fine, uniform powder.

If the compound is required in form of a granular powder, mix it with Alcohol to a soft paste, and rub this through a No. 20 tinned-iron sieve, or enamelled colander. Then dry it, and reduce it to a coarse, granular powder.

Ninety (90) grains (or about a heaped teaspoonful) of the above compound represent 10 grains of Citrate of Potassium.

230. Liquor Potassæ Chloratæ. N. F.

Solution of Chlorinated Potassa.

Liquor Potassæ Chlorinatæ. Javelle Water.
Carbonate of Potassium, 58 parts.
Chlorinated Lime (U. S. P.), 80 parts.
Water, enough to make 1000 parts.

Mix the Chlorinated Lime, contained in a tared flask, with four hundred (400) parts of Water. Dissolve the Carbonate of Potassium in three hundred (300) parts of boiling Water, and pour the hot solution into the mixture first prepared. Shake the flask well, stopper it, set it aside to cool, and then add enough Water to make the contents weigh one thousand (1000) parts. Allow the suspended matters to subside, and remove the clear solution by means of a siphon, or by straining through muslin. Keep the product in well-stoppered bottles.

Note.—The Chlorinated Lime should contain not less than 25 per cent. of available chlorine.

231. Liquor Potassii Arseniatis et Bromidi. N. F.

Solution of Arseniate and Bromide of Potassium.

Liquor Arsenii Bromidi. Solution of Bromide of Arsenic. Clemens' Solution.

Arsenious Acid,	78 gr.
Bicarbonate of Potassium,	78 gr.
Bromine,	117 gr.
Water,	enough to make 16 fl. oz.

Boil the Arsenious Acid with the Bicarbonate of Potassium and two (2) fluidounces of Water until solution is effected. Allow this to cool, add ten (10) fluidounces of Water, then the Bromine, and afterwards enough Water to make sixteen (16) fluidounces. Let the mixture stand a few hours, agitating it occasionally, then filter.

This solution contains an amount of Arsenic in combination, corresponding to about 1 per cent. of Arsenious Acid.

Note.—The title "Solution of Bromide of Arsenic" (*Liquor Arsenii Bromidi*), which is often applied to Clemens' Solution or similar preparations, is a misnomer, since bromide of arsenic cannot exist, as such, in presence of water, but is split up into hydrobromic and arsenious acids. The proportions of the ingredients, in the formula above given, have been adjusted, as closely as practicable, so as to yield definite compounds, viz., arseniate and bromide of potassium.

In order to prevent injury to the balances by weighing a definite amount of Bromine, the plan suggested in the Note to No. 208 may be applied to this preparation, viz., to prepare such a quantity of the latter at one time as will be commensurate to the actual contents of an original vial of Bromine.

89. Elixir Potassii Acetatis. N. F.

Elixir of Acetate of Potassium.

Acetate of Potassium,	640 gr.
Aromatic Elixir, enough to make	16 fl. oz.

Dissolve the Acetate of Potassium in twelve (12) fluidounces of Aromatic Elixir, then add enough of the latter to make sixteen (16) fluidounces. Filter, if necessary.

Each fluidrachm contains 5 grains of Acetate of Potassium.

91. Elixir Potassii Bromidi. N. F.

Elixir of Bromide of Potassium.

Bromide of Potassium,	1280 gr.
Citric Acid,	80 gr.
Adjuvant Elixir, enough to make	16 fl. oz.

Dissolve the Bromide of Potassium and the Citric Acid in about twelve (12) fluidounces of Adjuvant Elixir, by agitation. Then add enough Adjuvant Elixir to make sixteen (16) fluidounces, and filter.

Each fluidrachm contains 10 grains of Bromide of Potassium.

90. Elixir Potassii Acetatis et Juniperi. N. F.

Elixir of Acetate of Potassium and Juniper.

Acetate of Potassium,	640 gr.
Fluid Extract of Juniper,	2 fl. oz.
Carbonate of Magnesium,	120 gr.

Aromatic Elixir, enough to make 16 fl. oz.

Triturate the Fluid Extract of Juniper with the Carbonate of Magnesium, then add twelve (12) fluidounces of Aromatic Elixir in which the Acetate of Potassium had previously been dissolved. Filter, and add enough Aromatic Elixir through the filter to make sixteen (16) fluidounces.

Each fluidrachm represents 5 grains of Acetate of Potassium and 7½ grains of Juniper.

322. Sal Carolinum Factitium. N. F.

Artificial Carlsbad Salt.

I. In a dry, amorphous form (Germ. Pharm.).

Sulphate of Potassium,	2 parts.
Chloride of Sodium,	18 parts.
Bicarbonate of Sodium,	36 parts.
Sulphate of Sodium, dried,	44 parts.

Triturate the ingredients, previously well dried, to a fine, uniform powder.

Note.—The dried Sulphate of Sodium is prepared by slowly drying the crystalline salt until it has lost one-half of its weight.

II. In a crystalline form.

Sulphate of Potassium,	2 parts.
Chloride of Sodium,	18 parts.
Carbonate of Sodium, in clear crystals,	61 parts.
Sulphate of Sodium, crystallized,	88 parts.
Distilled Water,	50 parts.

Dissolve the Sulphate of Potassium and Chloride of Sodium in the Distilled Water, and add this solution to the other two salts, previously melted in a tared capsule and at a gentle heat in their own water of crystallization. Evaporate the mixture to about one hundred and eighty (180) parts, set it aside in a cool place, and stir frequently, so as to prevent the formation of large crystals, taking care, however, that none of the salts separate in a pulverulent form. Distribute any remaining water of crystallization uniformly over the crystals, and dry the whole mixture sufficiently by exposure to air, but so that it will retain its crystalline character.

A solution of about 16 grains of the dry, or about 27 grains of the crystalline, salt, in 6 fluidounces of water, represents an equal volume of Carlsbad Water (Sprudel) in its essential constituents.

Note.—The salts employed in the preparation of the crystalline form must have been purified by recrystallization.

304. Potassii Bromidum Effervescens.

N. F.

Effervescent Bromide of Potassium.

Bromide of Potassium, 400 parts.
Bicarbonate of Sodium, 600 parts.
Tartaric Acid, 540 parts.
Sugar, in very fine powder, 260 parts.
Triturate the ingredients, previously well dried, to a fine, uniform powder.

If the compound is required in form of a granular powder, mix it with Alcohol to a soft paste, and rub this through a No. 20 tinned-iron sieve, or enamelled colander. Then dry it, and reduce it to a coarse, granular powder.

Ninety (90) grains (or about a heaped teaspoonful) of the above compound represent 20 grains of Bromide of Potassium.

305. Potassii Bromidum Effervescens cum Caffeina. N. F.

Effervescent Bromide of Potassium with Caffeine.

Bromide of Potassium, 200 parts.
Caffeine, 20 parts.
Bicarbonate of Sodium, 600 parts.
Tartaric Acid, 540 parts.
Sugar, in very fine powder, 440 parts.
Triturate the ingredients, previously well dried, to a fine, uniform powder.

If the compound is required in form of a granular powder, mix it with Alcohol to a soft paste, and rub this through a No. 20 tinned-iron sieve, or enamelled colander. Then dry it, and reduce it to a coarse, granular powder.

Ninety (90) grains (or about a heaped teaspoonful) of the above compound represent 10 grains of Bromide of Potassium and 1 grain of Caffeine.

323. Sal Carolinum Factitium Effervescens. N. F.

Artificial Effervescent Carlsbad Salt.

Artificial Carlsbad Salt, in form of dry powder, 820 parts.
Bicarbonate of Sodium, 630 parts.
Tartaric Acid, 560 parts.
Sugar, in very fine powder, 240 parts.

Triturate the ingredients, previously well dried, to a fine, uniform powder.

If the compound is required in the form of a granular powder, mix it with Alcohol to a soft paste, and rub this through a No. 20 tinned-iron sieve, or enamelled colander. Then dry it, and reduce it to a coarse, granular powder.

A solution of about 87 grains of this preparation, in 6 fluidounces of water, represents an equal volume of Carlsbad Water (Sprudel) in its essential constituents.

Liniment of Iodide of Potassium.

Soap, 420 gr.
Potassium Iodide, 860 gr.
Oil of Lavender, 15 min.
Alcohol, 4 fl. oz.
Water, 6 fl. dr.

Dissolve the Soap in the Alcohol by means of a gentle heat, and filter if it is not perfectly transparent; then add the Oil and the Potassium Iodide dissolved in the Water; mix, and bottle it while warm.

Spleen Mixture.

(Gadberry's.)

Potassium Nitrate, 800 gr.
Quinine Sulphate, 65 gr.
Iron Sulphate, 65 gr.
Nitric Acid, 65 min.
Water, 16 fl. oz.

Mix. Dose, a tablespoonful three times a day.

Liquor Potassii Permanganatis. U. S.
1870. SOLUTION OF PERMANGANATE OF POTASSIUM.

Permanganate of Potassium, 64 gr.
Distilled Water, 16 fl. oz.

Dissolve the Permanganate in the Distilled Water.

Benzoated Alkaline Mixture.

(Dr. Ellwood Wilson.)

Potassium Bicarbonate, 90 gr.
Benzoic Acid, 80 gr.
Syrup of Orange, 4 fl. dr.
Water, 2½ fl. oz.

Rub the solids with 4 fl. dr. of Water until effervescence ceases, then add the rest of the Water, filter, and add the Syrup. Dose, a tablespoonful three times a day after meals.

LITHIUM AND SODIUM SALTS.

77. Elixir Lithii Bromidi. N. F.

Elixir of Bromide of Lithium.

Bromide of Lithium, 640 gr.
Citric Acid, 80 gr.
Adjuvant Elixir, enough to make 16 fl. oz.

Dissolve the Bromide of Lithium and the Citric Acid in about *twelve* (12) fluidounces of Adjuvant Elixir, by agitation. Then add enough Adjuvant Elixir to make *sixteen* (16) fluidounces, and filter.

Each fluidrachm contains 5 grains of Bromide of Lithium.

Neutralizing Powder.

Sodium Bicarbonate, 120 gr.
Powdered Rhubarb, 120 gr.
Oil of Peppermint, 2 min.

Dose, a teaspoonful, as an antacid in diarrhœa and dyspepsia.

78. Elixir Lithii Citratis. N. F.*Elixir of Citrate of Lithium.*

Citrate of Lithium, 640 gr.
 Adjuvant Elixir, enough to make 16 fl. oz.

Dissolve the Citrate of Lithium in about twelve (12) fluidounces of Adjuvant Elixir, by agitation. Then add enough Adjuvant Elixir to make sixteen (16) fluidounces, and filter.

Each fluidrachm contains 5 grains of Citrate of Lithium.

79. Elixir Lithii Salicylatis. N. F.*Elixir of Salicylate of Lithium.*

Salicylate of Lithium, 640 gr.
 Adjuvant Elixir, enough to make 16 fl. oz.

Dissolve the Salicylate of Lithium in about twelve (12) fluidounces of Adjuvant Elixir, by agitation. Then add enough Adjuvant Elixir to make sixteen (16) fluidounces, and filter.

Each fluidrachm contains 5 grains of Salicylate of Lithium.

Anti-Gout Pills.*(Corlieu's.)*

Sodium Silicate, 20 gr.
 Extract of Colchicum, 12 gr.
 Extract of Aconite, 25 gr.
 Sodium Benzoate, 40 gr.
 Powdered Soap, 40 gr.

Mix, and make into 100 pills.

Soda Mint.

Sodium Bicarbonate, 386 gr.
 Spearmint Water, 1 pint.
 Dissolve and filter. Dose, a tablespoonful.

Mel Sodii Boratis. U. S. 1870. HONEY OF BORATE OF SODIUM.

Borate of Sodium, in fine powder, 60 gr.
 Clarified Honey, 1 oz. (troy).
 Mix them.

Aromatic and Antacid Corrective of Indigestion.*(Dr. J. J. Levick.)*

Sodium Bicarbonate, 80 gr.
 Compound Tincture of Cardamom, 4 fl. dr.
 Compound Infusion of Gentian, 2 fl. oz.
 Peppermint Water, 8 fl. oz.
 Mix. A tablespoonful as required.

Glyceritum Sodii Boratis. U. S. 1870.**GLYCERITE OF BORAX.**

Sodium Borate, 2 oz. (troy).
 Glycerin, 8 fl. oz.

Rub them together in a mortar until the Sodium Borate is dissolved.

Troches of Borax.

Sodium Borate, 150 gr.
 Powdered Sugar, 1800 gr.
 Carmine, No. 40, 1 fl. gr.
 Tragacanth (in flakes), 5 gr.
 Distilled Water, 120 min.
 Tincture of Benzoin, 20 min.

Prepare a mucilage from the Tragacanth, with the addition of the Water and Tincture. Dissolve the Carmine in 80 minims of Water of Ammonia. Mix the dry ingredients together, add the Carmine solution and sufficient Tragacanth mucilage to form a mass. Divide the mass into 100 troches, each weighing 20 gr. and containing 1 fl. gr. of Sodium Borate.

Nipple Wash.*(Dr. Ades's.)*

Sodium Borate, 60 gr.
 Acacia, 120 gr.
 Tincture of Myrrh, 2 fl. dr.
 Rose Water, 2 fl. oz.

Dissolve the Borate in the Rose Water; make a thick mucilage with the Acacia, and emulsify the Tincture of Myrrh; then add the rest of the solution.

Hay-Fever Snuff.*(Dr. Mortimer Granville's.)*

Sodium Borate, 20 gr.
 Capsicum, 15 gr.
 Ammonium Carbonate, 10 gr.
 Mix.

234. Liquor Sodii Arseniatis, Pearson. N. F.*Pearson's Solution of Arseniate of Sodium.*

Arseniate of Sodium, in perfect crystals, 1 part.
 Distilled Water, enough to make 600 parts.

Dissolve the Arseniate of Sodium in enough Distilled Water to make six hundred (600) parts, and filter, if necessary.

Pearson's Solution of Arseniate of Sodium may also be prepared as follows:

Solution of Arseniate of Sodium
 (U. S. P. 1880), 1 part.
 Distilled Water, enough to make 10 parts.

Mix the Solution of Arseniate of Sodium with enough Distilled Water to make ten (10) parts, and filter, if necessary.

This solution contains about 1 per cent. of anhydrous Arseniate of Sodium.

Note.—This preparation should not be confounded with the *Liquor Sodii Arseniatis* of U. S. P. which is ten times stronger than the above preparation. Pearson's Solution is official in the French Pharm. under the title *Solut d'arseniate de soude* (or *Solution arsenicale de Pearson*). It is recommended that Pearson's Solution be dispensed only when expressly designated as "Pearson's."

Collyrium of Borate of Sodium.

Sodium Borate,	4 gr.
Camphor Water,	1 fl. oz.
Mix.	

238. Liquor Sodii Citro-Tartratis. N.F.*Solution of Citro-Tartrate of Sodium.*

Bicarbonate of Sodium,	890 gr.
Tartaric Acid,	860 gr.
Citric Acid,	80 gr.
Syrup,	1½ fl. oz.
Water,	10½ fl. oz.

Dissolve *three hundred and sixty (360) grains* of the Bicarbonate of Sodium in the Water and add the Tartaric Acid. When this is dissolved, filter the solution, add the Syrup to the filtrate, then the remainder of the Bicarbonate of Sodium, and, lastly, the Citric Acid, in crystals. Close the bottle at once with a stopper, which should be securely tied.

237. Liquor Sodii Citratis. N.F.*Solution of Citrate of Sodium.*

Mistura Sodii Citratis. Saturatio. Potio Riveri
(*Germ. Pharm.*).

Citric Acid,	150 gr.
Bicarbonate of Sodium,	190 gr.
Water,	16 fl. oz.

Dissolve the Citric Acid in the Water contained in a bottle, add the Bicarbonate of Sodium in divided portions, dissolve it by agitation, and immediately stopper the bottle securely.

This preparation should be freshly prepared when wanted for use.

Note.—The German Pharm. directs that, when "Saturatio" is prescribed, without any specification of the ingredients or strength, *Potio Riveri* represented here by *Liquor Sodii Citratis* be dispensed.

236. Liquor Sodii Carbolatis. N.F.*Solution of Carbolate of Sodium.*

(Phénol Sodique.)

Carbolic Acid, crystallized,	30 parts.
Soda,	2 parts.
Water,	28 parts.

Dissolve the Soda in the Water, add the Carbolic Acid, and warm gently until it is dissolved.

This preparation should be made fresh when wanted for use.

Note.—The formula is based upon that of the *Germ. Pharm.* (I., 1872).

235. Liquor Sodii Boratis Compositus. N.F.*Compound Solution of Borate of Sodium.*

Dobell's Solution.

Borate of Sodium,	120 gr.
Bicarbonate of Sodium,	120 gr.
Carbolic Acid, crystallized,	24 gr.
Glycerin,	½ fl. oz.
Water,	enough to make 16 fl. oz.

Dissolve the Salts in about *eight (8) fluidounces* of Water, then add the Glycerin and the Carbolic Acid previously liquefied by warming, and, lastly, enough Water to make *sixteen (16) fluidounces*. Finally, filter.

239. Liquor Sodii Oleatis. N.F.*Solution of Oleate of Sodium.*

White Castile Soap, dry and powdered, 16 tr. oz.
Water, enough to make 16 pints.

Mix the Castile Soap with *four (4) pints* of Water so as to produce a uniform and gelatinous mixture. Then add *ten (10) pints* more of Water, apply heat until the Soap is dissolved, allow the liquid to cool, and add enough Water to make it measure *sixteen (16) pints*.

Note.—This preparation is intended to be used in the preparation of Oleates.

100. Elixir Sodii Bromidi. N.F.*Elixir of Bromide of Sodium.*

Bromide of Sodium,	1280 gr.
Citric Acid,	80 gr.
Adjuvant Elixir, enough to make	16 fl. oz.

Dissolve the Bromide of Sodium and the Citric Acid in about *twelve (12) fluidounces* of Adjuvant Elixir by agitation. Then add enough Adjuvant Elixir to make *sixteen (16) fluidounces*, and filter, if necessary.

Each fluidrachm contains 10 grains of Bromide of Sodium.

102. Elixir Sodii Salicylatis. N.F.*Elixir of Salicylate of Sodium.*

Salicylate of Sodium,	640 gr.
Aromatic Elixir, enough to make	16 fl. oz.

Dissolve the Salicylate of Sodium in about *twelve (12) fluidounces* of Aromatic Elixir, by agitation. Then add enough Aromatic Elixir to make *sixteen (16) fluidounces*, and filter, if necessary.

This preparation should be freshly prepared when required for use.

Each fluidrachm contains 5 grains of Salicylate of Sodium.

263. Mistura Sodæ et Menthæ. N.F.*Mixture of Soda and Spearmint.*

Soda Mint.

Bicarbonate of Sodium,	820 gr.
Aromatic Spirit of Ammonia,	60 min.
Spearmint Water, enough to make	16 fl. oz.

Dissolve the Bicarbonate of Sodium in about *twelve (12) fluidounces* of Spearmint Water, add the Aromatic Spirit of Ammonia, and enough Spearmint Water to make *sixteen (16) fluidounces*. Filter, if necessary.

325. Sal Kissingense Factitium Effervescens. N. F.*Artificial Effervescent Kissingen Salt.*

Artificial Kissingen Salt, 540 parts.
 Bicarbonate of Sodium, 540 parts.
 Tartaric Acid, 480 parts.
 Sugar, in very fine powder, 240 parts.

Triturate the ingredients, previously well dried, to a fine, uniform powder.

If the compound is required in the form of a granular powder, mix it with Alcohol to a soft paste, and rub this through a No. 20 tinned-iron sieve, or enamelled colander. Then dry it, and reduce it to a coarse, granular powder.

A solution of about 80 grains of this preparation, in 6 fluidounces of water, represents an equal volume of Kissingen Water (Rakoczi Spring) in its essential constituents.

324. Sal Kissingense Factitium. N. F.*Artificial Kissingen Salt.*

Chloride of Potassium, 17 parts.
 Chloride of Sodium, 857 parts.
 Sulphate of Magnesium, anhydrous, 59 parts.
 Bicarbonate of Sodium, 107 parts.

Triturate the ingredients, previously well dried, to a fine, uniform powder.

A solution of about 24 grains of this preparation, in 6 fluidounces of water, represents an equal volume of Kissingen Water (Rakoczi Spring) in its essential constituents.

326. Sal Vichyanum Factitium. N. F.*Artificial Vichy Salt.*

Bicarbonate of Sodium, 852 parts.
 Carbonate of Potassium, 16 parts.
 Sulphate of Magnesium, anhydrous, 16 parts.
 Chloride of Sodium, 82 parts.

Triturate the ingredients, previously well dried, to a fine, uniform powder.

A solution of about 14 grains of this preparation, in 6 fluidounces of water, represents an equal volume of Vichy Water (Grande Grille Spring) in its essential constituents.

327. Sal Vichyanum Factitium Effervescens. N. F.*Artificial Effervescent Vichy Salt.*

Artificial Vichy Salt, 490 parts.
 Bicarbonate of Sodium, 570 parts.
 Tartaric Acid, 510 parts.
 Sugar, in very fine powder, 240 parts.

Triturate the ingredients, previously well dried, to a fine, uniform powder.

If the compound is required in the form of a granular powder, mix it with Alcohol to a soft paste, and rub this through a No.

20 tinned-iron sieve, or enamelled colander. Then dry it, and reduce it to a coarse, granular powder.

A solution of about 57 grains of this preparation, in 6 fluidounces of water, represents an equal volume of Vichy Water (Grande Grille Spring) in its essential constituents.

328. Sal Vichyanum Factitium Effervescens cum Lithio. N. F.*Artificial Effervescent Vichy Salt with Lithium.*

Artificial Vichy Salt, 280 parts.
 Citrate of Lithium, 100 parts.
 Bicarbonate of Sodium, 610 parts.
 Tartaric Acid, 540 parts.
 Sugar, 270 parts.

Triturate the ingredients, previously well dried, to a fine, uniform powder.

If the compound is required in the form of a granular powder, mix it with Alcohol to a soft paste, and rub this through a No. 20 tinned-iron sieve, or enamelled colander. Then dry it, and reduce it to a coarse, granular powder.

Ninety (90) grains (or about a heaped teaspoonful) of this preparation represent 14 grains of Artificial Vichy Salt and 5 grains of Citrate of Lithium.

329. Syrupus Sodii Hypophosphitis. N. F.*Syrup of Hypophosphite of Sodium.*

Hypophosphite of Sodium, 256 gr.
 Citric Acid, 10 gr.
 Sugar, 12 tr. oz.
 Water, enough to make 16 fl. oz.

Dissolve the Hypophosphite of Sodium and the Citric Acid in eight (8) fluidounces of Water, and filter the solution. In this dissolve the Sugar by agitation, and pass enough Water through the filter to make the product measure sixteen (16) fluidounces.

Each fluidrachm contains 2 grains of Hypophosphite of Sodium.

330. Soda cum Calce. N. F.*Soda with Lime.
London Paste.*

Soda, equal parts.
 Lime, each, equal parts.
 Reduce them to powder in a clean iron mortar, previously warmed, and mix them intimately. Keep the powder in small well-stoppered vials.

331. Sodii Boro-Benzoeas. N. F.*Boro-Benzoeate of Sodium.*

Borate of Sodium, in fine powder, 3 parts.
 Benzoate of Sodium, 4 parts.
 Mix them intimately.

AMMONIUM SALTS.

Carbonate of Ammonium Mixture.

Ammonium Carbonate,	90 gr.
Powdered Acacia,	90 gr.
Sugar,	90 gr.
Aromatic Spirit of Ammonia,	2 fl. dr.
Compound Tincture of Cardamom,	2 fl. dr.
Water,	8½ fl. oz.

Mix. A tablespoonful every two or three hours.

Ammonia Lozenges.

(Dr. Jackson's.)

Ammonium Chloride,	90 gr.
Morphine Hydrochlorate,	8 gr.
Powdered Elm,	860 gr.
Powdered Acacia,	420 gr.
Powdered Sugar,	420 gr.
Powdered Extract of Glycyrrhiza,	420 gr.
Oil of Sassafras,	4 min.
Tincture of Tolu,	8 fl. dr.

To be made with syrup into 180 lozenges, or into lozenges of 10 gr. each, containing ½ gr. of Ammonium Chloride and ⅛ gr. of Morphine Hydrochlorate.

Asthma Mixture.

(Fothergill's.)

Ammonium Iodide,	120 gr.
Ammonium Bromide,	180 gr.
Syrup of Tolu,	8 fl. oz.
Tincture of Lobelia,	5 fl. oz.

Mix. Teaspoonful every one, two, three, or four hours.

Solution of Valerianate of Ammonium.

TASTELESS AND ODORLESS.

(Rother's.)

Ammonium Valerianate,	119 gr.
Sodium Borate (Powdered),	191 gr.
Water of Ammonia, sufficient.	
Distilled Water, sufficient to make	8 fl. oz.

Mix the Ammonium Valerianate with 1 fl. oz. of Distilled Water, and add Water of Ammonia, drop by drop, until a clear and slightly alkaline solution is produced; then add 2 fl. oz. of Distilled Water and the Sodium Borate, and when all has dissolved, except the few contaminating crystals of Calcium Borate, add Distilled Water to make 8 fl. oz., and filter.

7. Aqua Sedativa. N. F.

Sedative Water.

Lotio Ammoniacalis Camphorata (Codex). Eau Sédative de Raspail.

Water of Ammonia,	2 fl. oz.
Spirit of Camphor,	90 min.
Chloride of Sodium,	1 tr. oz.
Water,	enough to make 16 fl. oz.

Dissolve the Chloride of Sodium in about eight (8) fluidounces of Water, add the Water of Ammonia and Spirit of Camphor, and finally enough Water to make sixteen (16) fluidounces.

Shake the liquid when it is to be dispensed.

26. Elixir Ammonii Bromidi. N. F.

Elixir of Bromide of Ammonium.

Bromide of Ammonium,	640 gr.
Citric Acid,	80 gr.
Adjuvant Elixir, enough to make	16 fl. oz.

Dissolve the Bromide of Ammonium and the Citric Acid in about eight (8) fluidounces of Adjuvant Elixir, by agitation. Then add enough Adjuvant Elixir to make sixteen (16) fluidounces, and filter, if necessary.

Each fluidrachm contains 5 grains of Bromide of Ammonium.

27. Elixir Ammonii Valerianatis. N. F.

Elixir of Valerianate of Ammonium.

Valerianate of Ammonium,	256 gr.
Water of Ammonia, a sufficient quantity.	
Chloroform,	6 min.
Tincture of Vanilla,	120 min.
Compound Tincture of Cudbear,	120 min.

Aromatic Elixir, enough to make 16 fl. oz.

Dissolve the Valerianate of Ammonium in about twelve (12) fluidounces of Aromatic Elixir, in a graduated vessel, and add enough Water of Ammonia, in drops, until a faint excess of it is perceptible in the liquid. Then add the Chloroform, Tincture of Vanilla, and Compound Tincture of Cudbear, and, finally, enough Aromatic Elixir to make sixteen (16) fluidounces. Filter, if necessary.

Each fluidrachm contains 2 grains of Valerianate of Ammonium.

Note.—Should the odor of valerianic acid become perceptible after the Elixir has been kept for some time, it may be overcome by slightly supersaturating with Water of Ammonia.

28. Elixir Ammonii Valerianatis et Quininae. N. F.

Elixir of Valerianate of Ammonium and of Quinine.

Hydrochlorate of Quinine,	82 gr.
Elixir of Valerianate of Ammonium,	16 fl. oz.

Dissolve the Hydrochlorate of Quinine in the Elixir by agitation, and, if necessary, by occasionally immersing the bottle containing the ingredients in hot water, until solution has been effected. Finally, filter.

Each fluidrachm contains ½ grain of Hydrochlorate of Quinine and 2 grains of Valerianate of Ammonium.

195. Linimentum Ammonii Iodidi. N. F.

Liniment of Iodide of Ammonium.

Iodine,	30 gr.
Oil of Rosemary,	110 min.
Oil of Lavender,	110 min.
Camphor,	220 gr.
Water of Ammonia,	1½ fl. oz.
Alcohol,	enough to make 16 fl. oz.

Dissolve the Iodine, the Oils, and the Camphor in *twelve* (12) *fluidounces* of Alcohol, then add the Water of Ammonia, and, lastly, enough Alcohol to make *sixteen* (16) *fluidounces*.

Note.—On standing, the liquid will become colorless, and there will, usually, be a slight precipitate, which may be separated by filtration.

205. Liquor Ammonii Acetatis Concentratus. N. F.

Concentrated Solution of Acetate of Ammonium.

Acetic Acid (U. S. P.),	16 fl. oz.
Carbonate of Ammonium,	a sufficient quantity.

Water, enough to make 32 fl. oz.

Neutralize the Acetic Acid with a sufficient quantity of Carbonate of Ammonium, carefully avoiding an excess. Then add enough Water to make the product measure *thirty-two* (32) *fluidounces*.

Note.—It is not recommended to keep this solution on hand for the preparation of the official *Liquor Ammonii Acetatis*, as this is preferably made freshly when wanted for use. When it is, however, required, or deemed of advantage, to dispense the concentrated solution, it is suggested that it be diluted with Carbonic Acid Water, or be directed to be diluted with this at the time of administration.

The product is about four times the strength of the official *Liquor Ammonii Acetatis*.

206. Liquor Ammonii Citratis Fortior. N. F.

Stronger Solution of Citrate of Ammonium.

Citric Acid,	9 tr. oz.
--------------	-----------

Stronger Water of Ammonia, Water, each, a sufficient quantity.

Neutralize the Citric Acid with the Stronger Water of Ammonia, and add enough Water to make *sixteen* (16) *fluidounces*. The solution should be kept in bottles free from lead.

Each fluidrachm contains about 40 grains of Citrate of Ammonium.

Note.—This Solution is apt to take up notable quantities of lead, if kept in bottles made of flint glass.

Liquor Ammonii Citratis (Brit. Pharm.) may be prepared from this Solution by mixing 1 volume of it with 4 volumes of Water.

249. Mistura Ammonii Chloridi. N. F.

Mixture of Chloride of Ammonium.

Mistura (or Mistura) Solvens Simplex.

Chloride of Ammonium,	180 gr.
Purified Extract of Glycyrrhiza,	180 gr.
Water,	enough to make 16 fl. oz.

Dissolve the solids in a sufficient quantity of Water to make *sixteen* (16) *fluidounces*.

Note.—Sometimes a *Mistura* (or *Mixture*) *Solvens Stibata* is prescribed. This may be prepared by dissolving 2 grains of Tartrate of Antimony and Potassium in each pint of *Mistura Ammonii Chloridi*.

257. Mistura Expectorans, Stokes. N. F.

Stokes's Expectorant Mixture.

Stokes's Expectorant.

Carbonate of Ammonium,	128 gr.
Fluid Extract of Senega,	½ fl. oz.
Fluid Extract of Squill,	½ fl. oz.
Camphorated Tincture of Opium,	3 fl. oz.
Water,	1½ fl. oz.
Syrup of Tolu, enough to make	16 fl. oz.

Dissolve the Carbonate of Ammonium in the Water, add the Fluid Extracts and Tincture, and, lastly, enough Syrup of Tolu to make *sixteen* (16) *fluidounces*.

MAGNESIUM SALTS.

Liquor Magnesii Acetatis. SOLUTION OF ACETATE OF MAGNESIUM.

(Neynaber's.)

Calcined Magnesia,	128 gr.
Acetic Acid, sufficient to saturate.	
Syrup of Citric Acid,	2 fl. oz.
Potassium Bicarbonate,	40 gr.
Water, to make	12 fl. oz.

Made and used like Solution of Magnesium Citrate (see page 574).

Magnesia Mixture.

(Dr. Isaac Remington's.)

Magnesia (Husband's),	90 gr.
Blue Mass,	30 gr.
Aromatic Spirit of Ammonia,	2 fl. dr.
Sugar,	60 gr.
Peppermint Water,	2 fl. oz.
Lime-Water,	3 fl. oz.

Mix. A tablespoonful every two hours.

252. Mistura Carminativa. N. F.

Carminative Mixture.

Dalby's Carminative.

Carbonate of Magnesium,	1 tr. oz.
Carbonate of Potassium,	20 gr.
Tincture of Opium,	180 min.
Oil of Caraway,	4 drops.
Oil of Fennel,	4 drops.
Oil of Peppermint,	4 drops.
Syrup,	2½ fl. oz.
Water,	enough to make 16 fl. oz.

Triturate the Oils with about *sixty* (60) *grains* of Carbonate of Magnesium, and *twelve* (12) *fluidounces* of Water, gradually added. Then add the remainder of the Carbonate of Magnesium and the other ingredients, and, lastly, add enough Water to make *sixteen* (16) *fluidounces*.

This preparation should be freshly made when wanted for use.

Each fluidounce represents about 1 grain of Opium.

223. Liquor Magnesii Bromidi. N. F.

Solution of Bromide of Magnesium.

Diluted Hydrobromic Acid (U. S. P.), 16 fl. oz.

Carbonate of Magnesium, a sufficient quantity.

Saturate the Diluted Hydrobromic Acid with a sufficient quantity (about one (1) *troisounce*) of Carbonate of Magnesium. When effervescence has ceased, filter.

Each fluidrachm contains about 7 grains of Bromide of Magnesium.

CALCIUM SALTS.

39. Elixir Calcii Lactophosphatis. N. F.

Elixir of Lactophosphate of Calcium.

Lactate of Calcium, 128 gr.

Phosphoric Acid (U. S. P. 50 per cent.), 128 min.

Water, 1 fl. oz.

Syrup, 1 fl. oz.

Aromatic Elixir, enough to make 16 fl. oz.

Triturate the Lactate of Calcium with the Phosphoric Acid, the Water, and the Syrup, until the salt is dissolved. Then add enough Aromatic Elixir to make sixteen (16) *fluidounces*, and filter.

Each fluidrachm represents 1 grain of Lactate of Calcium, or about 1½ grains of so-called Lactophosphate of Calcium.

Chalk Mixture.

(Richard's.)

Precipitated Calcium Carbonate, 1 oz. (troy).

Sugar, 1 oz. (troy).

Tincture of Opium, 1 fl. dr.

Spirit of Cinnamon, 15 min.

Compound Tincture of Lavender, 1 fl. oz.

Tincture of Kino, 1 fl. oz.

Water, 8 fl. oz.

Mix.

38. Elixir Calcii Hypophosphitis. N. F.

Elixir of Hypophosphite of Calcium.

Hypophosphite of Calcium, 256 gr.

Citric Acid, 80 gr.

Aromatic Elixir, enough to make 16 fl. oz.

Dissolve the Hypophosphite of Calcium in fourteen (14) *fluidounces* of Aromatic Elixir, and filter. Dissolve the Citric Acid in the filtrate and pass enough Aromatic Elixir through the filter to make sixteen (16) *fluidounces*.

Each fluidrachm contains 2 grains of Hypophosphite of Calcium.

Syrup of Hypophosphite of Calcium.

(Procter's.)

Calcium Hypophosphite, 2 oz. (troy).

Sugar, 24 oz. (troy).

Tincture of Vanilla, 1 fl. oz.

Water, 19 fl. oz.

Dissolve the salt in the Water, filter, add the Sugar, dissolve by aid of heat, and add the Tincture. Dose, a teaspoonful to a tablespoonful three times a day.

37. Elixir Calcii Bromidi. N. F.

Elixir of Bromide of Calcium.

Bromide of Calcium, 640 gr.

Citric Acid, 80 gr.

Adjuvant Elixir, enough to make 16 fl. oz.

Dissolve the Bromide of Calcium and the Citric Acid in about twelve (12) *fluidounces* of Adjuvant Elixir by agitation. Then add enough Adjuvant Elixir to make sixteen (16) *fluidounces*, and filter, if necessary.

Each fluidrachm contains 5 grains of Bromide of Calcium.

209. Liquor Calcis Sulphuratæ. N. F.

Solution of Sulphurated Lime.

Solution of Oxysulphuret of Calcium. Vie-minck's Solution (or Lotion).

Lime, freshly slaked, 2 parts.

Sublimed Sulphur, 8 parts.

Water, enough to make 12 parts.

Mix the slaked Lime with the Sulphur, and add the mixture gradually to twenty (20) parts of boiling Water. Then boil the whole, under constant stirring, until it is reduced to twelve (12) parts, strain, and, having allowed the solution to become clear by standing in a well-stoppered bottle, decant the clear brown liquid, and keep it in completely-filled and well-stoppered bottles.

385. Talcum Purificatum. N. F.

Purified Talcum.

Talcum, in fine powder, 100 parts.

Hydrochloric Acid, 15 parts.

Water, a sufficient quantity.

Mix five hundred (500) parts of boiling Water with the Talcum, gradually add ten (10) parts of the Hydrochloric Acid, and boil the mixture during fifteen minutes. Then allow the suspended Talcum to subside, pour off the supernatant liquid, and boil the residue again with five hundred (500) parts of Water mixed with the remainder of the Hydrochloric Acid. Again allow the mixture to become clear by settling, pour off the supernatant liquid, and wash the residue with Water, by repeated decantation, until a portion of the wash-water, filtered and placed in

a test-tube, ceases to produce a precipitate with test-solution of nitrate of silver acidified with nitric acid. Then transfer the magma to a close linen or muslin strainer, allow it to drain, and dry it by heat.

Note.—Purified Talcum is used as an aid in filtering turbid liquids containing finely-divided matters in suspension, which are apt to pass through the filter, or to stop up its pores.

331. Pulvis Talci Salicylicus. N. F.

Salicylated Powder of Talcum.

Salicylic Acid,	8 parts.
Boric Acid, in fine powder,	10 parts.
Talcum, in fine powder,	87 parts.

Mix them intimately.

Note.—The corresponding preparation of the Germ. Pharm. has the title *Pulvis Salicylicus cum Talco*, and contains 10 parts of Wheat Starch in place of Boric Acid.

354. Syrupus Calcii Chlorhydrophosphatis. N. F.

Syrup of Chlorhydrophosphate of Calcium.

Syrup of Chlorhydrophosphate of Lime.

Precipitated Phosphate of Calcium,	128 gr.
Hydrochloric Acid,	
Water, each,	a sufficient quantity.
Spirit of Lemon,	140 min.
Syrup,	enough to make 16 fl. oz.

Triturate the Precipitated Phosphate of Calcium with *one* (1) *fluidounce* of Water, and dissolve it with the aid of Hydrochloric Acid, avoiding an excess. Then add the Spirit of Lemon, filter the liquid, and wash the filter with a mixture of *one* (1) *fluidounce*, each, of Water and Syrup. Lastly, add enough Syrup to the filtrate to make *sixteen* (16) *fluidounces*.

Each fluidrachm contains 1 grain of Phosphate of Calcium.

358. Syrupus Calcii Lactophosphatis cum Ferro. N. F.

Syrup of Lactophosphate of Calcium with Iron.

Syrup of Lactophosphate of Lime with Iron.	
Lactate of Iron,	64 gr.
Citrate of Potassium,	64 gr.
Water,	1 fl. oz.

Syrup of Lactophosphate of Calcium (U.S.P.), enough to make 16 fl. oz.

Dissolve the Lactate of Iron and Citrate of Potassium in the Water with the aid of heat, and add enough Syrup of Lactophosphate of Calcium to make *sixteen* (16) *fluidounces*.

Each fluidrachm contains ½ grain of Lactate of Iron and about ½ grain of Lactate of Calcium (or about ¾ grain of so-called Lactophosphate of Calcium).

Syrup of Phosphate of Calcium.

(Wiegand's.)

Precipitated Calcium Phosphate,	1 oz. (troy).
Hydrochloric Acid,	4 fl. dr.
Sugar,	12 oz. (troy).
Water,	7 fl. oz.

Dissolve the Calcium Phosphate, previously mixed with an ounce of Water, by means of the Acid, and filter; add the Sugar, then the remaining Water, until the bulk is increased to 12 fl. oz., and strain. Dose, a teaspoonful.

Aromatic Chalk Powder.

(Ph. Br.)

Cinnamon,	2 oz. (troy).
Nutmeg,	
Saffron,	of each, 1½ oz. (troy).
Cloves,	360 gr.
Cardamom,	240 gr.
Sugar,	12½ oz. (troy).
Prepared Chalk,	5½ oz. (troy).

Reduce to a powder, and mix thoroughly; then pass through a fine sieve, and finally rub it lightly in a mortar.

312. Pulvis Cretæ Aromaticus. N. F.

Aromatic Powder of Chalk.

Cinnamon,	4 parts.
Saffron,	3 parts.
Nutmeg,	3 parts.
Cloves,	1½ parts.
Cardamom,	1 part.
Prepared Chalk,	11 parts.
Sugar,	25 parts.

Mix the ingredients and reduce them to a fine powder. Pass this through a fine sieve, and afterwards rub it lightly in a mortar. Keep it in a stoppered bottle.

Note.—This preparation is equivalent to the *Pulvis Cretæ Aromaticus* of the Brit. Pharm. This authority adds the following note: "If a product of bright color be desired, the saffron may previously be moistened and triturated with a little water or alcohol, or the fresh and faintly damp mixture may be subjected to considerable pressure in the triturating process."

313. Pulvis Cretæ Aromaticus cum Opio. N. F.

Aromatic Powder of Chalk with Opium.

Aromatic Powder of Chalk,	39 parts.
Powdered Opium,	1 part.

Mix them intimately.

Every 40 grains of this preparation contain 1 grain of Powdered Opium.

Note.—This preparation is official in the Brit. Pharm.

Chalk Ointment.

Prepared Chalk,	120 gr.
Olive Oil,	80 min.
Lard,	270 gr.

Mix.

Chalk Powders.

Prepared Chalk,	180 gr.
Acacia,	60 gr.
Sugar,	60 gr.
Cinnamon (Powdered),	15 gr.
Mix, and divide into 12 powders.	

Potter's Powder.

Prepared Chalk,	8 oz. (troy).
Powdered Camphor,	240 gr.
Ammonium Carbonate,	1 oz. (troy).
Mix.	

BARIUM SALTS.

Liquor Barii Chloridi. U. S. 1870. SOLUTION OF CHLORIDE OF BARIUM.

Chloride of Barium,	1 oz. (troy).
Distilled Water,	8 fl. oz.
Dissolve the Chloride in the Distilled Water, and filter through paper.	

ZINC SALTS.

Ceratum Zinci Carbonatis. U. S. 1870. CERATE OF CARBONATE OF ZINC.

Precipitated Carbonate of Zinc,	2 oz. (troy).
Ointment,	10 oz. (troy).
Mix them thoroughly.	

419. Unguentum Calaminæ. N. F. Calamine Ointment.

Unguentum Zinci Carbonatis (Impuri). Unguentum Calaminaræ. Turner's Cerate.

Prepared Calamine,	1 part.
Ointment (U. S. P.),	5 parts.

Mix them intimately, by trituration, so as to produce a smooth and homogeneous ointment.

Canquoin's Paste.

Fused Zinc Chloride,	300 gr.
Wheat Flour,	420 gr.
Alcohol,	1 fl. dr.

Rub the Chloride of Zinc to a fine powder, and make a paste with the Alcohol; then add the Wheat Flour, using strong pressure with the pestle. When the paste is homogeneous, spread with a roller into sheets about one-eighth of an inch thick, and, after a few hours' exposure, preserve in well-corked bottles.

Chloride of Zinc Paste.

(Latour's.)

Zinc Chloride,	300 gr.
Zinc Nitrate,	600 gr.
Water,	1 fl. oz.

Dissolve with the aid of heat, and when cool add to each ounce 800 gr. of Wheat Flour. Make a paste, and then roll into sheets one-eighth of an inch thick. Preserve in well-stoppered bottles.

Calamine Lotion.

(Dr. Tilbury Fox's.)

Levigated Calamine,	40 gr.
Zinc Oxide,	20 gr.
Glycerin,	20 min.
Rose Water,	1 fl. oz.
Mix.	

Solution of Sulphide of Zinc.

(Dr. Duhring's.)

Zinc Sulphate,	30 gr.
Potassium Sulphide,	30 gr.
Alcohol,	8 fl. dr.
Rose Water,	8½ fl. oz.
Mix. Used for lupus.	

Injection for Gonorrhœa.

Zinc Sulphate,	15 gr.
Lead Acetate,	30 gr.
Extract of Opium,	5 gr.
Tannin,	2 gr.
Rose Water,	8 fl. oz.
Mix, and dispense without filtering.	

Eye-Water.

(Thomas's.)

Zinc Sulphate,	20 gr.
Sodium Chloride,	20 gr.
Rose Water,	1 fl. oz.
Mix.	

109. Elixir Zinci Valerianatis. N. F.

Elixir of Valerianate of Zinc.

Valerianate of Zinc,	128 gr.
Stronger Solution of Citrate of Ammonium,	1½ fl. oz.
Alcohol,	2 fl. oz.
Oil of Bitter Almond,	1 drop.
Compound Tincture of Cudbear,	120 min.
Aromatic Elixir, enough to make 16 fl. oz.	

Mix the Stronger Solution of Citrate of Ammonium with four (4) fluidounces of Aromatic Elixir and the Alcohol, and triturate the Valerianate of Zinc with this mixture, added gradually and in portions, until solution has been effected. Then add the Oil of Bitter Almond, the Compound Tincture of Cudbear, and, finally, enough Aromatic Elixir to make sixteen (16) fluidounces. Allow the mixture to stand a few days, and filter.

Each fluidrachm contains 1 grain of Valerianate of Zinc.

273. Oleatum Zinci. N. F.

Oleate of Zinc.

Acetate of Zinc, crystallized,	8 tr. oz.
Solution of Oleate of Sodium (N. F.),	8 pints.
Water,	a sufficient quantity.
Dissolve the Acetate of Zinc in sixteen (16) pints of cold Water, filter the solu-	

tion, if necessary, through a pellet of absorbent cotton placed in the neck of a funnel, and then mix it slowly, and under constant stirring, with the Solution of Oleate of Sodium. Transfer the mixture to a wetted muslin strainer, and when the liquid has drained off, wash the precipitate with Water until the washings are practically tasteless. Lastly, dry the precipitate, spread on paper, by exposure to dust-free air, without heat.

The product contains an amount of Zinc corresponding to about 18 per cent. of Oxide of Zinc.

Note.—The theoretical yield of Oleate of Zinc obtainable from 8 troyounces of acetate of zinc is 3600 grains; in practice, about 7 troyounces will be obtained. Oleate of Zinc, prepared by the above process, is in the form of a soft, white powder, and may be converted into a plaster or ointment by mixing it with such a proportion of oleic acid as may be required.

241. Liquor Zinci et Ferri Compositus. N. F.

Compound Solution of Zinc and Iron.

Deodorant Solution.

Sulphate of Zinc,	16 tr. oz.
Sulphate of Iron,	16 tr. oz.
Naphthol,	20 gr.
Oil of Thyme,	60 min.
Hypophosphorous Acid,	120 min.
Water,	enough to make 5 pints.

Dissolve the Sulphate of Zinc and Sulphate of Iron in *five (5) pints* of boiling Water, add the Naphthol and Oil of Thyme, and shake the mixture occasionally, in a stoppered bottle, until it is cold. Then add the Hypophosphorous Acid, filter the liquid through a wetted filter, and, lastly, pass enough Water through the latter to make *five (5) pints*.

Note.—This solution is used as a simple deodorant and antiseptic for common domestic use, when it is unnecessary or impracticable to employ more powerful agents.

When a deodorant solution is required for purposes where iron is objectionable, as, for instance, when woven fabrics are to be steeped in it, the following preparation may be employed:

2. Liquor Zinci et Aluminiumi Compositus.

Sulphate of Zinc,	16 tr. oz.
Sulphate of Aluminium,	16 tr. oz.
Naphthol,	20 gr.
Oil of Thyme,	60 min.
Water,	enough to make 5 pints.

Dissolve the Sulphate of Zinc and the Sulphate of Aluminium in *five (5) pints* of Water, by the aid of heat, add the Naphthol and Oil of Thyme, and shake the mixture occasionally, in a stoppered bottle, until it cools. Set it aside for a few days, if convenient, and then pass it through a wetted filter, following it with enough Water to make *five (5) pints*.

The commercial Sulphate of Aluminium (not Alum) may be used for this preparation. This generally contains a trace of iron, but by allowing the liquid to stand, this will be gradually precipitated.

ALUMINUM SALTS.

Diarrhoea Powders.

Powdered Alum,	240 gr.
Powdered Kino,	60 gr.
Powdered Opium,	8 gr.

Mix, and divide into 12 powders. For use in obstinate cases. Dose, one every two or three hours.

204. Liquor Aluminiumi Acetico-Tartratis. N. F.

Solution of Acetico-Tartrate of Aluminium.

Alum (U. S. P.),	150 parts.
Carbonate of Sodium,	140 parts.
Glacial Acetic Acid,	80 parts.
Tartaric Acid,	27 parts.
Water,	enough to make 200 parts.

Dissolve the Alum and the Carbonate of Sodium, each, in *two thousand (2000) parts* of Water, mix the solutions, and wash the precipitate, first by decantation, and afterwards on a strainer, until the washings run off tasteless. Allow the precipitate to drain and to shrink in volume by exposure on the strainer. Then transfer it to a tared capsule, add the Glacial Acetic and the Tartaric Acids, and apply heat until solution has been effected. Finally, evaporate the liquid to *two hundred (200) parts*.

The product contains about 50 per cent. of dry, so-called Acetico-Tartrate of Aluminium.

Note.—The dry salt may be obtained by evaporating the solution.

203. Liquor Aluminiumi Acetatis. N. F.

Solution of Acetate of Aluminium.

Sulphate of Aluminium, crystallized,	80 parts.
Acetic Acid (U. S. P.),	80 parts.
Carbonate of Calcium,	13 parts.
Water,	100 parts.

Dissolve the Carbonate of Calcium in the Acetic Acid mixed with *twenty (20) parts* of Water, and the Sulphate of Aluminium in *eighty (80) parts* of Water. Mix the two solutions, and allow the mixture to stand for twenty-four hours, agitating occasionally. Then pour off the clear solution, and filter.

The Solution contains from 7.5 to 8 per cent. of Basic Acetate of Aluminium.

Note.—Practically identical with the *Liquor Aluminiumi Acetici* of the German Pharm.

Nipple Wash.

(Dr. Thomas's.)

Alum,	1 oz. (troy).
Tincture of Galls,	1 fl. oz.
Triturate together, and dispense without straining or filtering.	

Gargle of Alum.

Alum,	120 gr.
Honey,	1 fl. oz.
Infusion of Flaxseed,	8 fl. oz.
Make a gargle.	

Burrow's Solution.

Lead Acetate,	600 gr.
Alum,	860 gr.
Sodium Sulphate,	60 gr.
Water,	10 fl. oz.

Dissolve the Lead Acetate in 8 fl. oz. of Water, and the Sodium Sulphate and Alum in the remaining Water; mix the solutions and stir; allow it to stand for two days, and filter without washing the residue.

Bromo-Chloralum.

Aluminum Chloride,	1 oz. (troy).
Aluminum Bromide,	240 gr.
Boiling Water,	8 fl. oz.

Dissolve by heat in a water-bath; when cool, filter through paper.

MANGANESE SALTS.

Syrup of Iodide of Manganese.

(Procter's.)

Manganese Sulphate,	1 oz. (troy).
Potassium Iodide,	285 gr.
Sugar,	6 oz. (av.).
Water,	

Syrup, of each, sufficient.

Dissolve the Sulphate and Iodide, each, in 1½ fl. oz. of cold Water, to which 1 fl. dr. of Syrup has been added. Mix them in a glass-stoppered bottle, and, after the crystals of Potassium Sulphate cease to precipitate, throw the solution on a filter of fine muslin, and allow it to pass into an 8-oz. bottle containing the Sugar; add sufficient Water to the filter to bring up the measure of the resulting Syrup to exactly 8 fl. oz. This contains about 60 gr. of the Iodide to each fl. oz. Dose, 10 minims.

Syrup of Phosphate of Manganese.

(Wiegand's.)

Manganese Sulphate	
(cryst.),	785 gr.
Sodium Phosphate,	1200 gr.
Hydrochloric Acid,	4 fl. dr.
Sugar,	10 oz. (troy).
Water, sufficient.	

Dissolve the salts separately, each in 8 fl. oz. of Water, and add the solution of Sodium Phosphate to the solution of Manganese Sulphate, as long as it produces a precipitate, which wash with cold Water and dissolve by means of the Acid; dilute till it measures 7 fl. oz., then add the Sugar. Each fl. dr. contains 5 gr. of the salt.

IRON AND CHROMIUM SALTS.

Bitter Tincture of Iron.

(Physick's.)

Iron (filings),	8 oz. (av.).
Ginger (bruised),	
Gentian (bruised), of each,	1 oz. (av.).
Orange Peel,	½ oz. (av.).
Strong Old Cider,	16 fl. oz.
Macerate for two weeks or longer, express, and filter.	

Lemonade Iron.

(Goodell's.)

Tincture of Chloride of Iron,	2 fl. dr.
Diluted Phosphoric Acid,	6 fl. dr.
Spirit of Lemon,	2 fl. dr.
Syrup, sufficient to make	6 fl. oz.
Mix. A dessertspoonful in water after meals.	

Iron Pills.

Reduced Iron,	100 gr.
Manna,	80 gr.
Glucose, sufficient.	
Make a mass, and divide into 50 pills.	

Mixture of Iron and Conium.

(Dr. King's Am. Disp.)

Precipitated Carbonate of Iron,	800 gr.
Inspissated Juice of Conium,	150 min.
Sugar,	1 oz. (av.).
Oil of Cinnamon,	6 min.
Oil of Gaultheria,	6 min.
Tincture of Tolu,	8 fl. oz.
Madeira Wine,	4 fl. oz.
Water,	4 fl. oz.

Mix together, and allow to stand for a week, when it will be ready for use.

Mixture of Gentian and Iron.

(Meigs's.)

Citrate of Iron and Ammonium,	60 gr.
Sugar,	1½ oz. (troy).
Fluid Extract of Gentian,	30 min.
Compound Tincture of Lavender,	1 fl. oz.
Alcohol,	4 fl. dr.
Water, sufficient to make	8 fl. oz.
Mix the fluid extract with 1 fl. oz. of Water and add the Compound Tincture of Lavender; treat this with hydrated oxide of iron, and, having filtered it, mix with the other ingredients, and filter.	

59. Elixir Ferri Hypophosphitis. N. F.

Elixir of Hypophosphite of Iron.

Solution of Hypophosphite of Iron,	768 min.
Aromatic Elixir, enough to make	16 fl. oz.
Mix the Solution of Hypophosphite of Iron with enough Aromatic Elixir to	

make *sixteen* (16) *fluidounces*. Allow the mixture to stand a few days in a cool place, and filter, if necessary.

Each fluidrachm contains 1 grain of Hypophosphite of Iron (ferric).

60. *Elizir Ferri Lactatis. N. F.*

Elizir of Lactate of Iron.

Lactate of Iron, in crusts, 128 gr.
Citrate of Potassium, 884 gr.
Aromatic Elizir, enough to make 16 fl. oz.

Triturate the Lactate of Iron with the Citrate of Potassium and about *four* (4) *fluidounces* of Aromatic Elizir, gradually added, until solution has been effected. Then add enough Aromatic Elizir to make *sixteen* (16) *fluidounces*, and filter.

Each fluidrachm contains 1 grain of Lactate of Iron.

61. *Elizir Ferri Phosphatis. N. F.*

Elizir of Phosphate of Iron.

Phosphate of Iron (U. S. P. 1880), 256 gr.
Water, 1 fl. oz.
Aromatic Elizir, enough to make 16 fl. oz.

Dissolve the Phosphate of Iron in the Water with the aid of heat; then mix this solution with a sufficient quantity of Aromatic Elizir to make *sixteen* (16) *fluidounces*. Filter, if necessary.

Each fluidrachm contains 2 grains of Phosphate of Iron.

62. *Elizir Ferri Phosphatis, Cinchonidinæ, et Strychninæ. N. F.*

Elizir of Phosphate of Iron, Cinchonidine, and Strychnine.

Phosphate of Iron (U. S. P. 1880), 256 gr.
Citrate of Potassium, 82 gr.
Sulphate of Cinchonidine, 128 gr.
Sulphate of Strychnine, 1½ gr.
Alcohol, 1 fl. oz.
Water, 860 min.
Aromatic Elizir, enough to make 16 fl. oz.

Dissolve the Phosphate of Iron and Citrate of Potassium in the Water, using heat, if necessary. To *twelve* (12) *fluidounces* of Aromatic Elizir, contained in a bottle, add the Alcohol, and afterwards the alkaloidal salts, and agitate until the latter are dissolved, or nearly so. Then mix the two solutions, and, having shaken the mixture, add enough Aromatic Elizir to make *sixteen* (16) *fluidounces*. Finally, filter.

Each fluidrachm contains 2 grains of Phosphate of Iron, 1 grain of Sulphate of Cinchonidine, and 1½ grain of Sulphate of Strychnine.

Note.—When this Elizir is mixed with water, it will become cloudy or opaque through the separation of some of its constituents.

63. *Elizir Ferri Phosphatis, Quininæ, et Strychninæ. N. F.*

Elizir of Phosphate of Iron, Quinine, and Strychnine.

Phosphate of Iron (U. S. P. 1880), 256 gr.
Citrate of Potassium, 82 gr.
Hydrochlorate of Quinine, 128 gr.
Sulphate of Strychnine, 1½ gr.
Alcohol, 1 fl. oz.
Water, 860 min.
Aromatic Elizir, enough to make 16 fl. oz.

Dissolve the Phosphate of Iron and Citrate of Potassium in the Water, using heat, if necessary. To *twelve* (12) *fluidounces* of Aromatic Elizir, contained in a bottle, add the Alcohol, and afterwards the alkaloidal salts, and agitate until the latter are dissolved, or nearly so. Then mix the two solutions, and, having shaken the mixture, add enough Aromatic Elizir to make *sixteen* (16) *fluidounces*. Finally, filter.

Each fluidrachm contains 2 grains of Phosphate of Iron, 1 grain of Hydrochlorate of Quinine, and 1½ grain of Sulphate of Strychnine.

Note.—When this Elizir is mixed with water, it will become cloudy or opaque through the separation of some of its constituents.

64. *Elizir Ferri Pyrophosphatis. N. F.*

Elizir of Pyrophosphate of Iron.

Pyrophosphate of Iron (U. S. P. 1880), 256 gr.
Water, 1 fl. oz.
Aromatic Elizir, enough to make 16 fl. oz.

Dissolve the Pyrophosphate of Iron in the Water, and add enough Aromatic Elizir to make *sixteen* (16) *fluidounces*. Filter, if necessary.

Each fluidrachm contains 2 grains of Pyrophosphate of Iron.

65. *Elizir Ferri, Quininæ, et Strychninæ. N. F.*

Elizir of Iron, Quinine, and Strychnine.

Tincture of Citro-Chloride of Iron, 2 fl. oz.
Sulphate of Quinine, 128 gr.
Sulphate of Strychnine, 1½ gr.
Alcohol, 1 fl. oz.
Aromatic Elizir, enough to make 16 fl. oz.

Dissolve the alkaloidal salts in about *twelve* (12) *fluidounces* of Aromatic Elizir, then add the Tincture and the Alcohol, and, finally, enough Aromatic Elizir to make *sixteen* (16) *fluidounces*. Filter, if necessary.

Each fluidrachm represents about 1 grain of Ferri Chloride, 1 grain of Sulphate of Quinine, and 1½ grain of Sulphate of Strychnine.

178. Ferri et Quininae Citras Effervescens. N. F.

Effervescent Citrate of Iron and Quinine.

Citrate of Iron and Quinine, 20 parts.
Bicarbonate of Sodium, 600 parts.
Tartaric Acid, 540 parts.
Sugar, in very fine powder, 620 parts.

Triturate the ingredients, previously well dried, to a fine, uniform powder.

If the compound is required in the form of a granular powder, mix it with Alcohol to a soft paste, and rub this through a No. 20 tinned-iron sieve, or enamelled colander. Then dry it, and reduce it to a coarse, granular powder.

Ninety (90) grains (or about a heaped teaspoonful) of the above compound represent 1 grain of Citrate of Iron and Quinine.

179. Ferri Hypophosphis. N. F.

Hypophosphite of Iron.

Ferric Hypophosphite.

Sulphate of Iron and Ammonium (U. S. P.), in perfect crystals, 77 parts.
Hypophosphite of Sodium, 51 parts.
Distilled Water, a sufficient quantity.

Dissolve the Sulphate of Iron and Ammonium in three hundred (300) parts, and the Hypophosphite of Sodium in one hundred (100) parts of Distilled Water, and, if necessary, filter each solution. Then mix them, and stir thoroughly; after a short time transfer the mixture to a close linen or muslin strainer, and wash the precipitate with Distilled Water, until the washings run off tasteless. Transfer the strainer to a warm place and, when the contents are dry, preserve them for use.

Hypophosphite of Iron (ferric) may also be prepared in the following manner:

Hypophosphite of Calcium, 1 part.
Solution of Chloride of Iron (U. S. P.),

Distilled Water, each, a sufficient quantity.

Dissolve the Hypophosphite of Calcium in twelve (12) parts of Distilled Water, and filter the solution. To this add Solution of Chloride of Iron, in small portions, stirring well each time and allowing the precipitate to subside before adding a fresh portion. Toward the end, remove a small quantity of the clear supernatant liquid, add to it some Solution of Chloride of Iron diluted with about ten (10) times its volume of Water, and observe whether any turbidity occurs either at once or after a few minutes. If it remains clear, the precipitation may be regarded as complete. Then transfer the mixture to a close linen or muslin strainer, and wash the precipitate with Distilled Water, until

the washings run off tasteless. Transfer the strainer to a warm place and, when the contents are dry, preserve them for use.

Note.—Hypophosphite of Iron is rendered soluble in water by mixing it with about an equal weight of citrate of potassium, or some other alkaline citrate. Theoretically, 100 parts of Sulphate of Iron and Ammonium will yield 51.9 parts, and 100 parts of Hypophosphite of Calcium will yield 85.3 parts of dry Hypophosphite of Iron (ferric).

180. Ferri Phosphas Effervescens.

N. F.

Effervescent Phosphate of Iron.

Phosphate of Iron (U. S. P. 1880), 40 parts.
Bicarbonate of Sodium, 600 parts.
Tartaric Acid, 540 parts.
Sugar, in very fine powder, 620 parts.

Triturate the ingredients, previously well dried, to a fine, uniform powder.

If the compound is required in form of a granular powder, mix it with Alcohol to a soft paste, and rub this through a No. 20 tinned-iron sieve or enamelled colander. Then dry it, and reduce it to a coarse, granular powder.

Ninety (90) grains (or about a heaped teaspoonful) of the above compound represent 2 grains of Phosphate of Iron.

215. Liquor Ferri Hypophosphitis.

N. F.

Solution of Hypophosphite of Iron.

Solution of Ferric Hypophosphite.

Sulphate of Iron and Ammonium (U. S. P.), in perfect crystals, 2464 gr.
Hypophosphite of Sodium, 1622 gr.
Citrate of Potassium, 1600 gr.
Glycerin, 2½ fl. oz.
Water, enough to make 16 fl. oz.

Dissolve the Sulphate of Iron and Ammonium, and the Hypophosphite of Sodium, each, in twenty-four (24) fluidounces of Water, and, if necessary, filter each solution. Then mix them, and stir thoroughly; after a few minutes transfer the resulting magma to a close linen or muslin strainer, and wash the precipitate with about eight (8) fluidounces of Water. Allow it to drain, and then press it forcibly in the strainer, so as to remove as much of the liquid as possible. Transfer the precipitate from the strainer to a mortar, add to it the Citrate of Potassium, and triturate until a perfectly smooth paste results. Then add the Glycerin, and gradually, while stirring, enough Water to make the solution measure sixteen (16) fluidounces. Place it for several days in a cold place, if convenient; then pour off the clear solution from any precipitate or crystals that may have formed, and keep

the solution in small, completely-filled, and well-corked bottles.

Solution of Hypophosphite of Iron (ferric) may also be prepared in the following manner:

Hypophosphite of Iron,	1290 gr.
Citrate of Potassium,	1622 gr.
Glycerin,	2½ fl. oz.
Water,	enough to make 16 fl. oz.

Triturate the Hypophosphite of Iron with six (6) *fluidounces* of Water to a perfectly smooth mixture, then add the Citrate of Potassium and Glycerin, and apply a gentle heat, until solution has been effected. Allow the liquid to cool, and add enough Water to make sixteen (16) *fluidounces*. Place the solution for several days in a cold place, if convenient; then pour off the clear solution from any precipitate or crystals that may have formed, and keep the solution in small, completely-filled, well-corked bottles.

About 6 minims of this Solution represent 1 grain of Hypophosphite of Iron (ferric).

149. Extractum Ferri Pomatum. N. F.

Ferrated Extract of Apples.

Ferri Malis Crudus. Crude Malate of Iron.

Iron, in the form of fine, bright wire, and cut,	1 part.
Ripe Sour Apples,	50 parts.
Water,	a sufficient quantity.

Convert the Sour Apples into a homogeneous pulp by pounding or grinding, and express the liquid portion. Then mix the latter with the Iron in an enamelled or porcelain vessel, macerate for forty-eight hours, and then apply the heat of a water-bath, until no more bubbles of gas are given off, adding a little water from time to time to make up any loss by evaporation. Dilute the liquid with Water to make it weigh fifty (50) parts, and set it aside for a few days. Then filter, and evaporate the filtrate in the before-mentioned vessel to a thick extract, which should be greenish-black, and should yield a clear solution with water.

Note.—This preparation is inserted here with the title under which it is contained in the German Pharmacopœia. In some others it is called, more correctly, *Extractum Pomî* (or *Pomorum*) *Ferratum*.

216. Liquor Ferri Iodidi. N. F.

Solution of Iodide of Iron.

Iron, in the form of fine, bright, and finely-cut wire,	8 tr. oz.
Iodine,	4718 gr.
Hypophosphorous Acid (N. F.),	180 min.
Distilled Water, enough to make	16 fl. oz.

Mix the Iron with twelve (12) *fluid-ounces* of Distilled Water in a flask, add

about one-half of the Iodine, and agitate continuously until the liquid becomes hot. Then moderate the reaction by placing the flask in cold water, or by allowing cold water to flow over it, meanwhile keeping up the agitation. When the reaction has moderated, add one-half of the remaining Iodine at a time, and carefully moderate the reaction each time, in the manner above directed. Finally, raise the contents of the flask to boiling and filter immediately through moistened pure filtering paper (the point of the filter being supported by a pellet of absorbent cotton) into a bottle containing the Hypophosphorous Acid. When all the liquid has passed, rinse the flask with one-half (½) *fluidounce* of boiling Distilled Water, and pass this through the filter. Cork the bottle and set it aside to cool. Finally, add enough Distilled Water to make the product measure sixteen (16) *fluidounces*.

Each *fluidrachm* contains about 45 grains of Iodide of Iron (ferrous).

Note.—On mixing 1 volume of this Solution of Iodide of Iron with 5 volumes of Syrup, the product will contain about 80 grains of Iodide of Iron (ferrous) in each *fluidounce*, and will be practically identical, measure for measure, but not weight for weight, with the official Syrup of Iodide of Iron.

217. Liquor Ferri Oxysulphatis. N. F.

Solution of Oxysulphate of Iron.

Sulphate of Iron,	1200 gr.
Nitric Acid,	1200 gr.
Distilled Water, enough to make	16 fl. oz.

Dissolve the Sulphate of Iron in fifteen (15) *fluidounces* of boiling Distilled Water, in a flask, gradually add the Nitric Acid, and continue the heat, until the escaping vapors cease to have a nitrous odor. When the reaction is completed, allow the liquid to cool and add enough Distilled Water to make sixteen (16) *fluidounces*.

218. Liquor Ferri Protochloridi. N. F.

Solution of Protochloride of Iron.

Solution of Ferrous Chloride.

Iron, in the form of fine, bright, and finely-cut wire,	1180 gr.
Hydrochloric Acid,	10 tr. oz.
Glycerin,	4 fl. oz.

Hypophosphorous Acid (N. F.), 60 min.

Distilled Water, enough to make 16 fl. oz.

To the Iron, contained in a flask, add six (6) *fluidounces* of Distilled Water, and the Hydrochloric Acid, and apply a gentle heat, until effervescence ceases. Then raise the liquid to boiling, keep it at this temperature for a short time so that the Iron may be brought into solution as far as possible, filter the solution through a pellet of absorbent cotton placed in the neck of a funnel, and wash the cotton with a little Distilled Water. Evaporate the

filtrate, over a boiling water-bath, until crystals begin to form, and the escaping vapors cease to redden, or only slightly affect, moistened blue litmus paper. Now add the Glycerin and the Hypophosphorous Acid; continue the heat, if necessary, until a perfect solution is obtained; then transfer the liquid to a graduated bottle, allow it to cool, and add enough Distilled Water to make sixteen (16) fluidounces.

Each fluidrachm represents about 20 grains of Protochloride of Iron (ferrous chloride).

264. *Mistura Splenetica. N. F.*

Splenetic Mixture.

Spleen Mixture. Gadberr's Mixture.

Sulphate of Iron, 100 gr.
Sulphate of Quinine, 100 gr.
Nitric Acid, 100 min.
Nitrate of Potassium, 300 gr.

Water, enough to make 16 fl. oz.
Triturate the Sulphate of Iron, reduced to powder, with the Nitric Acid, previously mixed with an equal volume of Water. When effervescence has ceased, warm the mixture gently, until it no longer evolves visible vapors of a yellowish tint. Then add to it the Sulphate of Quinine, the Nitrate of Potassium, and, lastly, enough Water to make sixteen (16) fluidounces. When solution has been effected, filter.

295. *Pilulæ Ferri Carbonatis. N. F.*

Pills of Carbonate of Iron.

Ferruginous Pills. Bland's Pills. Chalybeate Pills.

Sulphate of Iron, in clear crystals, 240 gr.
Carbonate of Potassium, 140 gr.
Sugar, 48 gr.
Tragacanth, in fine powder, 16 gr.
Glycerin, 10 min.
Water, a sufficient quantity.

Triturate the Sulphate of Iron with the Sugar to a uniform powder. In another mortar triturate the Carbonate of Potassium with the Glycerin and ten (10) minims of Water. Add to this mixture the previously prepared powder, and beat the mass thoroughly until it assumes a greenish color. When the reaction appears to have terminated, incorporate the Tragacanth, and, if necessary, add a little more Water, so as to obtain a mass of a pilular consistence. Divide this into ninety-six (96) pills.

Each pill represents about 1 grain of Carbonate of Iron (ferrous).

Note.—Sometimes so-called "3-grain" Bland's Pills (*Pilulæ Blandi minores*) are prescribed or demanded. These may be prepared by using the quantities given in the above formula, and dividing the mass into one hundred and sixty-eight (168) pills.

298. *Pilulæ Metallorum. N. F.*

Metallic Pills.

Pilulæ Metallorum Amara. Bitter Metallic Pills.

Each pill contains:

Reduced Iron,	1 gr.
Sulphate of Quinine,	1 gr.
Strychnine, alkaloid,	$\frac{1}{10}$ gr.
Arsenious Acid,	$\frac{1}{10}$ gr.

Note.—A similar combination is known under the name of *Aitken's Tonic Pills*:

Each pill contains:

Reduced Iron,	$\frac{1}{2}$ gr.
Sulphate of Quinine,	1 gr.
Strychnine, alkaloid,	$\frac{1}{10}$ gr.
Arsenious Acid,	$\frac{1}{10}$ gr.

362. *Syrupus Ferri Arseniatis. N. F.*

Syrup of Arseniate of Iron.

Arseniate of Sodium (U. S. P.)
dried to a constant weight
at 100° C. (212° F.), 8 gr.
Citrate of Iron (U. S. P.), 2½ gr.
Water, ½ fl. oz.
Syrup, enough to make 16 fl. oz.

Dissolve the Arseniate of Sodium and Citrate of Iron in the Water, contained in a test-tube, by the aid of heat. Then mix the solution with enough Syrup to make sixteen (16) fluidounces.

Each fluidrachm contains about $\frac{1}{10}$ grain of Arseniate of Iron (ferric).

Note.—Care should be taken to select perfectly-formed crystals of Arseniate of Sodium, which must then be dried completely at 100° C. (212° F.), and the 8 grains required for the above formula must be weighed from the dried salt. It is advisable to dry a fresh quantity of the salt each time the above Syrup is to be prepared.

363. *Syrupus Ferri Citro-Iodidi. N. F.*

Syrup of Citro-Iodide of Iron.

Tasteless Syrup of Iodide of Iron.

Iodine, 400 gr.
Iron Wire, fine, bright, and finely cut, 200 gr.
Citrate of Potassium, 620 gr.
Sugar, 10 tr. oz.
Distilled Water, enough to make 16 fl. oz.

Mix the Iron with four (4) fluidounces of Distilled Water in a flask, add two hundred and sixty-seven (267) grains of the Iodine, and apply a gentle heat until the Iodine is combined and the solution has acquired a greenish color. Then heat the contents of the flask to boiling, filter the liquid, and wash the filter with one-half (½) fluidounce of hot Distilled Water. To the hot filtrate add the Citrate of Potassium, and afterwards the remainder of the Iodine, and agitate until the liquid has assumed a greenish color. Pour this upon the Sugar contained in a bottle, agitate until solution has been effected, and when

the liquid is cold, add enough Distilled Water to make *sixteen* (16) *fluidounces*.

Each fluidrachm contains an amount of Iron corresponding to about 8.6 grains of Ferric Iodide.

Note.—The official *Syrupus Ferri Iodidi* contains about 8 grains of *ferrous iodide* (protiodide of iron) in each fluidrachm. The above preparation contains the iron in the *ferric* condition.

364. *Syrupus Ferri et Mangani Iodidi.* *N. F.*

Syrup of Iodide of Iron and Manganese.

Iodine,	596 gr.
Iron Wire, fine, bright, and finely cut,	192 gr.
Sulphate of Manganese,	192 gr.
Iodide of Potassium,	280 gr.
Sugar,	12 tr. oz.
Distilled Water, enough to make	16 fl. oz.

Mix the Iron with *four* (4) *fluidounces* of Distilled Water in a flask, add the Iodine, and prepare a solution of ferrous iodide, in the usual manner, aiding the process, if necessary, by heating the contents of the flask, at first gently, and, finally, to boiling. Filter the liquid, through a small filter, directly upon the Sugar, contained in a suitable bottle. Dissolve the Sulphate of Manganese in *two* (2) *fluidounces* of Distilled Water, and the Iodide of Potassium in *two* (2) *fluidounces* of Diluted Alcohol, mix the two solutions and filter into the same bottle which contains the Sugar and the Iron solution. Wash the filter with *one-half* ($\frac{1}{2}$) *fluidounce* of cold Distilled Water, receiving the washings in the same bottle. Agitate until the Sugar is dissolved, and, if necessary, strain. Finally, make up the volume with Distilled Water to *sixteen* (16) *fluidounces*.

Each fluidrachm contains about 6 grains of Iodide of Iron (ferrous) and 8 grains of Iodide of Manganese.

366. *Syrupus Ferri Lactophosphatis.* *N. F.*

Syrup of Lactophosphate of Iron.

Lactate of Iron,	128 gr.
Phosphoric Acid (50 per cent.),	a sufficient quantity.
Water,	$\frac{1}{2}$ fl. oz.
Syrup,	enough to make 16 fl. oz.

Dissolve the Lactate of Iron in the Water with the aid of a sufficient quantity of Phosphoric Acid, avoiding an excess, and add enough Syrup to make *sixteen* (16) *fluidounces*.

Each fluidrachm contains 1 grain of Lactate of Iron, or about $1\frac{1}{2}$ grains of so-called Lactophosphate of Iron.

367. *Syrupus Ferri Protochloridi. N. F.*

Syrup of Protochloride of Iron.

Syrup of Ferrous Chloride.

Solution of Protochloride of Iron,	884 min.
Glycerin,	2 fl. oz.
Orange-Flower Water,	2 fl. oz.
Syrup,	enough to make 16 fl. oz.
Mix the Solution of Protochloride of Iron with the Glycerin and Orange-Flower Water, and add enough Syrup to make <i>sixteen</i> (16) <i>fluidounces</i> .	

Each fluidrachm contains about 1 grain of Protochloride of Iron (ferrous chloride).

Note.—This Syrup requires care in its preservation, notwithstanding the pains taken in preparing the Solution of Protochloride of Iron to protect it from oxidation.

It should be kept in small, well-stoppered bottles.

368. *Syrupus Ferri Saccharati Solubilis. N. F.*

Syrup of Soluble Saccharated Iron.

Syrupus Ferri Oxydati Solubilis (Germ. Pharm.).
Syrup of Saccharated Oxide of Iron. Syrup of Soluble Oxide of Iron.

1. Solution of Chloride of Iron (U. S. P.),	8 parts.
Soda,	a sufficient quantity.
Distilled Water, each,	80 parts.

Sugar, 80 parts.
Syrup, enough to make 100 parts.

Prepare a sufficient quantity of a solution of Soda, of the specific gravity 1.160; gradually add, under stirring, *twenty-three* (23) *parts* of this to the Solution of Chloride of Iron, previously mixed with *seven* (7) *parts* of Syrup, and set the mixture aside, during twenty-four hours, in a dark place. Then pour the clear liquid slowly into *one hundred and sixty* (160) *parts* of boiling Distilled Water, continue the boiling for a few minutes, and then set the mixture aside during one day, in a dark place, so that it may become clear by settling. Withdraw the supernatant liquid by means of a siphon, then wash the residue again with *one hundred and sixty* (160) *parts* of boiling Distilled Water, by decantation. Transfer the magma to a wetted strainer, and wash it with hot Distilled Water until this runs off colorless, but so that the mass on the strainer still retains a moderately strong alkaline reaction. Then allow the excess of liquid to drain off, transfer the moist magma to a tared porcelain capsule, add the Sugar, and heat it on a water-bath, with exclusion of daylight, during two hours, replacing from time to time any Water lost by evaporation, and cautiously adding small portions of the Soda solution, until the magma is entirely dissolved. Lastly, add enough Syrup to

make the product weigh *one hundred (100) parts*, and transfer the product to bottles, which should be completely filled and stored in a cool and dark place.

One hundred grains, or about 75 minims, of this Syrup represents approximately 1 grain of metallic Iron.

Note.—The above process is based upon that of the Germ. Pharm. (1st edition). The formula given by the second edition of this work presupposes the keeping in stock of a dry "Ferrum Oxydatum Saccharatum Solubile" (Saccharated Oxide of Iron), representing 3 per cent. of metallic Iron. When this is available, the *Syrup of Soluble Saccharated Iron* may also be prepared by the following formula:

Syrupus Ferri Saccharati Solubilis.

Syrup of Soluble Saccharated Iron.

(Second Formula.)

Saccharated Oxide of Iron,

Syrup,

Water, each, equal parts.
Dissolve the Saccharated Oxide of Iron in the mixed liquids.

365. Syrupus Ferri Hypophosphitis.

N. F.

Syrup of Hypophosphite of Iron.

Hypophosphite of Iron, 128 gr.

Citrate of Potassium, 160 gr.

Orange-Flower Water, 1 fl. oz.

Syrup, enough to make 16 fl. oz.

Dissolve the Hypophosphite of Iron, with the aid of the Citrate of Potassium, in the Orange-Flower Water, and add enough Syrup to make *sixteen (16) fluidounces*.

Each fluidrachm contains 1 grain of Hypophosphite of Iron (ferric).

396. Tinctura Ferri Chloridi Ætherea.

N. F.

Ethereal Tincture of Chloride of Iron.

Bestucheff's Tincture. Lamotte's Drops.

Solution of Chloride of Iron

(U. S. P.), 850 min.

Stronger Ether, 4 fl. oz.

Alcohol, enough to make 16 fl. oz.

Mix the Solution of Chloride of Iron with *ten (10) fluidounces* of Alcohol, add the Stronger Ether, and, lastly, enough Alcohol to make *sixteen (16) fluidounces*. Introduce the Tincture into bottles made of white (flint) glass, which should not be entirely filled. Cork them tightly and expose them to the rays of the sun until the Tincture has been completely decolorized. Then remove the bottles to a shady place, and open them occasionally, until the contents have again assumed a yellow color. Lastly, transfer the Tincture to bottles, which should be well stoppered and kept in a cool and dark place.

Each fluidrachm represents about $\frac{1}{2}$ grain of metallic Iron.

Note.—This preparation is practically identical with that which is official in the Germ. Pharm.

397. Tinctura Ferri Citro-Chloridi.

N. F.

Tincture of Citro-Chloride of Iron.

Tasteless Tincture of Chloride of Iron. Tasteless Tincture of Iron.

Solution of Chloride of Iron

(U. S. P.), 4 fl. oz.

Citrate of Sodium, 7 tr. oz.

Alcohol, 2½ fl. oz.

Water, enough to make 16 fl. oz.

Mix the Solution of Chloride of Iron with *four (4) fluidounces* of Water, and dissolve in this mixture the Citrate of Sodium with the aid of a gentle heat. Then add the Alcohol, and when the solution has become cold, make up the volume with water to *sixteen (16) fluidounces*. Set the product aside in a cold place for a few days, if convenient, so that the excess of saline matter may separate. Then filter, and pass enough cold Water through the filter to restore the original volume.

Each fluidrachm contains an amount of Iron equivalent to about $7\frac{1}{2}$ grains of dry Chloride of Iron (ferric).

Note.—This preparation is practically identical in the strength of iron, but not in the quantity of alcohol, with the official *Tinctura Ferri Chloridi*.

398. Tinctura Ferri Pomata. N. F.

Tincture of Ferrated Extract of Apples.

Tinctura Ferri Malatis Crudi. Tincture of Crude Malate of Iron.

Ferrated Extract of Apples, 800 gr.

Alcohol, 1½ fl. oz.

Cinnamon Water,

enough to make 16 fl. oz.

Dissolve the Ferrated Extract of Apples in *twelve (12) fluidounces* of Cinnamon Water, add the Alcohol, filter, and pass enough Cinnamon Water through the filter to make *sixteen (16) fluidounces*.

Each fluidrachm represents about $\frac{1}{2}$ grain of metallic Iron.

Note.—This preparation is practically identical with that official in the Germ. Pharm. Ferrated Extract of Apples is the *Extractum Ferri Pomatum*. See No. 149.

Grissolle's Pills.

Alcoholic Extract of Nux Vomica, 4 gr.

Iron Phosphate, 46 gr.

Extract of Quassia, 81 gr.

Extract of Gentian, sufficient.

Mix, and make into 25 pills. One pill three times a day, in conjunction with cold hip-baths, and abstention from drink during the evening. Used for incontinence of urine.

Compound Iron Pills.

(Thomson's.)

Iron Subcarbonate, 60 gr.

Extract of Conium, 60 gr.

Mix, and divide into 24 pills.

Mixture of Iron and Conium.

(Tully's.)

Iron Subcarbonate,	600 gr.
Extract of Conium,	300 gr.
Sugar,	8 oz. (troy).
Oil of Cassia,	18 min.
Oil of Gaultheria,	20 min.
Compound Tincture of Cinnamon,	2 fl. oz.
Tincture of Tolu,	4 fl. dr.
Water, sufficient to make	16 fl. oz.
Mix thoroughly.	

Startin's Mixture.

Iron Sulphate,	60 gr.
Magnesium Sulphate,	1 oz. (troy).
Tincture of Gentian,	1 fl. oz.
Diluted Sulphuric Acid,	4 fl. dr.
Water,	8 fl. oz.

A teaspoonful to be taken after eating.

Tonic Laxative.

(Dr. C. H. Thomas.)

Powdered Aloes,	24 gr.
Dried Iron Sulphate,	24 gr.
Alcoholic Extract of Hyoscyamus,	6 gr.
Extract of Nux Vomica,	6 gr.
Oleoresin of Capsicum,	4 gr.
Make into a mass, and divide into 24 pills.	

Emmenagogue Pills.

(Dr. Otto's.)

Dried Iron Sulphate,	48 gr.
Powdered Aloes,	12 gr.
Turpentine,	32 gr.
Oil of Turpentine,	10 min.
Make a mass, and divide into 80 pills.	
Dose, two, three times a day.	

213. Liquor Electropoeicus. N. F.**Battery Fluid.****A. For the Carbon and Zinc Battery.****I. For ordinary use.**

Bichromate of Sodium, in coarse powder,	6 tr. oz.
Sulphuric Acid, commercial,	6 fl. oz.
Water, cold,	48 fl. oz.

Pour the Sulphuric Acid upon the powdered Bichromate, and stir the mixture occasionally during one hour. Then slowly add the Water.

II. For use with the Galvano-Cautery.

Bichromate of Sodium, in coarse powder,	6½ tr. oz.
Sulphuric Acid, commercial,	14 fl. oz.
Water, cold,	48 fl. oz.

Proceed in the same manner as directed under No. 1.

Note.—Bichromate of Sodium is more soluble than the potassium salt, and its products of decomposition, in the battery, are also more soluble. As it is also much cheaper, it is now preferred in all large electric laboratories. When it cannot be obtained, Bichromate of Potassium may be used in place of it, as heretofore. The two salts may be substituted for each other, weight for weight.

B. For the Leclanché Battery.

Chloride of Ammonium,	6 tr. oz.
Water,	enough to make 20 fl. oz.
Dissolve the salt in the Water.	

NICKEL SALTS.**Syrup of Bromide of Nickel.**

(Dr. Da Costa's.)

Nickel Bromide,	160 gr.
Glycerin,	4 fl. dr.
Sugar,	8 oz. (av.).
Water,	4 fl. oz.

Dissolve the Nickel Bromide in the Water, and add the Glycerin. Make a syrup by cold percolation or agitation.

Pills of Bromide of Nickel.

(Dr. Da Costa's.)

Nickel Bromide,	60 gr.
Powdered Althæa,	6 gr.
Extract of Gentian,	6 gr.
Alcohol, sufficient.	

Mix, and make into 12 pills.

LEAD SALTS.**Pills of Acetate of Lead.**

(University College, London.)

Lead Acetate,	12 gr.
Morphine Hydrochlorate,	6 gr.
Extract of Hyoscyamus,	48 gr.
Make a mass, and divide into 24 pills.	

Compound Cerate of Lead.

(J. Parrish, Sr.)

Cerate of Subacetate of Lead,	240 gr.
Cerate,	240 gr.
Powdered Opium,	60 gr.
Mild Chloride of Mercury,	60 gr.

Mix. Used in eruptions of a local character.

III. Emplastrum Fuscum Camphoratum. N. F.**Camphorated Brown Plaster.**

Emplastrum Matris Camphoratum; Camphorated Mother's Plaster.

Red Oxide of Lead,	80 parts.
Olive Oil,	60 parts.
Yellow Wax,	15 parts.
Camphor,	1 part.

Triturate the Red Oxide of Lead with a portion of the Oil in a capacious copper kettle until a smooth paste results. Then add the remainder of the Oil, excepting a small quantity required for trituration with the Camphor, and boil the whole over a naked fire, under constant stirring, until gas bubbles rise, or until the red color of the mixture begins to turn brown. Then moderate the heat, but keep up the stirring until the mixture has acquired a dark-brown color, and from time to time allow some drops of it to fall into cold water to test its consistence. When this is satisfactory, remove the vessel from

the fire, add the Wax in small pieces, and finally the Camphor, previously rubbed to a smooth paste with a little Olive Oil. Mix thoroughly, allow the mixture to become somewhat cool, and while it is still warm, pour the plaster into paper moulds previously coated with mucilage containing about five per cent. of glycerin, and dried.

Note.—This preparation is official in the *German Pharmacopœia*.

Judkin's Ointment.

Lead Acetate,	360 gr.
Lead Oxide (Red),	1 oz. (troy).
Sodium Borate,	60 gr.
Oil of Turpentine,	15 min.
Olive Oil,	2 fl. dr.
Linseed Oil,	4 fl. oz.

Boil the first two oils together for four hours, remove from the fire, add, with stirring, the Lead Oxide, Sodium Borate, and Lead Acetate; when nearly cool, add the Turpentine.

246. Lotio Plumbi et Opii. N. F.

Lotion of Lead and Opium.

Lead and Opium Wash.

Acetate of Lead,	120 gr.
Tincture of Opium,	$\frac{1}{2}$ fl. oz.
Water,	enough to make 16 fl. oz.

Dissolve the Acetate of Lead in about ten (10) fluidounces of Water, add the Tincture of Opium, and enough Water to make sixteen (16) fluidounces.

This mixture should be well agitated whenever any of it is to be dispensed.

Glycerole of Subacetate of Lead.

(Dr. Balmano Squire.)

Lead Acetate,	1 oz. (troy).
Lead Oxide,	386 gr.
Glycerin,	4 fl. oz.

Mix, and expose for some time to a temperature of 176.6° C. (350° F.). Filter through paper in a hot-water funnel.

Diarrhœa Pills.

(Prof. William Thompson's.)

Lead Acetate,	16 gr.
Powdered Camphor,	12 gr.
Powdered Opium,	8 gr.
Bismuth Subcarbonate,	12 gr.
Extract of Gentian, sufficient.	

Mix, and make into 12 pills.

248. Mistura Adstringens et Escharotica. N. F.

Astringent and Escharotic Mixture.

Villate's Solution.

Solution of Subacetate of Lead,	1 $\frac{1}{2}$ fl. oz.
Sulphate of Copper,	1 tr. oz.
Sulphate of Zinc,	1 tr. oz.
Diluted Acetic Acid (U.S.P.),	13 fl. oz.

Dissolve the Sulphate of Copper and Sulphate of Zinc in the Diluted Acetic Acid, add the Solution of Subacetate of Lead, and agitate thoroughly. Set the mixture aside, so that the precipitate may subside. Then decant, or siphon off, the clear liquid and preserve it for use.

Note.—In attempting to pass the liquid through a filter, it will usually be found that the finely-divided precipitate of sulphate of lead will partially pass along with it. This may be prevented (in this and many similar cases) by adding to the mixture a small quantity of starch, thoroughly incorporating this by agitation, and pouring the mixture on the previously wetted filter. The first portions of the filtrate are poured back until it runs through clear.

271. Oleatum Plumbi. N. F.

Oleate of Lead.

Acetate of Lead,	8 tr. oz.
Solution of Oleate of Sodium (N. F.),	5 pints.
Acetic Acid,	
Water,	each, a sufficient quantity.

Dissolve the Acetate of Lead in ten (10) pints of Water. Should the solution be turbid or opalescent, add to it Acetic Acid, in drops, until it has become clear. Then filter it, if necessary, through a pellet of absorbent cotton placed in the neck of a funnel, and mix it slowly, and under constant stirring, with the Solution of Oleate of Sodium. Heat the mixture to boiling, transfer it to a strainer, and when the liquid has drained off, wash the residue with ten (10) pints of boiling Water. Lastly, take the mass from the strainer, remove any occluded Water by pressure, and transfer it, while warm and soft, to suitable vessels.

The product contains an amount of Lead corresponding to about 28 per cent. of Oxide of Lead.

Note.—The theoretical yield of Oleate of Lead obtainable from 8 troyounces of acetate of lead is 2839 grains; in practice, about 5 troyounces will be obtained. Oleate of Lead prepared by the above process is of about the consistence of lead-plaster, and may be converted into an ointment by mixing with it such a proportion of oleic acid as may be required.

Logan's Plaster.

Lead Oxide,	2 oz. (av.).
Lead Carbonate,	2 oz. (av.).
Soap,	1 $\frac{1}{2}$ oz. (av.).
Fresh Butter,	240 gr.
Olive Oil,	5 fl. oz.
Powdered Mastic,	20 gr.

Mix the Soap, Oil, and Butter together, then add the Lead Oxide, and boil it gently over a slow fire for an hour and a half, or until it has a pale brown color, stirring constantly; the heat may then be increased, and the boiling continued, till a portion of the melted plaster, being dropped on a smooth board, is found not to adhere; then remove it from the fire, and add the mastic.

Mother's Salve.(EMPLASTRUM FUSCUM. ONGUENT DE
LA MÈRE.)

Lead Oxide,	60 gr.
Burgundy Pitch,	12 gr.
Yellow Wax,	60 gr.
Mutton Tallow,	60 gr.
Lard,	60 gr.
Olive Oil,	120 gr.
Butter,	60 gr.

Place the fatty substances in a suitable vessel, and heat them until they begin to smoke; then add the Lead Oxide in small portions, constantly stirring the mass with a wooden spatula. Keep the mixture over the fire, constantly agitating, until it acquires a brown color, then mix in the Pitch and pour into moulds.

COPPER SALTS.**Cauterizing Pencils of Sulphate of Copper.**

Copper Sulphate,	240 gr.
Sodium Borate,	60 gr.

Triturate together in a warm mortar; the mass becomes soft from the liberation of water of crystallization and it may be readily rolled into sticks. If it becomes too dry, a little water may be added.

Metz's Balsam.

Powdered Aloes,	120 gr.
Verdigris,	180 gr.
Zinc Sulphate,	90 gr.
Turpentine,	2 oz. (troy).
Oil of Juniper,	4 fl. oz.
Oil of Cloves,	1 fl. dr.
Oil of Laurel Berries,	1 fl. oz.
Olive Oil,	4½ fl. oz.
Linseed Oil,	4½ fl. oz.

Melt the Turpentine, Olive Oil, Linseed Oil, and Oil of Laurel Berries by a gentle heat, and add the Aloes, Verdigris, and Zinc Sulphate. Pour into a bottle, and add the Oil of Juniper and Cloves, shaking well. Used as a dressing for ulcers, etc.

212. Liquor Cupri Alkalinus. N. F.*Alkaline Solution of Copper.**Fehling's Solution.***I. The Copper Solution.**

Sulphate of Copper,	
pure,	34.689 Gm. 505 gr.
Distilled Water,	
enough to make 500 C.c.	16 fl. oz.

Dissolve the Sulphate of Copper, which before being weighed should have been reduced to powder and pressed between blotting-paper, in a sufficient quantity of Distilled Water to produce the volume required by the corresponding formula above given.

II. The Alkaline Solution.

Tartrate of Potassium	
and Sodium,	178 Gm. 2520 gr.
Soda (U. S. P. 1880),	60 Gm. 2 tr. oz.
Distilled Water,	
enough to make 500 C.c.	16 fl. oz.

Dissolve the Tartrate of Potassium and Sodium and the Soda in a sufficient quantity of Distilled Water to produce the volume required by the corresponding formula above given. Set the mixture aside until the suspended impurities have been deposited; then remove the clear solution with a siphon.

Keep both solutions, separately, in small well-stoppered vials, in a cool and dark place. For use, mix exactly equal volumes of both solutions, by pouring the copper solution into the alkaline solution.

Note.—The two Solutions should be prepared with cold distilled water, and should be made up to their respective volumes at one and the same temperature. They should also be at the same temperatures at the time of mixing. On diluting a small quantity of the mixed Reagent with about three volumes of Distilled Water, and heating the liquid in a test-tube to boiling, it should remain entirely clear, without any trace of discoloration or precipitate.

After the Solutions have been mixed for use, and assuming that they have been prepared and mixed at the average in-door temperature, 10 C.c. of the mixture prepared by metric weight and measure correspond to 0.05 Gm. of glucose. Of the mixture prepared by apothecaries' weight and measure, 210 minims correspond to 1 grain of glucose.

SILVER SALTS.**Pills of Nitrate of Silver.**

Nitrate of Silver,	20 gr.
Powdered French Chalk,	80 gr.
Petrolatum, q. s.	

Make a mass, and divide into 40 pills.

MERCURY SALTS.**Mercurial Plaster.**

(De Vigo's.)

Lead Plaster,	2000 gr.
Yellow Wax,	100 gr.
Resin,	100 gr.
Powdered Olibanum,	80 gr.
Ammoniac,	80 gr.
Powdered Bdellium,	80 gr.
Powdered Myrrh,	80 gr.
Powdered Saffron,	20 gr.
Mercury,	600 gr.
Turpentine,	100 gr.
Storax,	800 gr.
Oil of Lavender,	10 gr.
Mix.	

Scott's Ointment.

Strong Mercurial Ointment,	1 oz. (troy).
Soap Cerate,	1 oz. (troy).
Powdered Camphor,	60 gr.
Mix.	

Compound Ointment of Mercury.

Mercurial Ointment,	120 gr.
Ointment of Belladonna,	120 gr.
Iodine Ointment,	120 gr.
Mix.	

Van Swieten's Solution.

(SOLUTION ANTISYPHILITIQUE DE VAN SWIETEN. LIQUEUR D'OXYMURIATE DE MERCURE.)

Corrosive Chloride of Mercury,	15 gr.
Alcohol (80 per cent.),	8½ fl. oz.
Distilled Water, sufficient to make	32 fl. oz.

A tablespoonful contains nearly ¼ grain of Corrosive Chloride of Mercury.

314. Pulvis Hydrargyri Chloridi Mitis et Jalapæ. N. F.

Powder of Mild Chloride of Mercury and Jalap.

Calomel and Jalap.

Mild Chloride of Mercury,	10 gr.
Jalap, in fine powder,	20 gr.
Mix them intimately.	

Note.—When "Calomel and Jalap" is prescribed for an adult, without any specification of quantities, it is recommended that the above mixture be dispensed as one dose.

219. Liquor Hydrargyri et Potassii Iodidi. N. F.

Solution of Iodide of Mercury and Potassium.

Solution of Iodo-hydrargyrate of Potassium.
Channing's Solution.

Red Iodide of Mercury,	72 gr.
Iodide of Potassium,	56 gr.
Distilled Water, enough to make 16 fl. oz.	
Dissolve the salts in the Distilled Water.	

244. Lotio Flava. N. F.

Yellow Lotion.

Yellow Wash. Lotio Hydrargyri Flava (*Brit. Pharm.*). Aqua Phagedanica Flava (*Germ. Pharm.*).

Corrosive Chloride of Mercury, 24 gr.
Water, a sufficient quantity.
Solution of Lime, enough to make 16 fl. oz.

Dissolve the Corrosive Chloride of Mercury in one-half (½) fluidounce of boiling Water, and add the solution to a sufficient quantity of Solution of Lime to make sixteen (16) fluidounces.

This mixture should be well agitated whenever any of it is to be dispensed.

245. Lotio Nigra. N. F.

Black Lotion.

Black Wash. Lotio Hydrargyri Nigra (*Brit. Pharm.*). Aqua Phagedanica Nigra (*Germ. Pharm.*).

Mild Chloride of Mercury, 64 gr.
Water, a sufficient quantity.
Solution of Lime, enough to make 16 fl. oz.

Triturate the Mild Chloride of Mercury with one-half (½) fluidounce of Water, and

gradually add a sufficient quantity of Solution of Lime to make sixteen (16) fluidounces.

This mixture should be well agitated whenever any of it is to be dispensed.

389. Tinctura Antacrida. N. F.

Antacid Tincture.

Dysmenorrhœa Mixture. Fenner's Gualac Mixture.

Corrosive Chloride of Mercury,	40 gr.
Resin of Guaiac, in fine powder,	2 tr. oz.
Canada Turpentine,	2 tr. oz.
Oil of Sassafras,	½ fl. oz.
Alcohol,	enough to make 16 fl. oz.

Introduce the Resin of Guaiac and the Canada Turpentine into a flask, together with twelve (12) fluidounces of Alcohol, cork the flask loosely, and heat the contents, on a water-bath, slowly to boiling. Then cool the flask, and filter the contents through a small filter. Dissolve the Corrosive Chloride of Mercury in one-half (½) fluidounce of Alcohol, and add this solution, as well as the Oil of Sassafras, to the filtrate. Lastly, pass enough Alcohol through the filter to make the product measure sixteen (16) fluidounces.

Each fluidrachm contains nearly ½ grain of Corrosive Chloride of Mercury.

Note.—The dose of this preparation is about 10 to 20 minims.

Liniment of Mercury.

Liniment of Camphor,	1 fl. oz.
Tincture of Quillaia,	8 fl. oz.
Stronger Water of Ammonia,	160 min.
Water,	140 min.
Mercurial Ointment,	1 oz. (troy).
Mix.	

Corrosive Sublimate Gauze.

Corrosive Chloride of Mercury,	2 gr.
Glycerin,	50 min.
Water,	1 fl. oz.

Immerse bleached absorbent muslin in this solution for about twelve hours; then wring it out, and allow it to dry as far as the Glycerin will permit.

Palmer's Lotion.

Corrosive Chloride of Mercury,	4 gr.
Alum,	6 gr.
Water,	8 fl. oz.

Dissolve. For external use.

Townsend's Mixture.

(N. Y. Hosp.)

Red Iodide of Mercury,	1 gr.
Potassium Iodide,	300 gr.
Syrup of Orange Peel,	2 fl. oz.
Compound Tincture of Cardamom,	2 fl. dr.
Water, sufficient to make	4 fl. oz.
Mix. Dose, 1 to 4 teaspoonfuls.	

Tetter Ointment.

(Dr. S. G. Morton.)

Alum,	120 gr.
Lead Carbonate,	120 gr.
Calomel,	120 gr.
Oil of Turpentine,	2 fl. dr.
Ointment,	1½ oz. (troy).

Triturate the powders together till they are impalpable and thoroughly mixed; then incorporate them with the Oil and Ointment.

Syrup of Iodohydrargyrate of Iron.

Red Iodide of Mercury,	1 gr.
Syrup of Iodide of Iron,	4 fl. oz.
Mix. Dose, 20 to 30 minims, as an alterative tonic.	

Unguentum Hydrargyri Iodidi Rubri.
U. S. 1870. OINTMENT OF RED IODIDE OF MERCURY.

Red Iodide of Mercury, in fine powder,	16 gr.
Simple Ointment,	1 oz. (av.).
Mix thoroughly.	

Syrup of Iodohydrargyrate of Potassium. (SIBOT GIBERT.)

Red Iodide of Mercury,	5 gr.
Potassium Iodide,	260 gr.
Distilled Water,	6 fl. dr.
Syrup, sufficient to make	16 fl. oz.
Dose, 1 teaspoonful.	

Compound Pills of Iodide of Mercury.

Green Iodide of Mercury,	10 gr.
Guaiac Resin,	40 gr.
Extract of Gentian,	80 gr.

Triturate the Guaiac Resin into a mass with a little Alcohol; then incorporate with it the Extract and Iodide of Mercury, and divide into 20 pills.

Cream for Chilblains.

(Vance's.)

Nitrate of Mercury Ointment,	1 oz. (troy).
Camphor,	60 gr.
Oil of Turpentine,	2 fl. dr.
Olive Oil,	4 fl. dr.

Mix well. To be applied with gentle friction before the chilblains break.

ANTIMONY SALTS.**Unguentum Antimonii.** U. S. 1870.**ANTIMONIAL OINTMENT.**

Tartrate of Antimony and Potassium,	100 gr.
Lard,	400 gr.

Rub the Tartrate of Antimony and Potassium with the Lard, gradually added, until they are thoroughly mixed.

Antimonial and Saline Mixture.

(Prof. Gross's.)

Antimony and Potassium Tartrate,	2½ gr.
Magnesium Sulphate,	2 oz. (troy).
Morphine Sulphate,	1½ gr.
Aromatic Sulphuric Acid,	80 min.
Tincture of Veratrum Viride,	90 min.
Syrup of Ginger,	2 fl. oz.
Distilled Water,	10 fl. oz.

Mix. Average dose, a tablespoonful; to be diminished in case of vomiting or much nausea.

Antimonial Powder.

(Tyson's.)

Antimony Oxide,	20 gr.
Calcium Phosphate,	180 gr.
Mix. Dose, 5 to 10 grains.	

Emplastrum Antimonii. U. S. 1870.**ANTIMONIAL PLASTER.**

Tartrate of Antimony and Potassium, in fine powder, 1 oz. (troy). Burgundy Pitch, 4 oz. (troy). Melt the Pitch by means of a water-bath, and strain; then add the powder, and stir them well together until the mixture thickens on cooling.

ARSENIC SALTS.**Solution of Arsenite of Sodium.**

(Harle's Solution.)

Arsenious Acid,	15 gr.
Sodium Carbonate (Exsiccated),	15 gr.
Cinnamon Water,	1 fl. oz.
Distilled Water, sufficient to make	4 fl. oz.

Boil the solids with 8 fl. oz. of Distilled Water until they are dissolved, make up the measure of 8 fl. oz. with Distilled Water, and add the Cinnamon Water. Dose, 4 minims.

Solution of Bromide of Arsenic.

(Clemens's.)

Arsenious Acid,	80 gr.
Potassium Carbonate,	80 gr.
Bromine,	160 gr.
Distilled Water,	15½ oz.

Boil the Potassium Carbonate and the Acid with most of the Water until dissolved; when cold, add the Bromine, and Water enough to make the prescribed quantity. It is said to improve by age, owing to the combination of the Bromine. Dose, 1 to 4 drops, in water, once or twice daily.

Solution of Arseniate of Ammonium.

(Blette's Arsenical Solution.)

Arseniate of Ammonium,	2 gr.
Distilled Water,	2 fl. oz.
Mix. Dose, 20 drops.	

Solution of Arsenic Chlorophosphide.

Arsenious Acid,	4 gr.
Phosphorus,	8 gr.
Diluted Hydrochloric Acid,	12 gr.
Water, sufficient to make	18 fl. oz.

Mix. Digest on a water-bath for twenty-four hours, and decant the supernatant liquid.

Painless Caustic.

(Esmarch's.)

Arsenious Acid,	2 gr.
Morphine Sulphate,	2 gr.
Mild Chloride of Mercury,	16 gr.
Powdered Acacia,	96 gr.

Mix.

BISMUTH SALTS.

Oxide of Bismuth Ointment.

(McCall Anderson.)

Bismuth Oxide,	50 gr.
Oleic Acid,	1 fl. oz.
White Wax,	150 gr.
Vaseline,	1 oz. (troy).
Oil of Rose,	1 min.

Mix.

Carbonate of Bismuth Mixture.

Bismuth Subcarbonate,	120 gr.
Cinnamon Water,	2 fl. oz.
Syrup of Acacia,	2 fl. oz.

Mix them. A teaspoonful for infants in cholera infantum.

183. Glyceritum Bismuthi. N. F.

Glycerite of Bismuth.

Liquor Bismuthi Concentratus. Concentrated Solution of Bismuth.

Subnitrate of Bismuth,	1480 gr.
Nitric Acid,	4 tr. oz.
Citric Acid,	1200 gr.
Water of Ammonia, a sufficient quantity.	
Glycerin,	8 fl. oz.
Water,	enough to make 16 fl. oz.

Dissolve the Subnitrate of Bismuth in the Nitric Acid mixed with an equal volume of Water. Add the Citric Acid previously dissolved in four (4) fluidounces of Water. Divide the solution into two equal portions. To one portion add Water of Ammonia until the precipitate first formed is redissolved, and then dilute with Water to eight (8) pints. To this add the reserved portion, stirring constantly. Let the mixture stand about six hours, then transfer it to a paper filter, inside of a muslin strainer, both being folded together. Wash the precipitate with Water, until it is free from Nitric Acid, and by gentle pressure remove as much of the Water as possible. Dissolve the precipitate in a sufficient quantity of Water of Ammonia, evaporate the solution on the water-bath, in a tared capsule, to eight (8) troyounces, then transfer it to a graduate, allow it to cool, and

wash the capsule with a little Water so as to make the whole volume of liquid measure eight (8) fluidounces. Finally, add the Glycerin, and filter, if necessary.

Glycerite of Bismuth, when required for immediate use, may also be prepared as follows:

Citrate of Bismuth and Ammonium,	2048 gr.
Stronger Water of Ammonia,	a sufficient quantity.

Glycerin,	8 fl. oz.
Water,	enough to make 16 fl. oz.

Triturate the Citrate of Bismuth and Ammonium with six (6) fluidounces of Water and four (4) fluidounces of Glycerin, and add to it gradually just enough Stronger Water of Ammonia to dissolve the salt, and to produce a neutral solution. Then add the remainder of the Glycerin and enough Water to make sixteen (16) fluidounces, and filter.

Each fluidrachm contains 16 grains of Citrate of Bismuth and Ammonium.

Note.—When this preparation is directed as an ingredient in other preparations, which are required to be filtered when completed, it may be added to them without previous filtration.

If Glycerite of Bismuth should at any time deposit a precipitate, this may be redissolved by the addition of just sufficient Stronger Water of Ammonia.

207. Liquor Bismuthi. N. F.

Solution of Bismuth.

Liquid Bismuth.

Glycerite of Bismuth,	2 fl. oz.
Alcohol,	2 fl. oz.
Distilled Water,	12 fl. oz.

Mix the Glycerite of Bismuth with twelve (12) fluidounces of Distilled Water, then add the Alcohol.

Solution of Bismuth may also be prepared in the following manner:

Citrate of Bismuth and Ammonium,	128 gr.
Alcohol,	2 fl. oz.
Water of Ammonia, a sufficient quantity.	
Distilled Water, enough to make 16 fl. oz.	

Dissolve the Citrate of Bismuth and Ammonium in thirteen (13) fluidounces of Distilled Water, and allow the solution to stand a short time. Should any insoluble matter have deposited, pour off the clear liquid and add just enough Water of Ammonia to the residue to dissolve it, or to cause it to retain a faint odor of Ammonia. Then filter the united liquids, add the Alcohol, and enough Distilled Water to make sixteen (16) fluidounces.

This preparation should be freshly made when wanted for use.

Each fluidrachm represents 1 grain of Citrate of Bismuth and Ammonium.

Glycerole of Bismuth Nitrate.

Bismuth Nitrate (Cryst.), 120 gr.
 Glycerin, 1 fl. oz.
 Dissolve the Bismuth Nitrate in the Glycerin, without heat.

Bismuth Catarrh Snuff.

Bismuth Subnitrate, 360 gr.
 Morphine Hydrochlorate, 2 gr.
 Acacia, 120 gr.
 Mix.

9. Bismuthi Oxidum Hydratum. N. F.
Hydrated Oxide of Bismuth.

Subnitrate of Bismuth, 6 tr. oz.
 Nitric Acid, 10 tr. oz.
 Water of Ammonia, 12 tr. oz.
 Bicarbonate of Sodium, 1 tr. oz.
 Distilled Water, a sufficient quantity.

Mix the Subnitrate of Bismuth with four (4) fluidounces of Distilled Water in a quart flask, add nine (9) troyounces of Nitric Acid, and promote the solution of the salt by agitation, and, if necessary, by a gentle heat. Pour the solution into one (1) gallon of Distilled Water previously acidulated with one (1) troyounce of Nitric Acid, and filter the liquid through absorbent cotton. Mix the Water of Ammonia with two (2) gallons of Distilled Water in a glazed vessel of double that capacity, and pour into it, slowly and with constant stirring, the bismuth solution. Let the mixture stand during four hours so that the precipitate may subside, then pour off

the supernatant liquid, and wash the precipitate four times more by decantation with Distilled Water, the Bicarbonate of Sodium being dissolved in the last wash-water. Pour the precipitate upon a wetted muslin strainer, and wash it with Distilled Water, until the washings run off tasteless. Transfer the strainer to a warm place, so that the precipitate may dry. Then rub the latter to powder and keep it in well-stoppered bottles.

Note.—Hydrated Oxide of Bismuth is sometimes demanded in the form of a creamy mixture with water, under the name of *Cremor Bismuthi* or *Cream of Bismuth*. This may be prepared by triturating 20 parts of the Oxide with 80 parts of Water.

32. Elixir Bismuthi. N. F.
Elixir of Bismuth.

Citrate of Bismuth and Ammonium, 256 gr.
 Water, hot, 1 fl. oz.
 Water of Ammonia, a sufficient quantity.
 Aromatic Elixir, enough to make 16 fl. oz.
 Dissolve the Citrate of Bismuth and Ammonium in the hot Water, allow the solution to stand until any undissolved matter has subsided; then decant the clear liquid, and add to the residue just enough Water of Ammonia to dissolve it. Then mix it with the decanted portion and add enough Aromatic Elixir to make sixteen (16) fluidounces. Filter, if necessary.

Each fluidrachm represents 2 grains of Citrate of Bismuth and Ammonium.

UNOFFICIAL PREPARATIONS OF ORGANIC SUBSTANCES.

CELLULIN.**Aromatic Vinegar.**

Glacial Acetic Acid,
 Oil of Cloves,
 Camphor, of each, 1 fl. oz.
 Mix.

i. Acetum Aromaticum. N. F.*Aromatic Vinegar.*

Oil of Lavender, 4 min.
 Oil of Rosemary, 4 min.
 Oil of Juniper, 4 min.
 Oil of Peppermint, 4 min.
 Oil of Cinnamon (Cassia), 4 min.
 Oil of Lemon, 8 min.
 Oil of Cloves, 8 min.
 Alcohol, 3 fl. oz.
 Acetic Acid (U. S. P.), 4 fl. oz.
 Water, enough to make 16 fl. oz.

Dissolve the Oils in the Alcohol, add the Acetic Acid, and, lastly, enough Water to make sixteen (16) fluidounces. Warm the turbid mixture, during several hours, at a temperature not exceeding 70°

C. (158° F.), taking care that it shall not suffer loss by evaporation. Then set it aside for a few days, occasionally agitating, and filter.

189. Gossypium Stypticum. N. F.
Styptic Cotton.

Purified Cotton,
 Solution of Chloride of Iron,
 Glycerin,
 Water, each, a sufficient quantity.
 Mix the liquids in the proportion of five (5) parts of the Iron Solution, one (1) part of Glycerin, and four (4) parts of Water, in such quantities that the Purified Cotton shall be completely immersed in the liquid when gently pressed. Allow the Cotton to remain in the liquid one hour, then remove it, press it, until it has been brought to twice its original weight, spread it out in thin layers, in a warm place, protected from dust and light, and when it is sufficiently dry, transfer it to well-closed receptacles.

Liquor Picis Carbonis.

Solution of Coal-Tar.

Liquor Carbonis Detergens.

Coal-Tar,	4 oz. av.
Tinct. Quillays (N.F.),	8 fl. oz.
Alcohol,	8 fl. oz.

Digest for two days, decant, and filter.

112. Emplastrum Picis Liquidæ Compositum. N. F.

Compound Tar Plaster.

Resin,	25 parts.
Tar,	20 parts.
Podophyllum, in No. 60 powder,	5 parts.
Phytolacca Root, in No. 60 powder,	5 parts.
Sanguinaria, in No. 60 powder,	5 parts.

Melt the Resin and Tar together, then stir in the mixed powders, and as the mass cools, mould it into rolls, or pour it into boxes.

87. Elixir Picis Compositum. N. F.

Compound Elixir of Tar.

Syrup of Wild Cherry,	8 fl. oz.
Syrup of Tolu,	8 fl. oz.
Sulphate of Morphine,	2½ gr.
Methylic Alcohol,	860 min.
Water,	a sufficient quantity.
Wine of Tar,	enough to make 16 fl. oz.

Dissolve the Sulphate of Morphine in about one (1) fluidrachm of hot Water, and add the solution to the two Syrups previously mixed. Then add the Methylic Alcohol and enough Wine of Tar to make sixteen (16) fluidounces.

Each fluidrachm contains about ½ grain of Sulphate of Morphine.

Note.—Much of the commercial "Wood Spirit" or "Wood Naphtha" is unfit for medicinal purposes. Refined Wood Naphtha or Methylic Alcohol should be colorless and freely miscible to a clear liquid with water, alcohol, and ether. Its odor, which is characteristic, should be free from empyreuma. It should contain at least 90 per cent. of absolute Methylic Alcohol, which corresponds to a specific gravity of 0.846 at 15° C. (59° F.). On mixing methylic alcohol cautiously with one-fourth its volume of sulphuric acid, the liquid should remain colorless or acquire not more than a very pale yellowish-red tint; and on gently heating methylic alcohol with an equal volume of a 10 per cent. solution of potassa, the mixture should not acquire a brown color.

260. Mistura Olei Picis. N. F.

Mixture of Oil of Tar.

Mistura Picis Liquidæ. Tar Mixture.

Purified Extract of Glycyrrhiza,	1 tr. oz.
Oil of Tar,	½ fl. oz.
Sugar,	4 tr. oz.
Chloroform,	75 min.
Oil of Peppermint,	20 min.
Alcohol,	2½ fl. oz.
Water,	enough to make 16 fl. oz.

Add the Purified Extract of Glycyrrhiza and the Sugar to ten (10) fluidounces

of Water, contained in a covered vessel, and heat the mixture to boiling until the Extract and Sugar are dissolved. Then add the Oil of Tar, cover the vessel, and allow the contents to cool, stirring occasionally. Next add the Chloroform and Oil of Peppermint, previously dissolved in the Alcohol, and, lastly, enough Water to make sixteen (16) fluidounces.

This mixture should be well agitated whenever any of it is to be dispensed.

229. Liquor Picis Alkalinus. N. F.

Alkaline Solution of Tar.

Tar,	4 tr. oz.
Potassa,	2 tr. oz.
Water,	10 fl. oz.

Dissolve the Potassa in the Water. Shake the solution with the Tar so that the latter may be dissolved, and strain the solution through muslin.

422. Unguentum Picis Compositum. N. F.

Compound Tar Ointment.

Oil of Tar,	4 parts.
Tincture of Benzoin,	2 parts.
Oxide of Zinc,	8 parts.
Yellow Wax,	26 parts.
Lard,	82 parts.
Cotton-Seed Oil,	85 parts.

Melt the Yellow Wax and Lard with the Cotton-Seed Oil at a gentle heat. Add the Tincture of Benzoin, and continue heating until all the alcohol has evaporated. Then withdraw the heat, add the Oil of Tar, and, finally, the Oxide of Zinc, incorporating the latter thoroughly, so that, on cooling, a smooth, homogeneous ointment may result.

433. Vinum Picis. N. F.

Wine of Tar.

Tar,	1½ tr. oz.
Water,	4 fl. oz.
Pumice, in moderately fine powder,	2 tr. oz.

Stronger White Wine, enough to make 16 fl. oz.

Upon the Tar contained in a suitable vessel pour four (4) fluidounces of cold Water, and triturate the mixture thoroughly; then pour off the Water and throw it away. Mix the remaining Tar thoroughly with the powdered Pumice, and add sixteen (16) fluidounces of Stronger White Wine. Stir frequently during four hours, then transfer the mixture to a wetted filter, and, after the liquid has passed, pour on enough Stronger White Wine to make the filtrate measure sixteen (16) fluidounces.

Camphorated Acetic Acid.

Camphor, 1 oz. (av.).
 Acetic Acid, 16 fl. oz.
 Powder the Camphor with the aid of alcohol, and dissolve it in the Acetic Acid.

Raspberry Vinegar.

Raspberry Syrup, 16 fl. oz.
 Glacial Acetic Acid, 1 fl. dr.
 Mix. Dilute with sufficient water.

Acetone Mixture.

(Dr. W. L. Adee.)

Acetone, 1 fl. dr.
 Camphorated Tincture of Opium, 1 fl. oz.
 Wine of Antimony, 1 fl. oz.
 Wine of Tar, 2 fl. oz.
 Mix. Dose, a teaspoonful.

187. Glyceritum Picis Liquidæ. N. F.*Glycerite of Tar.*

Tar, 1 tr. oz.
 Carbonate of Magnesium, 2 tr. oz.
 Glycerin, 4 fl. oz.
 Alcohol, 2 fl. oz.
 Water, enough to make 16 fl. oz.

Upon the Tar, contained in a mortar, pour *three* (3) *fluidounces* of cold Water, stir them thoroughly together, and pour off the Water. Repeat this once or twice, until the Water only feebly reddens blue litmus-paper. Now triturate the washed Tar with the Alcohol, gradually incorporate the Carbonate of Magnesium and Glycerin, and, lastly, *ten* (10) *fluidounces* of Water. Pour the mixture upon a filter of loose texture spread over a piece of straining muslin, and, after the liquid portion has passed through, wash the residue on the filter with Water, until the whole filtrate measures *sixteen* (16) *fluidounces*.

Infusum Picis Liquidæ. U. S. 1870.**INFUSION OF TAR. (TAR WATER.)**

Tar, 4 oz. (troy).
 Water, 16 fl. oz.

Mix them, and shake the mixture frequently during twenty-four hours; then pour off the infusion, and filter through paper.

Alkaline Solution of Tar.

(Dr. L. D. Bulkley.)

Tar, 2 fl. dr.
 Potassa, 60 gr.
 Distilled Water, 5 fl. dr.
 Mix.

Carbolate of Iodine.

(Dr. Holtz's formula.)

Carbolic Acid (Cryst.), 60 gr.
 Alcohol, 1 fl. dr.
 Tincture of Iodine, 4 fl. dr.
 Water, 5 fl. dr.
 Mix.

Aqua Acidi Carbolici. U. S. 1870.**CARBOLIC ACID WATER.**

Glycerite of Carbolic Acid, 5 fl. dr.
 Water, a sufficient quantity to make 8 fl. oz.
 Mix the Glycerite with the Water. Used as a gargle, and as a wash in various skin-diseases.

Glycerite of Birch Tar.

Birch Tar, 1 oz. (troy).
 Glycerin, 8 fl. oz.
 Dilute the Glycerin with one-fifth of its volume of water, and mix.

Unguentum Creasoti. U. S. 1870.**OINTMENT OF CREASOTE.**

Creasote, 1 fl. dr.
 Lard, 2 oz. (troy).
 Mix thoroughly.

Dobell's Solution.

Carbolic Acid, 45 min.
 Sodium Borate, 60 gr.
 Sodium Bicarbonate, 60 gr.
 Glycerin, 1 fl. oz.
 Water, sufficient to make 16 fl. oz.

Glyceritum Acidi Carbolici. U. S. 1870.**GLYCERITE OF CARBOLIC ACID.**

Carbolic Acid, 2 oz. (troy).
 Glycerin, 8 fl. oz.

Rub them together in a mortar until the Acid is dissolved.

275. Oleum Carbolatum. N. F.*Carbolized Oil.*

Carbolic Acid, 5 parts.
 Cotton-Seed Oil, 95 parts.
 Melt the Carbolic Acid with a gentle heat, and mix it with the Cotton-Seed Oil.

2. Acidum Carbolicum Iodatum. N. F.*Iodized Carbolic Acid.***Phenol Iodatum. Iodized Phenol.**

Iodine, reduced to powder, 20 parts.
 Carbolic Acid, 76 parts.
 Glycerin, 4 parts.

Introduce the Iodine into a flask, add the Carbolic Acid, previously melted, and the Glycerin, and digest the mixture at a gentle heat, frequently agitating, until the Iodine is dissolved.

Keep the product in glass-stoppered vials, in a dark place.

Carbolized Jute.

Carbolic Acid (Cryst.), 850 gr.
 Paraffin, 850 gr.
 Resin, 1400 gr.
 Benzin, 24 fl. oz.
 Make a solution and saturate 16 oz. of jute with it.

14. Carbasus Carbolata. N. F.

Carbolized Gauze.

Resin, in coarse powder, 40 parts.
Castor Oil, 5 parts.
Carbolic Acid, 10 parts.
Alcohol, 225 parts.
Gauze Muslin, a sufficient quantity.

Dissolve the Resin, Castor Oil, and Carbolic Acid in the Alcohol. Then immerse in the mixture loosely-folded pieces of Gauze Muslin, allow them to become thoroughly saturated, then take them out and press out the excess of liquid, until the weight of the impregnated Gauze amounts to one hundred and seventy (170) parts for every one hundred (100) parts of the original fabric. Spread out the pieces horizontally, and as soon as the Alcohol has nearly all evaporated, fold and wrap the pieces in paraffin paper, and preserve them in air-tight receptacles.

The impregnated Gauze, when dry, contains about 2.5 per cent. of Carbolic Acid.

Note.—The most suitable brands of Gauze Muslin for making carbolized or other antiseptic gauze, are those known in the market as "stillwater," or "Lehigh E."

Collodion for Corns.

(Geszow's.)

Salicylic Acid, 45 gr.
Extract of Indian Hemp, 8 gr.
Collodion, 6 fl. dr.
Dissolve.

24. Elixir Acidi Salicylici. N. F.

Elixir of Salicylic Acid.

Salicylic Acid, 640 gr.
Citrate of Potassium, 2 tr. oz.
Glycerin, 8 fl. oz.
Aromatic Elixir, enough to make 16 fl. oz.

Dissolve the Citrate of Potassium in the Glycerin with the aid of a gentle heat. Add the Salicylic Acid, and continue the heat until it is dissolved. Then add enough Aromatic Elixir to make sixteen (16) fluidounces.

This Elixir should be freshly made when wanted for use.

Each fluidrachm contains 5 grains of Salicylic Acid.

Salicylic Mixture.

(Thiersch's.)

Salicylic Acid, 80 gr.
Syrup of Orange Peel, 2 fl. oz.
Alcohol, 3 fl. oz.
Water, sufficient to make 10 fl. oz.

Mix. Dose, a teaspoonful.

Liebig's Corn Collodion.

Salicylic Acid, 5 gr.
Extract of Indian Hemp, 30 gr.
Collodion, 5 fl. dr.

Mix and dissolve.

Salicylic Acid Cotton.

Purified Cotton, 600 gr.
Salicylic Acid, 60 gr.
Alcohol, 10 fl. dr.
Glycerin, 6 min.

Dissolve the Salicylic Acid in the Alcohol, add the Glycerin to this solution, and saturate the Cotton with the liquid; press out the superfluous liquid, and dry.

Charcoal and Blue Mass Mixture.

Sodium Bicarbonate, 80 gr.
Charcoal, 60 gr.
Mass of Mercury, 8 gr.
Aromatic Syrup of Rhubarb, 2 fl. oz.
Water, 2 fl. oz.

Triturate together into a uniform mixture. Dose, a tablespoonful.

21. Collodium Salicylatum Compositum. N. F.

Compound Salicylated Collodion.

Corn Collodion.

Salicylic Acid, 11 parts
Extract of Indian Cannabis, 2 parts.
Alcohol, 10 parts.

Flexible Collodion, enough to make 100 parts.

Dissolve the Extract of Indian Cannabis in the Alcohol, and the Salicylic Acid in about fifty (50) parts of Flexible Collodion contained in a tared bottle. Then add the former solution to the latter, and finally add enough Flexible Collodion to make one hundred (100) parts.

18. Collodium Iodatum. N. F.

Iodized Collodion.

Iodine, reduced to powder, 5 parts.
Flexible Collodion, 95 parts.

Introduce the Iodine into a bottle, add the Flexible Collodion and agitate until the Iodine is dissolved.

19. Collodium Iodoformatum. N. F.

Iodoform Collodion.

Iodoform, 5 parts.
Flexible Collodion, 95 parts.

Dissolve the Iodoform in the Flexible Collodion by agitation.

20. Collodium Tigllii. N. F.

Croton Oil Collodion.

Croton Oil, 10 parts.
Flexible Collodion, 90 parts.
Mix them.

Charcoal Poultice.

(Thomsonian name.)

Charcoal, 1 oz. (troy).
Ginger, of each, 240 gr.
Bayberry, of each, 240 gr.
Elm, 1 oz. (troy).

Hot Water, sufficient.

Mix.

Naphthol Ointment.

(Hardy's.)

Naphthol, 120 gr.
Vaseline, 2½ oz. (troy).

Dissolve the Naphthol in half its weight of Ether; mix this solution with a portion of the Vaseline, and heat to about 40° C. (104° F.) until the Ether is completely evaporated; then add the remainder of the Vaseline, and triturate thoroughly; finally, preserve the ointment in a well-covered vessel.

Naphthol Salve.

(Kaposi's.)

Naphthol, 180 gr.
Green Soap, 600 gr.
Prepared Chalk, 120 gr.
Lard, 2½ oz. (av.).

Mix. Used in itch. The affected part to be rubbed twice a day.

AMYLACEOUS AND MUCILAGINOUS SUBSTANCES.**Soluble Iodide of Starch.**

Iodine, 360 gr.
Starch, 6 oz. (troy).
Ether, 10 fl. dr.

Dissolve the Iodine in the Ether, pour the solution over the Starch; then triturate till the Ether is evaporated; introduce into a water-bath, and continue the heat for half an hour with occasional stirring. A portion of the Iodine vapor has escaped, but the Starch, which has now become soluble, will be combined with about 4 per cent. of Iodine.

30. Elixir Malti et Ferri. N. F.*Elixir of Malt and Iron.*

Extract of Malt, 4 fl. oz.
Phosphate of Iron (U. S. P. 1880), 128 gr.
Water, ½ fl. oz.
Aromatic Elixir, enough to make 16 fl. oz.

Dissolve the Phosphate of Iron in the Water by the aid of heat, mix the solution with the Extract of Malt previously introduced into a graduated bottle, and add enough Aromatic Elixir to make sixteen (16) fluidounces. Set the mixture aside for twenty-four hours, and filter.

Each fluidrachm represents 1 grain of Phosphate of Iron and 15 grains of Extract of Malt.

Note.—Extract of Malt, most suitable for this preparation, should have about the consistence of Balsam of Peru, at a temperature of about 15° C. (59° F.). The filtration of this preparation will be greatly facilitated by allowing the mixture to stand a few days before pouring it on the filter.

Decoction Hordei. U. S. 1870. DECOCTION OF BARLEY.

Barley, 240 gr.
Water, sufficient.

Having washed away extraneous matters which adhere to the Barley, boil it with 2 fl. oz. of Water for a short time, and throw away the resulting liquid; then, having poured on it 16 fl. oz. of boiling Water, boil down to 8 fl. oz., and strain.

160. Extractum Malti Fluidum. N. F. Fluid Extract of Malt.

Malt, 16 tr. oz.
Alcohol, a sufficient quantity.
Water, each, a sufficient quantity.

Reduce the Malt to a coarse powder, not finer than No. 20. Moisten it with eight (8) fluidounces of a mixture of one (1) volume of Alcohol and three (3) volumes of Water, and set it aside, well covered, until it has ceased to swell. Then mix it with as much of the menstruum as it will take up without dripping, pack it uniformly, but without pressure, in a percolator, and add enough of the before-mentioned menstruum to cover it. When the liquid begins to drop from the orifice, close the latter, and allow the contents to macerate during twenty-four hours, adding from time to time more menstruum, if necessary, to keep the malt just covered. Then remove the cork and allow the percolation to proceed until the percolate weighs twelve (12) troyounces. Set this aside, well corked, until any suspended matters have been deposited. Then decant the clear liquid and preserve it for use.

Note.—The product thus obtained may be regarded as being practically equivalent to the drug in the proportion of minim for grain, the apparent excess of dissolved matters present in the first portions of the percolate being about offset by the soluble matters still remaining in the drug when the percolation is interrupted.

Care should be exercised to keep this preparation in well-stoppered bottles in a cool, dark place.

Syrup of Iodide of Starch.

Iodide of Starch (soluble), 360 gr.
Sugar, 19 oz. (troy).
Water, 12 fl. oz.

Dissolve the Iodide in the Water, and add the Sugar. This syrup contains 1 part of Iodine in 1000. Dose, a teaspoonful.

Infusum Lini Compositum. U. S. 1870. COMPOUND INFUSION OF FLAXSEED.

Flaxseed, ½ oz. (troy).
Glycyrrhiza (bruised), 120 gr.
Boiling Water, 16 fl. oz.

Macerate for two hours in a covered vessel, and strain.

Conserve of Hollyhock.

(Thomsonian name.)

Poplar Bark,	120 gr.
Bayberry,	120 gr.
Hydrastis,	120 gr.
Cloves,	120 gr.
Cinnamon,	120 gr.
Cypripedium,	120 gr.
Capsicum,	60 gr.
Oil of Pennyroyal,	1 fl. dr.
Hollyhock Flowers,	4 oz. (troy).

Pound, and form into balls of the size of small marbles.

247. Mistura Acaciæ. N. F.*Mixture of Acacia.**Mistura Gummosa (Germ. Pharm., I.).*

Acacia, in fine powder,	1 tr. oz.
Sugar,	1 tr. oz.
Water,	12 fl. oz.

Dissolve the Acacia and Sugar in the Water.

This preparation should be freshly made when wanted for use.

307. Pulvis Acaciæ Compositus. N. F.*Compound Powder of Acacia.**Pulvis Gummosus (Germ. Pharm.).*

Acacia, in fine powder,	15 parts.
Glycyrrhiza, in fine powder,	10 parts.
Sugar, in fine powder,	5 parts.

Mix them intimately.

188. Glyceritum Tragacanthæ. N. F.*Glycerite of Tragacanth.*

Tragacanth, in fine powder,	2 tr. oz.
Glycerin,	12½ fl. oz.
Water,	8 fl. oz.

Triturate the Tragacanth with the Glycerin in a mortar, add the Water, and continue the trituration, until a homogeneous, thick paste results.

Note.—The *Glyceritum Tragacanthæ* of the British Pharm. is prepared by mixing 3 troyounces of Tragacanth with 12 fluidounces of Glycerin in a mortar, adding 2 fluidounces of Water, and triturating until a translucent, homogeneous Jelly is formed.

Mucilago Tragacanthæ of the U. S. Pharm. (1880) is made by mixing 18 parts of Glycerin with 76 parts of Water, heating the mixture to boiling, adding 6 parts of Tragacanth, macerating for twenty-four hours, then adding Water to make 100 parts, beating it to a uniform consistency, and straining.

Unguentum Glycerini of the German Pharm. is prepared by triturating 1 part of Powdered Tragacanth with 5 parts (by weight) of Alcohol (of about 91 per cent.), then adding 50 parts of Glycerin, and heating on a steam-bath.

181. Gelatinum Chondri. N. F.*Chondrus Gelatin.*

Chondrus,	1 part.
Water,	a sufficient quantity.

Wash the Chondrus with cold Water, then place it in a suitable vessel, add fifty

(50) parts of hot Water, and heat it on a boiling water-bath for fifteen minutes, frequently stirring. Strain the decoction, while hot, through a strong muslin strainer; return the strained, mucilaginous liquid to the water-bath, evaporate it to a semi-fluid consistence, then transfer it to shallow, flat-bottomed trays, and evaporate it at a temperature not exceeding 90° C. (194° F.), so that the Gelatin may become detached in scales.

Note.—Chondrus Gelatin thus prepared furnishes a Mucilage of Chondrus which is opaque, like that made directly from the Chondrus itself. It may be prepared so as to yield a transparent mucilage by following the plan pointed out in the *Note to Mucilago Chondri*.

266. Mucilago Chondri. N. F.*Mucilage of Chondrus.*

Chondrus,	860 gr.
Water,	enough to make 80 fl. oz.

Wash the Chondrus with cold Water, then place it in a suitable vessel, add thirty (30) fluidounces of Water, and heat it, on a boiling water-bath, for fifteen minutes, frequently stirring. Then strain it through muslin, and pass enough Water through the strainer to make the liquid, when cold, measure thirty (30) fluidounces.

Mucilage of Chondrus may also be prepared in the following manner:

Chondrus Gelatin,	240 gr.
Water,	enough to make 80 fl. oz.

Heat the Chondrus Gelatin with thirty (30) fluidounces of Water, at a boiling temperature, until it is completely dissolved. Then allow the solution to cool, and add enough Water, if necessary, to make up the volume to thirty (30) fluidounces.

Note.—Mucilage of Chondrus thus prepared, is well adapted for the preparation of emulsions of fixed oils. If it is, however, required for admixture with clear liquids, it should be diluted, when freshly made, and while still hot, with about 3 volumes of boiling water, filtered, and the filtrate evaporated to the volume corresponding to the proportions above given. The filtration may be greatly facilitated by filling the filter loosely with absorbent cotton, and pouring the liquid upon the latter.

Mucilage of Chondrus may be preserved for some time by transferring it, while hot, into bottles, which should be filled to the neck, then pouring a layer of Olive Oil on top, securely stoppering the bottles, and keeping them, in an upright position, in a cool place. When the Mucilage is wanted for use, the layer of oil may be removed by means of absorbent cotton.

267. Mucilago Dextrini. N. F.*Mucilage of Dextrin.*

Dextrin,	1 part.
Water,	enough to make 8 parts.

Mix them in a tared vessel, and heat the mixture, under constant stirring, to near boiling, until the Dextrin is dissolved and a limpid liquid results. Then restore any loss of water by evaporation, strain the

liquid through muslin, and allow it to cool short of gelatinizing, when it will be ready for immediate use.

Note.—If the Mucilage is not at once to be used for preparing emulsions or other mixtures, transfer it, while hot, to bottles, which should be filled to the neck. Then pour into each bottle a sufficient quantity of Olive Oil to form a protecting layer, and when the mucilage has gelatinized, securely cork the bottles, and keep them in a cool place, in an upright position.

When gelatinized Mucilage of Dextrin is to be used for the preparation of emulsions or for other mixtures, pour off the protecting layer of oil from the surface, remove the remainder of the oil by a pellet of absorbent cotton, and warm the bottle gently until the Mucilage is liquefied. Then allow it to cool short of gelatinizing.

The kind of Dextrin suitable for this preparation is the commercial, *white* variety, provided it still contains some unaltered or only partially altered starch, and forms a jelly on cooling, when made into a mucilage after the formula above given. The yellow variety, which is completely soluble in about 2 parts of cold water, will not answer the purpose.

268. Mucilago Salep. N. F.

Mucilage of Salep.

Salep, in fine powder,	70 gr.
Cold Water,	1½ fl. oz.
Boiling Water,	14½ fl. oz.

Place the powdered Salep into a flask containing the Cold Water, and shake until the powder is divided. Then add the Boiling Water, and shake the mixture continuously until it has cooled to 25° C. (77° F.), or below this temperature. The cooling may be hastened by frequent and brief immersion of the flask in cold water.

Mucilage of Salep should be freshly made when wanted for use.

Note.—If Sugar or Syrup is prescribed in the same mixture with Mucilage of Salep, it is preferable to triturate the required quantity of powdered Salep with either of the former, as the case may be, and then to add rapidly the proportionate amount of Boiling Water.

359. Syrupus Chondri Compositus. N. F.

Compound Syrup of Chondrus.

Compound Syrup of Irish Moss.

Chondrus,	8 gr.
Fluid Extract of Ipecac,	8 min.
Fluid Extract of Squill,	120 min.
Fluid Extract of Senega,	120 min.
Camphorated Tincture of Opium,	210 min.
Purified Talcum,	120 gr.
Sugar,	10 tr. oz.
Water,	enough to make 16 fl. oz.

Macerate the Chondrus in one (1) fluid-ounce of Water until it is softened, then heat it on a boiling water-bath for fifteen minutes, strain it through flannel, without pressure, and wash the flannel and contents with one (1) fluid-ounce of hot Water. Mix the Fluid Extracts and Tincture with the Purified Talcum and

five (5) fluid-ounces of Water, shake the mixture frequently and thoroughly during half an hour, and then filter it through a wetted filter, returning the first portions of the filtrate, until it runs through clear. Mix the mucilage of Chondrus with the filtrate, then add the Sugar, and pass enough Water through the filter to make the product, after the Sugar has been dissolved by agitation, measure sixteen (16) fluid-ounces.

407. Tinctura Persionis. N. F.

Tincture of Cudbear.

Cudbear, in fine powder,	2 tr. oz.
Alcohol,	
Water, each,	enough to make 16 fl. oz.

Pack the Cudbear in a suitable percolator, and percolate it with a mixture of one (1) volume of Alcohol and two (2) volumes of Water, until sixteen (16) fluid-ounces of Tincture are obtained.

Note.—This preparation is intended as a coloring agent when a bright red tint or color is to be produced, particularly in acid liquids.

408. Tinctura Persionis Composita. N. F.

Compound Tincture of Cudbear.

Cudbear,	120 gr.
Caramel,	1½ tr. oz.
Alcohol,	
Water, each,	enough to make 16 fl. oz.

Mix one (1) volume of Alcohol with two (2) volumes of Water. Macerate the Cudbear with twelve (12) fluid-ounces of the menstruum during twelve hours, agitating occasionally, and then filter through paper, and add the Caramel, previously dissolved in two (2) fluid-ounces of Water. Then pass enough of the before-mentioned menstruum through the filter to make the whole measure sixteen (16) fluid-ounces.

Note.—This preparation is intended as a coloring agent, when a brownish-red tint or color is to be produced.

332. Species Emollientes. N. F.

Emollient Species.

Emollient Cataplasm (Germ. Pharm.).

Althaea Leaves,	
Mallow Leaves,	
Melilot Tops,	
Matricaria,	
Flaxseed, each,	equal parts.
Reduce them to a coarse powder, and mix uniformly.	

Note.—Mallow Leaves are derived from *Mahoe vulgaris* Fries, and *Mahoe sylvestris* Linné. Melilot Tops are the leaves and flowering branches of *Meilothus officinalis* Desrousseaux, and *Meilothus altissimus* Thuilliers.

SACCHARINE SUBSTANCES.

Syrup of Manna.

Manna,	1 oz. (troy).
Sugar,	5 oz. (troy).
Water,	4 fl. oz.

Dissolve the Manna in the Water, filter, add the Sugar, and heat to boiling, then strain.

Syrup of Liquorice Root.

Fluid Extract of Glycyrrhiza,	4 fl. oz.
Syrup, a sufficient quantity to make	16 fl. oz.
Mix.	

70. Elixir Glycyrrhizæ. N. F.

Elixir of Glycyrrhiza.

Elixir of Liquorice.

Purified Extract of Glycyrrhiza, 1 tr. oz.
Water of Ammonia, a sufficient quantity.
Aromatic Elixir, enough to make 16 fl. oz.

Triturate the Purified Extract of Glycyrrhiza with twelve (12) fluidounces of Aromatic Elixir gradually added. To ten (10) fluidounces of this mixture add Water of Ammonia in drops, until it is in slight excess. Mix this with the reserved portion, and, finally, add enough Aromatic Elixir to make sixteen (16) fluidounces. Filter, if necessary.

71. Elixir Glycyrrhizæ Aromaticum.

N. F.

Aromatic Elixir of Glycyrrhiza.

Aromatic Elixir of Liquorice.

Fluid Extract of Glycyrrhiza,	2 fl. oz.
Oil of Cloves,	6 min.
Oil of Cinnamon (Ceylon),	6 min.
Oil of Nutmeg,	4 min.
Oil of Fennel,	12 min.
Purified Talcum,	360 gr.
Aromatic Elixir, enough to make	16 fl. oz.

Triturate the Oils with the Purified Talcum and the Fluid Extract, then add fourteen (14) fluidounces of Aromatic Elixir, filter, and pass enough Aromatic Elixir through the filter to make sixteen (16) fluidounces.

151. Extractum Glycyrrhizæ Depuratum. N. F.

Purified Extract of Glycyrrhiza.

Purified Extract of Liquorice.

Extract of Glycyrrhiza, in sticks,
Water, each, a sufficient quantity.

Put a layer of well-washed rye-straw over the bottom of a keg or other suitable tall vessel. Then put a single layer of sticks of Extract of Glycyrrhiza, broken into coarse pieces, over it. Continue to put in alternate layers of straw and Extract of Glycyrrhiza until the vessel is full or the whole of the Extract has been disposed

of. Fill the vessel with cold Water, and allow it to remain for three days. Then draw off the solution which has formed, by means of a faucet, or siphon, or otherwise, refill the vessel with cold Water, and proceed as before. Mix the several solutions obtained, allow any suspended matter to subside, decant the clear solution, and strain the remainder without pressure. Finally, evaporate the liquid on a water-bath to the consistence of a pilular extract.

Note.—Purified Extract of Glycyrrhiza should not be confounded with the official Pure Extract of Glycyrrhiza (*Extractum Glycyrrhizæ Purum*).

359. Syrupus Glycyrrhizæ. N. F.

Syrup of Glycyrrhiza.

Syrup of Liquorice.

Pure Extract of Glycyrrhiza

(U. S. F.),	2 tr. oz.
Glycerin,	2 tr. oz.
Sugar,	10 tr. oz.
Water,	enough to make 16 fl. oz.

Dissolve the Pure Extract of Glycyrrhiza in eight (8) fluidounces of Water, add the Sugar, dissolve it by agitation, and strain. Then add the Glycerin, and, lastly, enough Water to make sixteen (16) fluidounces.

Each fluidrachm represents about 80 grains of Glycyrrhiza.

214. Liquor Extracti Glycyrrhizæ.

N. F.

Solution of Extract of Glycyrrhiza.

Solution of Extract of Liquorice.

Purified Extract of Glycyrrhiza,
a sufficient quantity.

Alcohol,	2 fl. oz.
Glycerin,	4 fl. oz.
Water,	enough to make 16 fl. oz.

In a small portion of Purified Extract of Glycyrrhiza, weighed into a tared capsule, determine the amount of water, by drying it to a constant weight. Then take of the Purified Extract a quantity equivalent to four (4) troyounces of dry extract, dissolve this, on a water-bath, in four (4) fluidounces of Water, add the Glycerin, and allow the liquid to cool. Lastly, add the Alcohol, and enough Water to make sixteen (16) fluidounces.

Each fluidrachm represents 15 grains of dry Extract of Glycyrrhiza.

232. Liquor Saccharini. N. F.

Solution of Saccharin.

Saccharin,	512 gr.
Bicarbonate of Sodium,	240 gr.
Alcohol,	4 fl. oz.
Water,	enough to make 16 fl. oz.

Dissolve the Saccharin and the Bicarbonate of Sodium in ten (10) fluidounces

of Water, filter the solution, add the Alcohol to the filtrate, and pass enough Water through the filter to make *sixteen* (16) fluidounces.

Each fluidrachm represents 4 grains of Saccharin.

Note.—The Saccharin directed in the above formula is, properly speaking, "anhydro-ortho-sulphamine-benzoic acid," an artificially prepared member of the so-called aromatic series of organic chemicals. It is a body having feebly acid properties, soluble in about 333 parts of water and in 33 parts of alcohol at 15° C. (59° F.). When neutralized by an alkali, it is quite soluble in water.

The Solution of Saccharin is intended to be used for sweetening liquids or solids, when the use of sugar is objectionable, or when a sweet taste is to be imparted to a liquid without increasing its density.

334. Species Pectorales. N. F.

Pectoral Species.

Species ad Infusum Pectorale. Breast Tea
(*Germa. Pharm.*)

Althæa, peeled,	8 parts.
Coltsfoot Leaves,	4 parts.
Glycyrrhiza, Russian, peeled,	8 parts.
Anise,	2 parts.
Mullein Flowers,	2 parts.
Orris Root,	1 part.

Cut, bruise, and mix them.

Note.—Coltsfoot Leaves are derived from *Tussilago Farfara* Linné. Mullein Flowers are from *Verbascum Thapsus* G. Meyer.

Infusum pectorale (Pectoral Infusion, or Infusion of Pectoral Species) is made by infusing 1 troyounce of the above preparation, in the usual manner, so as to obtain 10 fluidounces of strained product.

Pectoral Lozenges.

(Dr. Jackson's.)

Powdered Ipecac,	5 gr.
Sulphurated Antimony,	2½ gr.
Morphine Hydrochlorate,	8 gr.
Powdered Acacia,	330 gr.
Powdered Sugar,	330 gr.
Powdered Extract of Glycyrrhiza,	330 gr.
Oil of Sassafras,	2 min.
Tincture of Tolu,	2 min.

To be made into a stiff mass with Simple Syrup, and divided into 100 lozenges, or into lozenges of 10 gr. each. Each lozenge contains ⅓ gr. of Ipecac, ⅓ gr. of Antimony, ⅓ gr. of Morphine. One every three or four hours.

Pectoral Powder.

(Wedel's.)

Benzoic Acid,	8 gr.
Washed Sulphur,	75 gr.
Glycyrrhiza,	250 gr.
Iris,	80 gr.
Sugar,	300 gr.
Oil of Anise,	4 min.
Oil of Fennel,	4 min.

Mix. A tablespoonful three or four times a day in bronchitis, severe cough, or croup.

Cough Powder.

(Thomsonian name.)

Lobelia,	
Glycyrrhiza,	
Skunk Cabbage,	
Sugar,	of each, 1 oz. (troy).
Mix.	

DERIVATIVES OF SUGARS THROUGH THE ACTION OF FERMENTS.

Alcoholic Mixture.

(Gubler's.)

Alcohol (85 per cent.),	
Water,	
Syrup of Orange,	of each, 2 fl. oz.
A tablespoonful to be given every two hours.	

Solution of Butyl-Chloral.

(CROTON-CHLORAL.)

Butyl-Chloral,	7 gr.
Alcohol,	30 min.
Distilled Water,	2½ fl. oz.
Syrup of Orange,	2 fl. oz.
Mix.	A tablespoonful every two hours.

Camphorated Chloro-tannate of Iodine.

Chloral,	60 gr.
Iodine,	30 gr.
Oil of Camphor,	6 fl. dr.
Tannic Acid,	sufficient.

Dissolve, and add sufficient Tannic Acid to bring the mixture to the consistence of thick syrup.

Glycerole of Chloral and Camphor.

(C. Pavest.)

Camphor (in powder),	75 gr.
Chloral,	60 gr.
Oil of Juniper,	30 min.
Glycerin,	4 fl. dr.
Alcohol,	5 fl. dr.

Mix in a vial, and expose to a gentle heat (not over 40° C. = 104° F.) until solution has been effected. Let cool, and keep the vial well stoppered.

17. Chloral Camphoratum. N. F.

Camphorated Chloral.

Chloral et Camphora. Chloral and Camphor.

Chloral,	50 parts.
Camphor,	50 parts.

Mix them by agitation in a bottle, or by trituration in a warm mortar, until they are liquefied and combined.

Chloral Cream.

Chloral,	300 gr.
Sugar,	1½ oz. (troy).
Water,	15 fl. dr.

Dissolve the Chloral in the Water, and triturate with the Sugar in a mortar.

Elizir of Chloroform.

Chloroform,	6 fl. dr.
Oil of Cinnamon,	10 min.
Tincture of Opium,	
Tincture of Camphor,	
Aromatic Spirit of Ammonia,	
of each,	6 fl. dr.
Brandy,	1 fl. oz.
Mix. Dose, half a teaspoonful.	

5. Aqua Chloroformi. N. F.*Chloroform Water.*

Purified Chloroform,	80 min.
Distilled Water,	10 fl. oz.

Shake them together in a capacious bottle, until the Chloroform is dissolved, or until only a small quantity remains which cannot be dissolved by further agitation. Then filter in a covered funnel. Keep the product in well-stoppered bottles.

Note.—Chloroform Water, aside from its medicinal properties, is an efficient preservative agent, and forms a good solvent, in place of water, for preparing solutions which require to be kept free from micro-organisms.

41. Elizir Chloroformi Compositum. N. F.*Compound Elizir of Chloroform.*

Chloroform,	8 fl. oz.
Tincture of Opium,	8 fl. oz.
Spirit of Camphor,	8 fl. oz.
Aromatic Spirit of Ammonia,	8 fl. oz.
Alcohol,	8 fl. oz.
Oil of Cinnamon (Cassia),	40 min.
Water,	enough to make 16 fl. oz.

Mix the Chloroform with the Alcohol, then add the Oil of Cinnamon, Aromatic Spirit of Ammonia, Spirit of Camphor, Tincture of Opium, and, lastly, enough Water to make sixteen (16) fluidounces. Allow the mixture to stand a few hours, and filter in a well-covered funnel.

Each fluidrachm represents about 1 grain of Opium and 11 minims of Chloroform.

Note.—This preparation is called Chloroform Paregoric in some sections of the country. It is recommended that this title be abandoned, to prevent confusion with the official Paregoric or *Tinctura Opti Camphorata*.

113. Emulsio Chloroformi. N. F.*Emulsion of Chloroform.*

Chloroform,	40 min.
Tincture of Quillaja,	30 min.
Acacia, in fine powder,	12 gr.
Water,	enough to make 2 fl. oz.

Put the Chloroform and the Tincture of Quillaja into a two-ounce vial, add the Powdered Acacia, shake, and afterwards add the Water. Shake the mixture before using.

Each fluidrachm contains 2½ minims of Chloroform.

253. Mistura Chloral et Potassii Bromidi Composita. N. F.*Compound Mixture of Chloral and Bromide of Potassium.*

Chloral,	4 tr. oz.
Bromide of Potassium,	4 tr. oz.
Extract of Indian Cannabis,	16 gr.
Extract of Hyoscyamus,	16 gr.
Alcohol,	1 fl. oz.
Tincture of Quillaja (N. F.),	1 fl. oz.
Water,	enough to make 16 fl. oz.

Dissolve the Chloral and Bromide of Potassium in twelve (12) fluidounces of Water, dissolve in this solution the Extract of Hyoscyamus, and add the Tincture of Quillaja. Then dissolve the Extract of Indian Cannabis in the Alcohol, and add this solution gradually to that first prepared, agitating it during the addition. Finally, add enough Water to make sixteen (16) fluidounces.

This preparation should be shaken whenever any of it is to be dispensed.

Each fluidrachm contains 16 grains, each, of Chloral and of Bromide of Potassium, and ½ grain, each, of Extract of Indian Cannabis and of Extract of Hyoscyamus.

Note.—The resinous Extract of Indian Cannabis is merely held in suspension by means of the Tincture of Quillaja, as it is practically insoluble in the liquid. If the mixture is filtered, the resin will remain on the filter.

254. Mistura Chloroformi et Opii. N. F.*Mixture of Chloroform and Opium.**Chloroform Anodyne.*

Purified Chloroform,	2 fl. oz.
Oil of Peppermint,	16 min.
Tincture of Indian Cannabis,	2 fl. oz.
Tincture of Quillaja (N. F.),	2 fl. oz.
Fluid Extract of Belladonna,	128 min.
Deodorized Tincture of Opium,	2½ fl. oz.
Tincture of Capsicum,	1 fl. oz.
Purified Extract of Glycyrrhiza,	240 gr.
Water,	½ fl. oz.
Syrup,	enough to make 16 fl. oz.

Triturate the Purified Extract of Glycyrrhiza with the Water and one (1) fluidounce of the Syrup until it is dissolved. Mix the Fluid Extract of Belladonna, Deodorized Tincture of Opium, and Tincture of Capsicum, and add them to the solution first prepared. Then mix the Chloroform, Oil of Peppermint, Tincture of Indian Cannabis, and Tincture of Quillaja, and add them to the mixture. Finally, add enough Syrup to make sixteen (16) fluidounces and mix the whole thoroughly together.

This mixture should be shaken whenever any of it is to be dispensed. See

pages 481 and 1507, 16th ed. U. S. Dispensatory.

Each fluidrachm represents $7\frac{1}{2}$ minims of Chloroform, $7\frac{1}{2}$ minims of Tincture of Indian Cannabis, $3\frac{1}{2}$ minims of Tincture of Capsicum, 1 minim of Fluid Extract of Belladonna, and about 1 grain of Opium.

Note.—This preparation is intended to fulfil the same purposes as the *Tinctura Chloroformi et Morphine* of the British Pharm., though the composition of the latter differs materially from that of the mixture above given.

Gelatinized Chloroform.

Purified Chloroform, 6 fl. dr.
White of Egg, 6 fl. dr.

Put into a wide-mouth two-ounce vial, shake it, and allow it to stand for three hours.

Elixir of Chloroform.

(Dr. Hartshorn's Chloroform Paregoric.)

Chloroform, $1\frac{1}{2}$ fl. oz.
Tincture of Opium, $1\frac{1}{2}$ fl. oz.
Spirit of Camphor, $1\frac{1}{2}$ fl. oz.
Aromatic Spirit of Ammonia, $1\frac{1}{2}$ fl. oz.
Oil of Cinnamon, 20 min.
Brandy, 2 fl. oz.

Mix. Dose, $\frac{1}{2}$ fl. dr. or less.

315. Pulvis Iodoformi Dilutus. N. F.

Diluted Powder of Iodoform.

Iodoform and Naphthalin.

Iodoform, in fine powder, 2 tr. oz.
Boric Acid, in fine powder, 8 tr. oz.
Naphthalin, 5 tr. oz.
Oil of Bergamot, 120 min.

Triturate the Naphthalin with the Oil of Bergamot, then mix it with the Iodoform and Boric Acid, and triturate until a homogeneous powder is produced.

Note.—This powder is used in many cases where a diluted preparation of Iodoform, for external purposes, is desired. The odor of the Iodoform is masked both by the Oil of Bergamot and by the Naphthalin.

15. Carbasus Iodoformata. N. F.

Iodoform Gauze.

Iodoform, 10 parts.
Stronger Ether, 40 parts.
Alcohol, 40 parts.
Tincture of Benzoin, 5 parts.
Glycerin, 5 parts.
Gauze Muslin, a sufficient quantity.

Dissolve the Iodoform in the Stronger Ether, then add the Alcohol, Tincture of Benzoin, and Glycerin. Immerse in a weighed quantity of this solution, contained in a suitable vessel, the exact amount of Gauze Muslin required to absorb the whole of it, to produce a product of a prescribed percentage of iodoform, work it about with a pestle so as to impregnate it uniformly; then take it out, and hang it up to dry, in a horizontal position, and in a dark place. Lastly,

wrap it in paraffin paper and preserve it in air-tight receptacles.

Note.—To calculate the amount of muslin and of iodoform solution required to obtain a product approximately of any required percentage of iodoform, let x denote this required percentage. Then take of the above Iodoform Solution ten (10) times this quantity (or $10x$). Also multiply the required percentage (or by three (3), divide the resulting product by two (2), and subtract the quotient from one hundred (100). The remainder represents the number of parts by weight of Gauze Muslin to be used. Regarding the most suitable kind of Gauze Muslin, see note to *Carbasus Carbollata* (page 1191).

192. Iodoformum Aromatisatum. N. F.

Aromatized Iodoform.

Deodorized Iodoform.

Iodoform, 25 parts.
Cumarin, 1 part.

Mix them intimately by trituration.

Note.—Should Cumarin not be available, or should it be objectionable to the patient, the odor of Iodoform may also be more or less masked by many essential oils, for instance, those of peppermint, cloves, cinnamon, citronella, bergamot, sassafras, eucalyptus, etc. Another efficient covering agent is freshly-roasted and powdered coffee.

The odor of Iodoform may be removed from the hands or any utensils which it has come in contact with, by washing them with an aqueous solution of tannic acid.

Wade's Suppositories.

Iodoform, 60 gr.
Subnitrate of Bismuth, 60 gr.
Chloral, 8 gr.
Morphine, 24 gr.
Oil of Rose, 10 min.
Oil of Theobroma, 240 gr.

Mix, and divide into 12 suppositories one-eighth of an inch in diameter. One to be inserted into the urethra three times daily.

Carbolized Iodoform.

Iodoform, 150 gr.
Carbolic Acid, 1 min.
Oil of Peppermint, 2 min.

Mix the Iodoform and Acid by trituration, and then add the volatile oil.

Iodoform Paste.

Iodoform, 60 gr.
Mucilage of Acacia, 10 min.
Glycerin, 10 min.
Oil of Peppermint, 1 min.

Mix.

Iodoform Cotton.

Purified Cotton, 860 gr.
Iodoform, 24 gr.
Ether, 2 fl. dr.
Alcohol, 4 fl. dr.
Glycerin, 2 fl. dr.

Dissolve the Iodoform in the Ether and Alcohol mixed, add the Glycerin to this solution, and saturate the Cotton with this liquid. Let it dry by exposure to the air.

Iodoform Pencils.

Iodoform,
Oil of Theobroma, of each, 81 gr.
Triturate together, and roll the mass
into 5 pencils, one-twelfth of an inch
thick, then dust with lycopodium.

Compound Iodoform Ointment.

(Dr. J. Wm. White's.)

Iodoform, 60 gr.
Oil of Anise, 20 min.
Oil of Rose, 5 min.
Oil of Ylang-Ylang, 5 min.
Ointment of Rose Water, 1 oz. (troy).
Mix.

Compound Iodoform Ointment.

(N. Y. Hosp.)

Iodoform,
Tannic Acid, of each, 60 gr.
Vaseline, 1 oz. (troy).
Mix.

Compound Tincture of Iodoform.

Iodoform, 15 gr.
Potassium Iodide, 120 gr.
Glycerin, 2 fl. dr.
Alcohol, 6 fl. dr.

Mix. Rub the Iodoform and the Potassium Iodide in a mortar until a fine powder is produced, then add the Glycerin and rub to the consistency of cream; then add the Alcohol, and stir briskly until all is dissolved. Dose, 15 drops three times a day, on sugar or in syrup.

Liniment of Iodoform.

Iodoform, 80 gr.
Camphor, 80 gr.
Oil of Sassafras, 1 fl. dr.
Expressed Oil of Almond, 4 fl. oz.
Powder the Iodoform and Camphor, introduce into a dry vial, add the Oils, and heat in a water-bath, shaking frequently until dissolved.

Elixir of Paraldehyd.

Paraldehyd, 160 min.
Alcohol, 14 fl. dr.
Tincture of Vanilla, 80 min.
Water, 1 fl. oz.
Syrup, 1½ fl. oz.

Dose, 1 to 2 teaspoonfuls.

PRODUCTS OF THE ACTION OF FERMENTS UPON ACID SACHARINE FRUITS.

Potion of Todd.

(Dorvault's.)

Brandy, 6 fl. dr.
Distilled Water, 9 fl. dr.
Syrup, 4 fl. dr.
Tincture of Canella, 1 fl. dr.
Mix.

Brandy Mixture.

Yolk of Eggs, 2.
Sugar, 240 gr.
Oil of Cinnamon, 2 min.
Cinnamon Water, 4 fl. oz.
Brandy, 4 fl. oz.
Mix. Dose, a tablespoonful as occasion may require.

Strengthening Syrup.

(Thomsonian name.)

Comfrey Root, 2 oz. (av.).
Inula, 1 oz. (av.).
Marrubium, 240 gr.
Beth Root, 120 gr.
Brandy, 8 fl. oz.
Sugar, 8 oz. (av.).
Water, 8 pints.

Add the Water to the Comfrey Root, Inula, and Marrubium, and boil until the liquid measures 24 fl. oz., then strain, and add the remaining ingredients.

VOLATILE OILS.

Confectio Aurantii Corticis. U. S. 1870.
CONFECTION OF ORANGE PEEL.

Sweet Orange Peel, recently separated from the fruit by grating, 6 oz. (troy).
Sugar, 18 oz. (troy).
Beat the Orange Peel with the Sugar, gradually added, until they are thoroughly mixed.

Cardinal Drops, or Bishop Drops.

(TINCTURA EPISCOPALIS.)

Orange Peel, 720 gr.
Orange Berries, 720 gr.
Cloves, 120 gr.
Cinnamon, 120 gr.
Water, 8 fl. oz.
Bitter Almond Water, 2 fl. dr.
Alcohol, 12 fl. oz.

Mix, and macerate seven days.

342. Spiritus Olei Volatilis. N. F.

Spirit of a Volatile Oil.

Any Spirit or alcoholic solution of a Volatile Oil, for which no formula is given by the U. S. Pharm. or by this *Formulary*, should be prepared in accordance with the following general formula:

Any Volatile Oil, 400 min.
Deodorized Alcohol, enough to make 16 fl. oz.
Dissolve the Volatile Oil in the Deodorized Alcohol.

Note.—The strength of the Spirit thus prepared is approximately 5 per cent. by weight, provided the specific gravity of the Oil is about 0.900.

337. Spiritus Aromaticus. N. F.

Aromatic Spirit.

Compound Spirit of Orange (N. F.), 8 fl. oz.
Deodorized Alcohol, 7½ pints.

Mix them. Preserve the product, if it is to be kept in stock, in completely-filled and well-stoppered vials or bottles, and stored in a cool and dark place.

Aromatic Spirit may also be prepared in the following manner:

Sweet Orange Peel, fresh, and deprived of the white, inner portion, 16 tr. oz.
Lemon Peel, fresh, 2 tr. oz.
Coriander, bruised, 2 tr. oz.
Oil of Star Anise, 16 min.

Deodorized Alcohol, enough to make 1 gal.
Macerate the solids during four days with 1 gallon of Deodorized Alcohol; then add the Oil of Star Anise, filter, and pass enough Deodorized Alcohol through the filter to make the product measure one (1) gallon.

Note.—When good, fresh essential oils cannot be readily obtained for preparing the Compound Spirit of Orange, the second formula may be used. But the product obtained by it should not be employed in mixtures containing iron, as the latter would cause a darkening of the mixture.

338. Spiritus Aurantii Compositus. N. F.

Compound Spirit of Orange.

Oil of Bitter Orange Peel, 4 fl. oz.
Oil of Lemon, 1 fl. oz.
Oil of Coriander, 160 min.
Oil of Star Anise, 40 min.
Deodorized Alcohol, enough to make 20 fl. oz.

Mix them.

Note.—One fluidounce of this Spirit and 15 fluidounces of Deodorized Alcohol make 1 pint of Aromatic Spirit. (See No. 337.)

The essential oils used in this preparation, particularly those of orange and lemon, must be as fresh as possible, and absolutely free from any terebinthinate odor or taste. They should be diluted as soon as received, with a definite quantity of Deodorized Alcohol, which will retard deterioration. They should not be kept in stock, undiluted, for any length of time, or should at least be kept in bottles completely filled, and in a dark place. The alcoholic solution should be kept in the same manner. If Oil of Curaçao Orange of good quality can be obtained, it is advisable to use this, in place of ordinary oil of orange, as it imparts to the Spirit a finer flavor than the latter.

340. Spiritus Curassao. N. F.

Spirit of Curaçao.

Oil of Curaçao Orange, 2 fl. oz.
Oil of Fennel, 15 min.
Oil of Bitter Almond, 8 min.
Deodorized Alcohol, 10 fl. oz.

Mix the Oils with the Deodorized Alcohol, and keep the Spirit in completely-filled and well-corked bottles, and stored in a cool and dark place.

Note.—The essential oils used in this case must be as fresh as possible, and absolutely free from any terebinthinate odor or taste. Oil of Curaçao Orange may be obtained without difficulty in the market, but it should be carefully examined as to its quality, immediately upon receipt, and should not be kept in stock for any length of time, without special precautions (see Note to No. 338). A still finer quality of Oil of Orange is that derived from *Citrus nobilis*, which is known in the market as Oil of Mandarin.

53. Elixir Curassao. N. F.

*Elixir of Curaçao.**Curaçao Cordial.*

Spirit of Curaçao, 120 min.
Orris Root, in fine powder, 80 gr.
Deodorized Alcohol, 4 fl. oz.
Citric Acid, 50 gr.
Syrup, 8 fl. oz.
Purified Talcum, 120 gr.
Water, enough to make 16 fl. oz.

Mix the Spirit of Curaçao with the Alcohol, add the Orris Root, the Purified Talcum, and three (3) fluidounces of Water. Allow the mixture to stand twelve hours, occasionally agitating; then pour it on a wetted filter, returning the first portions of the filtrate until it runs through clear, and pass enough Water through the filter to make the filtrate measure eight (8) fluidounces. In this dissolve the Citric Acid, and finally add the Syrup.

274. Oleosacchara. N. F.

*Oil-Sugars.**Elæosacchara (Germ. Pharm.).*

Any Volatile Oil, 1 drop.
Sugar, 80 gr.
Triturate the Sugar with the Volatile Oil to a fine powder.

This preparation should be freshly made when wanted for use.

Note.—When *Elæosaccharum Anisi*, *E. Fœniculi*, *E. Menthe Piperitæ*, etc., are prescribed, these are to be prepared from the corresponding essential oils, according to the above formula.

352. Syrupus Asari Compositus. N. F.

*Compound Syrup of Asarum.**Compound Syrup of Canada Snake-Root.*

Asarum Root, in moderately coarse (No. 40) powder, 448 gr.
Alcohol, 3 fl. oz.
Cochineal, in fine powder, 10 gr.
Carbonate of Potassium, 20 gr.
Wine of Ipecac, 220 min.
Sugar, 11 tr. oz.
Water, enough to make 16 fl. oz.

Mix the Asarum intimately with the Cochineal and Carbonate of Potassium, previously triturated together. Moisten

the powder with a sufficient quantity of a menstruum prepared by mixing the Alcohol with *six* (6) *fluidounces* of Water, and allow it to macerate, in a covered vessel, for twenty-four hours, then transfer it to a small percolator, and pour on the remainder of the menstruum. Allow the percolation to proceed slowly, and then follow up the menstruum by Water, until *eight* (8) *fluidounces* of percolate are obtained. To this add the Wine of Ipecac, and afterwards the Sugar, and dissolve the latter by agitation. Finally, add enough Water, previously passed through the percolator, to make *sixteen* (16) *fluidounces*.

Each *fluidrachm* represents about 8½ grains of *Asarum*.

391. *Tinctura Aromatica. N. F.*

Aromatic Tincture.

Cinnamon (Cassia),	650 gr.
Ginger,	260 gr.
Galangal (root),	180 gr.
Cloves,	180 gr.
Cardamom,	180 gr.
Alcohol,	
Water, each,	enough to make 16 fl. oz.

Reduce the drugs to a moderately coarse (No. 40) powder, and percolate it, in the usual manner, with a mixture of two (2) *volumes* of Alcohol and one (1) *volume* of Water, until *sixteen* (16) *fluidounces* of percolate are obtained.

Note.—This preparation is practically identical with that which is official in the Germ. Pharm. Galangal is the root of *Alpinia officinarum* Hance.

343. *Spiritus Ophthalmicus. N. F.*

Ophthalmic Spirit.

Alcoholic Eye-Wash.

Oil of Lavender,	10 min.
Oil of Rosemary,	30 min.
Alcohol,	1 fl. oz.

Mix them by agitation, and, if necessary, filter the liquid through paper.

335. *Spiritus Amygdalæ Amarae. N. F.*

Spirit of Bitter Almond.

Essence of Bitter Almond.

Oil of Bitter Almond,	160 min.
Alcohol,	14 fl. oz.
Distilled Water, enough to make	16 fl. oz.

Dissolve the Oil in the Alcohol, and add enough Distilled Water to make *sixteen* (16) *fluidounces*.

346. *Spiritus Sinapis. N. F.*

Spirit of Mustard.

Volatile Oil of Mustard,	190 min.
Alcohol,	enough to make 16 fl. oz.

Mix them.

Note.—This preparation is official in the Germ. Pharm.

417. *Tinctura Vanillini Composita.*

N. F.

Compound Tincture of Vanillin.

Compound Essence of Vanillin.

Vanillin,	45 gr.
Cumarin,	8 gr.
Alcohol,	8 fl. oz.
Glycerin,	2 fl. oz.
Syrup,	2 fl. oz.

Compound Tincture of Cudbear

(N. F.),

120 min.

Water, enough to make 16 fl. oz.

Dissolve the Vanillin and Cumarin in the Alcohol, add the Glycerin, Syrup, and Compound Tincture of Cudbear, and, lastly, enough Water to make *sixteen* (16) *fluidounces*.

72. *Elixir Grindeliæ. N. F.*

Elixir of Grindelia.

Fluid Extract of Grindelia,	1 fl. oz.
Aromatic Spirit,	2 fl. oz.
Compound Elixir of Taraxacum,	13 fl. oz.

Mix them, allow the mixture to stand a few days, if convenient, then filter.

Each *fluidounce* represents 80 grains of *Grindelia*.

Red Elixir.

Compound Tincture of Coch-

ineal,	6 fl. dr.
Elixir of Orange,	24 fl. oz.
Mix.	

Red Drops.

(Whitwith's.)

Oil of Thyme,	2 fl. dr.
Tincture of Myrrh,	1 fl. oz.
Tincture of Camphor,	1 fl. dr.
Compound Tincture of Lavender,	1 fl. oz.
Alcohol,	4 fl. oz.

Dose, 25 drops in a suitable vehicle, two, three, or four times a day.

Confectio Aromatica. U. S. 1870. AROMATIC CONFECTION.

Aromatic Powder,	4 oz. (troy).
Clarified Honey,	4 oz. (troy).

Rub the Aromatic Powder with Clarified Honey until a uniform mass of the proper consistence is obtained.

Eucalyptus Gauze.

(Lister's.)

Oil of Eucalyptus,	60 min.
Damar,	180 gr.
Paraffin,	180 gr.

The Damar and Paraffin are melted, the Oil is added, and the mixture sprinkled or squirted over the muslin laid together in folds. It is then placed in an airtight heating apparatus, compressed by weights, and exposed to a dry heat. The finished gauze contains 10 to 11 per cent. of mixture.

Compound Spirit of Cajuput.

Oil of Cajuput,	
Oil of Cloves,	
Oil of Peppermint,	
Oil of Anise,	of each, 4 fl. dr.
Alcohol,	2 fl. oz.

Mix. A powerful stimulant.

Compound Mixture of Apium.

(Dr. W. A. Hammond's.)

Fluid Extract of Erythroxylon,	2 fl. oz.
Fluid Extract of Viburnum,	1 fl. oz.
Fluid Extract of Celery,	1 fl. oz.

Mix.

Elemi Ointment.

Elemi (Resin),	60 gr.
Cerate,	1 oz. (troy).
Resin Cerate,	120 gr.
Balsam of Peru,	120 min.

Fuse together, and mix thoroughly.

Croup Liniment.

Camphor,	320 gr.
Oil of Turpentine,	2 fl. oz.

Make a solution.

Carbolated Camphor.

Camphor,	60 gr.
Carbolic Acid,	20 gr.
Alcohol,	2 min.

Mix.

Brassicon.

Camphor,	20 gr.
Oil of Peppermint,	1 fl. dr.
Volatile Oil of Mustard,	12 min.
Ether,	2 fl. dr.
Alcohol,	6 fl. dr.

Spirit of Peppermint, sufficient to color.

Mix. Used externally in headache.

Cholera Remedy.

(Dr. Dwight's.)

Tincture of Camphor,	1 fl. oz.
Tincture of Opium,	1 fl. oz.
Compound Tincture of Rhubarb,	1 fl. oz.

Mix. Dose, half a teaspoonful.

25. Elixir Adjuvans. N. F.**Adjuvant Elixir.**

Sweet Orange Peel, recently dried,	2 tr. oz.
Wild Cherry,	4 tr. oz.
Glycyrrhiza, Russian, peeled,	8 tr. oz.
Coriander,	1 tr. oz.
Caraway,	1 tr. oz.
Alcohol,	
Water,	each, a sufficient quantity.
Syrup,	enough to make 1 gal.

Grind the Wild Cherry to a moderately coarse (No. 40) powder, moisten it with four (4) fluidounces of Water and set it aside for twelve hours. Reduce the other

solids also to a moderately coarse (No. 40) powder, mix this intimately with the Wild Cherry, and having mixed one (1) volume of Alcohol with two (2) volumes of Water, moisten the powder with four (4) fluidounces of the mixture, and pack tightly in a percolator. Then gradually pour menstruum on top until ninety-six (96) fluidounces of percolate are obtained. Mix this with thirty-two (32) fluidounces of Syrup, and filter.

Note.—This preparation is chiefly intended as a vehicle, particularly for acrid or saline remedies.

29. Elixir Anisi. N. F.**Elixir of Anise.****Aniseed Cordial.**

Anethol,	25 min.
Oil of Fennel,	5 min.
Oil of Bitter Almond,	1 drop.
Deodorized Alcohol,	4 fl. oz.
Syrup,	10 fl. oz.
Water,	2 fl. oz.
Purified Talcum,	120 gr.

Mix the Anethol and the Oils with the Deodorized Alcohol, add the Syrup and Water, and set the mixture aside for twelve hours. Then mix it intimately with the Purified Talcum, and filter it through a wetted filter, returning the first portions of the filtrate until it runs through clear.

Note.—This Elixir is liable to become cloudy from separation of essential oils, when it is exposed to a temperature lower than that at which it has been filtered. In general, it is recommended that it be cooled to, and filtered at, a temperature of about 15° C. (59° F.). In the northern sections of this country, or in winter time, it should be cooled to a proportionately lower temperature, previous to filtration.

Anethol is the steareopten of oil of anise, and possesses a finer and purer aroma and taste than any commercial variety of oil of anise. If it cannot be readily obtained, the so-called Saxon oil of anise may be substituted for it. Oil of star-anise, which is usually supplied by dealers when "oil of anise" without specification is ordered, does not answer well for this purpose. The oil of fennel should be that from the seed ("sweet"), and not that from the chaff.

31. Elixir Aromaticum. N. F.**Aromatic Elixir.**

Aromatic Spirit,	16 fl. oz.
Syrup,	24 fl. oz.
Water,	24 fl. oz.
Purified Talcum,	1 tr. oz.

Mix the Aromatic Spirit with twelve (12) fluidounces of Syrup, and add the Water. Incorporate the Purified Talcum thoroughly with the mixture, set the latter aside during a few days, if possible, occasionally agitating, then stir it well, and filter it through a wetted filter, returning the first portions of the filtrate until it runs through clear. Finally,

mix the filtrate with the remainder of the Syrup.

Note.—When this Elixir is to be used in preparations containing *iron*, the Aromatic Spirit to be used in this preparation should be that made from the essential oils. See *Spiritus Aromaticus*.

If it is desired to color this Elixir, this may be effected by the addition of two (2) *fluidrachms* of Compound Tincture of Cudbear to each pint.

30. Elixir Apii Graveolentis Compositum. N. F.

Compound Elixir of Celery.

Fluid Extract of Celery Root,	1 fl. oz.
Fluid Extract of Erythroxylon,	1 fl. oz.
Fluid Extract of Kola,	1 fl. oz.
Fluid Extract of Viburnum	
Prunifolium,	1 fl. oz.
Alcohol,	2 fl. oz.
Aromatic Elixir, enough to make	16 fl. oz.

Mix the Alcohol with four (4) *fluid-ounces* of Aromatic Elixir. To this add the Fluid Extract of Celery Root in several portions, shaking after each addition, and afterwards the other Fluid Extracts. Finally, add enough Aromatic Elixir to make *sixteen* (16) *fluidounces*; allow the mixture to stand twenty-four hours, and filter.

Note.—If this preparation is prescribed or quoted under its Latin title, it is recommended that the full title be given, so that the word "Apii" may not be mistaken for "Opil."

57. Elixir Eucalypti. N. F.

Elixir of Eucalyptus.

Fluid Extract of Eucalyptus,	2 fl. oz.
Alcohol,	2 fl. oz.
Carbonate of Magnesium,	120 gr.
Syrup of Coffee,	6 fl. oz.
Compound Elixir of Taraxacum,	6 fl. oz.

Mix the Fluid Extract with the Alcohol, then add the other ingredients, shake the mixture occasionally during forty-eight hours, and filter.

Each *fluidrachm* represents $7\frac{1}{2}$ grains of *Eucalyptus*.

110. Emplastrum Aromaticum. N. F.

Aromatic Plaster.

Spice Plaster.

Cloves,	10 parts.
Cinnamon, Saigon,	10 parts.
Ginger,	10 parts.
Capsicum,	5 parts.
Camphor,	5 parts.
Cotton-Seed Oil,	85 parts.
Lead Plaster,	25 parts.

Melt together the Lead Plaster and Cotton-Seed Oil, with the aid of heat. Cool the mixture and, while it is still soft, thoroughly incorporate with it the aromatic ingredients, previously reduced to a very fine powder.

199. Linimentum Terebinthinæ Aceticum. N. F.

Acetic Turpentine Liniment.

Linimentum Album. Stokes's Liniment. St. John Long's Liniment.

Oil of Turpentine,	8 fl. oz.
Fresh Egg, albumen and yolk,	1
Oil of Lemon,	60 min.
Acetic Acid (U. S. P.),	300 min.
Rose Water,	2½ fl. oz.

Triturate or beat the contents of the Fresh Egg with the Oil of Turpentine and the Oil of Lemon in a mortar until they are thoroughly mixed. Then incorporate the Acetic Acid and Rose Water. Shake the mixture whenever any of it is to be dispensed.

425. Vinum Aurantii Compositum. N. F.

Compound Wine of Orange.

Elixir Aurantiorum Compositum (*Germ. Pharm.*). Compound Elixir of Orange.

Bitter Orange Peel,	1600 gr.
Absinthium,	480 gr.
Menyanthes (leaves),	480 gr.
Cascarilla,	480 gr.
Cinnamon (Cassia),	820 gr.
Gentian,	820 gr.
Carbonate of Potassium,	80 gr.

Sherry Wine, enough to make 16 fl. oz.

Reduce the six first-named drugs to a moderately coarse (No. 40) powder, mix with this the Carbonate of Potassium, moisten the mixture with Sherry Wine, and let it macerate during twenty-four hours. Then pack it in a percolator, and percolate with Sherry Wine, in the usual manner, until *sixteen* (16) *fluidounces* of product are obtained.

Note.—The *Germ. Pharm.* directs to macerate the Orange Peel, Cinnamon, and Carbonate of Potassium with the Sherry Wine, and then to add the other drugs in form of extracts. The proportions above given produce a product practically identical with that of the *Germ. Pharm.*

339. Spiritus Cardamomi Compositus. N. F.

Compound Spirit of Cardamom.

Oil of Cardamom,*	12 min.
Oil of Caraway,	4 min.
Oil of Cinnamon, Cassia,	2 min.
Alcohol,	8 fl. oz.
Glycerin,	1 fl. oz.

Water, enough to make 16 fl. oz.
Dissolve the Oils in the Alcohol, add the Glycerin, and, lastly, enough Water to make *sixteen* (16) *fluidounces*.

Note.—This preparation is intended as a flavoring ingredient, being equivalent to the official *Tinctura Cardamomi Composita*, without the coloring matter.

* The oil of cardamom may be replaced by 180 grains of freshly-bruised cardamom, and macerating for two days in the alcoholic solution of the oils.

351. Syrupus Eriodictyi Aromaticus. N. F.

Aromatic Syrup of Eriodictyon.

Aromatic Syrup of Yerba Santa. Syrupus Corrigens.

Fluid Extract of Eriodictyon,	$\frac{1}{2}$ fl. oz.
Solution of Potassa,	180 min.
Compound Tincture of Cardamom,	1 fl. oz.
Oil of Sassafras,	4 drops.
Oil of Lemon,	4 drops.
Oil of Cloves,	8 drops.
Alcohol,	$\frac{1}{2}$ fl. oz.
Sugar,	18 tr. oz.
Water,	enough to make 16 fl. oz.

Mix the Fluid Extract of Eriodictyon and Solution of Potassa, then add *one and one-half* ($1\frac{1}{2}$) *fluidounces* of Water previously mixed with the Compound Tincture of Cardamom, and afterwards add the Oils dissolved in the Alcohol. Shake the mixture thoroughly, then filter it, and pour enough Water through the filter to obtain *six* (6) *fluidounces* of filtrate. Pour this upon the Sugar contained in a bottle, and dissolve it by placing the bottle in hot water, frequently agitating. Lastly, cool the product and add enough Water, passed through the filter previously used, to make *sixteen* (16) *fluidounces*.

Note.—This preparation is chiefly intended as a vehicle for disguising the taste of quinine or of other bitter substances.

352. Vinum Aurantii. N. F.

Wine of Orange.

Oil of Bitter Orange,	6 min.
Alcohol,	60 min.
Purified Talcum,	120 gr.
Sherry Wine,	enough to make 16 fl. oz.

Triturate the Purified Talcum, first with the Alcohol, in which the Oil of Bitter Orange had previously been dissolved, and afterwards with *twelve* (12) *fluidounces* of Sherry Wine, gradually added. Filter the mixture through a wetted filter, returning the first portions of the filtrate until it runs through clear, and, lastly, pass enough Sherry Wine through the filter to make *sixteen* (16) *fluidounces*.

353. Syrupus Cinnamomi. N. F.

Syrup of Cinnamon.

Cinnamon (Cassia), in moderately coarse powder,	$1\frac{1}{2}$ tr. oz.
Alcohol,	860 min.
Sugar,	11 tr. oz.
Cinnamon Water, enough to make	16 fl. oz.

Mix the Alcohol with *seven* (7) *fluidounces* of Cinnamon Water, moisten the Cinnamon with a sufficient quantity of this menstruum and allow it to macerate

for about two hours. Then transfer it to a small percolator and percolate in the usual manner, using first the remainder of the menstruum above directed and afterwards Cinnamon Water. Collect the first *eight* (8) *fluidounces* of the percolate separately and dissolve in it the Sugar. Then collect an additional quantity of percolate and add it to the Syrup, so as to make *sixteen* (16) *fluidounces*.

Note.—This preparation is practically identical with that official in the Germ. Pharm.

354. Mistura Sassafras et Opii. N. F.

Mixture of Sassafras and Opium.

Mistura Opii Alkalina. Godfrey's Cordial.

Oil of Sassafras,	6 min.
Tincture of Opium,	256 min.
Alcohol,	360 min.
Carbonate of Potassium,	60 gr.
Molasses,	5 fl. oz.
Water,	enough to make 16 fl. oz.

Mix the Tincture of Opium with the Alcohol, in which the Oil of Sassafras had previously been dissolved. Dissolve the Carbonate of Potassium in about *eight* (8) *fluidounces* of Water, mix this with the Molasses, then add the mixture first prepared, and, lastly, enough Water to make *sixteen* (16) *fluidounces*. Allow the mixture to become clear by standing, then pour off the liquid portion and preserve it for use.

Each fluidrachm contains 2 minims of Tincture of Opium, corresponding to about $\frac{1}{2}$ grain of Opium.

355. Mistura Camphoræ Aromatica. N. F.

Aromatic Camphor Mixture.

Parriah's Camphor Mixture.

Compound Tincture of Lavender,	4 fl. oz.
Sugar,	$\frac{1}{2}$ tr. oz.
Camphor Water, enough to make	16 fl. oz.

Mix the Compound Tincture of Lavender with about *eight* (8) *fluidounces* of Camphor Water, dissolve the Sugar in the mixture, and add enough Water to make *sixteen* (16) *fluidounces*.

356. Mistura Camphoræ Acida. N. F.

Acid Camphor Mixture.

Mistura Antidysenterica. Hope's Mixture.

Nitric Acid,	120 min.
Tincture of Opium,	80 min.
Camphor Water, enough to make	16 fl. oz.

Mix the Nitric Acid with about *eight* (8) *fluidounces* of Camphor Water, add the Tincture of Opium, and, lastly, enough Camphor Water to make *sixteen* (16) *fluidounces*.

242. *Liquor Zingiberis. N. F.*

Solution of Ginger.

Soluble Essence of Ginger.

Fluid Extract of Ginger, 4 fl. oz.
Pumice, in moderately fine powder, 1 tr. oz.
Water, enough to make 12 fl. oz.

Pour the Fluid Extract of Ginger into a bottle, add to it the Pumice, and shake the mixture thoroughly and repeatedly in the course of several hours. Then add the Water in portions of about two (2) *fluid-ounces*, shaking well and frequently after each addition. When all is added, repeat the agitation occasionally during twenty-four hours, then filter, returning the first portions of the filtrate until it runs through clear, and, if necessary, pass enough Water through the filter to make twelve (12) *fluidounces*.

Camphor Julep.

(Thomsonian name.)

Camphor, 80 gr.
Myrrh, 105 gr.
Sugar, 60 gr.
Water, 2 fl. oz.

Cream of Camphor.

Soap, 1½ oz. (troy).
Camphor, 860 gr.
Ammonium Chloride, 1½ oz. (troy).
Water of Ammonia, 1½ fl. oz.
Oil of Turpentine, 6 fl. dr.
Water, 12 fl. oz.

Dissolve the Soap (in shavings) in one-half of the Water previously mixed with the Water of Ammonia, and the Ammonium Chloride in the other half. Mix the solutions well, and add the Camphor dissolved in the Oil; then agitate briskly until the liquids are united and form a perfect emulsion.

16. *Ceratum Camphoræ Compositum. N. F.*

Compound Camphor Cerate.

Ceratum Camphoratum. Camphor Ica.

Camphor, in coarse powder, 1½ tr. oz.
White Wax, 2 tr. oz.
Castor Oil, 4 tr. oz.
Spermaceti, 7 tr. oz.
Carbolic Acid, liquefied by warming, 10 min.
Oil of Bitter Almond, 6 min.
Benzoic Acid, 60 gr.

Melt the White Wax and Spermaceti on a water-bath, add the Castor Oil, and afterwards the Camphor, and continue heating and stirring until the Camphor is dissolved. Then withdraw the heat, cover the vessel, and when the mixture has somewhat cooled, add the remaining in-

gredients, and thoroughly incorporate them by stirring. Lastly, pour the Cerate into suitable moulds.

420. *Unguentum Camphoræ. N. F.*

Camphor Ointment.

Unguentum Camphoratum.

Camphor, in coarse powder, 2 parts.
White Wax, 1 part.
Lard, 6 parts.

Melt the White Wax and Lard with a gentle heat, then add the Camphor, and stir the Ointment until it is cold.

Pills of Camphor and Opium.

Camphor, 48 gr.
Powdered Opium, 12 gr.
Alcohol, 12 min
Confection of Rose, sufficient.
Make a mass and divide into 24 pills.
Dose, 1 to 2 pills.

Compound Powder of Camphor.

(Gallop's Powder.)

Camphor,
Powdered Acacia,
Sugar, of each, 1 oz.
Mix.

421. *Unguentum Fuscum. N. F.*

Brown Ointment.

Unguentum Matris. Mother's Salve.

Camphorated Brown Plaster (N. F.), 2 parts.
Olive Oil, 1 part.
Suet, 1 part.

Melt them together, and stir the mass until it is cold.

Mixture of Thymol.

(L. Lewin.)

Thymol, 1½ gr.
Orange Flower Water, 1½ fl. oz.
Distilled Water, 8½ fl. oz.
Mix. Dose, a tablespoonful several times a day.

Thymol Inhalation.

(Warren.)

Thymol, 8 gr.
Sodium Borate, 300 gr.
Glycerin, 10 fl. dr.
Camphor Water, 2½ fl. oz.
Tar Water, 7 fl. oz.

Mix. To be used as an inhalation by means of an atomizer.

Antiseptic Solution.

(Volkman's.)

Thymol, 80 gr.
Alcohol, 5 fl. dr.
Glycerin, 10 fl. dr.
Water, 6 fl. oz.
Mix.

Cough Mixture.

(Prof. Pancoast.)

Wild Cherry Bark,	240 gr.
Senega,	240 gr.
Ipecac,	120 gr.
Extract of Conium,	15 gr.
Compound Tincture of Carda- mom,	1 fl. oz.
Compound Spirit of Juniper,	1 fl. oz.
Water, sufficient to make	10 fl. oz.

Percolate the solid ingredients with sufficient Water to make 8 fl. oz., then add the other ingredients. Two teaspoonfuls in water constitute the usual dose to relieve cough.

Antispasmodic Powders.

(Dr. Otto's.)

Ground Black Mustard,	240 gr.
Powdered Salvia,	240 gr.
Powdered Ginger,	240 gr.

Mix. Dose, in epilepsy, three teaspoonfuls for three mornings in succession; discontinue three mornings, and then give as before. To be mixed in water or molasses.

Garlic Ointment.

Fresh Garlic,	6 bulbs.
Lard,	2 oz. (troy).

Digest at a moderate heat for an hour, and strain.

VOLATILE OILS WITH RESIN PRODUCTS.**Confection of Black Pepper.**

(Ward's Paste.)

Black Pepper,	2 oz. (troy).
Powdered Inula,	2 oz. (troy).
Powdered Fennel,	6 oz. (troy).
Honey,	4 fl. oz.
Sugar,	4 oz. (troy).

Rub the dry ingredients together into a very fine powder, and keep them in a covered vessel; but, whenever the confection is to be used, add the powder gradually to the Honey, and beat them until thoroughly incorporated. Dose, 60 to 120 grains three times a day.

Emulsion of Cubeb.

Oleoresin of Cubeb,	120 drops.
Yolk of Egg,	1.
Sugar,	120 gr.
Peppermint Water,	8 fl. oz.

Triturate the Oleoresin with the Sugar and Yolk of Egg, and then dilute with Peppermint Water. Dose, a teaspoonful four times a day.

Ethereal Tincture of Cubeb.

Cubeb,	2 oz. (troy).
Spirit of Nitrous Ether,	16 fl. oz.

Macerate for eight days, and filter.

33. Elixir Buchu. N. F.*Elixir of Buchu.*

Fluid Extract of Buchu,	2 fl. oz.
Alcohol,	1 fl. oz.
Syrup,	1 fl. oz.
Purified Talcum,	120 gr.
Adjuvant Elixir, enough to make	16 fl. oz.

Mix the Fluid Extract of Buchu with the Alcohol, then add *twelve* (12) *fluidounces* of Adjuvant Elixir, and the Syrup. Incorporate with it the Purified Talcum, and filter. Finally, pass enough Adjuvant Elixir through the filter to make *sixteen* (16) *fluidounces*.

Each fluidrachm represents about 7½ grains of Buchu.

34. Elixir Buchu Compositum. N. F.*Compound Elixir of Buchu.*

Compound Fluid Extract of Buchu,	4 fl. oz.
Alcohol,	1 fl. oz.
Syrup,	1 fl. oz.
Purified Talcum,	120 gr.
Adjuvant Elixir, enough to make	16 fl. oz.

Mix the Compound Fluid Extract of Buchu with the Alcohol, then add *eight* (8) *fluidounces* of Adjuvant Elixir, and the Syrup. Incorporate with it the Purified Talcum, and filter. Finally, pass enough Adjuvant Elixir through the filter to make *sixteen* (16) *fluidounces*.

Each fluidrachm represents 15 minims of Compound Fluid Extract of Buchu.

Note.—It is advisable to allow the mixture of liquids with the Purified Talcum to remain at rest for several days before filtering.

35. Elixir Buchu et Potassii Acetatis. N. F.

<i>Elixir of Buchu and Acetate of Potassium.</i>	
Acetate of Potassium,	640 gr.
Elixir of Buchu, enough to make	16 fl. oz.

Dissolve the Acetate of Potassium in about *twelve* (12) *fluidounces* of Elixir of Buchu, filter, if necessary, and add enough Elixir of Buchu to make *sixteen* (16) *fluidounces*.

Each fluidrachm represents 5 grains of Acetate of Potassium and about 7 grains of Buchu.

74. Elixir Humuli. N. F.*Elixir of Humulus.*

<i>Elixir of Hops.</i>	
Fluid Extract of Hops (N. F.),	2 fl. oz.
Carbonate of Magnesium,	120 gr.
Tincture of Vanilla,	240 min.
Compound Elixir of Taraxa- cum,	2 fl. oz.
Aromatic Elixir, enough to make	16 fl. oz.

Triturate the Fluid Extract of Hops with the Carbonate of Magnesium, then gradually add the Compound Elixir of Taraxacum, Tincture of Vanilla, and enough Aromatic Elixir to make sixteen (16) fluidounces. Allow the mixture to stand several days, if convenient, occasionally agitating; then filter.

Each fluidrachm represents 7½ grains of Humulus (Hops).

107. Elixir Viburni Opuli Compositum.
N. F.

Compound Elixir of Viburnum Opulus.

Compound Elixir of Crampbark.

Fluid Extract of Viburnum

Opulus,	1½ fl. oz.
Fluid Extract of Trillium,	2½ fl. oz.
Fluid Extract of Aletris,	1½ fl. oz.
Compound Elixir of Taraxacum,	11 fl. oz.

Mix them, allow the mixture to stand a few days, and filter.

108. Elixir Viburni Prunifolii. N. F.

Elixir of Viburnum Prunifolium.

Elixir of Black Haw.

Fluid Extract of Viburnum

Prunifolium,	2 fl. oz.
Compound Tincture of Cardamom,	1 fl. oz.
Aromatic Elixir,	18 fl. oz.

Mix them, allow the mixture to stand a few days, and filter.

Each fluidrachm represents about 7½ grains of Viburnum Prunifolium.

Syrup of Cubeb.

(Mitchell's.)

Fluid Extract of Cubeb,	2 fl. oz.
Magnesium Carbonate,	240 gr.
Sugar,	12 oz. (troy).
Oil of Bitter Almond,	1 min.
Orange Flower Water,	2 fl. oz.
Water, a sufficient quantity to make	16 fl. oz.

Rub the Fluid Extract with the Magnesium Carbonate, and then add 2 fl. oz. of the Sugar in small portions; when thoroughly mixed, add gradually first the Orange Flower Water and then 7 fl. oz. of Water, constantly triturating the mixture until the Sugar is dissolved; filter, and add sufficient Water to measure 11 fl. oz., in which dissolve the remainder of the Sugar, without heat; add the Oil dissolved in a little Alcohol, and sufficient Water to make 16 fl. oz.

Compound Pills of Copaiba.

Copaiba,	80 gr.
Powdered Cubeb,	50 gr.
Wax,	15 gr.

Melt the Wax by a gentle heat, then add the Copaiba, and immediately afterwards sift in the Cubeb, stirring thoroughly; while it is yet warm, roll out into 25 pills.

Cubeb Mixture.

(Dr. J. Wm. White's.)

Oleoresin of Cubeb,	4 fl. dr.
Potassium Bromide,	1 oz. (troy).
Syrup of Acacia,	2 fl. oz.
Oil of Sassafras,	10 min.
Water, sufficient to make	6 fl. oz.

Mix.

Copaiba Mixture.

(Chapman's original formula.)

Copaiba,	1 fl. oz.
Powdered Acacia,	120 gr.
Sugar,	60 gr.
Spirit of Nitrous Ether,	1 fl. oz.
Compound Tincture of Lavender,	2 fl. dr.
Tincture of Opium,	2 fl. dr.
Distilled Water,	6 fl. oz.

Mix. Dose, a tablespoonful three times a day.

256. Mistura Copaibæ Composita.

N. F.

Compound Copaiba Mixture.

1. Lafayette Mixture.

Copaiba,	2 fl. oz.
Spirit of Nitrous Ether,	2 fl. oz.
Compound Tincture of Lavender,	2 fl. oz.
Solution of Potassa,	½ fl. oz.
Syrup,	5 fl. oz.
Mucilage of Dextrin (N. F.),	enough to make 16 fl. oz.

Mix the Copaiba with the Solution of Potassa and the Spirit of Nitrous Ether. Then add the Compound Tincture of Lavender, and, lastly, the Syrup and Mucilage of Dextrin. Mix the whole thoroughly by shaking.

This mixture should be well agitated whenever any of it is to be dispensed.

Each fluidrachm contains 7½ minims of Copaiba.

Note.—The above mixture has usually been prepared with Mucilage of Acacia; but if Mucilage of Dextrin (N. F.) be used, it will keep for a longer time without separating.

A mixture of somewhat similar composition, in considerable use in some parts of the country, is the following:

2. Chapman's Mixture.

Copaiba,	1½ fl. oz.
Spirit of Nitrous Ether,	1½ fl. oz.
Compound Tincture of Lavender,	360 min.
Tincture of Opium,	180 min.
Acacia, in fine powder,	180 gr.
Sugar,	280 gr.
Water,	enough to make 16 fl. oz.

Note.—The original formula of Prof. Chapman varies somewhat from these proportions.

Alkaline Copaiba Mixture.

Copaiba, 4 fl. dr.
 Acacia, 240 gr.
 Sugar, 240 gr.
 Solution of Potassa, 4 fl. dr.
 Spearmint Water, a sufficient quantity to make 8 fl. oz.

Mix the Copaiba and Solution of Potassa; add the Water, and triturate with the Acacia and Sugar.

Diphtheria Mixture.

(Dr. Bergeron's.)

Copaiba, 20 min.
 Syrup of Orange, 4 fl. dr.
 Peppermint Water, 8 fl. dr.
 Alcohol, 6 fl. oz.

Mix. Dose, a tablespoonful every two hours, in non-infectious diphtheria, to aid the disappearance of the false membrane.

Solution of Santal, Copaiba, and Cubeb.

(Nesbit's specific.)

Oil of Santal, 5 fl. oz.
 Oil of Copaiba, 4 fl. dr.
 Oil of Cubeb, 4 fl. dr.
 Oil of Pimenta, 1 fl. dr.
 Oil of Cassia, 1 fl. dr.
 Alcohol, sufficient to make 16 fl. oz.

Mix. Dose, a teaspoonful twice a day in water.

Compound Fluid Extract of Buchu.

Oil of Juniper, 12 min.
 Spirit of Nitrous Ether, 8 fl. oz.
 Fluid Extract of Cubeb, 8 fl. oz.
 Fluid Extract of Buchu, 10 fl. oz.

Dissolve the Oil of Juniper in the Spirit of Nitrous Ether, and mix with the Fluid Extracts. Do not filter; but shake well before dispensing.

Tinctura Lupulinæ. U. S. 1870. TINCTURE OF LUPULIN.

Lupulin, 4 oz. (troy).
 Alcohol, a sufficient quantity.

Pack the Lupulin in a narrow cylindrical percolator, and gradually pour Alcohol upon it until 82 fl. oz. of tincture are obtained.

Ethereal Tincture of Cannabis Indica.

Extract of Cannabis (Squire's), 240 gr.
 Spirit of Nitrous Ether, 8 fl. oz.
 Triturate together in a mortar till the Extract is dissolved. Dose, 5 to 15 drops.

Ethereal Tincture of Guaiac.

Guaiac, 1½ oz. (troy).
 Spirit of Nitrous Ether, 8 fl. oz.
 Make by maceration. Dose, a teaspoonful.

Anthelmintic Syrup.

Fluid Extract of Senna, 1 fl. dr.
 Oil of Chenopodium, 1 fl. dr.
 Syrup of Rhubarb, 2 fl. oz.
 Mix. Dose, a teaspoonful three times a day.

Arnica Liniment.

Arnica Flowers, 2 oz. (av.).
 Glycerin, 8 fl. oz.

Digest at a moderate temperature on a water-bath, express, and strain.

Syrup of Anthemis.

Anthemis, 240 gr.
 Sugar, 10 oz. (av.).
 Water, 6 fl. oz.

Make an infusion of the flowers with the Water, and add the Sugar, dissolving without heat.

392. Tinctura Capsici et Myrrhæ. N. F.*Tincture of Capsicum and Myrrh.*

Hot Drops.

Capsicum, in No. 20 powder, ½ tr. oz.
 Myrrh, in moderately coarse powder, 2 tr. oz.
 Alcohol,

Water, each, enough to make 16 fl. oz.
 Mix the powders with an equal bulk of clean, fine sand, and percolate them in the usual manner, with a mixture of nine (9) volumes of Alcohol, and one (1) volume of Water, until sixteen (16) fluid-ounces of percolate are obtained.

Note.—This preparation is known in some parts of this country by the old Thomsonian name "Number six."

Emulsion of Aspidium.

Fluid Extract of Aspidium, 1 fl. dr.
 Tincture of Quillaia, 30 min.
 Distilled Water, sufficient to make 1 fl. oz.
 Mix.

409. Tinctura Pimpinellæ. N. F.*Tincture of Pimpinella.*

Pimpinella Root, 2½ tr. oz.
 Alcohol,
 Water, each, enough to make 16 fl. oz.

Mix two (2) volumes of Alcohol with one (1) volume of Water. Macerate the Pimpinella, reduced to a moderately coarse (No. 40) powder, with enough of the menstruum to keep it distinctly damp during twelve hours. Then percolate it with the same menstruum, in the usual manner, until sixteen (16) fluid-ounces of Tincture are obtained.

Note.—This preparation is approximately of the same strength as that which is official in the Germ. Pharm. Pimpinella root is derived from *Pimpinella Saxifraga* Linné, and *Aspidium magus* Linné.

Nerve Powder.

(Thomsonian name.)

Powdered Cypripedium.

Liniment of Stillingia.

Oil of Stillingia,	1 fl. oz.
Oil of Cajuput,	4 fl. dr.
Oil of Lobelia,	2 fl. dr.
Alcohol,	2 fl. oz.

Mix. Used as a local application in croup, and as a cough medicine, in doses of 1 drop on a lump of sugar.

103. Elixir Stillingiæ Compositum.

N. F.

Compound Elixir of Stillingia.

Compound Fluid Extract of Stillingia,	4 fl. oz.
Aromatic Elixir,	12 fl. oz.

Mix them, allow the mixture to stand a few days, or longer, if convenient, and filter.

Each fluidrachm represents 15 minims of Compound Fluid Extract of Stillingia.

Syrup of Lactucarium.

(Aubergier's modified.)

Fluid Extract of Lactucarium (U. S.),	4 fl. dr.
Syrup of Orange Flowers,	4 fl. oz.
Syrup,	10 fl. oz.
Mix.	

351. Syrupus Actææ Compositus.

N. F.

Compound Syrup of Actæa.

Syrupus Cimicifugæ Compositus.* Compound Syrup of Cimicifuga (or Black Cohosh).

Fluid Extract of Cimicifuga,	300 min.
Fluid Extract of Glycyrrhiza,	150 min.
Fluid Extract of Senega,	150 min.
Fluid Extract of Ipecac,	75 min.
Wild Cherry, in moderately fine powder,	300 gr.
Purified Talcum,	120 gr.
Sugar,	10 tr. oz.
Water,	enough to make 16 fl. oz.

Mix the Wild Cherry with six (6) fluid-ounces of Water, and allow it to macerate during one hour. Then add to it the Fluid Extracts and the Talcum, and stir or agitate the mixture frequently and thoroughly during about fifteen minutes. Transfer it to a wetted filter and, when the liquid ceases to drop from the funnel, wash the contents of the filter with Water to obtain eight (8) fluidounces of filtrate. In this dissolve the Sugar by agitation, and add enough Water, previously passed through the filter, to make sixteen (16) fluidounces.

* Through an oversight by the committee, the title of this preparation should be "Syrupus Cimicifugæ Compositus" instead of "Syrupus Actææ Compositus;" the latter should be the synonyme.

Cough Lozenges.

(Keating's.)

Lactucarium,	120 gr.
Ipecac,	60 gr.
Squill,	45 gr.
Extract of Glycyrrhiza,	120 gr.
Sugar,	2 oz. (troy).

Mix. Make into a mass with Tragacanth and Mucilage, and divide into 20-grain lozenges.

RESINS, OLEORESINS, GUM-RESINS, AND BALSAMS.

122. Emulsio Olei Terebinthinæ. N. F.

Emulsion of Oil of Turpentine.

Oil of Turpentine,	½ fl. oz.
Acacia, in fine powder,	30 gr.
Yolk of Egg,	1.
Aromatic Elixir,	½ fl. oz.
Cinnamon Water, enough to make	4 fl. oz.

Triturate the Acacia with the Yolk of Egg, then add the Oil of Turpentine very slowly, continuing the trituration, and, finally, add the Water and Aromatic Elixir in the same manner.

Emulsion of Oil of Turpentine, or of any Volatile Oil, may also be prepared according to the following general formula:

Volatile Oil,	½ fl. oz.
Acacia, in fine powder,	120 gr.
Syrup,	1 fl. oz.
Water,	enough to make 4 fl. oz.

Pour the Volatile Oil into a dry four-ounce bottle, and, having corked the latter, agitate it so that the inner surface may be completely wetted by the Oil. Then add the Acacia, and shake again. Finally, add the Syrup, and add enough Water to make four (4) fluidounces, and mix thoroughly by shaking.

Note.—If this general formula is applied to Emulsion of Oil of Turpentine, and a product similar to that obtained by the first formula is desired, the Syrup should be replaced by Aromatic Elixir, and the Water by Cinnamon Water.

If a so-called "emulsion" of a Volatile Oil is to be made more permanent, this may be accomplished by incorporating with it a small proportion of some bland fixed oil, such as Expressed Oil of Almond. Usually, 1 volume of the fixed oil will be sufficient for 2 volumes of the volatile oil.

In this case, the mixture should be made in a mortar, by trituration.

Emulsion of Turpentine.

(J. W. Forbes.)

Oil of Turpentine,	1 fl. oz.
Powdered Acacia,	20 gr.
Water,	4 fl. dr.

Place the Oil in a dry bottle, add the Powdered Acacia, shake well, and mix thoroughly with the Oil; lastly, add the Water, and shake the whole thoroughly.

Emulsion of Turpentine.

Oil of Turpentine,	20 min.
Tincture of Quillaia,	20 min.
Distilled Water,	1 fl. oz.
Mix.	

Haarlem Oil.

Sulphurated Oil,	12 fl. oz.
Petroleum (Barbadoes),	4 fl. oz.
Oil of Amber (crude),	6 fl. oz.
Oil of Turpentine,	32 fl. oz.
Linseed Oil,	16 fl. oz.

Mix. The Sulphurated Oil is made by boiling 1 part of Sulphur with 8 parts of Olive Oil until they are united.

Thomson's Salve.

(Thomsonian name.)

Yellow Wax,	2 oz. (troy).
Fresh Butter,	2 oz. (troy).
Turpentine,	4 oz. (troy).
Balsam of Fir,	2 oz. (troy).
Mix.	

Fever Liniment.

(Saint Bartholemy's.)

Oil of Turpentine,	34 fl. dr.
Tincture of Opium,	80 min.
Camphor,	50 gr.
Olive Oil,	2 fl. oz.

Mix. Apply for six minutes every six hours to the whole spine.

Mistura Pini Sylvestris.

(Dr. Piffard's.)

Tar,	100 gr.
Oil of Lavender,	100 gr.
Oil of Scotch Fir (<i>Pinus sylvestris</i>),	300 gr.
Mix and filter.	

Ceratum Resinæ Compositum. U. S. 1870. COMPOUND RESIN CERATE. (DESHLER'S SALVE.)

Resin,	
Suet,	
Yellow Wax,	each, 6 oz. (troy).
Turpentine,	8 oz. (troy).
Oil of Flaxseed,	3½ oz. (troy).

Melt them together, strain the mixture through muslin, and stir it constantly until cool.

Compound Infusion of Myrrh.

Myrrh,	28 gr.
Aloes,	28 gr.
Saffron,	28 gr.
Potassium Carbonate,	15 gr.

Powdered Extract of Glycyrrhiza,	120 gr.
Water,	6 fl. oz.

Compound Tincture of Cardamom,

Boil slowly to 4 fl. oz., strain, and add the Compound Tincture of Cardamom.

Breast Plaster.

(Dewees'.)

Ammoniac Plaster,	120 gr.
Lead Plaster,	1½ oz. (troy)
Logan's Plaster,	360 gr.
Spermaceti,	60 gr.
Camphor,	60 gr.

Melt the Plaster, then add the Spermaceti and Camphor, and remove from the fire.

Sedative Pills.

(Gunther's.)

Powdered Asafetida,	57 gr.
Extract of Valerian,	57 gr.
Extract of Belladonna,	8 gr.
Oxide of Zinc,	1 gr.
Castor,	2 gr.

Mix, and make into 24 pills. Dose, 1 to 2 pills twice daily in chorea.

Syrup of Asafetida.

Asafetida,	240 gr.
Sugar,	16 oz. (av.).
Boiling Water,	8 fl. oz.

Rub the Asafetida with part of the Boiling Water until a uniform paste is made, then gradually add the rest of the Water, strain, and add the Sugar, using a gentle heat to dissolve it. Dose, a tablespoonful.

Liniment of Hypericum.

(RED OIL.)

Flowers of Hypericum (fresh),	8 oz. (troy).
Olive Oil, a sufficient quantity to cover the flowers.	

Macerate in the sun for fourteen days, express, and strain.

399. Tinctura Guaiaci Composita. N. F.*Compound Tincture of Guaiac.**Dewees' Tincture of Guaiac.*

Resin of Guaiac,	2 tr. oz.
Carbonate of Potassium,	45 gr.
Pimenta, in moderately fine powder,	240 gr.
Pumice, in fine powder,	1 tr. oz.
Alcohol,	7 fl. oz.
Water,	8 fl. oz.

Diluted Alcohol, enough to make 16 fl. oz. Triturate the Resin of Guaiac and Carbonate of Potassium with the Pimenta and the Pumice, and afterwards gradually with the Alcohol. Next add slowly seven (7) fluidounces of cold Water and triturate the mixture thoroughly. Then filter, and pass enough Diluted Alcohol through the filter to make sixteen (16) fluidounces.

Each fluidrachm represents 7½ grains of Resin of Guaiac.

Emulsion of Guaiac.

Guaiac (powdered),	12 gr.
Tincture of Quillaia,	1 fl. dr.
Distilled Water,	1 fl. oz.

Dissolve the Guaiac in the Tincture, filter, and then mix with the Water.

Syrup of Guaiac.

Guaiac (powdered),	640 gr.
Potassa,	58 gr.
Sugar,	16 oz. (av.).
Water, sufficient to make	8 fl. oz.

Dissolve the Potassa in 8 fl. oz. of Water, add the Guaiac, macerate seven days, filter, add the Sugar, and strain.

258. Mistura Guaiaci. N. F.*Mixture of Guaiac.*

Resin of Guaiac,	190 gr.
Sugar,	190 gr.
Acacia, in fine powder,	100 gr.
Cinnamon Water,	16 fl. oz.

Triturate the Resin of Guaiac with the Sugar and Acacia, then gradually add the Cinnamon Water.

This mixture should be well agitated whenever any of it is to be dispensed.

Note.—This preparation is practically identical with the *Mistura Guaiaci* of the Brit. Pharm.

259. Mistura Oleo-Balsamica. N. F.*Oleo-Balsamic Mixture.*

Mistura Oleo-Balsamica (Germ. Pharm.). Balsamum Vitæ Hoffmanni.

Oil of Lavender,	30 min.
Oil of Thyme,	30 min.
Oil of Lemon,	30 min.
Oil of Mace,	30 min.
Oil of Orange Flowers,	30 min.
Oil of Cloves,	25 min.
Oil of Cinnamon,	25 min.
Balsam of Peru,	80 min.
Alcohol,	enough to make 16 fl. oz.

Dissolve the Oils and the Balsam of Peru in the Alcohol, let the solution stand a few days, and then filter.

416. Tinctura Tolutana Solubilis. N. F.*Soluble Tincture of Tolu.*

Balsam of Tolu,	1½ tr. oz.
Carbonate of Magnesium,	60 gr.
Glycerin,	6 fl. oz.
Water,	
Alcohol, each,	enough to make 16 fl. oz.

Mix three (3) *fluidounces* of Alcohol with the Glycerin, and dissolve the Balsam of Tolu in the mixture with the aid of heat, avoiding loss by evaporation. Next add six (6) *fluidounces* of Water, and allow the mixture to become cold. Pour off the milky liquid from the resinous precipitate (which latter is to be rejected), mix it with the Carbonate of Magnesium by trituration, and filter. Lastly, pass enough

of a mixture of one (1) *volume* of Alcohol and two (2) *volumes* of Water through the filter to make the whole filtrate measure sixteen (16) *fluidounces*.

Note.—This preparation may be added to Syrup or Water without producing cloudiness. A mixture of 1 *fluidounce* of this preparation with 15 *fluidounces* of Syrup yields a product which may be used as Syrup of Tolu in all cases where the official preparation is not required.

Pills Number Three (Anti-Canker).

	(Thomsonian name.)	
Capsicum,	1 oz. (av.).	
Extract of Bayberry,	1 oz. (av.).	
Make into pills.		

Number Five.**(RESTORATIVE CORDIAL.)**

(Thomsonian name.)

White Aspen,	
Black Aspen,	
Poplar Bark,	of each, 8 oz. (av.).
Bayberry Root Bark,	16 oz. (av.).
Boil a few minutes in 2 gallons of Water, strain, add 7 pounds of Sugar, skim, and then add 3 quarts of Brandy.	

317. Pulvis Myricæ Compositus. N. F.*Compound Powder of Bayberry.**Composition Powder.*

Bayberry, bark of the root,	12 parts.
Ginger,	6 parts.
Capsicum,	1 part.
Cloves,	1 part.

Reduce the substances to a moderately fine powder.

Note.—Bayberry root bark is derived from *Myrica cerifera* Linné (Waxmyrtle; Candleberry).

Syrup of Bayberry.

(Thomsonian name.)

Bayberry,	12 oz. (troy).
Sugar,	12 oz. (troy).
Diluted Alcohol,	64 fl. oz.

Digest the Bayberry in the Diluted Alcohol for two days, strain, and evaporate to 16 fl. oz.; add the Sugar.

Tolu Cough Mixture.

Syrup of Squill,	4 fl. dr.
Tincture of Tolu,	1 fl. dr.
Syrup,	8 fl. oz.

Mix. Dose, a teaspoonful.

8. Balsamum Traumaticum. N. F.*Traumatic Balsam.*

Turlington's Balsam. Friar's Balsam.

Benzoin, in coarse powder,	1½ tr. oz.
Storax,	½ tr. oz.
Balsam of Tolu,	½ tr. oz.
Balsam of Peru,	120 gr.
Aloes, in coarse powder,	60 gr.
Myrrh, in coarse powder,	60 gr.
Angelica Root, in moderately coarse powder,	80 gr.
Alcohol,	16 fl. oz.

Macerate the substances with the Alcohol during ten days, frequently agitating; then filter.

Note.—The official *Tinctura Benzoini Composita* is a simplified preparation intended to replace the above compound.

Borobenzoate of Sodium.

(T. S. Wiegand.)

Sodium Borate, 8 oz. (troy).
Sodium Benzoate, 4 oz. (troy).
Water, sufficient to dissolve.

Make a solution of the Salts in the Water, filter, and evaporate, with constant stirring, to dryness.

FATS, FIXED OILS, SOAPS, ETC.

British Oil.

Petroleum, Barbadoes, 1 fl. oz.
Petroleum, American, 1 fl. oz.
Oil of Turpentine, 2 fl. oz.
Oil of Linseed, 24 fl. oz.
Oil of Amber, 8 fl. oz.
Oil of Juniper, 2 fl. dr.

Mix them well together.

309. Pulvis Amygdalæ Compositus. N. F.

Compound Powder of Almond.

Sweet Almond, 6 parts.
Sugar, in fine powder, 8 parts.
Acacia, in fine powder, 1 part.

Blanch the Sweet Almonds, then dry them thoroughly with a soft cloth, and rub them lightly in a mortar, until they form a mass of a smooth consistence. Mix the Acacia and Sugar, add them to the mass previously prepared, and rub the whole to a coarse powder, which is to be preserved in a lightly-covered jar.

Note.—If 820 grains of this preparation be thoroughly triturated with 17 fluidounces of Water, gradually added, and the mixture finally strained, the product will be about 16 fluidounces of *Mistura Amygdalæ* (U. S. P.).

Emulsion of Pumpkin-Seed.

Pumpkin-Seed (fresh), 2 oz. (av.).
Powdered Acacia, 60 gr.
Sugar, 240 gr.
Water, 4 fl. oz.

Blanch the seed, after soaking them in hot water, beat them into a mass with the Sugar, then add the Acacia, and gradually the Water.

121. Emulsio Olei Ricini. N. F.

Emulsion of Castor Oil.

I. Irish Moss Emulsion of Castor Oil.

Castor Oil, 5 fl. oz.
Mucilage of Chondrus (N. F.), 5 fl. oz.
Tincture of Vanilla, 180 min.
Syrup, 8 fl. oz.
Water, enough to make 16 fl. oz.

To the Mucilage of Chondrus, contained in a suitable bottle, add the Castor

Oil in divided portions, agitating each time until the last-added portion has been emulsified. Then add the Tincture of Vanilla, the Syrup, and enough Water to make sixteen (16) fluidounces. Finally, mix the whole thoroughly together.

This emulsion should not be prepared in larger quantity than may be consumed within a short time.

Emulsion of Castor Oil may also be prepared by other methods capable of emulsifying the oil, provided the vehicles and ingredients are compatible with the therapeutic employment of the preparation. In absence of any specific directions of the prescriber, it is recommended that Castor Oil Emulsion be prepared only either by means of Chondrus or by means of Acacia.

II. Acacia Emulsion of Castor Oil. N. F.

Castor Oil, 5 fl. oz.
Acacia, in fine powder, 1½ tr. oz.
Tincture of Vanilla, 180 min.
Syrup, 8 fl. oz.
Water, enough to make 16 fl. oz.

Mix the Syrup with two (2) fluidounces of Water, and triturate the Acacia with the mixture to a smooth paste. Then gradually incorporate with it the Castor Oil. Transfer the mixture to a bottle, add the Tincture of Vanilla, and enough Water to make sixteen (16) fluidounces. Finally, mix the whole thoroughly together.

This emulsion should not be prepared in larger quantity than may be consumed within a short time.

Emulsion of Castor Oil.

Castor Oil, 4 fl. dr.
Tincture of Quillaia, 80 min.
Distilled Water, sufficient to make 1 fl. oz.
Mix.

300. Linimentum Tiglii. N. F.

Liniment of Croton Oil.

Linimentum Crotonis (Brk. PA.).

Croton Oil, 2 fl. dr.
Oil of Cajuput, 7 fl. dr.
Alcohol, 7 fl. dr.

Mix them.

301. Linimentum Tiglii Compositum. N. F.

Compound Croton Oil Liniment.

Croton Oil, 1 fl. oz.
Oil of Sassafras, 1 fl. oz.
Oil of Turpentine, 1 fl. oz.
Oil of Olive, 2 fl. oz.
Mix them.

Ointment of Croton Oil.

Croton Oil, 80 min.
Lard, 1 oz. (troy).
Mix gradually.

Pills of Croton Oil.

Croton Oil, 6 min.
Crumb of Bread, 24 gr.
Make into 24 pills.

Croton Oil Pencils.

(Limousin's.)

Croton Oil, 2 fl. dr.
White Wax, 60 gr.
Oil of Theobroma, 60 gr.

Melt the Wax and Oil of Theobroma together, by means of a water-bath, in a flask, adding the Croton Oil, and keep the flask corked until the mixture begins to congeal; then pour into suitable cylindrical moulds, one-fourth to one-third of an inch in diameter. The pencils are covered with tin foil and kept in closed vessels.

Stronger Laxative Mixture.

(Bonsu's.)

Resin of Scammony, of each, $\frac{1}{2}$ gr.
Resin of Jalap, 15 gr.
Sugar, 2 min.
Croton Oil, 80 min.
Mucilage, 90 min.
Orange Flower Water, 1 fl. oz.
Compound Syrup of Senna, 8 fl. oz.
Peppermint Water, 8 fl. oz.
Dose, a tablespoonful.

Glycerin Ointment.

Spermaceti, 240 gr.
White Wax, 60 gr.
Glycerin, 1 fl. oz.
Expressed Oil of Almond, 8 fl. oz.

Melt the Wax and Spermaceti with the Oil at a moderate heat; put these in a Wedgwood mortar, add the Glycerin, and triturate until cold.

Glycerin Suppositories.

Sodium Carbonate, 40 gr.
Stearic Acid, 80 gr.
Glycerin, 1080 gr.

Dissolve the Sodium Carbonate in the Glycerin, add the Stearic Acid; heat carefully, make 12 suppositories, wrap each in tin foil. Each suppository contains ninety per cent. of Glycerin.

341. Spiritus Glonoini. N.

Spirit of Glonoin.

Spirit of Nitroglycerin. Solution of Nitroglycerin.

A solution of Glonoin (or Nitroglycerin) in official Alcohol, containing one (1) per cent., by weight, of the former.

Note.—The specific gravity of this Spirit, at 15° C. (59° F.) is 0.828. On mixing 10 C.c. of the Solution with Distilled Water, in a test-tube having a diameter of $\frac{1}{2}$ inch, both liquids being at the temperature of 15° C. (59° F.), it will require about 16 C.c. of the Water to render the liquid faintly turbid (when compared with the undiluted Solution); and about 4 C.c. more of

Water will be required to render it so opalescent that the eye cannot distinguish print placed behind the tube.

Glonoin (or Nitroglycerin), for medical purposes, is usually procured by wholesale dealers in drugs directly from the factory where it is made, in form of a 10 per cent. solution in alcohol. Such a solution is non-explosive, and may be diluted, as occasion requires, to the strength of 1 per cent. The specific gravity of the 10 per cent. solution is 0.863 at 15° C. (59° F.). Ten C.c. of it require about 2.5 C.c. of Distilled Water to render it so opalescent that print cannot be distinguished through it under the conditions just described in the case of the 1 per cent. solution.

Solutions of Glonoin, particularly the stronger (10 per cent.), should always be transported or kept in tin cans, and never in glass or other fragile vessels. Should the container of a Solution of Glonoin be broken, and the contents be soaked up by wood, or packing material, the latter may become dangerously explosive when the alcohol has evaporated. Should the proportion of Glonoin to porous material be not more than 70 parts of the former, and not less than 30 parts of the latter, the compound will be non-explosive (except by a detonator); and if the proportions are not more than 52 parts of the former, and not less than 48 parts of the latter, the compound cannot even be detonated. But, in presence of substances readily yielding oxygen, such as nitrates, chlorates, etc., so small a proportion as 5 per cent. of Glonoin will produce a dangerously explosive combination.

When handling an alcoholic solution of Glonoin, care should be taken that it be not brought in prolonged or extended contact with the skin, as it is readily absorbed and will then cause its characteristic physiological effects (distressing headache, nausea, etc.).

296. Pilulæ Glonoini. N. F.

Pills of Glonoin.

Pills of Nitroglycerin.

Spirit of Glonoin (N. F., 1 per cent.), 200 gr.
Althæa, in fine powder, 198 gr.
Confection of Rose, a sufficient quantity.

Mix the Spirit of Glonoin intimately with the powdered Althæa, expose the mixture for a short time to the air, so that the alcohol may evaporate, then make a pill-mass by means of Confection of Rose, and divide it into two hundred (200) pills.

Each pill contains $\frac{1}{100}$ grain of Glonoin (Nitroglycerin).

Ceratum Saponis. U. S. 1870.

SOAP CERATE.

Soap Plaster, 2 oz. (troy).
Yellow Wax, 2½ oz. (troy).
Olive Oil, 4 oz. (troy).

Melt together the Plaster and Wax, add the Oil, and, after continuing the heat a few minutes, stir the mixture until cool.

Pilula Saponis Composita. U. S. 1870.

COMPOUND PILL OF SOAP.

Opium, in fine powder, 60 gr.
Soap, in fine powder, 240 gr.

Beat them together with water so as to form a pilular mass.

Bathing Spirits.

(Jackson's.)

Soap,	8 oz. (troy).
Camphor,	8 oz. (troy).
Oil of Rosemary,	8 fl. dr.
Oil of Thyme,	8 fl. dr.
Alcohol,	64 fl. oz.
Mix.	

198. Linimentum Saponato-Camphoratum. N. F.*Camphorated Soap Liniment.*

Opodeldoc. Solid Opodeldoc.

White Castile Soap, dried and powdered,	1½ tr. oz.
Camphor,	½ tr. oz.
Alcohol,	20 fl. oz.
Oil of Thyme,	30 min.
Oil of Rosemary,	60 min.
Stronger Water of Ammonia	

(U. S. P.), 1 fl. oz.

Introduce the Castile Soap, Camphor, and Alcohol into a flask or suitable bottle, and apply a gentle heat until solution is effected, taking care that no loss of Alcohol be incurred by evaporation. Filter the liquid, while hot, into another flask or bottle; warm again, if necessary, to render the contents liquid, add the Oils and Stronger Water of Ammonia, and when the whole has been thoroughly mixed, pour it into small dry vials, which should have been previously warmed, and should immediately be corked and cooled.

Note.—The quantities above given are usually divided into 12 vials. Solid Opodeldoc is directed by the Germ. Pharm. to be made with soap made from animal fats; but pure, white Castile soap may be used, provided it is previously deprived of water. The stronger Water of Ammonia should be of the full strength prescribed by the U. S. Pharm.

329. Sapo Viridis. N. F.*Green Soap.*

Potassa,	8 parts.
Water,	12 parts.
Cotton-Seed Oil,	24 parts.

Dissolve the Potassa in the Water and, while stirring the solution, add the Cotton-Seed Oil. Stir it occasionally during forty-eight hours, then transfer the product to suitable vessels.

Note.—If refined Cotton-Seed Oil is used for this preparation, the product will have a yellowish color, free from greenish tint, but will answer the same purpose.

345. Spiritus Saponatus. N. F.*Spirit of Soap.*

Castile Soap, in shavings,	2½ tr. oz.
Alcohol,	9 fl. oz.
Water,	enough to make 16 fl. oz.

Introduce the Soap into a bottle, add the Alcohol and *three* (3) *fluidounces* of Water, cork the bottle, and immerse it in hot Water, frequently shaking. When

the Soap is dissolved, allow the bottle and contents to become cold, then add enough Water to make *sixteen* (16) *fluidounces*, and filter.

Note.—The *Spiritus Saponatus* of the Germ. Pharm. is prepared by saponifying Olive Oil with Potassa, and then adding Alcohol and Water.

If time permits, the Spirit ought to be set aside, in a moderately cold place, for about twelve hours before it is filtered.

Compound Tincture of Green Soap.

(Tilbury Fox.)

Green Soap,	1 oz. (troy).
Oil of Lavender,	90 min.
Oil of Cade,	
Alcohol,	of each, 1 fl. oz.
Mix.	

414. Tinctura Saponis Viridis Composita. N. F.*Compound Tincture of Green Soap.*

Green Soap,	2½ tr. oz.
Oil of Cade,	140 min.
Alcohol,	enough to make 16 fl. oz.

Dissolve the Green Soap in *twelve* (12) *fluidounces* of Alcohol, add the Oil of Cade, and then enough Alcohol to make the product measure *sixteen* (16) *fluidounces*, and filter.

Green Soap Lotion.

(Hebra's.)

Green Soap,	240 gr.
Oil of Lavender,	15 min.
Boiling Water,	8 fl. oz.
Mix.	

Tincture of Green Soap with Tar.

(Hebra's.)

Green Soap,	1 oz. (troy).
Tar,	
Alcohol,	of each, 1 fl. oz.

DRUGS CONTAINING BITTER PRINCIPLES, ETC.**394. Tinctura Coto. N. F.***Tincture of Coto.*

Coto Bark, bruised,	2 tr. oz.
Alcohol,	enough to make 16 fl. oz.

Macerate the Coto with *fourteen* (14) *fluidounces* of Alcohol during seven days; then pour off the liquid, press the residue, and filter the united liquids through paper. Lastly, wash the residue transferred to the filter with enough Alcohol to make the product measure *sixteen* (16) *fluidounces*.

Note.—Coto Bark is derived from an undetermined tree, probably belonging to the natural order Lauraceæ, and is obtained from Bolivia. There are two varieties known, one as "Coto" and the other as "Paracoto" bark. True Coto bark is, at times, difficult to obtain in the market, and the Paracoto bark is then frequently substituted for it. While they possess some useful properties in common, yet they differ materially in other respects. Hence, the Paracoto bark should not be substituted for the true Coto bark.

Tonic Tea.

(Gerhard's.)

Gentian, 1 oz. (troy).
Rhubarb, 120 gr.
Ginger, 240 gr.
Sodium Bicarbonate, 120 gr.
Boiling Water, 32 fl. oz.

Bruise the Gentian, Rhubarb, and Ginger, mix them, and add the Sodium Bicarbonate; then infuse in 32 fl. oz. of Boiling Water. Dose, a wineglassful three times a day.

Elixir of Gentian with Chloride of Iron.

Compound Fluid Extract of Gentian, 4 fl. dr.
Tincture of Chloride of Iron (tasteless), 2½ fl. dr.
Elixir of Orange, a sufficient quantity to make 8 fl. oz.
Mix.

Tincture of Burdock-Seed.

Ground Burdock-Seed, 4 oz. (troy).
Water, 4 fl. oz.
Alcohol, 12 fl. oz.

Mix the liquids, and percolate in the usual way until 16 fl. oz. of tincture are obtained. Dose, a teaspoonful three or four times a day.

Boker's Bitters.

Quassia, 60 gr.
Calamus, 60 gr.
Catechu, 60 gr.
Cardamom, 40 gr.
Orange Peel, 90 gr.
Whisky, 5½ fl. oz.
Water, 24 fl. oz.

Macerate, and filter.

Pilulæ Scillæ Compositæ. U. S. 1870.

COMPOUND PILLS OF SQUILL.

Squill, in fine powder, 12 gr.
Ginger, in fine powder,
Ammoniac, in fine powder, of each, 24 gr.
Soap, in fine powder, 86 gr.
Syrup, a sufficient quantity.

Mix the powders, then beat them with Syrup so as to form a pilular mass. To be divided into 24 pills.

Tinctura Hellebori. U. S. 1870. TINCTURE OF BLACK HELLEBORE.

Black Hellebore, in moderately fine powder, 4 oz (troy).
Diluted Alcohol, a sufficient quantity.
Moisten the powder with 1 fl. oz. of Diluted Alcohol, pack it in a cylindrical percolator, and gradually pour Diluted Alcohol upon it until 2 pints of tincture are obtained.

Cutter's Pills.

(For habitual costiveness.)

Powdered Ipecac, 10 gr.
Mild Chloride of Mercury, 8 gr.
Extract of Taraxacum, 40 gr.
Make into a mass and divide into 30 pills. Dose, one three times a day.

Laxative Syrup.

(Amussart's.)

Rasped Guaiac Wood,
Chicory Root,
Lappa,
Water-Dock Root,
Fumitory Tops,
Tops of Viola Tricolor,
of each, 154 gr.
Senna, 770 gr.

Sugar,
Honey, of each, 10½ oz. (av.).
Boiling Water, sufficient.

Bruise the materials, and infuse for twelve hours with 18 fl. oz. of Boiling Water; strain, and make a second infusion with 10 fl. oz. of Water; strain under pressure, filter through paper (evaporate to one-fourth), then add the Honey and Sugar and shake until dissolved; strain. Dose, 1 to 2 tablespoonfuls a day.

67. Elixir Gentianæ. N. F.

Elixir of Gentian.

Extract of Gentian (U. S. P.), 70 gr.
Aromatic Spirit, 180 min.
Tincture of Vanilla, 120 min.
Syrup, 1 fl. oz.

Aromatic Elixir, enough to make 16 fl. oz.
Dissolve the Extract of Gentian in about two (2) fluidounces of Aromatic Elixir, next add the Syrup, Aromatic Spirit, and Tincture of Vanilla, and, lastly, enough Aromatic Elixir to make sixteen (16) fluidounces. Filter, if necessary.

Each fluidrachm represents about 2 grains of Gentian.

Note.—This Elixir will be more likely to remain clear if, after the liquids are mixed together, 360 grains of Purified Talcum are added, the whole allowed to stand a few days, and then filtered.

68. Elixir Gentianæ et Ferri Phosphatis. N. F.

Elixir of Gentian and Phosphate of Iron.

Elixir Gentianæ Ferratum. Ferrated Elixir of Gentian. Ferrophosphated Elixir of Gentian.

Phosphate of Iron (U. S. P. 1880), 128 gr.
Water, ½ fl. oz.

Elixir of Gentian, enough to make 16 fl. oz.

Dissolve the Phosphate of Iron in the Water with the aid of heat, and add

enough Elixir of Gentian to make sixteen (16) *fluidounces*. Filter, if necessary.

Each fluidrachm represents 1 grain of Phosphate of Iron and nearly 2 grains of Gentian.

69. Elixir Gentianæ cum Tinctura Ferri Chloridi. N. F.

Elixir of Gentian with Tincture of Chloride of Iron.

Tincture of Citro-Chloride of Iron, 640 min.

Elixir of Gentian, enough to make 16 fl. oz.

Mix the Tincture of Citro-Chloride of Iron with enough Elixir of Gentian to make sixteen (16) *fluidounces*, and filter, if necessary.

Each fluidrachm represents about $\frac{3}{4}$ grain of Ferric Chloride and nearly 2 grains of Gentian.

52. Elixir Corydalis Compositum. N. F.

Compound Elixir of Corydalis.

Fluid Extract of Corydalis, 1 fl. oz.

Fluid Extract of Stillingia, 1 fl. oz.

Fluid Extract of Xanthoxylum, $\frac{1}{2}$ fl. oz.

Fluid Extract of Iris, $\frac{1}{2}$ fl. oz.

Alcohol, 2 fl. oz.

Iodide of Potassium, 384 gr.

Aromatic Elixir, enough to make 16 fl. oz.

Mix the Alcohol with the Fluid Extracts, dissolve the Iodide of Potassium in the mixture, and add enough Aromatic Elixir to make sixteen (16) *fluidounces*. Let the mixture stand a few days, if convenient, and filter.

Each fluidrachm contains 3 grains of Iodide of Potassium and small quantities of the several Fluid Extracts.

53. Elixir Euonymi. N. F.

Elixir of Euonymus.

Elixir of Wahoo.

Fluid Extract of Euonymus, 2½ fl. oz.

Water, 2 fl. oz.

Syrup of Coffee, 2 fl. oz.

Compound Elixir of Taraxacum, 9½ fl. oz.

Mix them, let the mixture stand forty-eight hours, and filter.

Each fluidrachm represents about 9½ grains of Euonymus.

54. Elixir Eriodictyi Aromaticum. N. F.

Aromatic Elixir of Eriodictyon.

Aromatic Elixir of Yerba Santa; Elixir Corrigens.

Fluid Extract of Eriodictyon, 1 fl. oz.

Syrup, 8 fl. oz.

Pumice, in fine powder, 4 tr. oz.

Carbonate of Magnesium, 80 gr.

Compound Elixir of Taraxacum, enough to make 16 fl. oz.

Mix seven (7) *fluidounces* of Compound Elixir of Taraxacum with the Syrup and Pumice, then add the Fluid Extract, and mix the whole thoroughly by agitation. Shake the mixture occasionally during two hours, then allow it to settle, and carefully decant the liquid into a funnel, the neck of which contains a small pellet of absorbent cotton. Afterwards add the dregs and allow them to drain. To the filtrate add the Carbonate of Magnesium and shake occasionally during several hours. Let the mixture stand at rest during twelve hours, if convenient, then decant the liquid and filter it through paper. To the filtrate add enough Compound Elixir of Taraxacum, if necessary, to make sixteen (16) *fluidounces*.

Note.—This preparation is chiefly intended as a vehicle for quinine and other bitter remedies.

106. Elixir Turnerae. N. F.

Elixir of Turnera.

Elixir of Damiana.

Fluid Extract of Turnera, 2½ fl. oz.

Carbonate of Magnesium, 240 gr.

Alcohol, 4 fl. oz.

Glycerin, 1 fl. oz.

Aromatic Elixir, enough to make 16 fl. oz.

Mix the Fluid Extract with the Alcohol, Glycerin, and eight (8) *fluidounces* of Aromatic Elixir. Incorporate the Carbonate of Magnesium thoroughly with the mixture by trituration. Then filter through a wetted filter, and pass enough Aromatic Elixir through the filter to make sixteen (16) *fluidounces*.

Each fluidrachm represents about 9½ grains of Turnera.

170. Extractum Stillingiæ Fluidum Compositum. N. F.

Compound Fluid Extract of Stillingia.

Stillingia, 4 tr. oz.

Corydalis (root), 4 tr. oz.

Iris, 2 tr. oz.

Sambucus, 2 tr. oz.

Chimaphila, 2 tr. oz.

Coriander, 1 tr. oz.

Xanthoxylum Berries, 1 tr. oz.

Reduce the drugs to a moderately coarse (No. 40) powder, and prepare a Fluid Extract in the usual manner with diluted alcohol.

384. Syrupus Stillingiæ Compositus. N. F.

Compound Syrup of Stillingia.

Compound Fluid Extract of

Stillingia (N. F.), 4 fl. oz.

Purified Talcum, 120 gr.

Sugar, 11 tr. oz.

Water, enough to make 16 fl. oz.

Mix the Compound Fluid Extract of *Stillingia* with the Purified Talcum, and afterwards with four and one-half (4½) fluidounces of Water, and shake them together thoroughly. Then pour the mixture upon a wetted filter, add the Sugar to the filtrate, and pass enough Water through the filter to make the product, after the Sugar has been dissolved by agitation, measure sixteen (16) fluidounces.

Each fluidrachm represents 15 minims of Compound Fluid Extract of *Stillingia*.

431. Vinum Fraxini Americane. N. F.

Wine of White Ash.

Fraxinus (bark), in No. 40 powder, 8 tr. oz.
Stronger White Wine (U. S. P.), enough to make 16 fl. oz.

Moisten the powdered Fraxinus with sixteen (16) fluidounces of Stronger White Wine, macerate it during three days in a well-covered vessel, then pack it in a percolator, and gradually pour on Stronger White Wine until sixteen (16) fluidounces of percolate are obtained. Keep the product in well-stoppered bottles, which should be completely filled and stored in a cool place.

Each fluidrachm represents 80 grains of Fraxinus (bark).

Note.—Fraxinus bark is the inner bark of the trunk or root of *Fraxinus Americana* Linné (White Ash).

105. Elixir Taraxaci Compositum. N. F.

Compound Elixir of Taraxacum.

Taraxacum,	1 tr. oz.
Wild Cherry,	1 tr. oz.
Sweet Orange Peel, recently dried,	1 tr. oz.
Glycyrrhiza, Russian, peeled;	3 tr. oz.
Cinnamon, Saigon,	120 gr.
Cardamom,	120 gr.
Canada Snake Root,	120 gr.
Caraway,	120 gr.
Cloves,	40 gr.
Alcohol,	
Water, each,	a sufficient quantity.
Syrup,	32 fl. oz.

Reduce the solid substances to a moderately coarse (No. 40) powder, and percolate, in the usual manner, with a mixture of one (1) volume of Alcohol and two (2) volumes of Water, until sixteen (16) fluidounces of percolate are obtained. Lastly, add the Syrup, let the mixture stand a few days, if possible, and filter.

Note.—If a precipitate should make its appearance in this preparation on standing, it ought to be removed by filtration. This Elixir is chiefly intended as a vehicle or corrigent, to cover the bitter taste of quinine and similar substances.

388. Tinctura Amara. N. F.

Bitter Tincture.

Stomachic Tincture. Bitter Stomachic Drops.
Stomach Drops

Gentian,	884 gr.
Centauri (herb),	884 gr.
Bitter Orange Peel,	256 gr.
Orange Berries,	128 gr.
Zedoary (root),	128 gr.
Alcohol,	
Water, each,	enough to make 16 fl. oz.

Reduce the drugs to a moderately coarse (No. 40) powder, and percolate it, in the usual manner, with a mixture of two (2) volumes of Alcohol and one (1) volume of Water, until sixteen (16) fluidounces of percolate are obtained.

Note.—Centauri is the herb of *Erythronium Persoon*. Orange Berries are the unripe fruit of *Citrus vulgaris* Risso, collected while small. Zedoary is the rhizome of *Curcuma Zedoaria* Roscoe. The product obtained by the above formula is practically identical with that which is official in the Germ. Pharm.

434. Vinum Pruni Virginianæ. N. F.

Wine of Wild Cherry.

Wild Cherry, in No. 40 powder,	4 tr. oz.
Sugar,	2½ tr. oz.
Water,	3 fl. oz.
Alcohol,	1 fl. oz.
Purified Talcum,	120 gr.
Angelica Wine, enough to make	16 fl. oz.

Dissolve the Sugar in the Water. Moisten the Wild Cherry with a sufficient quantity of this solution, and allow it to macerate during one hour. Then transfer it to a percolator, pour upon it the remainder of the solution, and afterwards enough Angelica Wine until fifteen (15) fluidounces of percolate are obtained. Add to this the Alcohol, mix the Purified Talcum intimately with the liquid, then filter, returning the first portions of the filtrate until it runs through clear, and, finally, pass enough Angelica Wine through the filter to make the product measure sixteen (16) fluidounces.

Each fluidrachm represents 15 grains of Wild Cherry.

435. Vinum Pruni Virginianæ Ferratum. N. F.

Ferrated Wine of Wild Cherry.

Tincture of Citro-Chloride of Iron,	640 min.
Wine of Wild Cherry,	
	enough to make 16 fl. oz.

Mix the Tincture with enough Wine of Wild Cherry to make sixteen (16) fluidounces.

Each fluidrachm represents 5 minims of Tincture of Citro-Chloride of Iron and 18½ grains of Wild Cherry.

418. *Tinctura Zedoariæ Amara. N. F.**Bitter Tincture of Zedoary.*

Compound Tincture of Zedoary.

Zedoary (root),	4 tr. oz.
Aloes,	2 tr. oz.
Rhubarb,	1 tr. oz.
Gentian,	1 tr. oz.
White Agaric,	1 tr. oz.
Saffron,	1 tr. oz.
Glycerin,	2 fl. oz.
Alcohol,	

Water, each, enough to make 16 fl. oz.

Reduce the solids to a moderately coarse (No. 40) powder, moisten this with a sufficient quantity of a mixture of two (2) volumes of Alcohol and one (1) volume of Water, and percolate it in the usual manner, with this menstruum, until twelve (12) fluidounces of percolate are obtained. Add to this the Glycerin and set it aside. Then continue the percolation until the drugs are practically exhausted, evaporate the new percolate to two (2) fluidounces and add it to the reserved portion.

Each fluidrachm represents 15 grains of Zedoary, 7½ grains of Aloes, and 3½ grains, each, of the other drugs.

Note.—The above preparation is not identical with the *Tinctura Zedoariæ Composita* (also known as *Tinctura Carminativa, Tinctura Weddellii*) which was formerly official in some continental pharmacopœias.

419. *Tinctura Quillajæ. N. F.**Tincture of Quillaja.*

Quillaja, in fine chips,	8 tr. oz.
Alcohol,	1 pint.
Water,	enough to make 8 pints.

Place the Quillaja in a suitable vessel with two (2) pints of Water, and boil it for fifteen minutes, then strain and add enough Water through the strainer to make the strained decoction, when cold, measure two (2) pints. Pour this into a bottle containing the Alcohol, let the mixture stand twelve hours, then filter it through paper, and add enough Water to the filtrate to make it measure three (3) pints.

Each fluidrachm represents 10 grains of Quillaja.

Note.—This preparation, aside from its therapeutic use, may be employed as an emulsifying agent for oils, balsams, resins. See *Note* to No. 114, IV. "Quillaja Emulsion of Cod-Liver Oil."

415. *Tinctura Strophanthi. N. F.**Tincture of Strophanthus.*

Strophanthus (seeds), freed from their comose appendage, reduced to No. 80 powder, and dried at 50° C. (122° F.), 1 tr. oz.

Stronger Ether, a sufficient quantity.
Alcohol, enough to make 20 fl. oz.

Pack the Strophanthus in a suitable percolator, pour on enough Stronger Ether to

saturate the powder thoroughly, cover the percolator, and macerate during twenty-four hours. Then allow the percolation to proceed, gradually pouring on Stronger Ether, until the liquid passes through colorless. This ethereal percolate is to be rejected. Remove the marc from the percolator, and dry it, first by exposure to air, and then at a temperature of 50° C. (122° F.). Again reduce it to powder, moisten it with Alcohol, repack it in the percolator, and macerate during forty-eight hours. Then percolate it with Alcohol, in the usual manner, until twenty (20) fluidounces of Tincture are obtained.

Each fluidrachm represents 8 grains of *Strophanthus*. The dose is about 2 to 10 minims.

Note.—*Strophanthus* seeds are obtained from one or more species of *Strophanthus* growing in Eastern Africa, and are usually referred to *Strophanthus Kombé* Oliver.

277. *Oxymel Scillæ. N. F.**Oxymel of Squill.*

Vinegar of Squill,	5 parts.
Honey,	10 parts.

Mix them in a tared porcelain capsule or enamelled iron vessel, and apply the heat of a water-bath until the mixture has been reduced to the weight of ten (10) parts. Then strain, allow it to cool, and transfer it to bottles, which should be well corked.

Note.—This very old preparation differs but slightly in proportions from that official under the same name in the British Pharmacopœia.

Hooper's Pills.

Powdered Ginger,	60 gr.
Powdered Canella,	60 gr.
Extract of Black Hellebore,	120 gr.
Myrrh,	120 gr.
Soap,	120 gr.
Dried Sulphate of Iron,	180 gr.
Aloes,	1 oz. (troy).

Beat them well together into a mass with syrup or water, and divide into pills each containing 2½ gr.

Syrup of Gillenia.

Gillenia,	1 oz. (troy).
Sugar,	15 oz. (troy).
Diluted Alcohol,	8 fl. oz.
Water,	5 fl. oz.

Reduce the Gillenia to a coarse powder, percolate with Diluted Alcohol until 8 fl. oz. are obtained, evaporate to 8 fl. oz., filter, and add sufficient Water to make the liquid measure 8 fl. oz.; then add the Sugar, and dissolve by a gentle heat.

Worm Tea.

Spigelia,	240 gr.
Manna,	240 gr.
Senna,	120 gr.
Fennel,	60 gr.

Contuse the *Spigelia* and mix it with the other ingredients; infuse in 16 fl. oz. of Boiling Water. Give a child, two years old or upwards, half a teacupful, warm, morning, noon, and night, before eating.

Trochisci Santonini. U. S. 1870.

TROCHES OF SANTONIN.

Santonin, in fine powder, 240 gr.
Sugar, in fine powder, 18 oz. (troy).
Tragacanth, in fine powder, 240 gr.
Orange Flower Water, a sufficient quantity.

Rub the powders together until they are thoroughly mixed; then, with Orange Flower Water, form a mass, to be divided into 480 troches.

CATHARTIC DRUGS.

Zimmerman's Decoction.

Rhubarb, 80 gr.
Potassium Bitartrate, 240 gr.
Barley, 240 gr.
Water, 16 fl. oz.

Boil for fifteen or twenty minutes, strain, and add enough simple syrup or sugar to sweeten the decoction.

Tamarind Electuary.

(Fuller's.)

Sugar, 800 gr.
Manna, 1½ oz. (troy).
Tamarind, 210 gr.
Potassium Bitartrate, 80 gr.
Powdered Senna, 120 gr.
Boiling Water, 8 fl. oz.

Dissolve the Sugar and Manna in the Boiling Water, and filter, then add the other ingredients.

Aperient Pills.

(Dr. Mitchell's.)

Powdered Aloes, 24 gr.
Powdered Rhubarb, 48 gr.
Mild Chloride of Mercury, 4 gr.
Antimony and Potassium Tartrate, 2 gr.

Make into a mass and divide into 24 pills.

Tinctura Rhei et Sennæ. U. S. 1870.

TINCTURE OF RHUBARB AND SENNA.

(Warner's Gout Cordial.)

Rhubarb, 1 oz. (troy).
Senna, 120 gr.
Coriander,
Fennel, of each, 60 gr.
Glycyrrhiza, 80 gr.
Raisins, deprived of their seeds, 6 oz. (troy).
Diluted Alcohol, 48 fl. oz.

Macerate for seven days, express, and filter through paper.

261. Mistura Rhei Composita. N. F.

Compound Mixture of Rhubarb.

Squibb's Rhubarb Mixture.

Fluid Extract of Rhubarb, 86 min.
Fluid Extract of Ipecac, 16 min.
Bicarbonate of Sodium, 172 gr.
Glycerin, 4 fl. oz.
Peppermint Water, enough to make 16 fl. oz.
Dissolve the Bicarbonate of Sodium in about eight (8) fluidounces of Peppermint Water, then add the Fluid Extracts and Glycerin, and, lastly, enough Peppermint Water to make sixteen (16) fluidounces.

411. Tinctura Rhei Aquosa. N. F.

Aqueous Tincture of Rhubarb.

1. Rhubarb (cut into thin slices and carefully freed from any adhering fine powder), 720 gr.
Borate of Sodium, 72 gr.
Carbonate of Potassium, 72 gr.
Cinnamon Water, 2 fl. oz.
Alcohol, 1½ fl. oz.
Water, enough to make 16 fl. oz.

Dissolve the Borate of Sodium and the Carbonate of Potassium in twelve (12) fluidounces of Water, and macerate in this solution, during twenty-four hours, the Rhubarb. Then strain it through muslin, heat the strained liquid to boiling, add the Cinnamon Water and Alcohol, stir it well, and filter, while warm, in a covered funnel. To the cold filtrate add enough Water to make the product measure sixteen (16) fluidounces.

Each fluidrachm represents about 5½ grains of Rhubarb.

Note.—The product is practically identical with that obtained by the process of the Germ. Pharm., in which this preparation is official. It is liable to deteriorate when kept too long, and should not be prepared in larger quantity than may be consumed within a short time.

When this preparation is required for immediate use, and it is not otherwise obtainable, it may be prepared in the following manner:

2. Fluid Extract of Rhubarb, 720 min.
Borate of Sodium, 72 gr.
Carbonate of Potassium, 72 gr.
Cinnamon Water, 2 fl. oz.
Alcohol, 1½ fl. oz.
Water, enough to make 16 fl. oz.

Dissolve the Borate of Sodium and the Carbonate of Potassium in about eight (8) fluidounces of Water. Add the Cinnamon Water, Alcohol, and Fluid Extract of Rhubarb, and, lastly, enough Water to make the product measure sixteen (16) fluidounces. Filter, if necessary.

412. Tinctura Rhei et Gentianæ. N. F.

Tincture of Rhubarb and Gentian.

1. Rhubarb, 512 gr.
Gentian, 128 gr.
Diluted Alcohol, enough to make 16 fl. oz.

Reduce the solids to a moderately coarse (No. 40) powder, and percolate it, in the usual manner, with Diluted Alcohol, until sixteen (16) fluidounces of percolate are obtained.

Each fluidrachm represents 4 grains of Rhubarb and 1 grain of Gentian.

Note.—When this preparation is required for immediate use, and it is not otherwise obtainable, it may be prepared in the following manner:

2 Fluid Extract of Rhubarb,	512 min.
Fluid Extract of Gentian,	128 min.
Diluted Alcohol, enough to make	16 fl. oz.

Mix the Fluid Extracts with enough Diluted Alcohol to make sixteen (16) fluidounces, and filter.

413. Tinctura Rhei Vinosa. N. F.

Vinous Tincture of Rhubarb.

Fluid Extract of Rhubarb,	600 min.
Fluid Extract of Bitter Orange	
Peel,	150 min.
Tincture of Cardamom,	600 min.
Sugar,	2 tr. oz.

Sherry Wine, enough to make 16 fl. oz.
Mix the Fluid Extracts and the Tincture with eight (8) fluidounces of Sherry Wine. In this dissolve the Sugar by agitation, then add enough Sherry Wine to make sixteen (16) fluidounces, and filter.

Note.—This preparation corresponds, in strength, to that which is official in the Germ. Pharm.

166. Extractum Rhei Fluidum Aromaticum. N. F.

Aromatic Fluid Extract of Rhubarb.

Rhubarb,	12 tr. oz.
Cinnamon,	2½ tr. oz.
Cloves,	2½ tr. oz.
Nutmeg,	1½ tr. oz.

Reduce the drugs to a moderately coarse (No. 40) powder, and prepare a Fluid Extract with diluted alcohol.

Note.—If 1 fl. oz. of this preparation is mixed with 16 fl. oz. of syrup, the product will be practically identical with the official Syrupus Rhei Aromaticus.

Compound Powder of Senna.

Powdered Senna,	2 oz. (troy).
Potassium Bitartrate,	2 oz. (troy).
Powdered Scammony,	240 gr.
Powdered Ginger,	120 gr.

Mix. Dose, 20 to 80 grains.

Chelsea Pensioner.

Rhubarb,	120 gr.
Powdered Guaiac,	60 gr.
Potassium Bitartrate,	1 oz. (troy).
Sulphur,	2 oz. (troy).
Powdered Nutmeg,	60 gr.
Honey,	10 fl. oz.

Make into a confection.

40. Elixir Catharticum Compositum. N. F.

Compound Cathartic Elixir.

Fluid Extract of Senna,	2 fl. oz.
Fluid Extract of Podophyllum,	1 fl. oz.
Fluid Extract of Leptandra,	360 min.
Fluid Extract of Jalap,	360 min.
Tartrate of Potassium and Sodium,	2 tr. oz.
Bicarbonate of Sodium,	128 gr.
Compound Elixir of Taraxacum,	4 fl. oz.
Elixir of Glycyrrhiza,	enough to make 16 fl. oz.

Mix the liquids, add the salts, and dissolve them by agitation.

The product should not be filtered, and should be shaken up whenever any of it is dispensed.

The average dose for an adult is 2 fluidrachms.

66. Elixir Frangulae. N. F.

Elixir of Frangula.

Elixir of Buckthorn.

Fluid Extract of Frangula	
(U. S. P.),	4 fl. oz.
Alcohol,	1 fl. oz.
Compound Elixir of Taraxacum,	4 fl. oz.
Aromatic Elixir,	7 fl. oz.

Mix them, allow the mixture to stand during forty-eight hours, if convenient, and filter.

Each fluidrachm represents 15 grains of Frangula.

95. Elixir Rhamni Purshianae. N. F.

Elixir of Rhamnus Purshiana.

Elixir of Cascara Sagrada.

Fluid Extract of Rhamnus Purshiana,	4 fl. oz.
Elixir of Glycyrrhiza,	4 fl. oz.
Compound Elixir of Taraxacum,	8 fl. oz.

Mix them. Allow the mixture to stand a few days, if convenient, and filter.

Each fluidrachm represents 15 grains of Rhamnus Purshiana.

96. Elixir Rhamni Purshianae Compositum. N. F.

Compound Elixir of Rhamnus Purshiana.

Compound Elixir of Cascara Sagrada. Elixir Laxativum; Elixir Purgans; Laxative Elixir.	
Fluid Extract of Rhamnus Purshiana,	2 fl. oz.
Fluid Extract of Senna,	1½ fl. oz.
Fluid Extract of Juglans,	1 fl. oz.
Fluid Extract of Glycyrrhiza,	½ fl. oz.
Compound Tincture of Cardamom,	½ fl. oz.
Aromatic Spirit,	2 fl. oz.
Syrup,	6 fl. oz.
Purified Talcum,	120 gr.
Water,	enough to make 16 fl. oz.

Mix the Fluid Extracts with the Compound Tincture of Cardamom and the Aromatic Spirit; then add the Syrup, and, lastly, enough Water to make sixteen (16) fluidounces. Incorporate the Purified Talcum thoroughly with the mixture, and filter.

The average dose for an adult of this preparation is 1 to 2 teaspoonfuls.

381. Syrupus Sennæ Aromaticus. N. F.
Aromatic Syrup of Senna.

Senna,	2 tr. oz.
Jalap,	884 gr.
Rhubarb,	128 gr.
Cinnamon,	80 gr.
Cloves,	80 gr.
Nutmeg,	16 gr.
Oil of Lemon,	10 min.
Sugar,	12 tr. oz.

Diluted Alcohol, enough to make 16 fl. oz.

Reduce the drugs to a moderately fine (No. 50) powder, add to it the Oil of Lemon, and percolate it, in the usual manner, with Diluted Alcohol. Remove the first eight (8) fluidounces of the percolate, and dissolve in this the Sugar, with the aid of a gentle heat, if necessary, but avoiding loss of alcohol by evaporation. Allow the solution to cool, collect a further portion of percolate, and add it to the Syrup, so as to make sixteen (16) fluidounces.

Each fluidrachm represents 7½ grains of Senna, 8 grains of Jalap, and 1 grain of Rhubarb, with aromatics.

382. Syrupus Sennæ Compositus. N. F.
Compound Syrup of Senna.

Fluid Extract of Senna,	1024 min.
Fluid Extract of Rhubarb,	256 min.
Fluid Extract of Frangula,	256 min.
Oil of Gaultheria,	80 min.
Alcohol,	1 fl. oz.

Syrup, enough to make 16 fl. oz.
Dissolve the Oil of Gaultheria in the Alcohol, and add this to the mixed Fluid Extracts. Then add enough Syrup to make sixteen (16) fluidounces, and mix by agitation.

Each fluidrachm represents 8 grains of Senna, 2 grains of Rhubarb, and 2 grains of Frangula.

97. Elixir Rhei. N. F.

Elixir of Rhubarb.

Sweet Tincture of Rhubarb (U. S. P.),	8 fl. oz.
Deodorized Alcohol,	1 fl. oz.
Water,	8 fl. oz.
Glycerin,	2 fl. oz.
Syrup,	2 fl. oz.

Mix them, and filter.

Each fluidrachm represents about 2½ grains of Rhubarb.

98. Elixir Rhei et Magnesii Acetatis. N. F.

Elixir of Rhubarb and Acetate of Magnesium.

Elixir Rhei et Magnesia. Elixir of Rhubarb and Magnesia.

Magnesia, calcined,	144 gr.
Acetic Acid (U. S. P.),	a sufficient quantity.

Fluid Extract of Rhubarb, 2 fl. oz.
Aromatic Elixir, enough to make 16 fl. oz.

Dissolve the Magnesia in two and one-half (2½) fluidounces of Acetic Acid, with the aid of a gentle heat, adding, if necessary, a little more Acetic Acid, drop by drop, until the solution is neutral to test-paper. Then add the Fluid Extract and enough Aromatic Elixir to make sixteen (16) fluidounces, and filter.

Each fluidrachm represents about 4 grains of Acetate of Magnesium and 7½ grains of Rhubarb.

333. Species Laxantes. N. F.
Laxative Species.

St. Germain Tea (Germ. Pharm.).

Senna, cut,	16 parts.
Elder Flowers,	10 parts.
Fennel, bruised,	5 parts.
Anise, bruised,	5 parts.
Bitartrate of Potassium, in fine powder,	4 parts.

Moisten the Senna with a small quantity of water; then sprinkle over it, as uniformly as possible, the Bitartrate of Potassium. When it has become dry, mix it lightly and uniformly with the other ingredients.

320. Pulvis Rhei et Magnesie Anisatis. N. F.

Anisated Powder of Rhubarb and Magnesia.

Compound Anise Powder.

Rhubarb, in fine powder,	1 tr. oz.
Heavy Magnesia, calcined,	2 tr. oz.
Oil of Anise,	110 min.
Alcohol,	160 min.

Mix the powders, add the Oil of Anise, previously dissolved in the Alcohol, and triturate until a uniform mixture results.

402. Tinctura Jalapæ. N. F.

Tincture of Jalap.

Jalap, in fine powder,	8 tr. oz.
Alcohol,	

Water, each, enough to make 16 fl. oz.

Mix two (2) volumes of Alcohol with one (1) volume of Water, percolate the Jalap with this mixture, in the usual manner, until sixteen (16) fluidounces of Tincture are obtained.

Note.—This preparation was official in the U. S. F. of 1870.

403. *Tinctura Jalapæ Composita. N. F.**Compound Tincture of Jalap.*

Jalap, in fine powder, 2 tr. oz.
 Scammony, in powder, ½ tr. oz.
 Alcohol,
 Water, each, enough to make 16 fl. oz.

Mix two (2) volumes of Alcohol with one (1) volume of Water. Mix the powders with half their weight of sand; moisten the mixture with a sufficient quantity of the menstruum, pack it in a percolator, and percolate it with the menstruum, in the usual manner, until sixteen (16) fluidounces of Tincture are obtained.

378. *Syrupus Rhamni Cathartica. N. F.**Syrup of Rhamnus Cathartica.*

Syrup of Buckthorn Berries. Syrupus Spinae Cervinae.

Sugar, 18 tr. oz.
 Fermented Juice of Buckthorn

Berries, enough to make 16 fl. oz.

Dissolve the Sugar in seven (7) fluidounces of the Juice, with the aid of a gentle heat, allow the Syrup to cool, then add enough of the Juice to make sixteen (16) fluidounces, and strain, if necessary.

Note.—This preparation is practically identical with that official in the Germ. Pharm. The species of Buckthorn to be used is the *Rhamnus cathartica* Linné, native of Europe, and naturalized, to some extent, in the U. S. If the fresh berries cannot be obtained, the imported fermented Juice may be used in preparing the Syrup.

Liver Pills.

(Dr. Chapman.)

Powdered Rhubarb, 60 gr.
 Powdered Ipecac, 10 gr.
 Powdered Acacia, sufficient.
 Oil of Caraway, 10 min.
 Mix, and make into 20 pills.

Purgative Tincture.

(Dobell's.)

Resin of Podophyllum, 8 gr.
 Tincture of Ginger, 5 fl. dr.
 Alcohol, 8 fl. dr.

Mix. Dose, a teaspoonful at night, when lying down.

Tinctura Jalapæ. U. S. 1870. TINCTURE OF JALAP.

Jalap, in fine powder, 6 oz. (troy).
 Alcohol,
 Water, each, a sufficient quantity.

Mix two measures of Alcohol with one of Water; then moisten the powder with 2 fl. oz. of the mixture; pack it moderately in a cylindrical percolator, and gradually pour the mixture upon it until 32 fl. oz. of tincture are obtained.

Compound Tincture of Jalap.

(TINCTURA PURGANS.)

Jalap, 1 oz. (troy).
 Turpeth Root, 60 gr.
 Scammony, 120 gr.
 Alcohol (60 per cent.), 12 fl. oz.

Macerate for ten days, express, and filter. Dose, 1 to 4 tablespoonfuls. Known in France as *Eau-de-Vie Allemande*, also *Lavolley's Purgative Elixir*. Sweetened with Sugar it is the *Elixir Antiglaireux de Guillie*.

Laxative Confection.

Potassium Bitartrate, 240 gr.
 Powdered Jalap, 240 gr.
 Confection of Senna, 1 oz. (troy).

Make into a mass, using Syrup of Ginger if too hard. Dose, a piece the size of a marble three times daily.

23. *Decoctum Aloes Compositum. N. F.**Compound Decoction of Aloes.*

Aqueous Extract of Aloes, 120 gr.
 Myrrh, 90 gr.
 Saffron, 90 gr.
 Carbonate of Potassium, 60 gr.
 Extract of Glycyrrhiza, in powder, 1 tr. oz.

Compound Tincture of Cardamom, 8 fl. oz.
 Water, enough to make 80 fl. oz.

Reduce the Myrrh and Extract of Aloes to a coarse powder, mix this with the Carbonate of Potassium and Extract of Glycyrrhiza in a suitable covered vessel, and pour on twenty (20) fluidounces of Water; boil for five minutes, and add the Saffron. When cool, add the Compound Tincture of Cardamom, and allow the mixture to macerate for two hours; then filter through flannel, and add enough Water to make the product measure thirty (30) fluidounces.

This preparation should be freshly made when wanted for use.

168. *Extractum Sennæ Fluidum Deodoratum. N. F.**Deodorized Fluid Extract of Senna.*

Senna, in No. 60 powder, 16 tr. oz.
 Alcohol,

Water, each, a sufficient quantity.

Moisten the Senna with six (6) fluidounces of Alcohol, pack it firmly in a percolator, and percolate it with Alcohol until it is practically exhausted by this menstruum. The alcoholic percolate thus obtained is rejected, and the Alcohol may be recovered therefrom by distillation. Then take out the moist powder, dry it, and prepare a Fluid Extract with a menstruum of Alcohol, 1 volume, and Water 1 volume.

Mettauer's Aperient.

Aloes (in coarse powder),	300 gr.
Sodium Bicarbonate,	600 gr.
Fluid Extract of Valerian,	1 fl. oz.
Compound Tincture of Lavender,	1 fl. oz.
Water,	16 fl. oz.
Mix. Macerate for seven days, and filter. Dose, a tablespoonful.	

Elixir Clauderi.

Potassium Carbonate,	240 gr.
Aloes,	60 gr.
Gualiac,	60 gr.
Myrrh,	60 gr.
Saffron,	60 gr.
Rhubarb,	60 gr.
Water,	9 fl. oz.
Macerate a few days, and decant. Dose, a tablespoonful.	

Compound Syrup of Juglans.(STYRUPUS ANTIRHACHITICUS.)
(Vanier's.)

Extract of Walnut Leaves,	152 gr.
Extract of Cinchona,	75 gr.
Potassium Iodide,	40 gr.
Anise Oil Sugar,	116 gr.
Alcohol,	2½ fl. dr.
White Wine,	4 fl. dr.
Syrup,	12 fl. oz.

Dose, for small children, a teaspoonful four to five times a day; for older children, half a tablespoonful. Vanier's syrup is said to contain, in addition to the above, 5 per cent. of Cod-Liver Oil.

Anderson's Scots Pills.

Aloes,	1 oz. (troy).
Soap,	80 gr.
Colocynth,	20 gr.
Gamboge,	20 gr.
Oil of Anise,	10 min.

Let the Aloes, Colocynth, and Gamboge be reduced to a very fine powder; then beat them and Soap with Water into a mass of a proper consistence to divide into pills each containing 3 gr.

Pulvis Aloës et Canellæ. U. S. 1870.
POWDER OF ALOES AND CANELLA
(HIERA PICRA).

Socotrine Aloes, in fine powder,	6 oz. (troy).
Canella, in fine powder,	1½ oz. (troy).

Rub them together until they are thoroughly mixed.

283. Pilulæ ad Prandium. N. F.**Dinner Pills.**

1. When "Dinner Pills," under this or some other equivalent name, are prescribed without further specification, it is recommended that the *Pilulæ Aloes et*

Mastiches of the U. S. P., also called Lady Webster's Dinner Pills, be dispensed.

Note.—Of other combinations, bearing similar names, or used for similar purposes, the following appear to be those most commonly in use:

2. Chapman's Dinner Pill.*Each pill contains:*

Aloes,	1½ gr.
Mastic,	1½ gr.
Ipecac, in fine powder,	1 gr.
Oil of Fennel, about	½ min.

3. Cole's Dinner Pill.*Each pill contains:*

Aloes,	1½ gr.
Mass of Mercury,	1½ gr.
Jalap, in fine powder,	1½ gr.
Tartrate of Antimony and Potassium,	½ gr.

4. Hall's Dinner Pill.*Each pill contains:*

Aloes,	1 gr.
Extract of Glycyrrhiza,	1 gr.
Soap, in powder,	1 gr.
Molasses,	1 gr.

293. Pilulæ Colocynthis et Hyoscyami. N. F.**Pills of Colocynth and Hyoscyamus.***Each pill contains:*

Extract of Colocynth,	1½ gr.
Aloes,	1½ gr.
Resin of Scammony,	1½ gr.
Oil of Cloves,	½ min.
Extract of Hyoscyamus,	1½ gr.

Note.—The *Pilula Colocynthis et Hyoscyami* of the Brit. Pharm. is directed to be made by mixing 2 parts of Compound Pill of Colocynth (see No. 292) with 1 part of Extract of Hyoscyamus, and is directed to be kept as a pill-mass, to be made into pills of such weight as may be directed. When such specification is omitted, it is recommended to dispense pills containing the quantities above directed.

292. Pilulæ Colocynthis Compositæ. N. F.**Compound Pills of Colocynth.****Pilulæ Coccis. Cochis Pills.***Each pill contains:*

Extract of Colocynth,	1 gr.
Aloes,	2 gr.
Resin of Scammony,	2 gr.
Oil of Cloves,	½ min.

Note.—The *Pilula Colocynthis Composita* of the Brit. Pharm., for which the above is an equivalent, is prepared with Colocynth Pulp, and contains Sulphate of Potassium, which was originally added as an aid to reduce the ingredients to powder. With the use of Extract of Colocynth this becomes unnecessary.

The Brit. Pharm. directs the above to be kept as a pill-mass, to be made into pills of such weight as may be prescribed. When such specification is omitted, it is recommended to dispense pills containing the quantities above directed.

284. Pilulæ Aloes et Podophylli Compositæ. N. F.**Compound Pills of Aloes and Podophyllum.****Janeway's Pills.***Each pill contains:*

Aloes,	1 gr.
Resin of Podophyllum,	1 gr.
Alcoholic Extract of Belladonna,	1 gr.
Extract of Nux Vomica,	1 gr.

287. Pilulæ Aloini, Strychninæ, et Belladonnæ Compositæ. N. F.*Compound Pills of Aloin, Strychnine, and Belladonna.*

<i>Each pill contains:</i>	
Aloin,	$\frac{1}{2}$ gr.
Strychnine, alkaloid,	$\frac{1}{10}$ gr.
Alcoholic Extract of Belladonna,	$\frac{1}{2}$ gr.
Extract of Rhamnus Purshiana,	$\frac{1}{2}$ gr.

Note.—If Extract of Rhamnus Purshiana is not available, take Fluid Extract of Rhamnus Purshiana, prepared without Glycerin, and evaporate it on a water-bath, to a pilular consistence.

These pills are also prepared with double the amount of Strychnine. It is recommended that the stronger pills be dispensed only when specially demanded.

288. Pilulæ Aloini, Strychninæ, et Belladonnæ. N. F.*Pills of Aloin, Strychnine, and Belladonna.*

<i>Each pill contains:</i>	
Aloin,	$\frac{1}{2}$ gr.
Strychnine, alkaloid,	$\frac{1}{10}$ gr.
Alcoholic Extract of Belladonna,	$\frac{1}{2}$ gr.

Note.—These pills are also prepared with double the amount of Strychnine. It is recommended that the stronger pills be dispensed only when specially demanded.

289. Pilulæ Aloini Compositæ. N. F.*Compound Pills of Aloin.*

<i>Each pill contains:</i>	
Aloin,	$\frac{1}{2}$ gr.
Resin of Podophyllum,	$\frac{1}{2}$ gr.
Extract of Belladonna,	$\frac{1}{2}$ gr.

301. Pilulæ Podophylli, Belladonnæ, et Capsici. N. F.*Pills of Podophyllum, Belladonna, and Capsicum.**Squibb's Podophyllum Pills.*

<i>Each pill contains:</i>	
Resin of Podophyllum,	$\frac{1}{2}$ gr.
Alcoholic Extract of Belladonna,	$\frac{1}{2}$ gr.
Capsicum, in moderately fine powder,	$\frac{1}{2}$ gr.
Sugar of Milk, in fine powder,	$\frac{1}{2}$ gr.
Acacia, in fine powder,	$\frac{1}{2}$ gr.
Glycerin,	
Syrup,	each, a sufficient quantity.

297. Pilulæ Laxativæ Post Partum. N. F.*Laxative Pills after Confinement.**Barker's Post-Partum Pills.*

<i>Each pill contains:</i>	
Compound Extract of Colocynth,	$\frac{1}{2}$ gr.
Aloes,	$\frac{1}{2}$ gr.
Extract of Nux Vomica,	$\frac{1}{2}$ gr.
Resin of Podophyllum,	$\frac{1}{2}$ gr.
Ipecac, in fine powder,	$\frac{1}{2}$ gr.
Extract of Hyoscyamus,	$\frac{1}{2}$ gr.

Note.—This is the formula generally employed by Dr. Fordyce Barker, except where special circumstances render modification necessary. The formula usually quoted in manufacturers' lists and some formularies is not correct.

291. Pilulæ Catharticæ Vegetabiles. N. F.*Vegetable Cathartic Pills.**"Improved" Vegetable Cathartic Pills.*

<i>Each pill contains:</i>	
Compound Extract of Colocynth,	$\frac{1}{2}$ gr.
Resin of Podophyllum,	$\frac{1}{2}$ gr.
Extract of Leptandra,	$\frac{1}{2}$ gr.
Abstract of Jalap, in fine powder,	$\frac{1}{2}$ gr.
Extract of Hyoscyamus,	$\frac{1}{2}$ gr.
Extract of Gentian,	$\frac{1}{2}$ gr.
Oil of Peppermint,	$\frac{1}{2}$ min.

Note.—Extract of Leptandra (U. S. P.) is preferable to the so-called Leptandrin, or Resin of Leptandra, as this is of very uncertain and varying composition.

294. Pilulæ Colocynthis et Podophylli. N. F.*Pills of Colocynth and Podophyllum.*

<i>Each pill contains:</i>	
Compound Extract of Colocynth,	$\frac{1}{2}$ gr.
Resin of Podophyllum,	$\frac{1}{2}$ gr.

303. Pilulæ Triplexes. N. F.*Triplex Pills.**Pilula Triplex.*

<i>Each pill contains:</i>	
1. Aloes,	2 gr.
Mass of Mercury,	1 gr.
Resin of Podophyllum,	$\frac{1}{2}$ gr.

Note.—When *Pilula Triplex*, under this name or some equivalent, is prescribed without further specification, it is recommended that the above preparation be dispensed. A formula devised by Dr. John W. Francis is also in use:

2. Francis's Triplex Pill.

Aloes,	$\frac{1}{2}$ gr.
Scammony,	$\frac{1}{2}$ gr.
Mass of Mercury,	$\frac{1}{2}$ gr.
Croton Oil,	$\frac{1}{2}$ min.
Oil of Caraway,	$\frac{1}{2}$ min.
Tincture of Aloes and Myrrh,	a sufficient quantity.

Knight's Pills.

Powdered Aloes,	54 gr.
Powdered Scammony,	27 gr.
Powdered Gamboge,	9 gr.
Mix, and make into 20 pills.	

Pills of Aloin and Podophyllum.

Aloin,	24 gr.
Podophyllin,	12 gr.
Oleoresin of Ginger,	4 min.
Triturate the solid ingredients into a uniform powder, add the Oleoresin, make a mass, and divide into 24 pills. Dose, 1 to 3 pills.	

Barker's Pills.

Compound Extract of Colocynth,	20 gr.
Extract of Hyoscyamus,	15 gr.
Aloes,	10 gr.
Extract of Nux Vomica,	5 gr.
Podophyllum,	1 gr.
Powdered Ipecac,	1 gr.
Mix, and make into 12 pills.	

Marshall's Pills.

Compound Extract of Colocynth,
Mass of Mercury,
Powdered Aloes,
Powdered Soap,
Powdered Rhubarb, of each, 60 gr.
Make into 60 pills.

Boisragon Pills.

(Dr. Hewson's formula.)

Mild Chloride of Mercury, 12 gr.
Powdered Scammony, 12 gr.
Compound Extract of Colocynth, 40 gr.
Oil of Caraway, 4 min.
Aloes, 8 gr.
Mix, and make into 14 pills.

Cobb's Pills.

Extract of Hyocyamus, 30 gr.
Extract of Conium, 30 gr.
Extract of Colocynth, 40 gr.
Extract of Nux Vomica, 4 gr.
Mix, and divide into 80 pills.

Laxative Pills.

(Cole's.)

Compound Extract of Colocynth, 60 gr.
Mild Chloride of Mercury, 20 gr.
Resin of Podophyllum, 2 gr.
Mix, and make into 20 pills.

ASTRINGENT DRUGS.

Astringent Tincture.

(AROMATIC TINCTURE OF GALLS.)

(Gilbert's.)

Nutgall, 16 oz. (av.).
Oil of Citron, 30 min.
Oil of Bergamot, 30 min.
Oil of Lemon, 30 min.
Oil of Thyme, 8 min.
Oil of Lavender, 8 min.
Oil of Rosemary, 8 min.
Tincture of Benzoin, 1 fl. dr.
Alcohol (90 per cent.), sufficient.

Exhaust the Gall by percolation with Alcohol, distil off the Alcohol, and evaporate to 8 fl. oz.; redissolve this extract in 8 fl. oz. of Alcohol, add the Oils, and filter.

311. Pulvis Catechu Compositus. N. F.

Compound Powder of Catechu.

Catechu, in fine powder, 4 parts.
Kino, in fine powder, 2 parts.
Krameria, in fine powder, 2 parts.
Cinnamon, in fine powder, 1 part.
Nutmeg, in fine powder, 1 part.
Mix them intimately, pass the powder through a fine sieve, and afterwards rub it lightly in a mortar. Keep it in a stoppered bottle.

Note.—This preparation is officinal in the Brit. Pharm.

Aromatic Syrup of Galls.

Nutgall, 240 gr.
Cinnamon, 120 gr.
Nutmeg, 120 gr.
Glycerin, 6 fl. dr.
Syrup, 6 fl. oz.
Brandy, sufficient.

Mix the powders, and, having moistened the mixture with a sufficient quantity of Brandy, pack it firmly in a small conical glass percolator, and gradually pour Brandy upon it until it commences to drop; then insert a cork tightly in the lower orifice of the percolator, and let it stand twenty-four hours; then withdraw the cork, and continue the percolation with Brandy until 6 fl. oz. of tincture are obtained. Mix this with the Glycerin, and evaporate by a water-bath, at a temperature not exceeding 125° F., to 8 fl. oz., filter, and thoroughly mix with the Syrup.

191. Infusum Rosæ Compositum. N. F.

Compound Infusion of Rose.

Red Rose, 96 gr.
Diluted Sulphuric Acid, 70 min.
Sugar, 800 gr.
Boiling Water, 16 fl. oz.

Pour the Boiling Water upon the Rose in a glass or porcelain vessel, add the Acid, cover the vessel, and macerate for an hour. Then dissolve the Sugar in the liquid, and strain.

6. Aqua Hamamelidis. N. F.

Hamamelis Water.

Witchhazel Water. Witchhazel Extract.

Hamamelis, shoots and twigs, 10 pounds.
Water, 20 pints.
Alcohol, 14 pints.

Place the Hamamelis in a still, add the Water and Alcohol, and allow the mixture to macerate during twenty-four hours. Distil ten (10) pints by applying direct heat, or, preferably, by means of steam.

Note.—This preparation should be made only from the fresh young twigs of Hamamelis, which are collected for this purpose, preferably, when the plant is in flower, in the late autumn of the year.

99. Elixir Rubi Compositum. N. F.

Compound Elixir of Blackberry.

Blackberry Root, 2 tr. oz.
Galls, 2 tr. oz.
Cinnamon, Saigon, 2 tr. oz.
Cloves, 1 tr. oz.
Mace, 1 tr. oz.
Ginger, 1 tr. oz.
Diluted Alcohol, a sufficient quantity.
Blackberry Juice, recently expressed, 8 pints.
Syrup, 8 pints.

Reduce the solids to a moderately coarse (No. 40) powder, moisten it with Diluted Alcohol, and percolate it with this menstruum in the usual manner, until *two* (2) *pints* of percolate are obtained. To this add the Blackberry Juice and Syrup, and mix thoroughly.

22. Cordiale Rubi Fructus. N. F.

Blackberry Cordial.

Blackberry Juice,	8 pints.
Cinnamon, in coarse powder,	2 tr. oz.
Cloves, in coarse powder,	$\frac{1}{2}$ tr. oz.
Nutmeg, in coarse powder,	$\frac{1}{2}$ tr. oz.
Diluted Alcohol,	2 pints.
Syrup,	8 pints.

Percolate the powdered spices with Diluted Alcohol to obtain *two* (2) *pints* of tincture, and add to this the *three* (3) *pints* of Blackberry Juice. Then add *one hundred and twenty* (120) *grains* of Purified Talcum. Set the mixture aside for twelve hours, or longer, if convenient, occasionally shaking, and filter. To the filtrate add the Syrup.

Note.—This formula differs in manipulation from that given in the text of the *National Formulary*, but is in accord with the corrected formula given in the *Errata* of the *Formulary*.

379. Syrupus Rubi Aromaticus. N. F.

Aromatic Syrup of Blackberry.

Rubus (U. S. P.),	2 tr. oz.
Cinnamon,	120 gr.
Nutmeg,	120 gr.
Cloves,	60 gr.
Allspice,	60 gr.
Diluted Alcohol,	a sufficient quantity.
Sugar,	10 tr. oz.
Blackberry Juice,	a sufficient quantity.

Reduce the Rubus (Blackberry Root) and the Aromatics to a moderately coarse (No. 40) powder, and percolate it, in the usual manner, with the Diluted Alcohol, until *four* (4) *fluidounces* of percolate are obtained. To this add *seven* (7) *fluidounces* of Blackberry Juice, and dissolve the Sugar in the liquid by agitation. Lastly, add enough Blackberry Juice to make *sixteen* (16) *fluidounces*.

316. Pulvis Kino Compositus. N. F.

Compound Powder of Kino.

Kino, in fine powder,	15 parts.
Powdered Opium,	1 part.
Cinnamon, in fine powder,	4 parts.

Mix them intimately, pass the mixed powder through a moderately fine sieve, and afterwards rub it lightly in a mortar. Keep it in a stoppered bottle.

Every 20 grains of this preparation contain 1 grain of Powdered Opium.

Note.—This preparation is official in the Brit. Pharm.

Pavesi's Hæmostatic.

Sulpho-Carbolic Acid,	3 fl. dr.
Benzoic Acid,	37 gr.
Tannic Acid,	37 gr.
Alcohol,	3 fl. dr.
Glycerin,	3 fl. dr.
Rose Water,	8 fl. oz.

The Sulpho-Carbolic Acid is prepared by mixing 1 part Sulphuric Acid and $\frac{1}{2}$ part Carbolic Acid and heating for a few minutes on a water-bath; the Benzoic Acid is dissolved in the Alcohol and Glycerin, the Tannic Acid in the Water, and both mixed.

Hæmostatic Collodion.

(Pavesi's.)

Tannic Acid,	80 gr.
Benzoic Acid,	45 gr.
Carbolic Acid,	158 min.
Collodion,	$3\frac{1}{2}$ fl. oz.

Mix and dissolve.

Pile Ointment.

Morphine Acetate,	5 gr.
Tannic Acid,	30 gr.
Solution of Subacetate of Lead,	1 fl. dr.
Ointment,	420 gr.

Incorporate the Solution with the Ointment, then add the other ingredients.

Glyceritum Acidi Tannici. U. S. 1870.

GLYCERITE OF TANNIC ACID.

Tannic Acid,	1 oz. (troy).
Glycerin,	4 fl. oz.

Rub them together in a mortar, then transfer the mixture to a porcelain dish, and apply a gentle heat until complete solution is effected.

Glyceritum Acidi Gallici. U. S. 1870.

GLYCERITE OF GALLIC ACID.

Gallie Acid,	2 oz. (troy).
Glycerin,	8 fl. oz.

Rub them together in a mortar, then transfer to a glass or porcelain capsule, and heat gently until the Acid is dissolved.

Infusum Catechu Compositum. U. S. 1870. COMPOUND INFUSION CATECHU.

Catechu, in fine powder,	240 gr.
Cinnamon, in moderately fine powder,	60 gr.
Boiling Water,	16 fl. oz.
Macerate in a covered vessel, and strain.	

Compound Tincture of Kino.

Powdered Opium,	60 gr.
Powdered Kino,	60 gr.
Camphor,	90 gr.
Cloves,	90 gr.
Diluted Alcohol,	16 fl. oz.

Make a tincture by percolation.

404. Tinctura Kino Composita. N. F.*Compound Tincture of Kino.*

Tincture of Kino,	1½ fl. oz.
Tincture of Opium,	1½ fl. oz.
Spirit of Camphor,	520 min.
Oil of Cloves,	10 min.
Cochineal, in powder,	64 gr.
Aromatic Spirit of Ammonia,	60 min.
Diluted Alcohol, enough to make	16 fl. oz.

Triturate the Cochineal with the Aromatic Spirit of Ammonia, and gradually add *eleven* (11) *fluidounces* of Diluted Alcohol. Then add the two Tinctures, the Spirit of Camphor, and the Oil of Cloves, and filter the mixture through paper. Lastly, pass enough Diluted Alcohol through the filter to make *sixteen* (16) *fluidounces*.

Each fluidrachm represents about ½ grain, each, of Kino and of Powdered Opium.

Tannin Nasal Bougies.

Tannic Acid,	31 gr.
Tragacanth,	100 gr.
Althæa,	31 gr.
Glycerin,	100 min.
Distilled Water,	50 min.

Make 4 cuneiform rods three inches long, upon a pill-tile, using powdered Althæa to dust the tile. To be moistened before being introduced into the nose.

Diarrhœa Mixture.

(Dr. Wm. Gould.)

Compound Tincture of Rhubarb,	1 fl. oz.
Tincture of Opium,	4 fl. dr.
Spirit of Camphor,	2 fl. dr.
Water of Ammonia,	1 fl. dr.
Oil of Peppermint,	30 min.

Mix. Dose, a teaspoonful in hot, sweetened water. Repeat as often as necessary till relieved.

Syrup of Pipsissewa.

Fluid Extract of Chimaphila,	4 fl. oz.
Syrup, a sufficient quantity to make	16 fl. oz.
Mix.	

DRUGS CONTAINING ALKALOIDS.**197. Linimentum Opii Compositum. N. F.***Compound Liniment of Opium.**Canada Liniment.*

Tincture of Opium,	1½ fl. oz.
Camphor,	120 gr.
Alcohol,	4 fl. oz.
Oil of Peppermint,	180 min.
Water of Ammonia,	6 fl. oz.
Oil of Turpentine, enough to make	16 fl. oz.

Dissolve the Camphor and the Oil of Peppermint in the Alcohol, then add the Tincture of Opium, Water of Ammonia, and Oil of Turpentine. Shake the mixture whenever any of it is to be dispensed.

Note.—This Liniment will separate a short time after it has been mixed. It may be made somewhat more permanent by adding 180 minims of Tincture of Quillaja (N. F.) to the Water of Ammonia, before adding it to the mixture.

Sun Cholera Mixture.

Tincture of Opium,	
Tincture of Capsicum,	
Tincture of Rhubarb,	
Spirit of Camphor,	
Spirit of Peppermint,	of each, 1 fl. oz.
Mix. Dose,	a teaspoonful in water after each evacuation of the bowels.

Compound Tincture of Opium.

(Squibb's Diarrhœa Mixture.)

Tincture of Opium,	1 fl. oz.
Tincture of Capsicum,	1 fl. oz.
Spirit of Camphor,	1 fl. oz.
Purified Chloroform,	3 fl. dr.
Alcohol, sufficient to make	5 fl. oz.
Mix. Dose,	from 30 to 60 minims.

255. Mistura Contra Diarrhœam. N. F.**1. Loomis's Diarrhœa Mixture.**

Tincture of Opium,	½ fl. oz.
Tincture of Rhubarb,	½ fl. oz.
Compound Tincture of Catechu (U. S. P.),	1 fl. oz.
Oil of Sassafras,	20 min.
Compound Tincture of Lavender,	enough to make 4 fl. oz.

2. Thielemann's Diarrhœa Mixture.

Wine of Opium,	1 fl. oz.
Tincture of Valerian,	1½ fl. oz.
Ether,	½ fl. oz.
Oil of Peppermint,	60 min.
Fluid Extract of Ipecac.	15 min.
Alcohol,	enough to make 4 fl. oz.

This preparation is practically identical with the *Mistura Thielemanni* of the Swedish Pharm.

3. Velpau's Diarrhœa Mixture.

Tincture of Opium,	
Compound Tincture of Catechu (U. S. P.),	
Spirit of Camphor, each,	equal volumes.

224. Liquor Morphine Citratæ. N. F.*Solution of Citrate of Morphine.*

Morphine (alkaloid),	16 gr.
Citric Acid,	12 gr.
Cochineal,	½ gr.
Alcohol,	60 min.
Distilled Water, enough to make	1 fl. oz.
Triturate the solids with the Alcohol and <i>seven</i> (7) <i>fluidrachms</i> of Water; filter and pass enough Distilled Water through the filter to make <i>one</i> (1) <i>fluidounce</i> .	

This solution should not be kept on hand, but prepared only when required.

Each fluidrachm contains 2 grains of Morphine in the form of Citrate.

225. Liquor Morphine Hypodermicus.*N. F.**Hypodermic Solution of Morphine.**Magendie's Solution of Morphine.*

Sulphate of Morphine, 16 gr.
 Distilled Water, warm, 1 fl. oz.

Dissolve the Sulphate of Morphine in the warm Distilled Water, and filter the solution through a small pellet of absorbent cotton. When the solution is cold, pass a little Distilled Water through the cotton, if necessary, to make the filtrate measure *one (1) fluidounce*. Keep the solution in well-stoppered vials, in a dark place.

Note.—Particular care should be taken in dispensing and labelling this solution, so that it may not be mistaken for the so-called United States Solution of Morphine (*Liquor Morphie Sulphatis*, U. S. P. 1870), containing only 1 grain of Sulphate of Morphine in each fluidounce, which is still used in some parts of this country.

The development of fungoid growths or micro-organisms in this and similar solutions used hypodermically may be prevented, or at least greatly retarded, by using Chloroform Water instead of plain Distilled Water as a solvent. This should, however, be done only with the knowledge, or by the direction, of the physician.

Another efficient method to preserve such solutions is to sprinkle a little Benzoic Acid on the surface of the absorbent cotton through which the solutions are filtered. Or, about 5 grains of Boric Acid may be added to each fluidounce.

310. Pulvis Anticatatarrhalis. N. F.*Catatarrh Powder.**Catatarrh Snuff.*

Hydrochlorate of Morphine, 1 part.
 Acacia, in fine powder, 60 parts.
 Subnitrate of Bismuth, 180 parts.

Mix them intimately by trituration.

Bateman's Pectoral Drops.

Opium, 120 gr.
 Catechu, 120 gr.
 Camphor, 120 gr.
 Oil of Anise, 80 min.
 Caramel, 1½ fl. oz.
 Diluted Alcohol, 64 fl. oz.

Digest for ten days.

Jackson's Pectoral Syrup.

Oil of Sassafras, 64 min.
 Tincture of Tolu, 8 fl. oz.
 Magnesium Carbonate, 2 oz. (troy).
 Water, 8 pints.
 Sugar, 14 lb. (av.).
 Morphine Hydrochlorate, 64 gr.

Rub up the Tincture of Tolu and Oil of Sassafras with the Carbonate, gradually add ½ lb. of the Sugar and then the Water, filter, recovering 8 pints, in which dissolve the remainder of the Sugar. Dissolve the Morphine in 1 fl. oz. of Water, add to the Syrup, and make the measure up to 16 pints.

Godfrey's Cordial.

Tincture of Opium, 8 fl. oz.
 Potassium Carbonate, 150 gr.
 Oil of Sassafras, 80 min.
 Molasses (sugar-house), 82 fl. oz.
 Alcohol, 4 fl. oz.
 Water, 52 fl. oz.

Dissolve the Potassium Carbonate in the Water, add the Molasses, and heat over a gentle fire till they simmer; remove the scum which rises, and add the Tincture of Opium, Alcohol, and Oil, having previously mixed them together.

Battley's Sedative.

Extract of Opium, 860 gr.
 Boiling Water, 7 fl. oz.
 Alcohol, 1½ fl. oz.
 Cold Water, sufficient to make 10 fl. oz.

Dissolve the Extract in Boiling Water; when cold, add to the solution the Alcohol and enough Water to make 10 fl. oz.; and, lastly, filter through paper. Dose, 5 minims.

Camphorated Dover's Powder.

(Dr. Ell Ives's.)

Potassium Bitartrate, 1 oz. (troy).
 Powdered Camphor, 120 gr.
 Powdered Ipecac, 60 gr.
 Powdered Opium, 60 gr.

Mix, and pass through a fine sieve.

Confectio Opii. U. S. 1870.**CONFECTION OF OPIUM.**

Opium, in fine powder, 270 gr.
 Aromatic Powder, 6 oz. (troy).
 Clarified Honey, 14 oz. (troy).

Rub the Opium with the Aromatic Powder, then add the Honey, and beat the whole together until thoroughly mixed.

269. Olea Infusa. N. F.*Infused Oils.*

The Dry Herb, in moderately coarse (No. 40) powder, 100 parts.
 Alcohol, 75 parts.
 Water of Ammonia, 2 parts.
 Lard Oil, 250 parts.
 Cotton-Seed Oil, 250 parts.

Moisten the powdered Herb with a sufficient quantity of the Alcohol and Water of Ammonia, previously mixed, then pack it tightly into a stone or enamelled iron vessel of suitable capacity, pour on the remainder of the ammoniated Alcohol, cover it well, and allow the mixture to macerate for twenty-four hours. Then add *sixty (60) parts* of the mixed Oils, digest, under frequent agitation, during twelve hours, at a temperature between 50° and 60° C. (122° to 140° F.), transfer the mixture to a strainer, and express strongly. To the residue, returned to

the vessel, add the remainder of the Oils, digest and express in the same manner, and unite the expressed portions.

Note.—This process is a modification of that prescribed by the Germ. Pharm. The alcohol and free ammonia are dissipated during the digestion. Infused Oils are usually prepared only from so-called narcotic plants, but it is known that only a portion of their active constituents is taken up by the oil. The above process is to be used for the preparation of *Oleum Hyoscyami* of the Germ. Pharm., and similar Infused Oils.

276. Oleum Hyoscyami Compositum.
N. F.

Compound Oil of Hyoscyamus.

Balsamum Tranquillans.

Oil of Absinthe,	8 drops.
Oil of Lavender,	8 drops.
Oil of Rosemary,	8 drops.
Oil of Sage,	8 drops.
Oil of Thyme,	8 drops.
Infused Oil of Hyoscyamus,	5 fl. oz.
Mix them.	

Note.—Oil of Absinthe is the volatile oil of *Artemisia Absinthium* Linné (Wormwood), and Oil of Sage is the volatile oil of *Salvia officinalis* Linné. Infused Oil of Hyoscyamus is the *Oleum Hyoscyami* of the Germ. Pharm.; see under No. 269. The *Balsam Tranquille* (*Balsamum tranquillans*) of the Codex is a more complex preparation, not identical with the above, but possessing about the same properties.

Asiatic Tincture.

(For cholera.)

Opium,	240 gr.
Camphor,	240 gr.
Capsicum,	240 gr.
Oil of Cloves,	4 fl. dr.
Compound Spirit of Ether,	8 fl. oz.

Macerate from ten to twenty days, or prepare by percolation in a close percolator. Dose, 20 to 60 drops every second, third, or fourth hour in sweetened water.

Tinctura Opii Acetata. U. S. 1870.

ACETATED TINCTURE OF OPIUM.

Powdered Opium,	2 oz. (troy).
Distilled Vinegar,	12 fl. oz.
Alcohol,	8 fl. oz.

Macerate for a week, express, and filter.

Liquor Opii Compositus.

COMPOUND SOLUTION OF OPIUM.

(Squibb's.)

Deodorized Solution of Opium,	14 fl. dr.
Alcohol,	18 fl. dr.
Purified Chloroform,	1 fl. dr.
Acetic Ether,	2 fl. dr.

Mix. See Am. Jour. Pharmacy, 1870, p. 47. Dose, 15 to 30 min.

Ferrated Elixir of Calisaya.

Citrate of Iron and Ammonium,	512 gr.
Elixir of Calisaya,	82 fl. oz.
Dissolve.	

299. Pilulæ Opii et Camphoræ. N. F.

Pills of Opium and Camphor.

Each pill contains:

Powdered Opium,	1 gr.
Camphor,	2 gr.

300. Pilulæ Opii et Plumbi. N. F.

Pills of Opium and Lead.

Each pill contains:

Powdered Opium,	1 gr.
Acetate of Lead,	1 gr.

Golden Tincture.

Ether,	2 fl. oz.
Tincture of Opium,	2 fl. oz.
Chloroform,	4 fl. dr.
Alcohol,	2 fl. oz.

Mix. Dose, 8 to 20 drops.

Syrup of Morphine.

(SIROP DE MORPHINE. Fr. Codex.)

Morphine Hydrochlorate,	1 gr.
Distilled Water,	20 min.
Syrup, sufficient to make	27 fl. dr.

Mix. A tablespoonful contains about $\frac{1}{4}$ gr. Morphine.

Schuyler's Powder.

Morphine Sulphate,	15 gr.
Camphor,	90 gr.
Powdered Ipecac,	90 gr.
Powdered Glycyrrhiza,	1½ oz. (troy).
Sugar,	1½ oz. (troy).
Mix.	

Liquor Morphine Sulphatis. U. S. 1870.

SOLUTION OF SULPHATE OF MORPHIA.

Sulphate of Morphia,	8 gr.
Distilled Water,	8 fl. oz.
Dissolve the Sulphate in the Distilled Water.	

Gout Mixture.

(Laville's.)

Quinine Sulphate,	80 gr.
Cinchonine Sulphate,	22 gr.
Extract of Colocynth,	195 gr.
Diluted Alcohol,	8 fl. oz.
Red Wine, sufficient to make	16 fl. oz.
Mix.	

Neuralgia Pills.

(Prof. Gross's.)

Quinine Sulphate,	60 gr.
Morphine Sulphate,	1½ gr.
Strychnine,	1 gr.
Arsenious Acid,	1½ gr.
Extract of Aconite,	15 gr.

Mix, and make into 30 pills.

Pills of Chinoidine.

Chinoidine,	60 gr.
Diluted Sulphuric Acid, sufficient	
Soften the Chinoidine with the Acid in the mortar, and divide into 20 pills.	

289. Pilulæ Antineuralgicæ. N. F.*Antineuralgic Pills.***1. Gross's Antineuralgic Pills.***Each pill contains:*

Sulphate of Quinine,	2 gr.
Sulphate of Morphine,	$\frac{1}{10}$ gr.
Strychnine, alkaloid,	$\frac{1}{10}$ gr.
Arsenious Acid,	$\frac{1}{10}$ gr.
Extract of Aconite Leaves (U.S.P. 1870),	$\frac{1}{2}$ gr.

Note.—When "Antineuralgic Pills," or "Neuralgia Pills," without other specification, are prescribed, it is recommended that the above preparation be dispensed. Sometimes the Sulphate of Morphine is directed to be omitted.

2. Brown-Séquard's Antineuralgic (or Neuralgia) Pills have the following composition:*Each pill contains:*

Extract of Hyoscyamus,	$\frac{1}{2}$ gr.
Extract of Conium,	$\frac{1}{2}$ gr.
Extract of Ignatia,	$\frac{1}{2}$ gr.
Extract of Opium,	$\frac{1}{2}$ gr.
Extract of Aconite Leaves (U.S.P. 1870),	$\frac{1}{2}$ gr.
Extract of Indian Cannabis,	$\frac{1}{2}$ gr.
Extract of Stramonium,	$\frac{1}{2}$ gr.
Alcoholic Extract of Belladonna,	$\frac{1}{2}$ gr.

Elixir of Calisaya.

Quinine Sulphate,	72 gr.
Cinchonine Sulphate,	24 gr.
Quinidine Sulphate,	20 gr.
Cinchonidine Sulphate,	12 gr.
Elixir of Orange,	128 fl. oz.

Caramel, a sufficient quantity to color.
Triturate the mixed Sulphates with 1 pint of the Elixir; pour the mixture into a glass flask, and heat in a water-bath until the solution is effected; while still hot, add the remainder of the Elixir and Caramel; when cold, filter.

272. Oleatum Quininæ. N. F.*Oleate of Quinine.*

Quinine (U.S.P. 1880) dried at 100° C. (212° F.) until it ceases to lose weight, 25 parts.
Oleic Acid, 75 parts.

Triturate the Quinine with the Oleic Acid, gradually added, then apply a gentle heat, and stir frequently, until the Quinine is dissolved.

The product contains 25 per cent. of dry Quinine (U. S. P. 1880).

Note.—When the official Quinine ($C_{20}H_{24}N_2O_2 \cdot 3H_2O$) is not available, the quantity corresponding to 25 parts of dry Quinine may be prepared as follows: Take 34 parts of official Sulphate of Quinine, dissolve it in 200 parts of Water with the aid of a sufficient quantity of Diluted Sulphuric Acid, then precipitate the Quinine by means of Water of Ammonia, added, under constant stirring, until it is in slight excess. Transfer the magma to a close muslin strainer, previously wetted, allow the liquid to drain off, and wash the precipitate with ice-cold Water until the washings are practically tasteless, but using not more than about 200 parts of Water. Lastly, dry the precipitate.

The theoretical quantity of dry quinine obtainable from 34 parts of the sulphate is 25.27 parts. In practice, approximately 25 parts will be obtained.

302. Pilulæ Quatuor. N. F.*Quatuor Pills.**Pilulæ Ferri et Quininæ Compositæ.**Each pill contains:*

Dried Sulphate of Iron,	1 gr.
Sulphate of Quinine,	1 gr.
Aloes,	1 gr.
Extract of Nux Vomica,	$\frac{1}{2}$ gr.
Extract of Gentian, a sufficient quantity.	

42. Elixir Cinchonæ. N. F.*Elixir of Cinchona.**Elixir of Calisaya.**Tincture of Cinchona (U. S. P.*

1880),	2 $\frac{1}{2}$ fl. oz.
Aromatic Spirit,	2 fl. oz.
Syrup,	6 fl. oz.
Purified Talcum,	120 gr.
Water,	enough to make 16 fl. oz.

Mix the liquids, allow the mixture to stand for twenty-four hours or longer, if convenient, then incorporate the Purified Talcum, and filter through a wetted filter, returning the first portions of the filtrate until it runs through clear.

Each fluidounce represents about 14 grains of Yellow Cinchona.

Note.—When Elixir of Cinchona is directed in combination with preparations of iron, the *Elixir Cinchonæ Detannatum* should be used in place of the above preparation.

43. Elixir Cinchonæ et Hypophosphitum. N. F.*Elixir of Cinchona and Hypophosphites.**Elixir of Calisaya and Hypophosphites.*

Hypophosphite of Calcium,	128 gr.
Hypophosphite of Sodium,	128 gr.
Citric Acid,	80 gr.
Water,	2 fl. oz.

Elixir of Cinchona, enough to make 16 fl. oz.

Dissolve the Hypophosphites and the Citric Acid in the Water, add enough Elixir of Cinchona to make sixteen (16) fluidounces, and filter.

Each fluidrachm contains 1 grain, each of the Hypophosphites of Calcium and Sodium.

44. Elixir Cinchonæ Detannatum. N. F.*Detannated Elixir of Cinchona.**Detannated Elixir of Calisaya.**Detannated Tincture of Cin-*

chona,	2 $\frac{1}{2}$ fl. oz.
Aromatic Spirit,	2 fl. oz.
Syrup,	6 fl. oz.
Purified Talcum,	120 gr.
Water,	enough to make 16 fl. oz.

Mix the liquids, allow the mixture to stand twenty-four hours or longer, if convenient, then incorporate the Purified Talcum, and filter through a wetted filter, returning the first portions of the filtrate, until it runs through clear.

Each fluidounce represents about 14 grains of Yellow Cinchona.

Note.—This preparation is to be used when *Elixir Cinchonæ* is directed in combination with preparations of iron.

When Detannated Elixir of Cinchona is not available, and the preparation, of which it forms a constituent, is required at once, an equivalent quantity of Compound Elixir of Quinine, colored by the addition of 120 minims of Compound Tincture of Cudbear to each pint, may be substituted for it.

45. Elixir Cinchonæ et Ferri. N. F.

Elixir of Cinchona and Iron.

Elixir of Calisaya and Iron. Ferrated Elixir of Calisaya.

Phosphate of Iron (U. S. P. 1880), 256 gr.
Water, boiling, 1 fl. oz.
Detannated Elixir of Cinchona,

enough to make 16 fl. oz.

Dissolve the Phosphate of Iron in the boiling Water, then add enough Detannated Elixir of Cinchona to make sixteen (16) fluidounces, and filter.

Each fluidrachm contains 2 grains of Phosphate of Iron.

46. Elixir Cinchonæ, Ferri, Bismuthi, et Strychninæ. N. F.

Elixir of Cinchona, Iron, Bismuth, and Strychnine.

Elixir of Calisaya, Iron, Bismuth, and Strychnine.

Citrate of Bismuth and Ammonium, 128 gr.
Sulphate of Strychnine, 1½ gr.
Water, hot, a sufficient quantity.
Elixir of Cinchona and Iron,

enough to make 16 fl. oz.

Dissolve the Citrate of Bismuth and Ammonium in one-half (½) fluidounce of hot Water; allow the solution to stand until any undissolved matter has subsided, then decant the clear liquid, and add to the residue enough Water of Ammonia to dissolve it, carefully avoiding an excess. Dissolve the Sulphate of Strychnine in one (1) fluidrachm of hot Water, and having mixed the two solutions, add enough Elixir of Cinchona and Iron to make sixteen (16) fluidounces. Let the mixture stand twenty-four hours, if convenient, and filter.

Each fluidrachm contains 1 grain of Citrate of Bismuth and Ammonium, 1½ grain of Sulphate of Strychnine, and nearly 2 grains of Phosphate of Iron.

47. Elixir Cinchonæ, Ferri, et Bismuthi. N. F.

Elixir of Cinchona, Iron, and Bismuth.

Elixir of Calisaya, Iron, and Bismuth.

Citrate of Bismuth and Ammonium, 128 gr.
Water, hot, ½ fl. oz.
Elixir of Cinchona and Iron,

enough to make 16 fl. oz.

Dissolve the Citrate of Bismuth and Ammonium in the hot Water, allow the solution to stand until any undissolved matter has subsided; then decant the clear liquid, and add to the residue enough Water of Ammonia to dissolve it, carefully avoiding an excess. Then mix the solution with enough Elixir of Cinchona and Iron to make sixteen (16) fluidounces. Let the mixture stand twenty-four hours, if convenient, and filter.

Each fluidrachm contains 1 grain of Citrate of Bismuth and Ammonium and nearly 2 grains of Phosphate of Iron.

48. Elixir Cinchonæ, Ferri, et Calcii Lactophosphatis. N. F.

Elixir of Cinchona, Iron, and Lactophosphate of Calcium.

Elixir of Calisaya, Iron, and Lactophosphate of Lime.

Lactate of Calcium, 64 gr.
Phosphoric Acid (50 per cent.), 64 min.
Water of Ammonia, ½ fl. oz.
Citric Acid, 120 gr.
Elixir of Cinchona and Iron,

enough to make 16 fl. oz.

Dissolve the Lactate of Calcium in seven (7) fluidounces of Elixir of Cinchona and Iron, with the aid of the Phosphoric Acid. Then add the Citric Acid, and when this is dissolved, the Water of Ammonia. Finally, add enough Elixir of Cinchona and Iron to make sixteen (16) fluidounces, and filter.

Each fluidrachm contains ½ grain of Lactate of Calcium (or about ¾ grain of so-called Lactophosphate of Calcium) and nearly 2 grains of Phosphate of Iron.

49. Elixir Cinchonæ, Ferri, et Pepsini. N. F.

Elixir of Cinchona, Iron, and Pepsin.

Elixir of Calisaya, Iron, and Pepsin.

Pepsin (N. F.), 128 gr.
Hydrochloric Acid, 80 min.
Water, 8 fl. oz.
Elixir of Cinchona and Iron,

enough to make 16 fl. oz.

Dissolve the Pepsin in the Water mixed with the Hydrochloric Acid; then add enough Elixir of Cinchona and Iron to

make *sixteen* (16) *fluidounces*. Let the mixture stand a few days, if convenient, and filter.

Each fluidrachm represents 1 grain of Pepsin (N. F.) and about 1½ grains of Phosphate of Iron.

50. Elixir Cinchonæ, Ferri, et Strychninæ. N. F.

Elixir of Cinchona, Iron, and Strychnine.

Elixir of Callaya, Iron, and Strychnine.

Sulphate of Strychnine, 1½ gr.
Water, 120 min.

Elixir of Cinchona and Iron,
enough to make 16 fl. oz.

Dissolve the Sulphate of Strychnine in the Water, and add enough Elixir of Cinchona and Iron to make *sixteen* (16) *fluidounces*.

Each fluidrachm contains 1½ grain of Sulphate of Strychnine and about 2 grains of Phosphate of Iron.

51. Elixir Cinchonæ, Pepsini, et Strychninæ. N. F.

Elixir of Cinchona, Pepsin, and Strychnine.

Elixir of Callaya, Pepsin, and Strychnine.

Sulphate of Quinine, 16 gr.
Sulphate of Cinchonine, 8 gr.
Sulphate of Strychnine, 1½ gr.
Elixir of Pepsin, 16 fl. oz.

Dissolve the alkaloidal salts in the Elixir, and filter, if necessary.

Each fluidrachm represents small quantities of Cinchona Alkaloids, 1½ grain of Sulphate of Strychnine, and 1 grain of Pepsin (N. F.).

92. Elixir Quininæ Compositum. N. F.

Compound Elixir of Quinine.

Sulphate of Quinine, 16 gr.
Sulphate of Cinchonidine, 8 gr.
Sulphate of Cinchonine, 8 gr.
Aromatic Elixir, 16 fl. oz.

Add the alkaloidal salts to the Aromatic Elixir, and dissolve them by agitation. Finally, filter.

Each fluidounce contains 1 grain of Sulphate of Quinine and ½ grain, each, of the Sulphates of Cinchonidine and Cinchonine.

Note.—This preparation is chiefly intended as a substitute for Elixir of Cinchona in certain cases, when the presence of other constituents of Cinchona is deemed unnecessary, or where the Elixir is intended rather as a vehicle than a medicine.

If it is desired to impart a color to this Elixir, this may be effected by the addition of 120 minims of Compound Tincture of Cudbear to each pint.

93. Elixir Quininæ et Phosphatum Compositum. N. F.

Compound Elixir of Quinine and Phosphates.

Sulphate of Quinine, 32 gr.
Phosphate of Iron (U. S. P. 1880), 128 gr.
Citrate of Potassium, 128 gr.
Syrup of Lactophosphate of Calcium, 4 fl. oz.
Water, ½ fl. oz.

Aromatic Elixir, enough to make 16 fl. oz.
Dissolve the Sulphate of Quinine in *ten* (10) *fluidounces* of Aromatic Elixir, if necessary with the aid of a gentle heat. Dissolve the Phosphate of Iron and the Citrate of Potassium in the Water, and add the solution to that first prepared. Then add the Syrup of Lactophosphate of Calcium, and, lastly, enough Aromatic Elixir to make *sixteen* (16) *fluidounces*. Filter, if necessary.

Each fluidrachm contains ½ grain of Sulphate of Quinine, 1 grain of Phosphate of Iron, and about ½ grain of so-called Lactophosphate of Calcium.

94. Elixir Quininæ Valerianatis et Strychninæ. N. F.

Elixir of Valerianate of Quinine and Strychnine.

Valerianate of Quinine, 128 gr.
Sulphate of Strychnine, 1½ gr.
Compound Tincture of Cudbear, 120 min.
Aromatic Elixir, enough to make 16 fl. oz.
Triturate the Valerianate of Quinine and the Sulphate of Strychnine with about *eight* (8) *fluidounces* of Aromatic Elixir, until they are dissolved. Then add the Compound Tincture of Cudbear, and, lastly, enough Aromatic Elixir to make *sixteen* (16) *fluidounces*. Filter, if necessary.

Each fluidrachm contains 1 grain of Valerianate of Quinine and 1½ grain of Sulphate of Strychnine.

36. Elixir Caffeinæ. N. F.

Elixir of Caffeine.

Caffeine, 128 gr.
Diluted Hydrobromic Acid (U. S. P.), 82 gr.
Syrup of Coffee, 4 fl. oz.
Aromatic Elixir, enough to make 16 fl. oz.

Rub the Caffeine, in a mortar, with the Diluted Hydrobromic Acid and about *two* (2) *fluidounces* of Aromatic Elixir, until solution is effected. Then add the Syrup of Coffee, and, lastly, enough Aromatic Elixir to make *sixteen* (16) *fluidounces*. Filter, if necessary.

Each fluidrachm contains 1 grain of Caffeine.

11. *Caffeinæ Citras Effervescens. N. F.*

Effervescent Citrate of Caffeine.

Caffeine, 20 parts.
Citric Acid, 20 parts.
Bicarbonate of Sodium, 600 parts.
Tartaric Acid, 640 parts.
Sugar, in very fine powder, 620 parts.

Triturate the ingredients, previously well dried, to a fine, uniform powder.

If the compound is required in form of a granular powder, mix it with Alcohol to a soft paste, and rub this through a No. 20 tinned-iron sieve, or enamelled colander. Then dry it, and reduce it to a coarse, granular powder.

Ninety (90) grains (or about a heaped teaspoonful) of the above compound represent 1 grain of Caffeine.

12. *Caffeinæ Sodio-Benzoes. N. F.*

Sodio-Benzoeate of Caffeine.

Caffeine, 50 parts.
Benzoeate of Sodium, 50 parts.
Alcohol, a sufficient quantity.

Triturate the Caffeine with the Benzoeate of Sodium and a sufficient quantity of Alcohol to a smooth paste, and dry this by exposure in a moderately warm place. Rub the dry mass to powder, and keep it in well-stoppered bottles.

Note.—The product contains 50 per cent. of Caffeine, and is soluble in 2 parts of water.

13. *Caffeinæ Sodio-Salicylas. N. F.*

Sodio-Salicylate of Caffeine.

Caffeine, 50 parts.
Salicylate of Sodium, 50 parts.
Alcohol, a sufficient quantity.

Triturate the Caffeine with the Salicylate of Sodium and a sufficient quantity of Alcohol to a smooth paste, and dry this by exposure in a moderately warm place. Rub the dry mass to powder, and keep it in well-stoppered bottles.

Note.—The product contains 50 per cent. of Caffeine, and is soluble in 2 parts of water.

55. *Elixir Erythroxyli. N. F.*

Elixir of Erythroxylin.

Elixir of Coca.

Fluid Extract of Erythroxylin, 2 fl. oz.
Alcohol, 1 fl. oz.
Syrup, 2 fl. oz.
Tincture of Vanilla, 120 min.
Purified Talcum, 120 gr.

Aromatic Elixir, enough to make 16 fl. oz.

Mix the Fluid Extract with the Alcohol, the Syrup, and ten (10) fluidounces of Aromatic Elixir, add the Purified Talcum and incorporate the latter thoroughly. Let the mixture stand during forty-eight hours, if convenient, shaking occasionally; then filter, add the Tincture of

Vanilla to the filtrate, and pass enough Aromatic Elixir through the filter to make the product measure sixteen (16) fluidounces.

Each fluidrachm represents 7½ grains of Erythroxylin (Coca).

56. *Elixir Erythroxyli et Guarani. N. F.*

Elixir of Erythroxylin and Guarana.

Elixir of Coca and Guarana.

Fluid Extract of Erythroxylin, 2 fl. oz.
Fluid Extract of Guarana, 2 fl. oz.
Purified Talcum, 120 gr.

Compound Elixir of Taraxacum, 12 fl. oz.

Mix the liquids, and thoroughly incorporate the Purified Talcum with the mixture. Let it stand during forty-eight hours, if convenient, occasionally agitating, then filter.

Each fluidrachm represents 7½ grains each of Erythroxylin (Coca) and Guarana.

73. *Elixir Guarani. N. F.*

Elixir of Guarana.

Fluid Extract of Guarana

(U. S. P.), 8 fl. oz.

Aromatic Elixir, 8 fl. oz.

Compound Elixir of Taraxacum, 10 fl. oz.

Mix them, allow the mixture to stand during forty-eight hours, if convenient, and filter.

Each fluidrachm represents about 11 grains of Guarana.

88. *Elixir Pilocarpi. N. F.*

Elixir of Pilocarpus.

Elixir of Jaborandi.

Fluid Extract of Pilocarpus, 1 fl. oz.

Syrup of Coffee, 8 fl. oz.

Tincture of Vanilla, ½ fl. oz.

Compound Elixir of Taraxacum, enough to make 16 fl. oz.

Mix them, allow the mixture to stand during four days, if convenient, and filter.

Each fluidrachm represents 8½ grains of Pilocarpus.

240. *Liquor Strychninæ Acetatis. N. F.*

Solution of Acetate of Strychnine.

Hall's Solution of Strychnine.

Acetate of Strychnine, 16 gr.

Diluted Acetic Acid, ½ fl. oz.

Alcohol, 4 fl. oz.

Compound Tincture of Cardamom, 60 min.

Water, enough to make 16 fl. oz.

Dissolve the Acetate of Strychnine in about eight (8) fluidounces of Water mixed with the Diluted Acetic Acid, then add the Alcohol, Compound Tincture of Cardamom, and, lastly, enough Water to

make sixteen (16) fluidounces. Allow the mixture to stand a few days, if convenient, and filter.

Each fluidrachm contains $\frac{1}{2}$ grain of Acetate of Strychnine.

Note.—The Brit. Pharm. directs a *Liquor Strychninæ Hydrochloratis* (with synonyme: *Liquor Strychnis*) which is much stronger, and should not be confounded with the above preparation. It should never be dispensed unless expressly designated. It may be prepared by dissolving 1 grain of crystallized Strychnine (alkaloid) in 80 minims of Water with the aid of 2 drops of Diluted Hydrochloric Acid, and then adding 20 minims of Alcohol. The product contains $\frac{1}{2}$ grain of Strychnine in each fluidrachm.

104. Elixir Strychninæ Valerianatis. N. F.

Elixir of Valerianate of Strychnine.

Valerianate of Strychnine, $1\frac{1}{2}$ gr.
Acetic Acid, a sufficient quantity.
Tincture of Vanilla, 120 min.
Compound Tincture of Cud-
bear, 120 min.

Aromatic Elixir, enough to make 16 fl. oz.

Triturate the Valerianate of Strychnine with about one (1) fluidounce of Aromatic Elixir, gradually added, and effect complete solution by the addition of one or more drops of Acetic Acid, avoiding an excess. Then add the Tinctures, and, lastly, enough Aromatic Elixir to make sixteen (16) fluidounces. Filter, if necessary.

Each fluidrachm contains $\frac{1}{165}$ grain of Valerianate of Strychnine.

270. Oleatum Aconitinæ. N. F.

Oleate of Aconitinæ.

Aconitine, alkaloid, 2 parts.
Oleic Acid, 98 parts.

Triturate the Aconitine with a small portion of the Oleic Acid in a mortar, then incorporate the remainder of the Oleic Acid, and stir the mixture frequently until the alkaloid is dissolved.

Note.—The market affords a variety of Aconitines made by different processes, by different manufacturers, and of greatly different potency. Only the pure crystallized or crystallizable alkaloid, prepared by Duquesnel's method, or at least one equal to it in strength, should be used for this preparation.

185. Glyceritum Hydrastis. N. F.

Glycerite of Hydrastis.

Hydrastis, in fine powder, 16 tr. oz.
Glycerin, 8 fl. oz.
Alcohol, a sufficient quantity.
Water, enough to make 16 fl. oz.

Moisten the Hydrastis with six (6) fluidounces of Alcohol, pack it firmly in a percolator, and percolate with Alcohol until the Hydrastis is practically exhausted. To the percolate add four (4) fluidounces of Water, and then remove the Alcohol by

evaporation or distillation. After the Alcohol is driven off, add enough Water to the residue to make it measure eight (8) fluidounces, set it aside for twenty-four hours, then filter, pass enough Water through the filter to make the filtrate measure eight (8) fluidounces, and, lastly, add the Glycerin.

194. Linimentum Aconiti et Chloroformi. N. F.

Liniment of Aconite and Chloroform.

Tincture of Aconite, 2 fl. oz.
Chloroform, 2 fl. oz.
Soap Liniment, 12 fl. oz.
Mix them.

353. Syrupus Coffeæ. N. F.

Syrup of Coffee.

Coffee, roasted, 8 tr. oz.
Sugar, 24 tr. oz.
Water, a sufficient quantity.

Introduce the Coffee, reduced to a moderately coarse powder, into a suitable vessel; pour upon it sixteen (16) fluidounces of boiling Water, then cover it well, and boil for five minutes. Allow it to become cold, keeping the vessel well covered; strain off the liquid and pass enough Water through the strainer to make the strained liquid, when cold, measure sixteen (16) fluidounces. In this dissolve the Sugar, by agitation, without heat, and strain through muslin.

Note.—It is recommended that a mixture of equal parts of the commercial varieties of Coffee, known as "Java" and "Mocha," be employed for this purpose. The Coffee may also be exhausted by percolation, but special arrangements are then necessary to maintain the menstruum at the proper temperature.

371. Syrupus Ipecacuanhæ et Opil. N. F.

Syrup of Ipecac and Opium.

Syrup of Dover's Powder.

Fluid Extract of Ipecac, 64 min.
Deodorized Tincture of Opium (U. S. P.), 670 min.
Sugar, 12 tr. oz.
Cinnamon Water, enough to make 16 fl. oz.

Mix the Fluid Extract and Tincture with six (6) fluidounces of Cinnamon Water, and filter the liquid. To this add the Sugar and enough Cinnamon Water to make the product, after the Sugar has been dissolved by agitation, measure sixteen (16) fluidounces.

Each fluidrachm represents 5 grains of Dover's Powder, or $\frac{1}{2}$ grain, each, of Ipecac and Opium.

Note.—In place of the above-directed quantities of Fluid Extract of Ipecac and Deodorized Tincture of Opium, 640 minims of the official *Tinctura Ipecacuanhæ et Opil* may be taken.

380. Syrupus Sanguinariae. N. F.

Syrup of Sanguinaria.

Syrup of Bloodroot.

Sanguinaria, in No. 20 powder, $3\frac{1}{2}$ tr. oz.
Acetic Acid, 2 fl. oz.
Sugar, 18 tr. oz.
Water, enough to make 16 fl. oz.

Mix the Acetic Acid with six (6) fluid-ounces of Water, moisten the Sanguinaria with a sufficient quantity of this menstruum, and allow it to macerate for two hours. Then pack it in a glass percolator, and percolate in the usual manner, first with the remainder of the menstruum previously prepared, and afterwards with Water until twelve (12) fluidounces of percolate are obtained, or until the Sanguinaria is practically exhausted. Evaporate the percolate, at a moderate heat, to seven (7) fluidounces. In this dissolve the Sugar with a gentle heat, if necessary, and add enough Water to make sixteen (16) fluidounces.

Each fluidrachm represents about 18 grains of Sanguinaria.

406. Tinctura Pectoralis. N. F.

Pectoral Tincture.

Guttæ Pectorales. Pectoral Drops. Bateman's Pectoral Drops.

Tincture of Opium, 320 min.
Compound Tincture of Catechu, 240 min.
Spirit of Camphor, 300 min.
Oil of Anise, 8 min.
Caramel, 120 min.
Diluted Alcohol, enough to make 16 fl. oz.

Mix the first five ingredients with enough Diluted Alcohol to make sixteen (16) fluidounces, and filter.

Each fluidrachm contains $2\frac{1}{2}$ minims of Tincture of Opium.

393. Tinctura Cinchonæ Detannata. N. F.

Detannated Tincture of Cinchona.

Fluid Extract of Cinchona
(U. S. P.), 8 fl. oz.
Alcohol, 8 fl. oz.
Solution of Tersulphate of Iron, 6 fl. oz.
Water of Ammonia, 6 fl. oz.
Water,
Diluted Alcohol, each, a sufficient quantity.

To the Water of Ammonia, diluted with twenty-four (24) fluidounces of Water, gradually add the Solution of Tersulphate of Iron, previously diluted with forty (40) fluidounces of Water, under constant stirring. Pour this mixture, containing Ferric Hydrate as a precipitate, upon a wet muslin strainer (which has been tared, after having been wetted and deprived of the excess of water by moderate pressure),

and when the liquid has drained off, return the precipitate to the vessel, and mix it intimately with about sixty-four (64) fluidounces of Water. Again drain it on the strainer, transfer it once more to the vessel, and treat it as before. Finally, drain and press the precipitate on the strainer until it weighs eight (8) troyounces.

Mix the Fluid Extract of Cinchona with eight (8) fluidounces of Alcohol, and add the Ferric Hydrate previously prepared. Agitate the mixture frequently until the tincture is deprived of tannin, which may be known by the absence of a blackish-green color when a small portion of the clear tincture is treated with a drop or two of tincture of chloride of iron. Insert a plug of absorbent cotton into a suitable percolator, and introduce the mixture. As soon as the liquid has disappeared from the surface, pour on enough Diluted Alcohol to make the product measure sixteen (16) fluidounces.

Note.—This preparation is practically identical, in strength of Cinchona (without the tannin), with the official *Tinctura Cinchonæ*.

387. Tinctura Aconiti, Fleming. N. F.

Fleming's Tincture of Aconite.

1. Aconite (root), in fine powder, 10 tr. oz.
Alcohol, enough to make 15 fl. oz.
Moisten the Aconite with enough Alcohol to render it distinctly damp and to maintain it so after twenty-four hours' maceration in a well-covered vessel. Then pack it tightly in a percolator, and percolate it slowly, in the usual manner, with Alcohol, until fifteen (15) fluidounces of tincture are obtained.

Note.—This preparation is still prescribed by many physicians. It is recommended that their attention be directed to the official Fluid Extract and Tincture of Aconite, so that the above preparation may be gradually abandoned.

When this preparation is required for immediate use, and it is not otherwise available, it may be prepared in the following manner:

Fluid Extract of Aconite, 10 fl. oz.
Alcohol, 5 fl. oz.
Mix them.

405. Tinctura Papaveris. N. F.

Tincture of Poppy.

Poppy capsules, freed from seeds, and in coarse powder, 8 tr. oz.
Glycerin, 2 fl. oz.
Alcohol,

Water, each, enough to make 16 fl. oz.

Digest the Poppy capsules with three (3) pints of boiling Water during two hours, then express and strain. Evaporate the strained liquid to eight (8) fluidounces, mix it with four (4) fluidounces of Alcohol, and set the mixture aside, well covered, until it is quite cold. Then filter, add the Glycerin to the filtrate, and pass enough of a mixt-

ure of two (2) volumes of Water and one (1) volume of Alcohol through the filter to make the product measure sixteen (16) fluidounces.

Each fluidrachm represents 80 grains of Poppy capsules freed from seeds.

488. *Pilulæ Antidyspepticas. N. F.*

Antidyspeptic Pills.

Each pill contains:

Strychnine, alkaloid,	$\frac{1}{10}$ gr.
Ipecac, in fine powder,	$\frac{1}{10}$ gr.
Alcoholic Extract of Belladonna,	$\frac{1}{10}$ gr.
Mass of Mercury,	2 gr.
Compound Extract of Colocynth,	2 gr.

490. *Pilulæ Antiperiodicæ. N. F.*

Antiperiodic Pills.

Warburg's Pills.

1. *With Aloes.*

Each pill contains:

Aqueous Extract of Aloes,	1 gr.
Rhubarb,	$\frac{1}{2}$ gr.
Angelica Seed,	$\frac{1}{2}$ gr.
Elecampane,	$\frac{1}{2}$ gr.
Saffron,	$\frac{1}{2}$ gr.
Fennel,	$\frac{1}{2}$ gr.
Zedoary, root,	$\frac{1}{2}$ gr.
Cubebs,	$\frac{1}{2}$ gr.
Myrrh,	$\frac{1}{2}$ gr.
White Agaric,	$\frac{1}{2}$ gr.
Camphor,	$\frac{1}{2}$ gr.
Sulphate of Quinine,	1½ gr.
Extract of Gentian, a sufficient quantity.	

Reduce the drugs to a fine, uniform powder, and make this into pills, by means of Extract of Gentian, in accordance with the formula above given.

2. *Without Aloes.*

Prepare the pills in the same manner as directed in the previous formula, but omit the Aqueous Extract of Aloes.

Note.—These pills have been introduced for the purpose of facilitating the administration of Warburg's Tincture in a solid form. When "Warburg's Pills," or "Pills of Warburg's Tincture," are prescribed, without further specification, those containing Aloes should be dispensed. Those without Aloes should be furnished only when they are expressly demanded.

Each Warburg's Pill represents about 1 fluidrachm of Warburg's Tincture, with or without aloes, respectively. (See *Tinctura Antiperiodica*.)

429. *Vinum Erythroxyli. N. F.*

Wine of Erythroxylin.

Wine of Coca.

Fluid Extract of Erythroxylin,	1 fl. oz.
Alcohol,	1 fl. oz.
Sugar,	1 tr. oz.
Claret Wine, enough to make	16 fl. oz.

Dissolve the Sugar in about ten (10) fluidounces of Claret Wine, add the Alcohol and Fluid Extract, and enough Claret Wine to make sixteen (16) fluidounces. Let the mixture stand a few days in a cold place, if convenient, then filter, and pass

enough Claret Wine through the filter to restore the original volume.

Each fluidounce represents 80 grains of Erythroxylin (Coca).

Note.—In place of Claret Wine, any other palatable wine may be used, according to the demand or preference of the prescriber or consumer.

430. *Vinum Erythroxyli Aromaticum.*

N. F.

Aromatic Wine of Erythroxylin.

Aromatic Wine of Coca.

Fluid Extract of Erythroxylin,	1 fl. oz.
Compound Elixir of Taraxacum,	60 min.
Syrup of Coffee,	180 min.
Port Wine,	2½ fl. oz.
Aromatic Elixir,	4½ fl. oz.
Sherry Wine, enough to make	16 fl. oz.

Mix the five first-named ingredients with seven (7) fluidounces of Sherry Wine. Let the mixture stand several days in a cold place, if convenient, then filter, and pass enough Sherry Wine through the filter to make the product measure sixteen (16) fluidounces.

Each fluidounce represents 80 grains of Erythroxylin (Coca).

390. *Tinctura Antiperiodica. N. F.*

Antiperiodic Tincture.

Warburg's Tincture.

1. *Without Aloes.*

Rhubarb,	448 gr.
Angelica (seed),	448 gr.
Elecampane,	224 gr.
Saffron,	224 gr.
Fennel,	224 gr.
Gentian,	112 gr.
Zedoary (root),	112 gr.
Cubeb,	112 gr.
Myrrh,	112 gr.
White Agaric,	112 gr.
Camphor,	112 gr.
Sulphate of Quinine,	1280 gr.
Diluted Alcohol, enough to make	8 pints.

Reduce the fibrous vegetable drugs to a coarse (No. 20) powder, mix this with the Myrrh and Camphor, previously powdered, and digest the whole, during twelve hours, in a suitable, well-covered vessel, with seven (7) pints of Diluted Alcohol, on a water-bath, avoiding, as much as possible, any loss of Alcohol by evaporation. Then strain off the liquid with pressure, dissolve the Sulphate of Quinine in the strained liquid, with a gentle heat, if necessary, filter, and pass enough Diluted Alcohol, first through the strainer and then through the filter, to make the product measure eight (8) pints.

Each fluidounce contains 10 grains of Sulphate of Quinine.

Note.—This preparation, made without Aloes, is intended to serve as a stock-tincture, from which

the regular "Warburg's Tincture" is to be made, when required. "Warburg's Tincture without Aloes" is also often prescribed or asked for, and in this case the above preparation is to be dispensed.

The original formula directed by Dr. Warburg contained the old *Confectio Damocensis* as one of the ingredients. This is a very complex preparation, many of the constituents of which are unobtainable at the present day. It has, therefore, been omitted.

2. With Aloes.

Aqueous Extract of Aloes, 28 gr.

Antiperiodic Tincture, without Aloes, 16 fl. oz.

Dissolve the Extract in the Tincture.

Note.—When "Warburg's Tincture," without any further specification, is ordered, this preparation (containing Aloes) is to be dispensed.

Compound Tincture of Ignatia.

(GOUTTES AMÈRES. BITTER DROP.)

Ignatia, 8 oz. (troy).

Alcohol, 60 per cent., 16 oz. (by weight).

Potassium Carbonate, 80 gr.

Charcoal, 6 gr.

Oil of Wormwood, 6 fl. dr.

Macerate fifteen days, and then recover 16 fl. oz. by percolation.

Vinum Tabaci. U. S. 1870.

WINE OF TOBACCO.

Tobacco, 240 gr.

White Wine, 8 fl. oz.

Macerate and filter.

Rheumatic Pills.

(Dr. Isaac Remington's.)

Acetic Extract of Colchicum,

Compound Extract of Colocynth,

Extract of Rhubarb, of each, 60 gr.

Veratrine, 5 gr.

Oil of Anise, 10 drops.

Make into 40 pills. Take 1 or 2 at bedtime.

Ethereal Tincture of Colchicum.

Colchicum, 8 oz. (troy).

Spirit of Nitrous Ether, sufficient to make 8 fl. oz.

Made by percolation. Dose, 20 to 30 drops.

Linimentum Aconiti. U. S. 1870.

LINIMENT OF ACONITE.

Aconite, in fine powder, 8 oz. (troy).

Glycerin, 1 fl. oz.

Alcohol, a sufficient quantity.

Moisten the powder with 4 fl. oz. of Alcohol, and let it macerate for twenty-four hours, then pack in a conical percolator, and gradually pour Alcohol upon it until 2 pints of tincture have been obtained. Distil off a pint and a half of Alcohol, and evaporate the remainder until it measures 7 fl. oz.; to this add the Glycerin, and mix them thoroughly.

Gout Pills.

(Bequaerel's.)

Quinine Sulphate, 60 gr.

Extract of Digitalis, 7½ gr.

Powdered Colchicum-Seed, 20 gr.

Make into a mass and divide into 25 pills. Dose, 1 to 3 pills each day for several days.

Gout Pills.

(Lartigue's.)

Compound Extract of Colocynth, 96 gr.

Acetated Extract of Colchicum, 10 gr.

Extract of Digitalis, 5 gr.

Make into a mass and divide into 24 pills. Take 2 for a dose.

Mixture for Gout.

(Scudamore's.)

Magnesium Sulphate, 240 gr.

Magnesia, 80 gr.

Vinegar of Colchicum, 4 fl. dr.

Syrup of Saffron, 4 fl. dr.

Peppermint Water, 5 fl. oz.

Mix. Dose, 1 to 3 tablespoonfuls every two hours till four to six evacuations are produced in twenty-four hours.

Remedy for Tape-Worm.

(Schafhirt's.)

Pomegranate, 240 gr.

Pumpkin-Seed, 1 oz. (troy).

Ethereal Extract of Aspid-

ium, 60 gr.

Powdered Ergot, 80 gr.

Powdered Acacia, 120 gr.

Croton Oil, 2 min.

Mix.

Dinner Pills.

(Fothergill's.)

Powdered Ipecac, 20 gr.

Strychnine, 1 gr.

Oil of Black Pepper, 40 min.

Pill of Aloes and Myrrh, 50 gr.

Mix, and make into 20 pills.

Number One.

(Thomsonian name.)

Lobelia inflata.

Brown Lobelia.

The Thomsonian name for the seed.

Green Lobelia.

The Thomsonian name for the Herb.

Third Preparation.

(Thomsonian name.)

Lobelia-Seed,

Capsicum, of each, 1 oz. (av.).

Cypripedium Powder, 10 gr.

Add 12 fl. oz. of Number Six (page 1206), macerate, and keep on the dregs.

Syrup of Lobelia.

(Thomsonian name.)

Lobelia-Seed,	1 oz. (av.).
Sugar,	16 oz. (av.).
Tincture of Lobelia,	4 fl. oz.
Vinegar,	1 fl. oz.
Water,	16 fl. oz.

Boil the Seed with the Vinegar and Water for half an hour; add the Sugar; and lastly, when cold, add the Tincture of Lobelia.

Tobacco Ointment.

Tobacco, in fine powder,	120 gr.
Lard,	4 oz. (troy).
Water, sufficient.	

Percolate the Tobacco with Water until 2 fl. oz. have been obtained, evaporate to an extract, and mix with the Lard.

Compound Elixir of Turkey Corn.

Fluid Extract of Corydalis,	4 fl. dr.
Fluid Extract of Stillingia,	4 fl. dr.
Fluid Extract of Prickly Ash,	2 fl. oz.
Fluid Extract of Iris,	6 fl. oz.
Potassium Iodide,	180 gr.
Alcohol,	1 fl. oz.
Elixir of Orange,	5 fl. oz.

Mix the Elixir and Alcohol, and add the Fluid Extracts; dissolve the Iodide in the mixture, and allow it to stand twenty-four hours, then filter.

ANIMAL PRODUCTS.**279. Pepsinum. N. F.***Pepsin.*

The digestive principle of the gastric juice, obtained from the mucous membrane of the stomach of the hog, prepared in a dry and undiluted form, and capable of dissolving not less than *five hundred* (500) times its own weight of hard-boiled egg-albumen, under the conditions prescribed for the process of assay below given.

Assay of Pepsin.

1. *Preliminary Assay.*—Prepare an Acidulated Water by mixing 1 litre of Distilled Water with 5 Gm. of Hydrochloric Acid. Mix 0.1 Gm. of the dry and undiluted Pepsin with 0.9 Gm. of Sugar of Milk, by thorough trituration in a Wedgwood mortar. Weigh of this mixture four portions, of 0.05 Gm. (A), 0.06 Gm. (B), 0.1 Gm. (C), and 0.2 Gm. (D), respectively, place each portion in a wide-mouthed flask or bottle of the capacity of about 200 C.c., together with 80 C.c. of the Acidulated Water, previously warmed, and set the flasks in a water-bath, the temperature of which is maintained constantly at 51° C. (125° F.). After twenty minutes, add to the contents of each flask 10 Gm. of hard-boiled egg-albumen, prepared by boiling fresh eggs for fifteen minutes, then separating the whites and rubbing this through a clean hair sieve having 80 meshes to the linear inch. Each portion of 10 Gm. of egg-albumen is to be put into a small warmed mortar, triturated with a portion of the fluid from one of the flasks, the mixture then transferred to the latter, and the mortar rinsed with 20 C.c.

of warmed Acidulated Water, which is added to the contents of the flask. Keep the flasks in the water-bath for sixty minutes, shaking well at intervals of five minutes, and at the end of that time note the condition of the egg-albumen in the several flasks. If the Pepsin is of good quality, not more than a few undissolved flakes should remain in any but the first flask (A). If more than this remains in the fourth flask (D), the Pepsin should be rejected, as being below the requisite standard.

2. *Actual Assay.*—Having thus ascertained the approximate digestive power of the Pepsin, and having found this to be of satisfactory strength, make at least two assays, in precisely the same manner as just described, but using such a proportion of egg-albumen that about one-fourth of it will remain undissolved at the close of the experiment.

Then add to the contents of the flask 3 Gm. of finely-scraped and purified asbestos, previously dried to a constant weight, and afterwards add 100 C.c. of cold distilled water. Shake the flask strongly, until the asbestos has clarified the liquid as far as possible, then transfer the contents of the flask to a tared filter (deprived of matters soluble in hydrochloric acid), wash the residue with distilled water, until the washings cease to affect test-solution of nitrate of silver acidulated with nitric acid, and dry the filter with contents at a temperature of 105° C. (221° F.), to a constant weight. From this deduct the weight of the filter and asbestos. Multiply the remainder (representing the undigested and dried albumen) by 7.5, to find the quantity of moist egg-albumen to which it corresponds, and deduct the product from the amount originally used to ascertain the proportion dissolved by the Pepsin.

Note.—Finely-scraped asbestos has been found to be the best medium for clarifying liquids containing peptones. Pure, white, fibrous asbestos should be scraped with a knife so as to obtain a fine feathery mass, which is boiled with diluted hydrochloric acid, then thoroughly washed with water, and dried. If it is to be used in quantitative determinations requiring its subsequent ignition, it should be ignited before its tare is taken.

281. Pepsinum Saccharatum. N. F.*Saccharated Pepsin.*

Pepsin (N. F.), a sufficient quantity. Sugar of Milk, enough to make 100 parts.

Triturate as many parts of the Pepsin as may be found to be capable of dissolving *five thousand* (5000) parts of egg-albumen by the process of assay given under *Pepsinum*, with enough Sugar of Milk to make *one hundred* (100) parts.

Note.—The process of assay given under *Pepsinum* (see No. 279) is also applicable to this preparation.

Pepsinum Saccharatum is official in the U. S. P., but no process is there given for its preparation. The product obtained by the above formula corresponds, in strength, to that intended by the U. S. P.

280. Pepsinum Aromaticum. N. F.*Aromatic Pepsin.*

Saccharated Pepsin,	1 tr. oz.
Aromatic Fluid Extract	
(U. S. P.),	30 min.
Tartaric Acid,	8 gr.
Chloride of Sodium,	8 gr.

Mix the ingredients by trituration, dry the product by exposure to warm air, and keep it in well-stoppered bottles.

319. Pulvis Pepsini Compositus. *N. F.*

Compound Powder of Pepsin.

Pulvis Digestivus.

Saccharated Pepsin,	150 gr.
Pancreatin (<i>N. F.</i>),	150 gr.
Diastase,	10 gr.
Lactic Acid,	10 min.
Hydrochloric Acid,	20 min.
Sugar of Milk, enough to make	1000 gr.

Add the Acids gradually to the Sugar of Milk, and triturate until they are thoroughly mixed. Mix the Pepsin, Pancreatin, and Diastase, and then incorporate this mixture, by trituration, with the Sugar of Milk. Finally, rub the mixture through a hair sieve, and preserve the powder in bottles.

Note.—The best commercial variety of Diastase, capable of converting the largest comparative amount of starch into dextrin and glucose, should be used for this preparation.

81. Elixir Pepsini. *N. F.*

Elixir of Pepsin.

Pepsin (<i>N. F.</i>),	128 gr.
Hydrochloric Acid,	80 min.
Glycerin,	2 fl. oz.
Compound Elixir of Taraxacum,	1 fl. oz.
Alcohol,	8 fl. oz.
Purified Talcum,	120 gr.
Sugar,	4 tr. oz.
Water,	enough to make 16 fl. oz.

Mix the Pepsin with six (6) fluid-ounces of Water, add the Glycerin and Acid, and agitate until solution has been effected. Then add the Compound Elixir of Taraxacum, Alcohol, and the Purified Talcum, and mix thoroughly. Set the mixture aside for a few hours, occasionally agitating. Then filter it through a wetted filter, dissolve the Sugar in the filtrate, and pass enough Water through the filter to make the whole product measure sixteen (16) fluidounces.

Each fluidrachm represents 1 grain of Pepsin (N. F.).

Note.—The filtration of this preparation will be greatly facilitated by allowing the mixture to stand a few days before pouring it on the filter.

84. Elixir Pepsini et Ferri. *N. F.*

Elixir of Pepsin and Iron.

Tincture of Citro-Chloride of Iron,	512 min.
Elixir of Pepsin, enough to make	16 fl. oz.

Mix the Tincture of Citro-Chloride of Iron with a sufficient quantity of Elixir of Pepsin to make sixteen (16) fluidounces, and filter, if necessary.

Each fluidrachm represents about $\frac{1}{2}$ grain of Chloride of Iron (ferric) and nearly 1 grain of Pepsin (N. F.).

432. Vinum Pepsini. *N. F.*

Wine of Pepsin.

Pepsin (<i>N. F.</i>),	128 gr.
Glycerin,	800 min.
Hydrochloric Acid,	80 min.
Water,	1 fl. oz.
Purified Talcum,	120 gr.
Stronger White Wine (U.S.P.),	enough to make 16 fl. oz.

Mix the Water, Glycerin, and Hydrochloric Acid, and agitate the Pepsin with the mixture until it is completely disintegrated and apparently dissolved. Then add enough Stronger White Wine to make sixteen (16) fluidounces, mix the liquid intimately with the Purified Talcum, allow it to stand for a week, if convenient, frequently shaking, then filter, and pass enough Stronger White Wine through the filter to restore the original volume.

Each fluidrachm represents 1 grain of Pepsin (N. F.).

227. Liquor Pepsini Aromaticus. *N. F.*

Aromatic Solution of Pepsin.

Pepsin (<i>N. F.</i>),	128 gr.
Oil of Cinnamon,	2 drops.
Oil of Pimenta,	2 drops.
Oil of Cloves,	4 drops.
Purified Talcum,	120 gr.
Alcohol,	$\frac{1}{2}$ fl. oz.
Hydrochloric Acid,	$\frac{7}{8}$ min.
Glycerin,	4 fl. oz.
Water,	enough to make 16 fl. oz.

Mix the Pepsin with eight (8) fluidounces of Water and the Hydrochloric Acid, and shake the mixture frequently until the Pepsin is dissolved. Then add the Purified Talcum and the Oils, previously dissolved in the Alcohol; mix the whole thoroughly, by agitation, and filter it through a wetted filter, returning the first portions of the liquid until it runs through clear. Pass enough Water through the filter to make the filtrate measure twelve (12) fluidounces. To this add the Glycerin.

Each fluidrachm represents 1 grain of Pepsin (N. F.).

186. Glyceritum Pepsini. *N. F.*

Glycerite of Pepsin.

Pepsin (<i>N. F.</i>),	640 gr.
Hydrochloric Acid,	80 min.
Purified Talcum,	120 gr.
Glycerin,	8 fl. oz.
Water,	enough to make 16 fl. oz.

Mix the Pepsin with seven (7) fluidounces of Water and the Hydrochloric Acid, and agitate until solution has been effected. Then incorporate the Purified Talcum with the liquid, filter, returning the first portions of the filtrate until it runs through clear, and pass enough

Water through the filter to make the filtrate measure *eight* (8) *fluidounces*. To this add the Glycerin, and mix.

Each fluidrachm represents 5 grains of Pepsin (N. F.).

Note.—For filtering the aqueous solution of Pepsin first obtained by the above formula, as well as for filtering other liquids of a viscid character, a filter paper of loose texture (preferably that known as "Textile Filtering Paper"), or a layer of absorbent cotton placed in a funnel, or percolator, should be employed.

226. Liquor Pancreaticus. N. F.

Pancreatic Solution.

Pancreatin (N. F.), 128 gr.
Bicarbonate of Sodium, 384 gr.
Glycerin, 4 fl. oz.
Compound Spirit of Cardamom (N. F.), 1 fl. oz.
Alcohol, 1 fl. oz.
Purified Talcum, 120 gr.

Water, enough to make 16 fl. oz.
Triturate the Pancreatin and the Bicarbonate of Sodium gradually with *ten* (10) *fluidounces* of Water; add the Alcohol, Compound Spirit of Cardamom, and Purified Talcum; mix them thoroughly by shaking, and pour the mixture upon a wetted filter, returning the first portions of the filtrate until it runs off clear. Wash the filter with enough Water to obtain *twelve* (12) *fluidounces* of filtrate. To this add the Glycerin.

Each fluidrachm represents 1 grain of Pancreatin (N. F.).

278. Pancreatinum. N. F.

Pancreatin.

Pancreas of the Hog, fresh,
Water, each, a sufficient quantity.
Alcohol, each, a sufficient quantity.

Reduce the fresh Pancreas of the Hog, freed as much as possible from fat and membranes, to a fine paste by means of a suitable chopping machine. Mix it with half its weight of cold Water, and knead it thoroughly and frequently during one hour; then transfer the mass to a strainer, express it forcibly, filter the liquid as quickly as possible through flannel, and add to the filtrate an equal volume of Alcohol. Collect the precipitate, drain it, and free it by pressure from as much of the adherent liquid as possible. Then spread it on shallow trays, dry it by exposure to warm air, at a temperature not exceeding 40° C. (104° F.), reduce it to powder, and keep it in well-stoppered bottles.

Note.—If larger quantities of Pancreas are operated upon, and there is risk of its decomposition in presence of the water, it is advisable to saturate the latter with chloroform, which will retard decomposition for a long time.

If there be added to 4 fluidounces of tepid water, contained in a suitable flask or bottle,

first, 5 grains of Pancreatin and 20 grains of bicarbonate of sodium, and afterwards 1 pint of fresh cow's milk, previously heated to 38° C. (100.4° F.), and if this mixture be maintained at the same temperature for thirty minutes, the milk should be so completely peptonized that, on adding to a small portion of it, transferred to a test-tube, a slight excess of nitric acid, coagulation should not occur.

As peptonized milk is chiefly used as a food for the sick, and as Pancreatin is probably more largely employed for the practical purpose of peptonizing milk, it is important to observe the quality of the peptonized product yielded with any specimen of Pancreatin. Peptonized milk as prepared by the above process, or when the process is allowed to go on to the development of a very distinct bitter flavor, should not have an odor at all suggestive of rancidity. Milk has simply a marked bitter taste when thoroughly peptonized.

In place of Pancreatin, prepared by the formula above given, any other commercial preparation of the Pancreas may be used, provided it reaches the standard of peptonizing power prescribed for the former. (See also *Note* to No. 318, below.)

318. Pulvis Pancreaticus Compositus. N. F.

Compound Pancreatic Powder.

Peptonizing Powder.

Pancreatin (N. F.), 5 gr.
Bicarbonate of Sodium, 20 gr.
Mix them by trituration.

Note.—If Pancreatin of proper strength (see No. 278) is not available, any other commercial preparation of the Pancreas, as, for instance, the extract, may be used in place of it, provided it attains the required standard.

The quantities above given are sufficient to peptonize 1 pint of fresh cow's milk, by proceeding in the following manner:

Add the Compound Pancreatic Powder to 4 fluidounces of tepid water, contained in a suitable flask, and afterwards add 1 pint of fresh cow's milk, previously heated to 38° C. (100.4° F.). Maintain the mixture at this temperature during thirty minutes, then transfer the flask to a cold place.

Milk thus peptonized should not be used when it has been kept over twenty-four hours or when it has developed a rancid taste.

349. Succus Limonis cum Pepsino. N. F.

Lime Juice and Pepsin.

Pepsin (N. F.), 256 gr.
Water, 8 fl. oz.
Glycerin, 8 fl. oz.
Alcohol, 1 1/2 fl. oz.
Purified Talcum, 120 gr.

Lime Juice, enough to make 16 fl. oz.

Dissolve the Pepsin in the Water, mixed with about *eight* (8) *fluidounces* of Lime Juice. Then add the Glycerin and Alcohol, and, lastly, enough Lime Juice to make *sixteen* (16) *fluidounces*. Incorporate the Purified Talcum with the liquid, let it stand a few days in a cold place, if convenient, occasionally agitating, then filter it through a wetted filter, and, finally, pass enough Lime Juice through the filter to restore the original volume.

Each fluidrachm represents 2 grains of Pepsin (N. F.).

82. Elixir Pepsini, Bismuthi, et Strychnine. N. F.

Elixir of Pepsin, Bismuth, and Strychnine.

Sulphate of Strychnine, 1½ gr.
Elixir of Pepsin and Bismuth, 16 fl. oz.

Dissolve the Sulphate of Strychnine in the Elixir.

Each fluidrachm represents 1½ grain of Sulphate of Strychnine, 1 grain of Pepsin (N. F.), and 2 grains of Citrate of Bismuth and Ammonium.

83. Elixir Pepsini et Bismuthi. N. F.

Elixir of Pepsin and Bismuth.

Pepsin (N. F.), 128 gr.

Citrate of Bismuth and Ammonium, 256 gr.

Water of Ammonia, a sufficient quantity.

Glycerin, 2 fl. oz.

Alcohol, 8 fl. oz.

Syrup, 8 fl. oz.

Compound Elixir of Taraxacum, 1 fl. oz.

Purified Talcum, 120 gr.

Water, enough to make 16 fl. oz.

Dissolve the Pepsin in four (4) fluidounces of Water. Dissolve the Citrate of Bismuth and Ammonium in one (1) fluidounce of warm Water, allow the solution to stand until clear, if necessary; then decant the clear liquid, and add to the residue just enough Water of Ammonia to dissolve it, carefully avoiding an excess. Then mix the two solutions, and add the Glycerin, Compound Elixir of Taraxacum, and Alcohol. Thoroughly incorporate the Purified Talcum with the mixture, filter it through a wetted filter, and pass enough Water through the filter to make the filtrate measure thirteen (13) fluidounces. To this add the Syrup.

Each fluidrachm represents 1 grain of Pepsin (N. F.) and 2 grains of Citrate of Bismuth and Ammonium.

Emulsion of Cod Liver Oil with Phosphate of Calcium and Sodium.

Calcium Phosphate, 256 gr.
Sodium Phosphate, 64 gr.
Acacia, 2 oz. (av.).
Hydrochloric Acid, 128 min.
Cod Liver Oil, 8 fl. oz.
Water, 4 fl. oz.

Place the Powdered Acacia in a dry mortar, add the Cod Liver Oil, and rub until smooth. Dissolve the Phosphates in the Water by the aid of the Acid, and add all at once to the above mixture, rubbing until a perfect emulsion is formed; then add sufficient Water to make 16 fl. oz.

Emulsion of Cod Liver Oil.

(60 per cent.)

Cod Liver Oil, 8 fl. oz.
Powdered Acacia, 2 oz. (av.).
Water, 4 fl. oz.

Place the Powdered Acacia in a dry mortar, add the Cod Liver Oil, and rub until smooth; then add the Water all at once, and rub until a perfect emulsion is formed; then add sufficient Water to make 16 fl. oz.

Emulsion of Cod Liver Oil with Lactophosphate of Calcium.

Calcium Lactate, 256 gr.
Acacia, 2 oz. (av.).
Diluted Phosphoric Acid, 2 fl. oz.
Cod Liver Oil, 8 fl. oz.
Water, 2 fl. oz.

Place the Powdered Acacia in a dry mortar, add the Cod Liver Oil, and rub until smooth. Dissolve the Calcium Lactate in Acid and Water, and add all at once to the above mixture, rubbing until a perfect emulsion is formed; then add sufficient Water to make 16 fl. oz.

Pancreatic Emulsion of Cod Liver Oil.

Cod Liver Oil, 8 fl. oz.
Powdered Pancreatin, 60 gr.
Syrup, 1 fl. oz.

Digest at a moderate heat. The emulsion is miscible with water, and may be given in chocolate, milk, coffee, or both.

Emulsion of Cod Liver Oil with Wild Cherry Bark.

Acacia, 2 oz. (av.).
Oil of Bitter Almond, 8 min.
Fluid Extract of Wild Cherry, 1 fl. oz.
Cod Liver Oil, 8 fl. oz.
Water, 8 fl. oz.

Place the Powdered Acacia in a dry mortar, add the Cod Liver Oil, and rub until smooth. Mix the Fluid Extract with the Water, and add all at once to the above mixture; then add the Oil of Bitter Almond, and, lastly, sufficient Water to make 16 fl. oz.

Emulsion of Cod Liver Oil with Hypophosphites.

Calcium Hypophosphite, 128 gr.
Sodium Hypophosphite, 96 gr.
Potassium Hypophosphite, 64 gr.
Acacia, 2 oz. (av.).
Cod Liver Oil, 8 fl. oz.
Water, 4 fl. oz.

Place the Powdered Acacia in a dry mortar, add the Cod Liver Oil, and rub until smooth. Dissolve the Hypophosphites in the Water, and add all at once to the above mixture, rubbing until a perfect emulsion is formed; then add sufficient Water to make 16 fl. oz.

Emulsion of Cod Liver Oil with Hypophosphite of Calcium and Sodium.

Calcium Hypophosphite, 128 gr.
 Sodium Hypophosphite, 96 gr.
 Powdered Acacia, 2 oz. (av.).
 Cod Liver Oil, 8 fl. oz.
 Water, 4 fl. oz.

Place the Powdered Acacia in a dry mortar, add the Cod Liver Oil, and rub until smooth. Dissolve the Hypophosphites in the Water, and add all at once to the above mixture, rubbing until a perfect emulsion is formed; then add sufficient Water to make 16 fl. oz.

Emulsion of Cod Liver Oil with Hypophosphite of Calcium.

Cod Liver Oil, 8 fl. oz.
 Powdered Acacia, 2 oz. (av.).
 Calcium Hypophosphite, 128 gr.
 Water, 4 fl. oz.

Place the Powdered Acacia in a dry mortar, add the Cod Liver Oil, and rub until smooth. Dissolve the Calcium Hypophosphite in the Water, and add all at once to the above, rubbing until a perfect emulsion is formed; then add sufficient Water to make 16 fl. oz.

114. Emulsio Olei Morrhue. N. F.**Emulsion of Cod Liver Oil.****I. Irish Moss Emulsion of Cod Liver Oil.**

Cod Liver Oil, 8 fl. oz.
 Mucilage of Chondrus (N. F.), 5 fl. oz.
 Syrup of Tolu, 2 fl. oz.
 Flavoring, a sufficient quantity.
 Water, enough to make 16 fl. oz.

Pour the Mucilage of Chondrus into a suitable bottle, add the Cod Liver Oil in divided portions, shaking well after each addition, and, when a perfect emulsion is formed, add the Syrup of Tolu and the Flavoring, and, lastly, enough Water to make sixteen (16) fluidounces. Finally, mix the whole thoroughly together.

This emulsion may also be prepared by mixing the Mucilage of Chondrus with the Oil and other ingredients in a mortar, or, when larger quantities are to be prepared, it may be mixed by some mechanical contrivance.

Note.—When Emulsion of Cod Liver Oil, particularly that made with Chondrus, is to be kept for some time, its deterioration may be prevented or retarded by the addition of one (1) fluidounce of Alcohol in place of the same quantity of Water, after the oil has been emulsified.

Emulsion of Cod Liver Oil may also be prepared by any other method capable of emulsifying the oil, the following being given as examples:

II. Acacia Emulsion of Cod Liver Oil. N. F.

Cod Liver Oil, 8 fl. oz.
 Acacia, in fine powder, 1½ tr. oz.
 Syrup of Tolu, 2 fl. oz.
 Flavoring, a sufficient quantity.
 Water, enough to make 16 fl. oz.

Triturate the Acacia with three (3) fluidounces of Water to a smooth paste; then add the Cod Liver Oil and the Syrup of Tolu, alternately, and in divided portions, triturating well until the last-added portion of the Oil is thoroughly emulsified. Next add the Flavoring, and, lastly, enough Water to make sixteen (16) fluidounces. Finally, mix the whole thoroughly together.

III. Glyconin Emulsion of Cod Liver Oil. N. F.

Cod Liver Oil, 8 fl. oz.
 Glycerite of Yolk of Egg (U. S. P.), 2½ fl. oz.
 Syrup of Tolu, 2 fl. oz.
 Flavoring, a sufficient quantity.
 Water, enough to make 16 fl. oz.
 Triturate the Glycerite of Yolk of Egg (Glyconin) in a mortar with the Oil, added in small portions at a time, and thoroughly incorporate each portion before adding the next. Then, continuing the trituration, gradually add the Syrup of Tolu and the Flavoring. Finally, add enough Water to make sixteen (16) fluidounces, and mix the whole thoroughly together.

IV. Quillaja Emulsion of Cod Liver Oil. N. F.

Cod Liver Oil, 8 fl. oz.
 Tincture of Quillaja (N. F.), 1 fl. oz.
 Syrup of Tolu, 2 fl. oz.
 Flavoring, a sufficient quantity.
 Water, enough to make 16 fl. oz.

Pour the Tincture into a suitable bottle, then add the Cod Liver Oil in portions of about two (2) fluidounces each, and shake after each addition until a perfect emulsion results. Next add the Syrup of Tolu and the Flavoring, and, lastly, enough Water to make sixteen (16) fluidounces. Finally, mix the whole thoroughly together.

An 85 per cent. Emulsion of Cod Liver Oil may be prepared by mixing in the manner just described:

Cod Liver Oil, 8½ fl. oz.
 Tincture of Quillaja (N. F.), 1 fl. oz.
 Flavoring, a sufficient quantity.
 Syrup of Tolu, enough to make 10 fl. oz.

Note.—Emulsion of Cod Liver Oil made with Quillaja should not be dispensed without the direction or consent of the prescriber.

V. Dextrin Emulsion of Cod Liver Oil. N. F.

Cod Liver Oil, 8 fl. oz.
 Mucilage of Dextrin (N. F.), 5 fl. oz.
 Syrup of Tolu, 2 fl. oz.
 Flavoring, a sufficient quantity.
 Water, enough to make 16 fl. oz.

To the Mucilage of Dextrin, contained in a suitable bottle, add the Cod Liver Oil, first in small portions, agitating each time, until the last-added portion is emulsified. Then add the Flavoring, the Syrup of

Tolu, and, lastly, enough Water to make sixteen (16) fluidounces, and mix the whole thoroughly together.

Flavoring.—Since no single or compound aromatic can be devised which would be acceptable under all circumstances as a flavoring for Emulsion of Cod Liver Oil, the selection of the most suitable aromatic must be left to the prescriber or dispenser. Among those which are found to be most generally serviceable are the following, the quantities given below being intended for one (1) pint of finished emulsion, though in some cases a smaller or a larger quantity, in the same proportions, may be preferable:

1. Oil of Gaultheria,	30 min.
2. Oil of Gaultheria,	15 min.
Oil of Sassafras,	15 min.
3. Aromatic Spirit (N. F.),	120 min.
4. Oil of Gaultheria,	15 min.
Oil of Bitter Almond,	2 min.
Oil of Coriander,	2 min.
5. Oil of Gaultheria,	10 min.
Oil of Sassafras,	10 min.
Oil of Bitter Almond,	2 min.
6. Oil of Gaultheria,	20 min.
Oil of Bitter Almond,	20 min.
7. Oil of Neroli,	12 min.
Oil of Bitter Almond,	12 min.
Oil of Cloves,	2 min.

117. Emulsio Olei Morrhue cum Calcii Phosphate. N. F.

Emulsion of Cod Liver Oil with Phosphate of Calcium.

Emulsion of Cod Liver Oil with Phosphate of Lime.

Cod Liver Oil,	8 fl. oz.
Mucilage of Chondrus (N. F.),	5 fl. oz.
Phosphate of Calcium,	256 gr.
Syrup of Tolu,	1 fl. oz.
Alcohol,	1 fl. oz.
Flavoring,	a sufficient quantity.
Water,	enough to make 16 fl. oz.

To the Mucilage of Chondrus, contained in a suitable vessel, gradually add the Cod Liver Oil, and prepare an emulsion as directed under *Emulsio Olei Morrhue*. Triturate the Phosphate of Calcium with the Syrup of Tolu and add this to the emulsion; then add the Alcohol, Flavoring, and enough Water to make sixteen (16) fluidounces. Mix the whole thoroughly together.

Note.—If any other method of emulsifying the oil is adopted, the Phosphate of Calcium should be triturated with Water, or some other of the liquid constituents, which are added last. A very good emulsion can be made by using mucilage of dextrin.

118. Emulsio Olei Morrhue cum Extracto Maltii. N. F.

Emulsion of Cod Liver Oil with Extract of Malt.

Cod Liver Oil,	8 fl. oz.
Mucilage of Dextrin (N. F.),	2 fl. oz.
Extract of Malt,	6 fl. oz.

To the Mucilage of Dextrin, contained in a suitable bottle, add the Extract of

Malt, and mix them thoroughly by agitation. Then gradually add the Cod Liver Oil, first in small portions, agitating each time until the last-added portion is perfectly incorporated.

Note.—Extract of Malt, most suitable for this preparation, should have about the same consistence as Balsam of Peru, at a temperature of 15° C. (59° F.).

119. Emulsio Olei Morrhue cum Hypophosphite. N. F.

Emulsion of Cod Liver Oil with Hypophosphite.

Cod Liver Oil,	8 fl. oz.
Mucilage of Chondrus (N. F.),	5 fl. oz.
Any Soluble Hypophosphite,	128 gr.
Syrup of Tolu,	1 fl. oz.
Alcohol,	1 fl. oz.
Flavoring,	a sufficient quantity.
Water,	enough to make 16 fl. oz.

Dissolve the Hypophosphite in the Mucilage of Chondrus, and emulsify the Cod Liver Oil with the latter as directed under *Emulsio Olei Morrhue*. Then add the Syrup of Tolu, Alcohol, and Flavoring, and, finally, enough Water to make sixteen (16) fluidounces. Mix the whole thoroughly together.

Note.—If another method of emulsifying the oil is adopted, the Hypophosphite should be dissolved in the aqueous portion of the mixture.

If more than one Hypophosphite is directed in combination with Emulsion of Cod Liver Oil, and no definite quantities of the salts are prescribed, equal parts of the several Hypophosphites may be taken, amounting altogether to 128 grains for every pint of emulsion.

116. Emulsio Olei Morrhue cum Calcii Lactophosphate. N. F.

Emulsion of Cod Liver Oil with Lactophosphate of Calcium.

Emulsion of Cod Liver Oil with Lactophosphate of Lime.

Cod Liver Oil,	8 fl. oz.
Mucilage of Chondrus (N. F.),	5 fl. oz.
Lactate of Calcium,	256 gr.
Phosphoric Acid (50 per cent.),	256 min.
Syrup of Tolu,	1 fl. oz.
Flavoring,	a sufficient quantity.
Water,	enough to make 16 fl. oz.

To the Mucilage of Chondrus, contained in a suitable bottle, gradually add the Cod Liver Oil, and emulsify the latter as directed under *Emulsio Olei Morrhue*. Dissolve the Lactate of Calcium in one (1) fluidounce of Water with the aid of the Phosphoric Acid, add the solution gradually to the emulsion, then the syrup of Tolu, the Flavoring, and, lastly, enough Water to make sixteen (16) fluidounces. Mix the whole thoroughly together.

This emulsion should be freshly prepared when wanted for use.

Note.—If any other method of emulsifying the oil is adopted, the solution of Lactophosphate of Calcium should be made to replace an equivalent volume of the aqueous portion of the emulsion. A very good emulsion can be made by using mucilage of dextrin.

120. Emulsio Olei Morrhue cum Pruno Virginiana. N. F.

Emulsion of Cod Liver Oil with Wild Cherry.

Cod Liver Oil,	8 fl. oz.
Mucilage of Chondrus (N. F.),	5 fl. oz.
Fluid Extract of Wild Cherry,	1 fl. oz.
Syrup of Tolu,	1 fl. oz.
Alcohol,	$\frac{1}{2}$ fl. oz.
Flavoring,	a sufficient quantity.
Water,	enough to make 16 fl. oz.

To the Mucilage of Chondrus, contained in a suitable bottle, gradually add the Cod Liver Oil, and prepare an emulsion as directed under *Emulsio Olei Morrhue*. Next add the Fluid Extract of Wild Cherry, then the Syrup of Tolu, Alcohol, Flavoring, and enough Water to make sixteen (16) fluidounces.

Note.—If another method of emulsifying the oil is adopted, the Fluid Extract of Wild Cherry is to be added after the emulsion of the oil is accomplished, if necessary, with omission of a corresponding volume of one of the secondary constituents.

123. Emulsio Phosphatica. N. F.

*Phosphatic Emulsion.
Mistura Phosphatica.*

Cod Liver Oil,	4 fl. oz.
Glycerite of Yolk of Egg (U. S. P.),	$2\frac{1}{2}$ tr. oz.
Diluted Phosphoric Acid,	360 min.
Oil of Bitter Almond,	10 min.
Rum, Jamaica,	4 fl. oz.
Orange Flower Water,	enough to make 16 fl. oz.

To the Glycerite of Yolk of Egg (Glyconin), contained in a suitable bottle, gradually add the Cod Liver Oil, in small portions at a time, shaking after each addition, until the added portion is emulsified. Then gradually add the Phosphoric Acid, Rum, and Oil of Bitter Almond, incorporating them thoroughly. Finally, add enough Orange Flower Water to make sixteen (16) fluidounces, and mix the whole thoroughly together.

125. Emulsio Olei Morrhue cum Calcii et Sodii Phosphatibus. N. F.

Emulsion of Cod Liver Oil with Phosphates of Calcium and Sodium.

Emulsion of Cod Liver Oil with Phosphates of Lime and Soda.

Cod Liver Oil,	8 fl. oz.
Mucilage of Chondrus (N. F.),	5 fl. oz.
Phosphate of Calcium,	128 gr.
Phosphate of Sodium,	128 gr.
Syrup of Tolu,	1 fl. oz.
Alcohol,	1 fl. oz.
Flavoring,	a sufficient quantity.
Water,	enough to make 16 fl. oz.

Dissolve the Phosphate of Sodium in the Mucilage of Chondrus, and emulsify the

Cod Liver Oil, with the latter, as directed under *Emulsio Olei Morrhue*. Then triturate the Phosphate of Calcium with the Syrup of Tolu, add the mixture to the emulsion, afterwards add the Alcohol and Flavoring, and, finally, enough Water to make sixteen (16) fluidounces. Mix the whole thoroughly together.

Note.—If another method of emulsifying the oil is adopted, the Phosphate of Sodium should be dissolved in the aqueous portion of the mixture, and the Phosphate of Calcium incorporated mechanically. A very good emulsion can be made by using mucilage of dextrin.

129. Lac Fermentatum. N. F.

Fermented Milk.

Kumys.

Cow's Milk, fresh,	32 fl. oz.
Yeast, semi-liquid,	60 min.
Sugar,	1 tr. oz.

Dissolve the Sugar in the Milk, contained in a strong bottle, add the Yeast, cork the bottle securely, and keep it at a temperature between 25° and 32° C. (76° to 90° F.) for six hours; then transfer it to a cold place.

126. Vinum Carnis. N. F.

Wine of Beef.

Beef and Wine.

Extract of Beef,	256 gr.
Hot Water,	1 fl. oz.
Sherry Wine, enough to make 16 fl. oz.	

Pour the Hot Water upon the Extract of Beef contained in a mortar or other suitable vessel, and triturate until a smooth mixture results. Then gradually add, while stirring, fourteen (14) fluidounces of Sherry Wine. Transfer the mixture to a bottle, set this aside for a few days in a cold place, if convenient, then filter, and pass enough Sherry Wine through the filter to make sixteen (16) fluidounces.

Each fluidrachm represents 2 grains of Extract of Beef.

Note.—The Extract of Beef suitable for this or similar preparations is that which is prepared by Liebig's method.

127. Vinum Carnis et Ferri. N. F.

Wine of Beef and Iron.

Beef, Wine, and Iron.

Extract of Beef,	256 gr.
Tincture of Citro-Chloride of Iron,	256 min.
Hot Water,	1 fl. oz.
Sherry Wine, enough to make 16 fl. oz.	

Pour the Hot Water upon the Extract of Beef contained in a mortar or other suitable vessel, and triturate until a smooth mixture results. Then gradually add, while stirring, twelve (12) fluidounces of Sherry Wine. Next add the Tincture

and enough Sherry Wine to make sixteen (16) fluidounces. Transfer the mixture to a bottle, set this aside for a few days in a cold place, if convenient, filter, and pass enough Sherry Wine through the filter to restore the original volume.

Each fluidrachm represents 2 grains of Extract of Beef and 2 minims of Tincture of Citro-Chloride of Iron.

Note.—Regarding Extract of Beef, see *Note* to No. 426, page 1244.

428. Vinum Carnis, Ferri, et Cinchonæ. N. F.

Wine of Beef, Iron, and Cinchona.

Beef, Wine, Iron, and Cinchona.

Extract of Beef,	256 gr.
Tincture of Citro-Chloride of Iron,	256 min.
Sulphate of Quinine,	16 gr.
Sulphate of Cinchonidine,	8 gr.
Citric Acid,	6 gr.
Hot Water,	1 fl. oz.

Angelica Wine, enough to make 16 fl. oz.

Dissolve the Citric Acid and the Sulphates of Quinine and Cinchonidine in the Hot Water, and pour the solution upon the Extract of Beef contained in a mortar or other suitable vessel. Triturate the liquid with the Extract until they form a smooth mixture, then gradually add, while stirring, twelve (12) fluidounces of Angelica Wine, and afterwards the Tincture of Citro-Chloride of Iron. Transfer the mixture to a bottle, set this aside for a few days in a cold place, if convenient, filter, and pass enough Angelica Wine through the filter to make sixteen (16) fluidounces.

Each fluidrachm represents 2 grains of Extract of Beef, 2 minims of Tincture of Citro-Chloride of Iron, and small quantities of Cinchona alkaloids.

Note.—Regarding Extract of Beef, see *Note* to No. 426, page 1244. Angelica Wine is a variety of sweet California wine.

433. Liquor Seriparus. N. F.

Liquid Rennet.

Calves' Rennet, fresh,	2 tr. oz.
Chloride of Sodium,	360 gr.
Alcohol,	4 fl. oz.
Water,	16 fl. oz.

Dissolve the Chloride of Sodium in the Water, add the Alcohol, and macerate in this mixture the Rennet (or the washed mucous membrane of the fresh stomach of a suckling calf), during three days, under frequent agitation. Then filter.

Note.—If this liquid is to be used merely for curdling the milk, without separating the whey as a distinct layer, it should be added to the milk, previously warmed to a temperature of about 35° C. (95° F.), and the mixture should then be set aside, undisturbed, until it coagu-

lates. If the whey is to be separated, the Liquid Rennet should be added to the milk while cold, and the mixture heated to about 85° C. (95° F.), but not exceeding 40° C. (104° F.). One part of the liquid should coagulate between 200 and 300 parts of milk.

210. Liquor Carmini. N. F.

Solution of Carmine.

Carmine,	1 tr. oz.
Water of Ammonia,	6 fl. oz.
Glycerin,	6 fl. oz.
Water,	enough to make 16 fl. oz.

Triturate the Carmine to a fine powder in a Wedgwood mortar, gradually add the Water of Ammonia, and afterwards the Glycerin, under constant trituration. Transfer the mixture to a porcelain capsule, and heat it upon a water-bath, constantly stirring, until the liquid is entirely free from ammoniacal odor. Then cool, and add enough Water to make sixteen (16) fluidounces.

Note.—The best quality of Carmine, known in commerce as "No. 40," should be used for this preparation.

211. Liquor Coccineus. N. F.

Cochineal Color.

Cochineal, in No. 50 powder,	1 tr. oz.
Carbonate of Potassium,	$\frac{1}{2}$ tr. oz.
Alum,	$\frac{1}{2}$ tr. oz.
Bitartrate of Potassium,	1 tr. oz.
Glycerin,	8 fl. oz.
Alcohol,	1 fl. oz.
Water,	enough to make 16 fl. oz.

Triturate the Cochineal intimately with the Carbonate of Potassium and eight (8) fluidounces of Water. Then add the Alum and Bitartrate of Potassium successively, heat the mixture to boiling in a capacious vessel, then set it aside to cool, add to it the Glycerin and Alcohol, filter, and pass enough Water through the filter to make sixteen (16) fluidounces.

335. Spiritus Acidi Formici. N. F.

Spirit of Formic Acid.

Spiritus Formicarum (Germ. Pharm.). Spirit of Ants.

Formic Acid,	250 min.
Distilled Water,	8 $\frac{1}{2}$ fl. oz.
Alcohol,	enough to make 16 fl. oz.

Mix the Formic Acid with the Distilled Water, and add enough Alcohol to make sixteen (16) fluidounces.

Note.—Formic Acid is required by the Germ. Pharm. to have a specific gravity of 1.060 to 1.063.

347. Spongia Compressa. N. F.

Compressed Sponge.

Sponge Tent.

Sponge,	a sufficient quantity.
Mucilage of Acacia,	1 volume.
Water,	9 volumes.

Mix a sufficient quantity of Mucilage of Acacia and of Water, in the proportion of

one (1) volume of the former to nine (9) volumes of the latter, and immerse in the liquid the Sponge, previously freed from sand and other obvious impurities, and cut into suitable pieces. When the Sponge has been thoroughly impregnated, firmly wrap twine around it so as to bring it to the desired shape, and then dry it.

Note.—Sponge thus prepared is best preserved with the twine wrapped around it. If the twine is removed, special care must be taken to protect the Sponge against damp air.

348. Spongia Decolorata. N. F.

Decolorized Sponge.

Bleached Sponge.

Sponge,
Permanganate of Potassium,
Hyposulphite of Sodium,
Hydrochloric Acid,
Water, each, a sufficient quantity.

Free the Sponge from sand and any other obvious impurities or damaged portions by beating, washing, and trimming, then soak it for about fifteen minutes in a sufficient quantity of solution of Permanganate of Potassium, containing *one hundred and twenty* (120) grains to the pint, wringing the Sponge out occasionally and replacing it in the liquid. Then remove it and wash it with Water, until the latter runs off colorless. Wring out the Water, and then place the Sponge into a solution of Hyposulphite of Sodium containing *one* (1) troyounce to the pint. Next add for every pint of the last-named solution used, *one* (1) fluidounce of Hydrochloric Acid diluted with four (4) fluidounces of Water. Macerate the Sponge in the liquid for about fifteen minutes, expressing it frequently, and replacing it in the liquid. Then remove it, wash it thoroughly with Water, and dry it. In the case of large and dark-colored sponges, this treatment may be repeated until the color has been removed as far as possible.

Note.—If it is desired to keep the Sponge soft, and to prevent it from shrinking when dry, it may be dipped, after having been finally washed, into a mixture of 1 volume of Glycerin and 5 volumes of Water, after which it is to be wrung out and allowed to dry.

Ethereal Tincture of Cantharides.

Cantharides, 1 oz. (troy).
Spirit of Nitrous Ether, 14 fl. oz.
Macerate for eight days, and filter.

Hair Tonic.

(Prof. Gross.)

Tincture of Cantharides, 90 min.
Tincture of Capsicum, 20 min.
Glycerin, 80 min.
Perfumed Spirit, sufficient to make 6 fl. oz.
Mix.

Unguentum Cantharidis. U. S. 1870.

OINTMENT OF CANTHARIDES.

Cantharides,
Yellow Wax, of each, 1 oz. (av.).
Olive Oil, 6 fl. oz.

Infuse the Cantharides in the Oil in a covered vessel for twelve hours; then place the vessel in boiling water for fifteen minutes, strain through muslin with strong pressure, add the product to the Wax, previously melted, and stir constantly while the mixture cools.

Antispasmodic Mixture.

(Sydenham's.)

Tincture of Valerian, 5 fl. dr.
Compound Spirit of Ether, 1 fl. dr.
Tincture of Castor, 10 fl. dr.
Fennel Water, 12½ fl. oz.

Mix. Dose, a tablespoonful every three or four hours.

Tinctura Castorei. U. S. 1870.

TINCTURE OF CASTOR.

Castor (bruised), 1 oz. (troy).
Alcohol, 16 fl. oz.

Macerate for seven days, express, and filter through paper.

SODA-WATER SYRUPS.

Vanilla Syrup.

Fluid Extract of Vanilla, 2 fl. oz.
Syrup, a sufficient quantity to make 82 fl. oz.
Mix.

Ginger Syrup.

Tincture of Ginger, 4 fl. oz.
Syrup, a sufficient quantity to make 128 fl. oz.
Mix.

Lemon Syrup.

Solution of Citric Acid (1 in 10), 8 fl. oz.
Spirit of Lemon, 1½ fl. oz.
Syrup, 8 pints.
Tincture of Curcuma, a sufficient quantity to color.
Mix.

Syrup of Sarsaparilla.

Fluid Extract of Sarsaparilla, 2 fl. oz.
Oil of Sassafras,
Oil of Anise, of each, 12 min.
Oil of Gaultheria, 9 min.
Syrup, a sufficient quantity to make 8 pints.
Mix.

Orange Syrup.

Oil of Orange (fresh), 10 min.
Citric Acid, 120 gr.
Syrup, 64 fl. oz.
Mix.

Strawberry Syrup.

Strawberry Juice,	82 fl. oz.
Sugar,	128 oz. (av.).
Water,	82 fl. oz.

Mix the Juice and Water, and dissolve the Sugar by percolating with the mixture.

Raspberry Syrup.

Raspberry Juice,	82 fl. oz.
Sugar,	128 oz. (av.).
Water,	82 fl. oz.

Mix the Juice and Water, and dissolve the Sugar by percolating with the mixture.

Pineapple Syrup.

Pineapple Juice,	82 fl. oz.
Sugar,	128 oz. (av.).
Water,	82 fl. oz.

Mix the Juice and Water, and dissolve the Sugar by percolating with the mixture.

Nectar Syrup.

Vanilla Syrup,	40 fl. oz.
Pineapple Syrup,	8 fl. oz.
Strawberry Syrup,	16 fl. oz.
Mix.	

Chocolate Syrup.

Best Chocolate,	8 oz. (av.).
Sugar,	64 oz. (av.).
Water,	82 fl. oz.

Mix the Chocolate in the Water, and stir thoroughly over a slow fire; strain, and add the Sugar.

Sherbet Syrup.

Vanilla Syrup,	48 fl. oz.
Pineapple Syrup,	16 fl. oz.
Lemon Syrup,	16 fl. oz.
Mix.	

Coffee Syrup.

Coffee (roasted),	8 oz. (av.).
Boiling Water,	8 pints.
Sugar,	112 oz. (av.).
Make an infusion, filter, add the Sugar, and strain.	

COLORS FOR SHOW-BOTTLES.**Dark Blue.**

Copper Nitrate,	4 oz. (av.).
Water,	16 pints.
Water of Ammonia, a sufficient quantity.	
Dissolve the Copper salt, add Ammonia as long as it deepens the color; filter.	

Dark Green.

Copper Sulphate,	8 oz. (av.).
Potassium Bichromate,	60 gr.
Water,	16 pints.
Mix, and filter.	

Red.

Fuchsine,	20 gr.
Acetic Acid,	2 fl. oz.
Water,	8 pints.
Mix.	

Yellow.

Potassium Bichromate,	4 oz. (av.).
Nitric Acid,	4 fl. oz.
Water,	16 pints.
Mix, and filter.	

PREPARATIONS OF THE U.S.P. 1880 NOT ADMITTED TO THE U.S.P. 1890.

THIS list of preparations has been appended on account of the occasional call for such formulas, and because many of them possess decided merit and will no doubt be used for years to come. One advantage in grouping such by themselves is that the dismissed preparations can all be seen together, and this will aid the student in determining their character. The dismissed chemical salts will be found in the lists of unofficial substances at the beginning of the various chapters.

Abstracts.

The abstracts, with their formulas, will be found on page 458.

Acetum Lobeliae. U. S. 1880. *Vinegar of Lobelia.*

Lobelia, in No. 80 powder, 10 parts, or
Diluted Acetic Acid, a sufficient quantity,

By measure.

1½ oz. av.

To make 100 parts, or 1 pint.

Moisten the powder with 5 parts [or 1 fl. oz.] of Diluted Acetic Acid, pack it firmly in a conical glass percolator, and gradually pour Diluted Acetic Acid upon it until 100 parts [or 1 pint] of filtered liquid are obtained.

Acetum Sanguinariae. U. S. 1880. *Vinegar of Sanguinaria.*

Sanguinaria, in No. 80 powder, 10 parts, or
Diluted Acetic Acid, a sufficient quantity,

By measure.

1½ oz. av.

To make 100 parts, or 1 pint.

Moisten the powder with 5 parts [or 1 fl. oz.] of Diluted Acetic Acid, pack it firmly in a conical glass percolator, and gradually pour Diluted Acetic Acid upon it until 100 parts [or 1 pint] of filtered liquid are obtained.

Amylum Iodatum. U. S. 1880. *Iodized Starch.*

Starch, 95 parts, or 418 grains.
Iodine, 5 parts, or 22 grains.
Distilled Water, a sufficient quantity,

To make 100 parts, or about 1 oz. av.

1880

Triturate the Iodine with a little Distilled Water; add the Starch gradually and continue triturating until the compound assumes a uniform blue color, approaching black. Dry it at a temperature not exceeding 40° C. (104° F.) and rub it to a fine powder.

Ceratum Extracti Cantharidis. U. S. 1880. *Cerate of Extract of Cantharides.*

By measure.

Cantharides, in No. 60 powder, 80 parts, or 6 oz. av.
Resin, 15 parts, or 8 oz. av.
Yellow Wax, 85 parts, or 7 oz. av.
Lard, 85 parts, or 7 oz. av.
Alcohol, a sufficient quantity.

Moisten the Cantharides with 18 parts [or 4 fl. oz.] of Alcohol, and pack firmly in a cylindrical percolator; then gradually pour on Alcohol, until 180 parts [or 2½ pints] of percolate are obtained, or until the Cantharides are exhausted. Distil off the Alcohol by means of a water-bath, transfer the residue to a tared capsule and evaporate it, on a water-bath, until it weighs 15 parts [or 3 oz. av.]. Add to this the Resin, Wax, and Lard, previously melted together, and keep the whole at a temperature of 100° C. (212° F.) for 15 minutes. Lastly, strain the mixture through muslin, and stir it constantly until cool.

Ceratum Sabinæ. U. S. 1880. *Savine Cerate.*

By measure.

Fluid Extract of Savine, 25 parts, or 5 oz. av.
Resin Cerate, 90 parts, or 18 oz. av.

Melt the Resin Cerate by means of a water-bath, add the Fluid Extract of Savine, and continue the heat until the alco-

hol has evaporated; then remove the heat, and stir constantly until cool.

Charta Cantharidis. U. S. 1880. *Cantharides Paper.*

White Wax, 8 parts, or	4 oz. av.
Spermaceci, 3 parts, or	1½ oz. av.
Olive Oil, 4 parts, or	2 fl. oz.
Canada Turpentine, 1 part, or	½ oz. av.
Cantharides, in No. 40 powder, 1 part, or	½ oz. av.
Water, 10 parts, or	5 fl. oz.

Mix all the substances in a tinned vessel, and boil gently for two hours, constantly stirring. Strain through a woollen strainer without expressing, and, by means of a water-bath, keep the mixture in a liquid state in a shallow, flat-bottomed vessel with an extended surface. Coat strips of sized paper with the melted plaster, on one side only, by passing them successively over the surface of the liquid; when dry, cut the strips into rectangular pieces.

Elixir Aurantii. U. S. 1880. *Elixir of Orange.* [Simple Elixir.]

Oil of Orange Peel, 1 part, or	2½ fl. dr.
Cotton, 2 parts, or	4 dr.
Sugar, in coarse powder, 100 parts, or	25 oz. av.
Alcohol,	
Water, each, a sufficient quantity,	

To make 800 parts, or about 4 pints.

Mix Alcohol and Water in the proportion of one part [or 1 pint] of Alcohol to 8 parts [or 2½ pints] of Water. Add the Oil of Orange Peel to the Cotton, in small portions at a time, distributing it thoroughly by picking the cotton apart after each addition; then pack tightly in a conical percolator, and gradually pour on the mixture of Alcohol and Water, until 200 parts (or 8½ pints) of filtered liquid are obtained. In this liquid dissolve the sugar by agitation, without heat, and strain.

Emplastrum Ammoniaci. U. S. 1880. *Ammoniac Plaster.*

Ammoniac, 100 parts, or	5 oz. av.
Diluted Acetic Acid, 140 parts, or	½ pint.

Digest the Ammoniac in the Diluted Acetic Acid, in a suitable vessel, avoiding contact with metals, until it is entirely emulsionized; then strain, and evaporate the strained liquid, by means of a water-bath, stirring constantly, until a small portion, taken from the vessel, hardens on cooling.

Emplastrum Asafetidae. U. S. 1880. *Asafetida Plaster.*

Asafetida, 35 parts, or	18 oz. av.
Lead Plaster, 35 parts, or	18 oz. av.
Galbanum, 15 parts, or	5½ oz. av.
Yellow Wax, 15 parts, or	5½ oz. av.
Alcohol, 120 parts, or	8 pints.

Digest the Asafetida and Galbanum with the Alcohol on a water-bath, separate the liquid portion, while hot, from the coarser impurities by straining, and evaporate it to the consistence of honey; then add the Lead Plaster and the Wax, previously melted together, stir the mixture well, and evaporate to the proper consistence.

Emplastrum Galbani. U. S. 1880. *Galbanum Plaster.*

Galbanum, 16 parts, or	8 oz. av.
Turpentine, 2 parts, or	1 oz. av.
Burgundy Pitch, 6 parts, or	8 oz. av.
Lead Plaster, 76 parts, or	38 oz. av.

To make 100 parts, or 50 oz. av.

To the Galbanum and Turpentine, previously melted together and strained, add, first, the Burgundy Pitch, then the Lead Plaster, melted over a gentle fire, and mix the whole thoroughly.

Emplastrum Picis Canadensis. U. S. 1880. *Canada Pitch Plaster.* [Hemlock Pitch Plaster.]

Canada Pitch, 90 parts, or	9 oz. av.
Yellow Wax, 10 parts, or	1 oz. av.

To make 100 parts, or 10 oz. av.

Melt them together, strain the mixture, and stir constantly until it thickens on cooling.

Extractum Cornus Fluidum. U. S. 1880. *Fluid Extract of Cornus.*

Cornus, in No. 60 powder, 100 grammes, or	50 oz. av.
Glycerin, 20 grammes, or	7½ fl. oz.
Diluted Alcohol, a sufficient quantity,	

To make 100 cubic centimeters, or 8 pints.

Mix the Glycerin with 80 Gm. [or 41 fl. oz.] of Diluted Alcohol. Moisten the powder with 80 Gm. [or 15 fl. oz.] of the mixture, and pack it firmly in a cylindrical percolator; then add enough of the menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for 48 hours. Then allow the percolation to proceed, gradually adding, first, the re-

mainder of the menstruum, and afterward, Diluted Alcohol, until the Cornus is exhausted. Reserve the first 85 C.c. [or 40 fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough Diluted Alcohol to make the Fluid Extract measure 100 C.c. [or 3 pints].

Extractum Lactucarii Fluidum. U. S. 1880. *Fluid Extract of Lactucarium.*

Lactucarium, in coarse pieces, 12½ oz. av.
100 Gm., or 1 pint.
Ether, 100 Gm., or
Alcohol,
Water, each, a sufficient quantity,

To make 100 C.c., or 12 fl. oz.

Add the Lactucarium to the Ether contained in a tared flask having the capacity of 600 C.c. [or about 4½ pints], and let it macerate for 24 hours; then add 800 Gm. [or 2½ pints] of Water, and shake the mixture well. Fit a bent glass tube into the neck of the flask, and, having immersed the flask in hot water, recover the Ether by distillation. When all the Ether has distilled over, remove the tube, and, after thoroughly shaking the contents of the flask, continue the heat for half an hour. Let the mixture cool, add 100 Gm. [or 14½ fl. oz.] of Alcohol, and enough Water to make the whole mixture weigh 500 Gm. [or 64 oz. av.]; after maceration for 24 hours, with occasional agitation, express and filter the liquid. Return the dregs to the flask and macerate them with 200 Gm. [or 28 fl. oz.] of a mixture of Alcohol and Water made in the proportion of 1 part [or 8 fl. oz.] of Alcohol to 3 parts [or 20 fl. oz.] of Water; repeat the maceration 2 or 3 times, successively, with fresh portions of the mixture, until the dregs are tasteless, or nearly so. Mix, and filter the liquids thus obtained, and concentrate them, by means of a water-bath (the first expressed liquid by itself), until the combined weight of the liquids is 60 Gm. [or 7½ oz. av.]; mix the liquids, add 40 Gm. [or 6 fl. oz.] of Alcohol, and let the mixture cool in the evaporating vessel, stirring the mixture frequently, and during the intervals keeping the vessel well covered. When cool, add enough Alcohol to make the mixture weigh 100 Gm. [or 12½ oz. av.], transfer the liquid to a flask, and add enough Water to make the mixture measure 100 C.c. [or 12 fl. oz.], using the Water so required to rinse the evaporating vessel. Shake the mixture occasionally, during several hours (and frequently, if a portion of the precipitate is found to be

tenacious), and, when a uniform mixture results, set it aside for 24 hours, so that any precipitate formed may subside. Decant the clear liquid, transfer the precipitate to a filter, and, after thoroughly draining it into the decanted liquid, wash it with a mixture of Alcohol and Water made in the proportion of 3 parts [or 10 fl. dr.] of Alcohol to 4 parts [or 11 fl. dr.] of Water, until the washings pass tasteless. Concentrate the washings, by evaporation, to a syrupy consistence, mix with the decanted liquid, and add enough of the last-named mixture of Alcohol and Water to make the whole measure 100 C.c. [or 12 fl. oz.]. Lastly, after 24 hours, having meanwhile shaken the Fluid Extract occasionally, filter it through paper.

Extractum Malti. U. S. 1880. *Extract of Malt.*

Malt, in coarse powder, not finer than No. 12, 100 parts, or 80 oz. av.
Water, a sufficient quantity.

Upon the powder, contained in a suitable vessel, pour 100 parts [or 5 pints] of Water, and macerate for 6 hours. Then add 400 parts [or 20 pints] of Water, heated to about 80° C. (86° F.), and digest for an hour at a temperature not exceeding 55° C. (131° F.). Strain the mixture with strong expression. Finally, by means of a water-bath, or vacuum-apparatus, at a temperature not exceeding 55° C. (131° F.), evaporate the strained liquid rapidly to the consistence of thick honey. Keep the product in well-closed vessels, in a cool place.

Extractum Mezerei. U. S. 1880. *Extract of Mezereum.*

Mezereum, in No. 80 powder, 100 parts, or 16 oz. av.
Alcohol, a sufficient quantity.

Moisten the powder with 40 parts [or 6 fl. oz.] of Alcohol, and pack it firmly in a cylindrical percolator; then add enough Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for 48 hours. Then allow the percolation to proceed, gradually adding Alcohol, until 800 parts [or 3 pints] of tincture are obtained, or the Mezereum is exhausted. Reserve the first 90 parts [or 13 fl. oz.] of the percolate; evaporate the remainder, at a temperature not exceeding 50° C. (122° F.) to 10 parts [or 2 fl. oz.]; mix this with the reserved portion, and evaporate, at or below the before-mentioned temperature, in a porcelain capsule, on a water-bath, to a pilular consistence.

Fel Bovis Inspissatum. U. S. 1880.
Inspissated Ox Gall.

Fresh Ox Gall, 3 parts, or 16 oz. av.
Alcohol, 1 part, or 6 fl. oz.

Evaporate the Ox Gall in a porcelain capsule, on a water-bath, to 1 part [or 5½ oz. av.], then add to it the Alcohol, agitate the mixture thoroughly, and let it stand, well covered, for 24 hours. Decant the clear solution, filter the remainder, and, having mixed the liquids and distilled off the Alcohol, evaporate to a pilular consistence. (See Fel Bovis Purificatum.)

Infusum Brayeræ. U. S. 1880. *Infusion of Brayera.*

Brayera, in No. 20 powder, 6 parts, or 1 oz. av.
Boiling Water, 100 parts, or 1 pint.

Pour the Boiling Water upon the Brayera, and let it macerate in a covered vessel until cool. This infusion should be dispensed without straining.

Linimentum Cantharidis. U. S. 1880.
Cantharides Liniment.

Cantharides, in No. 60 powder, 15 parts, or 1 oz. av.
Oil of Turpentine, a sufficient quantity, or 8 fl. oz.

To make 100 parts, or ½ pint.

Digest the Cantharides with 100 parts [or ½ pint] of Oil of Turpentine, in a closed vessel, by means of a water-bath, for 8 hours; then strain and add enough Oil of Turpentine through the strainer to make the Liniment weigh 100 parts [or measure ½ pint].

Linimentum Plumbi Subacetatis. U. S. 1880. *Liniment of Subacetate of Lead.*

Solution of Subacetate of Lead, 40 parts, or 2 oz. av.
Cotton Seed Oil, 60 parts, or 8 oz. av.

To make 100 parts, or 5 oz. av.

Mix them.

Liquor Ferri et Quininae Citratis. U. S. 1880. *Solution of Citrate of Iron and Quinine.*

Citrate of Iron and Ammonium, 65 parts, or 568 grains.
Quinine, dried at 100° C. (212° F.), until it ceases to lose weight, 12 parts, or 105 grains.
Citric Acid, 28 parts, or 245 grains.
Alcohol, 80 parts, or 6 fl. dr.
Distilled Water, a sufficient quantity,

To make 200 parts, or 4 oz. av.

Dissolve the Citrate of Iron and Ammonium in 200 parts (or 4 fl. oz.) of Distilled Water, contained in a tared porcelain capsule, heat the solution to 80° C. (140° F.) on a water-bath, add the Citric Acid, and, when it is dissolved, add the Quinine, stirring the mixture until a perfect solution has been obtained. Evaporate this to 160 parts (or 8 oz. av.), allow it to cool, add the Alcohol, and finally enough Distilled Water to make the solution weigh 200 parts (or 4 oz. av.).

Liquor Gutta-Perchæ. U. S. 1880. *Solution of Gutta-Percha.*

Gutta-Percha, in thin slices, nine parts, 9
Commercial Chloroform, ninety-one parts, 91
Carbonate of Lead, in fine powder, ten parts, 10

To make one hundred parts, 100

Add the Gutta-Percha to 70 parts of the Chloroform, contained in a bottle, cork it well, and shake it occasionally until the Gutta-Percha is dissolved. Then add the Carbonate of Lead, previously mixed with the remainder of the Chloroform, and, having several times shaken the whole together, at intervals of half an hour, set the mixture aside until the insoluble matters have subsided and the solution has become perfectly clear. Lastly, decant the liquid and preserve it in small, cork-stoppered bottles.

Liquor Pepsini. U. S. 1880. *Solution of Pepsin.* [Liquid Pepsin.]

Saccharated Pepsin, 40 parts, or 400 grains.
Hydrochloric Acid, 12 parts, or 100 minims.
Glycerin, 400 parts, or 7 fl. oz.
Water, 548 parts, or 12 fl. oz.

To make 1000 parts, or about 20 fl. oz.

Dissolve the Saccharated Pepsin in the Water, previously mixed with the Hydrochloric Acid, add the Glycerin, let the mixture stand 24 hours, and filter.

Mistura Magnesiæ et Asafetida. U. S. 1880. *Mixture of Magnesia and Asafetida.* [Dewees' Carminative.]

Carbonate of Magnesium, 5 parts, or 860 grains.
Tincture of Asafetida, 7 parts, or 10 fl. dr.
Tincture of Opium, 1 part, or 75 minims.
Sugar, 10 parts, or 1½ oz. av.
Distilled Water, a sufficient quantity,

To make 100 parts, or about 1 pint.

Rub the Carbonate of Magnesium and Sugar in a mortar, with the Tincture of Asafetida and Tincture of Opium. Then gradually add enough Distilled Water to make the mixture weigh 100 parts [or measure 16 fl. oz.].

Mistura Potassii Citratis. U. S. 1880.
Mixture of Citrate of Potassium. [Neutral Mixture.]

Fresh Lemon Juice, strained, 4 fl. oz.
100 parts, or
Bicarbonate of Potassium, about 10 parts, or a sufficient quantity, 170 grains.

Add the Bicarbonate of Potassium gradually to the Lemon Juice until it is neutralized.

This preparation should be freshly made, when wanted for use.

Mucilago Cydonii. U. S. 1880. *Mucilage of Cydonium.*

Cydonium, 2 parts, or 86 grains.
Distilled Water, 100 parts, or 4 fl. oz.

Macerate the Cydonium for half an hour, in a covered vessel, with the Distilled Water, frequently agitating. Then drain the liquid through muslin, without pressure. This preparation should be freshly made, when required for use.

Pilulæ Ferri Compositæ. U. S. 1880.
Compound Pills of Iron.

	Grains.	Grammes.
Myrrh, in fine powder, one hundred and fifty grains,	150	9.75
Carbonate of Sodium, seventy-five grains,	75	4.85
Sulphate of Iron, seventy-five grains,	75	4.85
Syrup, a sufficient quantity,		
	800	19.45

To make one hundred pills, 100

Pilulæ Galbani Compositæ. U. S. 1880.
Compound Pills of Galbanum.

	Grains.	Grammes.
Galbanum, one hundred and fifty grains,	150	9.75
Myrrh, one hundred and fifty grains,	150	9.75
Asafetida, fifty grains,	50	3.25
Syrup, a sufficient quantity,		
	850	22.75

To make one hundred pills, 100

Spiritus Odoratus. U. S. 1880. *Perfumed Spirit.* [Cologne Water.]

Oil of Bergamot, 16 parts, or 2 fl. oz.
Oil of Lemon, 8 parts, or 1 fl. oz.
Oil of Rosemary, 8 parts, or 1 fl. oz.
Oil of Lavender Flowers, 4 parts, or ½ fl. oz.
Oil of Orange Flowers, 4 parts, or ½ fl. oz.
Acetic Ether, 2 parts, or 2 fl. dr.
Water, 158 parts, or 18 fl. oz.
Alcohol, 800 parts, or 6½ pints.

To make 1000 parts, or about 8 pints.

Dissolve the Oils and the Acetic Ether in the Alcohol, and add the Water. Set the mixture aside, in a well-closed bottle, for eight days, then filter through paper, in a well-covered funnel.

Syrupus Ferri Bromidi. U. S. 1880.
Syrup of Bromide of Iron.

A syrupy liquid containing 10 percent. of Ferrous Bromide [FeBr₂; 216.5].

Iron, in the form of fine wire, and cut into small pieces, 30 parts, or 1½ oz. av.
Bromine, 75 parts, or 9 fl. dr.
Sugar, in coarse powder, 600 parts, or 28 oz. av.
Distilled Water, a sufficient quantity,

To make 1000 parts, or about 2 pints.

Introduce the iron into a flask of thin glass of suitable capacity, add to it 200 parts [or 9 fl. oz.] of Distilled Water and afterward the Bromine. Shake the mixture occasionally, until the reaction ceases and the solution has acquired a green color and has lost the odor of Bromine. Place the Sugar in a porcelain capsule, and filter the solution of bromide of iron into the Sugar. Rinse the flask and Iron wire with 90 parts [or 4 fl. oz.] of Distilled Water, and pass the washings through the filter into the Sugar. Stir the mixture with a porcelain or wooden spatula, heat it to the boiling point on a sand-bath, and, having strained the Syrup through linen into a tared bottle, add enough Distilled Water to make the product weigh 1000 parts [or measure 2 pints]. Lastly, shake the bottle and transfer its contents to small vials, which should be completely filled, securely corked, and kept in a place accessible to daylight.

Syrupus Limonis. U. S. 1880. *Syrup of Lemon.*

Lemon Juice, recently expressed and strained, 40 parts, or 17 fl. oz.
Fresh Lemon Peel, 2 parts, or 1 oz. av.
Sugar, in coarse powder, 60 parts, or 28 oz. av.
Water, a sufficient quantity,

To make 100 parts, or about 2 pints.

Heat the Lemon Juice to the boiling point; then add the Lemon Peel, and let the whole stand, closely covered, until cold. Filter, add enough Water through the filter to make the filtrate weigh 40 parts [or measure 17 fl. oz.], dissolve the Sugar in the filtered liquid by agitation, without heat, and strain.

Tinctura Conii. U. S. 1880. *Tincture of Conium.*

Conium in No. 30 powder, 150 parts, or 4½ oz. av.
Diluted Hydrochloric Acid, 4 parts, or 1 fl. dr.
Diluted Alcohol, a sufficient quantity,

To make 1000 parts, or 2 pints.

Moisten the powder with 45 parts [or 2 fl. oz.] of Diluted Alcohol, previously mixed with the Diluted Hydrochloric Acid, and macerate for 24 hours; then pack it moderately in a conical glass percolator, and gradually pour Diluted Alcohol upon it, until 1000 parts [or 2 pints] of Tincture are obtained.

Tinctura Ferri Acetatis. U. S. 1880. *Tincture of Acetate of Iron.* [Tincture of Ferric Acetate.]

Solution of Acetate of Iron, 50 parts, or 4 fl. oz.
Alcohol, 80 parts, or 8 fl. oz. 8 fl. dr.
Acetic Ether, 20 parts, or 2 fl. oz.

To make 100 parts, or 9 fl. oz.

Mix the Alcohol and Acetic Ether, and gradually add the Solution of Acetate of Iron, taking care that the mixture remains cool. Keep the Tincture in glass-stoppered bottles, in a cool and dark place.

Tinctura Ignatiæ. U. S. 1880. *Tincture of Ignatia.*

Ignatia, in No. 60 powder, 10 parts, or 8 oz. av.
Alcohol,
Water, each, a sufficient quantity.

Mix Alcohol and Water in the proportion of 8 parts [or 4½ pints] of Alcohol to 1 part [or ½ pint] of Water. Moisten the

powder with 10 parts [or ½ pint] of the menstruum, and macerate for 24 hours; then pack it firmly in a cylindrical percolator, and gradually pour menstruum upon it, until the Ignatia is exhausted. Reserve the first 90 parts [or 4½ pints] of the percolate, evaporate the remainder to 10 parts [or ½ pint], and mix with the reserved portion. Of this Tincture take any convenient number of parts, and, by means of a water-bath, evaporate it to dryness. Weigh the resulting extract, and from its weight calculate the quantity of extract contained in the 100 parts of Tincture obtained; then dissolve the dried extract in the remainder of the Tincture, and add enough of the above menstruum to make the product weigh so many parts that each 100 parts of Tincture shall contain 1 part of dry extract. Lastly, mix thoroughly, and filter through paper.

Trochisci Magnesie. U. S. 1880.

Troches of Magnesia.

	Grains.	Grammes.
Magnesia, 300 grains,	300	19.50
Nutmeg, in fine powder, fifteen grains,	15	1.00
Sugar, in fine powder, nine hundred grains,	900	58.50
Mucilage of Tragacanth, a sufficient quantity,		

To make 100 troches, 100

Rub the Magnesia and the powders together until they are thoroughly mixed; then, with Mucilage of Tragacanth, form a mass, to be divided into 100 troches.

Trochisci Sodii Santoninatis. U. S. 1880. *Troches of Santoninate of Sodium.*

	Grains.	Grammes.
Santoninate of Sodium, in fine powder, 100 grains,	100	6.50
Sugar, in fine powder, 2000 grains,	2000	130.00
Tragacanth, in fine powder, 50 grains,	50	3.25
Orange Flower Water, a sufficient quantity,		

To make 100 troches, 100

Rub the powders together until they are thoroughly mixed; then, with Orange Flower Water, form a mass, to be divided into 100 troches.

Unguentum Acidi Gallici. U. S. 1880. *Ointment of Gallic Acid.*

Gallic Acid, 10 parts, or 48 grains.
Benzoinated Lard, 90 parts, or 1 oz. av.

To make 100 parts, or about 1 oz. av.

Rub the Gallic Acid with the Benzoinated Lard, gradually added, until they are thoroughly mixed, avoiding the use of an iron spatula.

Unguentum Mezerei. U. S. 1880. *Mesereum Ointment.*

Fluid Extract of Mezereum,	2 fl. dr.
25 parts, or	
Lard, 80 parts, or	880 grains.
Yellow Wax, 12 parts, or	54 grains.

To make about 1 oz. av.

Melt together the Lard and Wax with a moderate heat, add the Fluid Extract, and stir the mixture constantly until the alcohol has evaporated; then continue to stir until cool.

Unguentum Sulphuris Alkalinum. U. S. 1880. *Alkaline Sulphur Ointment.*

Washed Sulphur, 20 parts, or	96 grains.
Carbonate of Potassium, 10 parts, or	48 grains.
Water, 5 parts, or	$\frac{1}{2}$ fl. dr.
Benzoinated Lard, 65 parts, or	812 grains.

To make 100 parts, or about 1 oz.

Rub the Sulphur with the Carbonate of Potassium and the Water, gradually add the Benzoinated Lard, and mix thoroughly.

Vinum Aloes. U. S. 1880. *Wine of Aloes.*

Purified Aloes, 6 parts, or	2 oz. av.
Cardamom, 1 part, or	146 grains.
Ginger, 1 part, or	146 grains.
Stronger White Wine, a sufficient quantity,	

To make 100 parts, or 2 pints.

Mix the Aloes, Cardamom, and Ginger, and reduce them to a moderately coarse (No. 40) powder. Macerate the powder

with 90 parts [or 26 fl. oz.] of Stronger White Wine for 7 days, with occasional agitation, and filter through paper; adding, through the filter, enough Stronger White Wine to make the filtered liquid weigh 100 parts [or measure 2 pints].

Vinum Aromaticum. U. S. 1880. *Aromatic Wine.*

Lavender, 1 part, or	72 grains.
Origanum, 1 part, or	72 grains.
Peppermint, 1 part, or	72 grains.
Rosemary, 1 part, or	72 grains.
Sage, 1 part, or	72 grains.
Wormwood, 1 part, or	72 grains.
Stronger White Wine, a sufficient quantity,	

To make 100 parts, or 1 pint.

Mix the solid ingredients, and reduce them to a coarse (No. 20) powder. Moisten the powder with 4 parts [or 6 fl. dr.] of Stronger White Wine, pack it moderately in a conical glass percolator, and gradually pour enough Stronger White Wine upon it to make the filtered liquid weigh 100 parts [or measure 1 pint].

Vinum Rhei. U. S. 1880. *Wine of Rhubarb.*

Rhubarb, in No. 80 powder, 10 parts, or	8 $\frac{1}{2}$ oz. av.
Calamus, in No. 80 powder, 1 part, or	140 grains.
Stronger White Wine, a sufficient quantity,	

To make 100 parts, or 2 pints.

Moisten the mixed powders with 5 parts [or 1 $\frac{1}{2}$ fl. oz.] of Stronger White Wine, pack the mixture in a conical glass percolator, and gradually pour enough Stronger White Wine upon it to make the filtered liquid weigh 100 parts [or measure 2 pints].

APPENDIX.

ANSWERS TO PRACTICAL PROBLEMS AND EXERCISES.

(See page 24.)

[The answers to these questions have been worked out from the data given in the problems or chapters, but may vary slightly from other results on account of the use of metric or other equivalents not given in this book, or because in the answer or in some of the results leading to it, the decimals have not been carried out far enough or perhaps too far.]

1. Ans. 700 gr. each of powdered ipecac and opium and 5600 gr. of powdered sugar of milk. 2. Ten per cent. each of powdered ipecac and opium and eighty per cent. of powdered sugar of milk. 3. 3195 gr. 4. 3775 gr. 5. 34 cents. 6. 128. 7. 7680. 8. 9600. 9. 1750. 10. 1822.8. 11. 1920. 12. 48 + (1 pint = 7291.2 gr.). 13. 41.66 +. 14. 80. 15. Linseed oil, 131; lime water, 13iv. 16. Six. 17. Place 4.55 gr. (one per cent. of 455 gr.) of cocaine hydrochlorate in a graduate, and dissolve it in enough distilled water to make a fluid-ounce; or, more conveniently, dissolve 5 grains in 1 fl. oz. 40 min. of water and use 1 fl. oz. of the solution. 18. Strychnine, 2 gr.; quinine, 128 gr.; ferric phosphate, 256 gr. 19. \$1.20. 20. He would lose \$1. 21. 7500 mm. 22. 8.0628 M. 23. 6.80 M. 24. 12.548 M. 25. 12.548 M. 26. 1.001 M. 27. Twenty-five dekametres. 28. Twenty-five decimetres. 29. Yes. 30. One metre and twenty centimetres. 31. \$1.2 is an unusual way of expressing one dollar and two-tenths: one dollar and two dimes is also unusual; but one dollar and twenty cents is common. 32. Four thousand two hundred and sixty-three metres and six hundred and seventy-eight millimetres. 33. 81.896 M. (Place each row in position, beginning at the right-hand column, and add in the usual manner; if 816 cm. is to be placed, beginning with 6 in the centimetre place, and 8 would be in the metre place, thus 8.16; 782 dm. would be 78.2, while 36 mm. would be 0.036)—

$$\begin{array}{r} 8.16 \\ 78.2 \\ \hline 0.086 \\ \hline 81.896 \end{array}$$

34. 0.015 M. 35. 478.016 M. 36. 500. 37. 8.86 sq. M. 38. 8.8608 sq. M. 39. 8.030808 sq. M. 40. 20.202020 sq. M. 41. 505.0005 sq. M. 42. 1,000,000. 43. 68.068068068 cu. M. 44. 1000. 45. A litre. 46. 50. 47. 174.625 L., or 174 L. 625 C.c. 48. Oil of juniper, 2 Gm.; oil of caraway, oil of fennel, each 0.20 Gm.; alcohol, 600 Gm.; water, 897.60 Gm. 49. Oil of juniper, 14 gr.; oil of caraway, oil of fennel, each 1.4 gr.; alcohol, 4200 gr.; water, 2788.2 gr. 50. 82.28 +. 51. 62.49 + fl. oz. (7291.2 \times 1.405, the sp. gr. of solution of chloride of iron (see page 88), = 10244.186, the weight of one pint of solution of chloride of iron; 10244.186 \times 37.8 = 3872.2834080, the number of grains of anhydrous salt in one pint of solution of chloride of iron; 10 times this amount (10 \times 3872.2834080) equals the weight in grains of a solution containing 10 per cent. of anhydrous salt, 38722.834 gr.; now if the weight of one pint of solution of chloride of iron be subtracted from it, the remainder must be the number of grains of water to be added to make the whole 10 per cent., 38722.834 — 10244.186 = 28478.698; then 28478.698 \div 455.7 (the number of grains in a fluidounce of water) = 62.49 + fl. oz.). 52. 8.46 + fl. oz. solution, 7.53 + fl. oz. water. 53. 15 per cent. 54. 5.5 gr. 55. 377 gr. 56. 16 min. 57. 480. 58. 680 gr. 59. 604.88 + gr. 60. 497.6 + gr. 61. 11. 62. 3236.47 gr. 63. 25.277 + gr. 64. 28.700 + gr. 65. 8059 gr. 66. 4938 69 + gr. 67. 88.58 + gr. 68. 15.5 + min. 69. 2762.19 +. 70. 108.78 + min. 71. 1800. 72. 61.025 + (gallon = 281 cu. in.). 73. 4731 +. 74. 28314.87 +. 75. 946.82 +. 76. 2118.4 +. 77. 270.52 +. 78. 458.59 +. 79. 1870.17 +. 80. 378250.88 +. 81. 91.44 +. 82. 189. 83. 1021.2. 83a. 1.0212. 83b. 1021200. 84. 1609.829 +. 85. 721.65 +. 86. 187.2. 87. 5 oz., 262.5 gr. 88. 20. 89. 8.47 + gr. 90. 324 Gm., 5 gr. nearly. 91. 5248 gr. 92. 10 lbs. troy, or 8 lbs. 8 oz. 287.5 gr. av. 93. 30 lbs. troy, or 24 lbs. 10 oz. 425 gr. av. 94. 8 lbs. 9 oz. 382.5 gr. troy, or 7 lbs. 8 oz. 87.5 gr. av. 95. 8.982

GLOSSARY

OF

UNCOMMON NAMES, TERMS, OR SUBSTANCES.

A.

- Acetum Acerrimum.** Concentrated acetic acid.
- Bezoardicum.** Aromatic vinegar.
- Saturni.** Solution of lead subacetate.
- Theriacle.** Aromatic vinegar.
- Acetylphenylamine.** Acetanilid, *U. S. P.*
- Acid, Anticyclic.** Mixture of antipyrin and salicylic acid.
- Boroboracic (Acid Boroboric).** Mixture of equal parts of borax and boric acid.
- Borussic.** Prussic. Hydrocyanic.
- Carbasotic (Picronitric acid).** Picric acid.
- Coalic.** Obtained by treating coal with 84 per cent. nitric acid.
- Cresylic.** Cresol.
- Nancic.** Lactic acid.
- Phenic.** Carbolic acid.
- Soriodolic.** Diiodoparaphenolsulphonic acid. (Antiseptic.)
- Sozolic.** Orthophenolsulphonic acid.
- Sulphhydric.** Hydrogen sulphide.
- Sulphuretted hydrogen.** Hydro-sulphuric acid.
- Thiolic.** Sulphurated and sulphonated linseed oil.
- Tumenolsulphonic.** Obtained by treating the distillate of a mineral oil with sulphuric acid.
- Acidum Asepticum (Acidum Aseptinum).** Mixture of solution of hydrogen peroxide with boric and salicylic acids.
- Chloronitrosam.** Nitrohydrochloric acid.
- Ceruleum (Blue acid).** Hydrocyanic acid.
- Muriaticum Oxygenatum.** Chlorine.
- Nitrico-Nitrosam.** Fuming nitric acid.
- Ossium.** Glacial phosphoric acid.
- Scytodepsicum.** Tannic acid.
- Actina.** Contains menthol, oil of mustard, and ether.
- Adeps Anserinus.** Goose-grease.
- Gadi.** Cod-liver oil.
- Lanæ.** Lanolin (purified wool-fat).
- Ovillus.** Mutton-suet.
- Adipatum.** Substitute for lard; a mixture of lanolin, vaselin, and ceresin.
- Adragante.** Tragacanth.
- Aer Fixus.** Carbonic acid gas.
- Aerosus Lapis.** Lapis calaminaris.
- Aerosol.** Ozonized volatile oils. (Ozone Co., New York.)
- Ærugo.** Crude copper acetate.
- Æs.** Copper.
- Æs Aratum.** Copperas.
- Æther Vegetabilis.** Acetic ether.
- Ætheroleum.** Volatile (essential) oil.
- Æthiops Antimonialis.** Chiefly a mixture of black antimony and mercury.
- Martialis.** A black iron oxide; formed by keeping iron filings covered with water for a long time.
- Mineralis.** Mixture of mercury and sulphur.
- per se.** Mercury oxide.
- Vegetabilis.** Charcoal of sea-weed.
- Affium.** Extract of poppy-heads (opium).
- Agathin.** Salicylalphamethylphenylhydrazone. (Anodyne.)
- Agnine.** Lanolin without the water. (Metcalf & Co., Boston.)
- Agopyrin.** Said to be a mixture of salpyrin, ammonium chloride, and cinchonine sulphate. (Influenza remedy.)
- Alabastine.** An improved kalsomine.
- Alanin-Mercury.** Mercury amidopropionate.
- Alboline.** A purified petroleum product, similar to white vaselin. (McKesson & Robbins.)
- Album Græcum.** Excrement of dogs.
- Nigrum.** Excrement of mice or rats.
- Alcohol Sulphuris.** Carbon disulphide.
- Alcolene.** A mixture of ethyl and methyl alcohols.
- Alcoolat (French).** A distilled spirit.
- Alcoolature (French).** An alcoholic tincture of a fresh plant. ("Green tinctures.")

- Alcoolé** (French). An alcoholic solution of a substance entirely soluble in the alcohol.
- Alegar**. Ale vinegar. (Made by fermenting ale upon raisins or vine cuttings.)
- Alexine**. A generic name for protective albuminous preparations used for inoculations.
- Algaroth**. Antimony oxychloride.
- Alkali, Vegetable**. Potassium carbonate.
- Volatile**. Ammonium carbonate.
- Alkalithia**. Contains caffeine, sodium, and potassium bicarbonates, and lithium carbonate. (Specialty of Keasbey & Mattison.)
- Alkathrepta**. A homœopathic preparation of cacao.
- Almond Bran**. A cosmetic powder for washing, consisting of perfumed powdered almonds and borax.
- Alum, Rock** (Alumen Rupeum). Lump alum as it occurs with the earth attached.
- Roman**. See Rock Alum.
- Alumen Plumosum**. Asbestos.
- Alummol**. Aluminum salt of oxymethylsulphonic acid. Aluminum naphthol sulfonate. (Astringent antiseptic.)
- Amadou**. Punk; tinder.
- Ambretta Seeds**. Musk seeds.
- Amianthus**. Asbestos.
- Amidol**. Diamidophenol (for photographic purposes).
- Amidum**. Starch.
- Ammonium Carbonicum Pyro-Oleosum**. A mixture of ammonium carbonate with "animal oil."
- Sulpho-Ichthyolate**. Ichthyol.
- Amphion**. Opium.
- Amplosia**. An unfermented juice of the grape.
- Amylopsin**. Starch-converting ferment of the pancreatic juice.
- Analgesic**. An antineuralgic and anodyne. Orthoexethylalphamonoacetyl-amidoquinoline. Orthoöxyethylanamobenzoylamidoquinoline.
- Analgesine**. Antipyrin.
- Anaphromeli**. Clarified honey (Mel despumatum).
- Anaspalin**. Ointment base, similar to lanolin.
- Angioneurosin**. Nitroglycerin.
- Anima Articulorum** (Life of the Limbs). A name given to colchicum.
- Rhei**. Aqueous tincture of rhubarb.
- Anidalin**. Aristol. (Antiseptic.)
- Anodynin**. Antipyrin.
- Antacidines**. Lime-water tablets. (Metcalf & Co., Boston.)
- Anthos** (Flores or Herba). Rosemary (flowers or herb).
- Anthrakokali**. Coal treated with caustic potassa.
- Anthrarobine**. Dioxanthranol. Leucoalizarin. (Antiseptic dermic.)
- Antibacteride**. A mixture of borax, boric acid, and glucose.
- Anticholerine**. A product of cholera bacteria, according to Klebs.
- Antidiphtherine**. Potassium chlorate with a trace of iron chloride.
- Antidotum Fuchsi**. Fluid ferric hydrate. (Arsenic antidote.)
- Antifebrin**. Acetanilid, U. S. P. Acetylphenylamine. Phenylacetamide.
- Antifungin**. Antiseptic. Contains magnesium bichlorate and free boric acid.
- Antikamnia**. An anodyne. Said to be a mixture of antifebrin, sodium bicarbonate (with or without caffeine), and tartaric acid. (Anodyne, antipyrretic.)
- Antikol**. Mixture of acetanilid, sodium bicarbonate, and tartaric acid.
- Antimonium Album**. Bismuth.
- Antimony, Diaphoretic**. Potassium antimonate.
- Antinervine**. Salicyl-bromanilid. Said to be a mixture of acetanilid, ammonium bromide, and salicylic acid. (Sedative.)
- Antinonnine**. Potassium orthodinitrocresol with soap and glycerin. (Parasiticide.)
- Antipyrin**. Analgesine. Anodynine. Dimethyloxychinoxin. Parodyn. Metosin. Phenazon. Phenylon. Phenyl dimethylpyrazolon. Pyracin. Phenyl dimethylisopyrazolon. Pyrazolon. Oxydimethyl-chinizin. Sedatin. Oxydiethylquinizine.
- Antisepsin**. Monobromacetanilid. Paramonobromphenylacetamide.
- Antiseptin**. Mixture of zinc iodide and sulphate with boric acid and thymol.
- Antiseptol**. Cinchonine iodosulphate. (Antiseptic.)
- Antithermal**. A new antipyrretic of unknown composition.
- Antithermin**. Phenylhydrazine-levulinic acid. (Antipyrretic.)
- Antlia Gastrica**. Stomach-pump.
- Apioline**. Chapoteau's specialty; active principle of parsley.
- Apone**. Liniment. (Capsicum, ammonia, chloral.)
- Apyonin**. French designation for yellow pyoktanin. (Antiseptic.)
- Apyrothium**. Sulphur.
- Aqua Binelli**. Creosote water.
- Bullientis** (Aque). Boiling water.
- Cerasorum**. Diluted bitter almond water.
- Crotonis**. Water from Croton Lake, New York (that is, hydrant water).
- Flava**. Yellow wash.
- Fœtida Antibysterica**. A distillate from asafoetida, galbanum, myrrh, valerian, etc.
- Fortis**. Nitric acid.

Aqua Gummosa. Diluted mucilage of gum arabic (about 1 part of gum in 64 of water).
Hydrothionica. Sulphuretted hydrogen water.
Laxativa Viennensis. Compound infusion of senna. (Modified black draught.)
Metallorum. Mercury.
Naphæ. Orange flower water.
Nigra. Black wash.
Phagedænica. Yellow wash.
Regis. Nitrohydrochloric acid.
Saturnina. Lead water.
Vitæ. Brandy or whiskey.
Aquila Alba. Calomel.
Aquozon. Ozonized water. (Ozone Co., New York.)
Argentum Fugitivum. Quicksilver.
Musivum. Mosaic gold.
Vivum. Quicksilver.
Argilla. Clay. (In pharmacy it means alumina.)
Sulphurica Alcalisata. Alum.
Argols. Crude potassium bitartrate.
Aristol. Dithymoldiiodide. Di-iodo-dithymol. (Antiseptic.)
Arquebusade. An agreeably smelling vulnerary water, which might be called "compound sage water."
Asa Dulcis. Benzoin.
Asaprol. Calcium salt of betanaphthol-alphamonosulphonic acid. (Antiseptic.)
Asbolin. An alcoholic distillate of soot. (Antitubercular.)
Asepsin. Antiseptin.
Aseptin. Mixture of boric acid, borax, and alum.
Aseptol. Sozolic acid. Orthophenylsulphonic acid (38 per cent. aqueous solution).
Asparoline. Contains guaiacum, asparagin, parsley seed, black haw, and hyoscyamus. (According to Wampole & Co., Philadelphia.)
Ater (Atra). Black (Niger).
Atramentum. Black ink.
Indicum (Sinense). India ink.
Auramin. Yellow pyoktanin. (Antiseptic.)
Aureoline. Hair bleach. (A more or less diluted solution of hydrogen peroxide.)
Aurum Musivum (Mosaic Gold). Tin bisulphide.
Azungia. Adeps. (Fat.)

B.

Baker's Salt. Ammonium subcarbonate.
Balata. Gum chicle.
Balsam, Friar's. Compound tincture of benzoin.

Balsam, Hungarian. Exudation from *Pinus pumilio*.
Persian. Compound tincture of benzoin.
Riga. By distillation from the leaves of *Pinus cembra*; generally an artificial aromatic spirit.
Sulphur. Sulphurated linseed oil.
Traumatic. Compound tincture of benzoin.
Balsamum Arcæi. An ointment of elemi.
Gileadense. Balm of Gilead.
Judaicum. Balm of Gilead.
Nucistæ. An ointment containing the volatile and fixed oils of nutmeg.
Ophthalmicum Rubrum. Ointment of red precipitate.
Saponaceum. Opodeldoc.
St. Yves. Ointment of red precipitate.
Universale. Ointment of lead subacetate, made with yellow wax and rape-seed oil.
Verum. Balm of Gilead.
Vitæ Hoffmanni. Alcoholic solution of sundry balsamic oils.
Bang. *Cannabis Indica*.
Barbotine. See *Semen Contra*.
Barilla. Impure sodium carbonate.
Barm. Yeast.
Baudruche. Goldbeaters' skin.
Baume de Vie. Compound decoction of aloes.
Tranquille. Compound infused oil of hyoscyamus.
Belle Dame. *Atropa belladonna*.
Benedictum Vinum. Antimonial wine.
Benzene. Of English chemists, means benzol (coal-tar benzin), and not the American benzin (from petroleum).
Benzoic Ether. Ethyl benzoate.
Benzonaphthol. Betanaphthylbenzoate.
Betanaphthol-benzoate. (Intestinal antiseptic.)
Benzophenoneid. Apyonin (yellow pyoktanin).
Benzosol. Benzoyl-guaiacol. Guaiacol benzoate (Antitubercular.)
Betel Nut. Areca nut.
Betol. Betanaphthyl salicylate. Betanaphthol salicylate. (Intestinal antiseptic.)
Big "G." Injection. Contains borax and berberine.
Bilis Bovinum. Ox's gall.
Bi-Palatinoid. Gelatin capsule divided by a partition, to keep two powders separate until swallowed.
Bitumen Judaicum. Asphaltum.
Black Draught. A compound infusion of senna; must not be confounded with "Black Drop."
Black Drop. Vinegar of opium.

Black Flux. A mixture of charcoal and potassium carbonate.

Blanc Fixe. Artificial barium carbonate or sulphate.

Blue, Berlin. Prussian blue.

Black. A name for ivory-black.

Chinese. Prussian blue.

Bolus Armena. Red bole. Bole Armenian.

Boroglyceride. Boroglycerin.

Boroglycerin. A concentrated solution of boric acid in glycerin.

Borol. Fused mixture of boric acid and sodium bisulphate.

Borussic. Prussian. Hydrocyanic.

Bovine. Meat juice preserved by glycerin and boric acid.

Bovox. An essence of beef. (Boston.)

Bovril. Extract of beef, peptone, albumen, and fibrin. (London.)

Brain Salt, Effervescent. Contains chiefly ammonium bromide and caffeine.

Brasium. Malt.

British Gum. Dextrin.

Brofeine. Specialty of Wohlfarth, New York (?).

Bromo-Febrin. Said to be potassium or ammonium bromide and antifebrin. (Specialty of Weiller & Co., Baltimore.)

Bromo-Caffeine. Specialty of Keasbey & Mattison, Ambler, Pa.

Bromo-Pyrene. Specialty of Wampole, Philadelphia.

Bromo-Soda. Specialty of Warner & Co., Philadelphia.

Bromol. Tribromophenol. (Antiseptic.)

Brotipyrine. Specialty of Stearns & Co., Detroit.

Butter of Antimony. Solution of antimony chloride.

Butylhypnal. Butylchloral-antipyrin.

Butyrum Majoranæ. Ointment of sweet marjoram.

Nucistæ. Expressed oil of nutmeg.

Byne (Bynin). Apparently a favorite name in England for malt and malted preparations.

Bynol. Malt and cod-liver oil. (Allen & Hanbury, London.)

C.

C. See also K.

Cactina. A preparation of *Cactus grandiflorus*. (Sultan Co., St. Louis.)

Caffa. Camphor.

Caffeoresorcin. Combination of caffeine with resorcin.

Cail-Cedra. Bark of *Swietenia senegalensis*.

Calamine. Impure zinc carbonate.

Calciathos. Copper subacetate.

Calisaya. Cinchona (Yellow).

Camphoid. Gun-cotton dissolved in an alcoholic solution of camphor. 1:20 solution of pyroxylin in Rubini's camphor solution. (Vehicle for dermics.)

Camphol. A mixture of camphor and salol. (Antiseptic.)

Camphor Julep. Camphor mixture.

Camphorline. A trade name for naphthalin.

Cancroin. Extract of cancerous tumors, according to Adamkiewicz. (Alexine of cancer, according to Adamkiewicz.)

Cancroium Lapilli. Crabs' stones.

Chelæ. Crabs' claws.

Candelæ Fumales. Fumigating pastilles.

Canthos. A special cantharidal plaster of Johnson & Johnson, London.

Capita Papaveris. Poppy-heads.

Capsulæ Amylaceæ. Wafer capsules.

Carbasus. Gauze.

Carboline. A hair preparation. Perfumed liquid vaselin.

Carbon Black. The soot of natural gas.

Carnine Syrup, Niemann's. Beef juice preserved by cane sugar.

Cassius's Purple. A compound of tin with gold oxide.

Castoria. A laxative. Said to be a modified compound infusion of senna.

Celerina. Said to be a combination of celery, black haw, coca, and probably kola.

Cera Sigillata. Sealing-wax.

Cerate, Compound Camphor. Camphor ice.

Ceratum Citrini (P. L. 1745). Resin cerate.

Epuloticum (P. L. 1745). Ceratum calaminaris. Turner's cerate.

Labiale. Lipsalve.

Lithargyri Acetati Compositum. Goulard's cerate. (P. L. 1787.)

Cerate, Turner's. Cerate of calamine.

Ceresin. Earth-wax. An impure paraffin.

Cerussa. Lead carbonate.

Chalcanthum. Copperas.

Charpie. Lint.

Chelen (Kelene). Ethyl chloride. (Local anæsthetic.)

Chemical Food. Compound syrup of phosphates.

Chinium. Quinine.

Chionia. A preparation of *Chionanthus*. (Peacock Co., St. Louis.)

Chloral Caffeine. Molecular combination (1:1) of chloral and caffeine. (Anodyne, antispasmodic.)

Camphor. A mixture of chloral and camphor.

Chloral Carmine. Staining fluid prepared by heating together on a water-bath for half an hour .05 Gm. carmine, 20 C.c. absolute alcohol, and 80 drops hydrochloric acid (sp. gr. 1.124), adding 25 Gm. chloral hydrate, and filtering when cool.

Chloralamide. Chloral formamide.

Chloralimide. Trichlorethylidenimide.

Chlorobrom. Solution of potassium bromide and chloralamide in water.

Chlorol. Solution of corrosive sublimate, sodium chloride, hydrochloric acid, and copper sulphate in water. (Antiseptic.)

Chlorophenol. Antiseptic.

Christia. Manilla paper made waterproof with chrome gelatin.

Chymosin. Pepsin.

Cibus Deorum. Asafetida.

Cineras Clavellati. Crude potassium carbonate.

Cinnabar (Vermilion). Mercuric sulphide.

Coal-Tar Naphtha. Benzol.

Cognac. Brandy.

Colcothar. Crude ferric oxide.

Colla Piscium. Isinglass.

Conchinine (of the German chemists). Quinidine

Confectio Cardiaca. Aromatic confection.

Damocratis. Damocrates' confection. An aromatic astringent confection containing opium, which originally had 64 ingredients.

Connecticut Lead. Barytes.

Cornu Cervi. Hart's horn. Ammonium carbonate.

Cervi Ustum Nigrum. Bone-black.

Cream of Tartar, Soluble. Potassium and sodium borotartarate.

Cremor Antisepticus. Chiefly vaselin and thymol. (London.)

Creolin. Mixture of coal-tar hydrocarbons with resin soap (Pearson's), or with cresolsulphonic acid (Artmann's creolin).

Creosotal. Creosote carbonate.

Creosote Carbonate. Chiefly an impure guaiacol carbonate.

Cresalol. Paracresol salicylate. Paracresylic ether of salicylic acid. (Intestinal antiseptic.)

Cresol. Cresylic acid.

Cresolin. A preparation similar to creolin.

Cresylol. Cresol. Cresylic acid. Metacresol. (Antiseptic.)

Crocus Martis. Ferric oxide.

Metallorum (Antimonii). Brown antimony oxide.

Saturni. Red lead.

Croton-Chloral. Butyl-chloral.

Cryst Alba. Refined naphthalene. (Disinfectant.)

Crystalli Tartari. Cream of tartar.

Cuca. Coca.

Cullet. Broken glass for remelting.

Cuprum Scoriatum. Crude copper acetate. (Verdigris.)

Curaçao. Elixir of orange peel.

Cutch. Dark (black) gum catechu.

Cynobats. See Hips.

D.

Dactyli. Dates.

Dagutt. See Daggett, Oil of.

Dasjespis. Insipidated urine of the South African badger (Hyrax).

Decoctum Album. A kind of chalk mixture.

Diaphoreticum. Compound decoction of guaiacum.

Lignorum. Compound decoction of guaiacum wood.

Zitmanni. Compound decoction of sarsaparilla.

Dermatol. Bismuth subgallate. (Astringent antiseptic.)

Derosne's Salt. Narcotine.

Diabolus Metallorum. Tin.

Diacodium. Poppy-heads. (Old name for syrup of poppies.)

Diagrydium. Scammony.

Diana. Silver.

Diapente. A tonic powder, or electuary, composed of 5 ingredients.

Diaphtherin. Oxychinaseptol. (Oxychinolin and orthosulphonic acid.) Orthophenol sulphonate. (Antiseptic.)

Diascordium. An aromatic electuary of tormentil root and scordium (water germander) with opium.

Dilapsus. As an adjective to several salts means effloresced.

Dimethyl-oxy-chinisin. Antipyrin.

Disinfectant, Jeye's. Mixture of coal-tar hydrocarbons with resin soap.

Ledoyen's. Solution of lead nitrate.

Disinfectol. A product similar to creolin.

Dithione. Mixture of the sodium salts of the isomers of dithiosalicylic acid. (Antirheumatic.)

Diuretin ("I. & II."). Theobromine sodium salicylate. (Diuretic.)

Draco Mitigatus. Calomel.

Dulcin. A new sweetening agent. Paraphenetolcarbamid. (Sucrol.)

Dutch Drops. Haarlem oil.

Liquid. } The chloride of olefant
Oil. } gas.

Tea. A variety of St. Germain tea. (Laurent.)

E.

Earth, Japan. Catechu.

Nut. Peanut.

Eau de Rabel. See Elixir, Haller's.

Sédative de Raspail. Contains ammonia, salt, camphor, alcohol, and water.

Ebur Ustum. Boneblack.

Eikonogen. Sodium salt of the amidobetananaphtholbetamonesulphonic acid. (For photographic purposes.)

Elæosaccharum. Oil sugar. (Sugar flavored with volatile oil.)

Electuarium. Confection. (Soft.)

Dentifricium. Tooth paste.

Elephant Louse. The nut of cashew.

Eliteine. Specialty of Ingram, Detroit, Mich. (Skin lotion.)

Elixir Adjuvans. A kind of simple elixir.

Anisi. Aniseed cordial.

Aperitivum. Compound tincture of aloes.

Aurantiorum Compositum. A compound elixir of orange peel and gentian.

of the Three Chlorides. Contains iron, mercury, and arsenic, with elixir cinchona. (Renz & Henry, St. Louis.)

Corrigens. Aromatic elixir of yerba santa.

Daffy's. Compound tincture of senna.

Garus. Mixture of syrup with an alcoholic distillate of aloes and spices.

Haller's. 8 parts alcohol and 1 part sulphuric acid, mixed slowly.

of Long Life. A modification of the well-known Swedish Bitters.

ad Longam Vitam. Elixir of Long Life.

Nutrans. Tonic. (Allaire, Woodward & Co., Peoria, Illinois.)

Pectorale. Compound ammoniated elixir of liquorice with oils of fennel and anise.

Proprietatis (Paracelsi). Compound tincture of aloes and myrrh.

Purgans. Compound tincture of jalap.

Rhei Darelii. Tinctura rhei dulcis.

Roborans Whyttii. Compound tincture of cinchona (containing saffron).

Salutis. Compound tincture of senna.

Stomachic. } Compound tincture
Stoughton's. } of gentian.

Viscerale. Compound tincture of orange peel and gentian.

Vitrioli Mynsichti. Aromatic sulphuric acid.

Emplastrum Cantharidum Perpetuum.

A mild cantharidal plaster.

Fuscum. Mother plaster. Universal plaster. Brown salve.

Gummosum. Compound plaster of galbanum.

Ens Martis. Ammoniated iron.

Veneris. Ancient name of ammonium and copper chlorides.

Epidermine. Ointment basis, consisting of white wax, water, gum, and glycerin, equal parts.

Ergotole. Specialty of Sharp & Dohme, Baltimore.

Eserine. Physostigmine.

Essence (French). Volatile oil.

of Mirbane. Nitrobenzol. (Artificial oil of bitter almonds.)

Éthérolat, Éthérolaturé, Éthérolé (French). Correspond to the alcoholic terms. (See Alcoolat, etc.)

Ethyl Bromide. Monobrom-ethane. Must not be confounded with ethylene bromide.

Ethylene Bromide. Dibrom-ethane. Different from ethyl bromide.

Eucalyptol. Eucalyptene bichloride (according to Lafarge). (Antiseptic.)

Eucalyptoresorcin. Combination of eucalyptol and resorcin.

Eulyptol. A mixture of salicylic acid, carbolic acid, and oil of eucalyptus. (Antiseptic.)

Euphorin. Phenyl-urethane. Phenyl-ethylic urethane. Ethyl and phenyl carbamate.

Europphen. Diisobutylorthocresoliodide. Substitute for iodoform.

Exalgin. Methylacetanilid. Methyl-phenylacetamide. (Anodyne.)

Exodine. Mixture of acetanilid, sodium salicylate, and sodium bicarbonate. Exodyne. (Antipyretic.)

Expectorant, Stokes's. Senega and squill cough mixture with ammonium carbonate.

Extract of Apple, Ferrated. Crude iron malate.

Extractum Catholicum. Compound extract of rhubarb.

Martis Pomatum. Crude iron malate in the form of extract.

Panchymagogum Crolii. Compound extract of rhubarb. (Rhubarb, aloes, jalap, soap.)

Eyesolens. Eye-salve of Spitler & Drexler, Paterson, N.J.

Eyestones. Crabs' eyes.

F.

Faba Porcina. } The fruit of Hyoscyamus niger.

Suilla. } Castor oil bean.

Purgatrix. Castor oil bean.

Fæcula. Starch. (Amylum.)

Fairoline. Ointment of unknown composition.

Farina Hordei Præparata. Barley flour heated in a steam bath for about thirty hours.

Febicide. Antipyretic. Composition unknown. (Health Restorative Co., New York.)

Ferri Scobs. Iron filings.

Ferro Pagliari. Solution of ferrous chloride.

Ferrugo. Iron rust.

Ferrum Alcoholisatum. Finely powdered iron, which is not the same as reduced iron.

Limatum. Iron filings.

Pomatum (extract, tincture, etc.). Iron malate.

Firwein. Contains bromine, iodine, and phosphorus with balsams. (Tilden & Co., New Lebanon, N.Y.)

Flake White. Carbonate of lead.

Flea Seeds. Seeds of *Nigella*.

Flores Antimonii. Antimony sesquioxide.

Benzoës. Benzoic acid.

Bismuthi. Bismuth oxide.

Zinci. Zinc oxide.

Flos Æruginis. Copper acetate.

Flos Salis. Sodium subcarbonate.

Fluor Spar. Calcium fluoride.

Flowers of Antimony. Oxide of antimony.

of Benjamin. Benzoic acid.

of Zinc. Oxide of zinc.

Fo-di-ta. A pepsin tablet. (New York & Chicago Chemical Co.)

Formalin. 40 per cent. solution. Formaldehyde. (Antiseptic.)

Formol. Formaldehyde.

Formylum Chloratum. Chloroform.

Fossiline. Similar to petrolatum, vaselin, etc. Vaseline.

Frankincense. Olibanum.

French Polish. An alcoholic solution of shellac.

White. Pulverized talc.

Friar's Balsam. Compound tincture of benzoin.

Fromentin. The embryo of wheat.

Fulgokali. An alkaline solution of soot evaporated to dryness.

Fuller's Earth. A species of clay.

Furfur. Bran.

Fustic, Old. The wood of *Morus tinctoria*.

Young. The wood of *Rhus cotinus*.

G.

Galactic. Lactic.

Galena. Lead sulphide.

Gallacetophenone. Methylketotrioxylbenzol. Methylketotrioxylbenzene.

Trioxylacetophenone. Alizarin-yellow "C."

Gallein. Coal-tar color. Used as an indicator.

Gallobromol. Dibromogallic acid.

Gambir. Pale gum catechu.

Gannal's Solution. Solution of aluminum acetate.

Gelatol. Ointment basis, consisting of oil, glycerin, gelatin, and water.

Gentian, White. A German rural domestic medicine, which is dried white dog-dung.

Glacialin. Mixture of borax, boric acid, and sugar (or glycerin).

Glacies. Ice.

Mariz. Isinglass-stone; Muscovy glass. (A variety of calcium sulphate.)

Glandes Quercus (Tostæ). Acorns. (Acorn coffee.)

Glass Gall. The scum forming on the surface of melting glass.

of Antimony. Vitrified antimony oxide.

Globuli Martiales. A crude iron treatate in the form of balls or marbles.

Glonoin. Nitroglycerin. Trinitrin.

Glusidum. The official name for saccharin in the Brit. Ph.

Gluten. Glue.

Glycéré (Glycérat) (French). Soft or solid glycerin preparations.

Glycerinum Pepticum. One of Fairchild's pepsin preparations.

Glycerolé (French). Liquid glycerin preparations.

Glyceryl Borate. Boroglyceride.

Glyconin. A mixture of yolk of egg and glycerin.

Glycozone. Probably a solution of hydrogen peroxide in glycerin. (Marchand, New York.)

Gommeline. Crude dextrin.

Grains d'Avignon. French berries (*Rhamnus infectorius*).

Graphite. Black lead.

Green Vitriol. Ferrous sulphate.

Guaiacolsalol. Guaiacol salicylate. (Intestinal antiseptic.)

Gum Dragon. Tragacanth.

Gummi Elasticum. India rubber.

Guttæ (Gutti). Gamboge.

Rubrum Gambiense. Kino.

Scorponis. } Gum arabic.

Thebaicum. }

Gunjah. *Cannabis Indica*.

Gypsum. Plaster of Paris.

H.

Hæmatites. Bloodstone.

Hæmatogen. Iron albuminate, as found in eggs.

Hæmogallol. Produced by the action of pyrogallol upon the coloring matter of blood. Reduction product of hæmatin. Blood-producer.

Hæmol. Produced by the action of zinc-dust upon the coloring matter of the blood. Reduction product of hæmatin. Blood-producer.

Hagiospermus. *Santonica*.

Hamburg Drops. A kind of "Swedish Bitters."

Tea. Identical with *St. Germain* tea, differently flavored.

Headine. Mixture of acetanilid and sodium bicarbonate. (Headache cure.)

Heberden's Ink. Aromatic mixture of iron. (*Ph. Dublin.*)

Helianthin. Methyl-orange. (Anilin color.)

Hepar. Liver (of sulphur, antimony, lime, etc.).

Antimonii. An impure antimonium and potassium sulphide.

Sulphuris. *Potassa sulphurata*. "Liver of sulphur."

Herba Corta. Specialty of Griswold, Hartford, Conn.

Hiera Picra. (Incorrectly, but commonly, called *Hiera Picra*.) *Pulvis aloes et canellæ*.

Hill's Balsam of Honey. A tincture of tolu, honey, etc.

Hips. The fruit of dog-rose.

Homburg's Phosphorus. Calcium chloride.

Pyrophorus. A mixture of alum and brown sugar, or of potassium sulphide, alumina, and charcoal.

Huxham's Tincture of Bark. Compound tincture of cinchona.

Hydracetine. Acetophenylhydrazine.

Pyrodine. Acetylphenylhydrazine.

Hydrargyri Oxyurias. Corrosive chloride of mercury.

Hydrargyri Murialis. Corrosive chloride of mercury.

Hydrastis, Colorless. Solution of hydrastine in glycerin and water. (Keith & Co.)

Hydrochrite. Barley water.

Hidrolat (French). A distilled water.

Hidrolé (French). An aqueous solution.

Hydrosine. A kind of pancreatic emulsion of cod-liver oil. (Crittenden, New York.)

Hydranaphthol. Antiseptic. Said to be different from betanaphthol. (Rigney & Wolf, New York.)

Hydropege. Spring or hydrant water.

Hydrophilous (Hygrophilous) Cotton. Absorbent cotton.

Hygrine. One of the alkaloids of coca.

Hypnal. Chloral-antipyrin. Trichloraldehydphenyldimethylpyrazolone. (Hypnotic.)

Hypnone. Acetophenone. (Hypnotic.)

Hypoderma. Tablets for hypodermic injections. (Allen & Hanbury, London.)

I.

Ichthyocolla. Isinglass.

Ichthyol. Ammonium ichthyol-sulphate from a peculiar bituminous shale.

Indian Pink. *Spigelia marilandica*.

Tobacco. *Lobelia inflata*.

Indicum. Indigo.

Inflammable Air. Hydrogen.

Ingluvin. Pepsin obtained from the crop of chicken.

Injection Brou. A French specialty for gonorrhœa.

Iodol. Pyrrol tetraiodide. Tetraiodopyrrole. (Antiseptic, alterative.)

Iodophenine. Combination of phenacetin with iodine. (Antiseptic.)

Iodophenochloral. Mixture of tincture of iodine, carbolic acid, and chloral hydrate.

Iodopyrine. Iodoantipyrine. Antipyrine monolodide.

Iron, Alcoholized. Finely powdered iron. It is not the same as iron by hydrogen.

by Hydrogen. Reduced iron.

Nitrogenized. Syrup of iron and sodium albuminates.

Issue Peas. Small orange berries, or round pills turned from orris root.

Izal. By-product obtained in coke-formation. "Thorncliffe disinfectant."

J.

Japan Earth. Catechu.

Jap-Menthol. Menthol from Japanese oil of peppermint.

Jesuits' Bark. Cinchona.

Drops. Contain gualacum, sarsaparilla, and Peruvian balsam.

Jews' Pitch. Asphaltum.

Judas's Ear. A fungus of elder-tree. (*Eridia*.)

Jupiter. An ancient name for tin.

Jusculum. Broth (of beef, veal, turtle, etc.).

K.

K. See also C.

Kairine. Oxychinolinethyl hydrochlorate. (Antipyretic.)

"A." Oxyquinolinethylhydride. (Antipyretic.)

Kali Aceratum. Potassium carbonate.

Kalicum Hydras. Fused potassa.

Kalium, Kali. Potassium, potassa.

Kaolin. China clay. A hydrated silicate of alumina.

Kefir. A kind of kumys.

Kelene. Chelen. Ethyl chloride. (Local anæsthetic.)

Keratin. Horn substance, peptonized.

Kina Kina. Cinchona.

King's Yellow. Yellow arsenic sulphide.

Kochine. Tuberculin.
Kodosonol. Ozonized cod-liver oil (Ozone Co., New York.)
Kreosonol. Ozonized oil of tar. (Ozone Co., New York.)
Kresin. A solution of cresol in a solution of sodium cresoxyl-acetate. (A 25-per-cent. solution.)
Kresylol. See Cresylol.
Kumysgen. Kumyss in a dry form. (Reed & Carnrick, New York.)

L.

Lac Magnesie. Milk of magnesia. Virginis. See Virgin's Milk.
Lacca Cœrulea. Litmus.
Musica (Lakmus). Litmus.
Lactin. Sugar of milk.
Lacto Preparata. A kind of malted milk with cereals, etc. (Reed & Carnrick, New York.)
Lakmoid. Substitute for litmus; a coal-tar color.
Lamium Album. Blind nettle.
Lamotte's Drops. Ethereal tincture of ferric chloride.
Lanadeps. A purified lanolin. (Lloyd & Co., Leicester, England.)
Lanain. Adeps lanæ. Lanolin.
Lana Philosophica. Zinc oxide.
Lanesin. Similar to lanolin.
Lanolin. Purified wool fat emulsified with water. Adeps lanæ. Lanain.
Lapides Cancrorum. Eyestones.
Lapilli Cancrorum. Crab's eyes, crabstones; concretions found in the stomach of the European crawfish.
Lapis Baptista. Ancient name for talcum.
Calaminaris. Impure zinc carbonate.
Causticus. Potassa. (In sticks.)
Cœruleus. Copper sulphate.
Divinus. Copper aluminate.
Hæmatites. Bloodstone.
Infernalis. Lunar caustic. (Fused silver nitrate.)
Lazuli. Ultramarine.
Smiridis. Emery.
Latrol. A substitute for iodoform. By the action of iodine upon one of the anilines. (Clinton Pharm. Co., Syracuse, New York.)
Ledoyen's Disinfecting Liquid. Solution of nitrate of lead.
Lenitive Electuary. Confection of senna.
Leucœnus. White wine.
Leucogene. Sodium bisulphite.
Levant Nut. Cocculus Indicus. (Fish berries.)
Lichen Islandicus. Iceland moss.
Life-Everlasting. Gnaphalium polycephalum.

Lignia Nitrica. Gun-cotton.
Lignum Sanctum. Guaiacum wood. (Lignum vite.)
Vitæ. Guaiacum wood.
Limatura Ferri. Iron filings.
Linonine. Compound emulsion of linseed oil. (Danbury Pharm. Ass., Conn.)
Lintine. Absorbent cotton in thin sheets. (Johnson & Johnson, New York.)
Liparin. An olive oil containing 6 per cent. of free oleic acid. (Alterative.)
Liquor Anodymus (Hoffmanni). Hoffmann's anodyne.
Cornu Cervi (Liquor C.C.). Solution of ammonium carbonate, containing empyreumatic oil.
Cornu Cervi Succinatus (Liquor C. C. Succinatus). Solution of ammonium succinate.
Ferri Oxychlorati. Dialyzed iron.
Fumans Boylii. Ammonium hydrosulphide.
Salicylicus, Sellers's. Contains sodium and quinine salicylates and salicin.
Seriparus. Liquid rennet.
Stypticus Looffi. Solution of ferric chloride.
Tongæ Salicylatus. See Tongaline.
Listerine. Antiseptic. Contains borax, thymol, eucalyptol, oils of wintergreen and peppermint.
Lithiated Hydrangea. Kidney remedy. Contains hydrangea and lithium benzo-salicylate. (Lambert Co., St. Louis.)
Lithines. Lithia water tablets. (Metcalf & Co., Boston.)
London Paste. Soda with lime.
Looch Album. An emulsion of almonds and oil of almonds.
Loofah. "Vegetable sponge;" the skeleton of a gourd.
Losophan. Triiodometacresol. Triiodometacresylic acid. (Antiseptic dermic.)
Love-Apple. Tomato.
Luna. Silver.
Lysol. Mixture of cresols with soap. (Antiseptic.)

M.

Magisterium Bismuthi. Bismuth subnitrate.
Coccionellæ. Carmine.
Sulphuris. Washed sulphur.
Magnesia Alba. Magnesium carbonate.
Nigra. Black manganese oxide.
Mala. Poma (apple).
Mallein. A product of the "epizootic" bacilli, prepared by Adamkiewicz.
Alexine of glands, according to Adamkiewicz.
Marcasita. Metallic bismuth.

Marine Acid. Hydrochloric acid.
Salt. Sodium chloride.
Mars, or Martis. Iron (*Tinctura Martis* is tincture of iron).
Massicot. Lead protoxide.
Mater Metallorum. Mercury.
Matta. The cortical portion from a variety of millet-seed, used for adulterating pepper.
Maw-Seed. Poppy-seed.
Meadow Saffron. Colchicum.
Meconium. The juice of the poppy.
Medulla Bovis. Ox-marrow.
Lactis. Butter.
Sassafras. Sassafras pith.
Mel Egyptiacum. Liniment of copper.
Melanosmegma. Soft (green) soap.
Meleguette Pepper. Grains of Paradise.
Mellite (French). A honey.
Mephite of Soda. Impure sodium carbonate.
Mercure Précipité Blanc (French). White precipitate.
Mercurius Dulcis. Calomel.
Præcipitatus Albus. A name for calomel.
Mortis. } Antimony oxide.
Vitæ. }
Mercury Alanin. Mercury amidopropionate.
Hahnemann's Soluble. Black mercury oxide.
Methacetine. Paraacetanisidine. Paraoxymethylacetanilid. Acetylmethylparamidophenol. (Antipyretic.)
Methanilid. Eralgin.
Metheglin. Honey wine. Mead.
Methonal. Dimethylsulphonedimethylmethane.
Methozin. Antipyrin.
Methylal. Methylenedimethyl ether. (Anæsthetic.)
Metol. Salt of monomethylparaamidometacresol (for photographic uses).
Metopium. Expressed oil of almonds.
Metozin. Antipyrin.
Metrenchyta. Vaginal injection; sometimes a vaginal syringe.
Mica Panis. Bread crumb.
Microcidin. Sodium betanaphтол. Sodium betanaphтол (75 per cent.). (Antiseptic.)
Microcosmic Salt. A mixture of sodium and ammonium phosphates.
Mikozone. Hypnotic and sedative. (A variety of chlorodyne).
Milk of Sulphur. Precipitated sulphur. (Strictly only that precipitated by sulphuric acid.)
Virgin's. Rose-water rendered milky by the addition of tincture of benzoin.
Mineral Gum. Soluble glass; sodium or potassium silicate.

Minium. Red lead.
Græcorum, Minium Purum. Red mercuric sulphide.
Miraculum Chemicum. Magnesium carbonate.
Mithridate. See *Confectio Damocratis*.
Mistura Acacis. Mucilage of gum arabic of variable strength.
Oleoso-Balsamica. An alcoholic solution of Peru balsam, oil of amber, and sundry volatile oils.
Mixtura Alba. Compound chalk mixture.
Salina. *Potio Riveri.* (Effervescent mixture of potassium citrate.)
Solvens. Solution of ammonium chloride with liquorice.
Solvens Stibiata. Solution of ammonium chloride with liquorice and tartar emetic.
Mixture, Antidysenteric. Acid camphor mixture.
Dysmenorrhœa. Guaiac mixture with corrosive sublimate.
French. Carbolyzed solution of iodine.
Gadberry's. Acid mixture of quinine and iron.
Griffith's. Compound mixture of iron.
Hope's. Acid camphor mixture.
Mollin. Ointment basis, consisting of a glycerin soap containing an excess of fat or oil.
Mollisin. Ointment basis of 4 parts of paraffin oil and 1 part of yellow wax.
Molybdos. Lead.
Morrhual. Alcoholic extract of cod-liver oil.
Mosaic Gold. Tin bisulphide.
Mosquera Preparations. Contain meat digested by pine-apple juice. (Parke, Davis & Co., Detroit, Mich.)
Mountain Fat. Paraffin.
Muride. } Bromine.
Murina. }
Muscus. Moss. (Iceland, Irish, etc.)
Myrrholin. Solution of myrrh in castor oil, equal parts. (Alterative.)

N.

Naphæ Flores (Aqua). Orange flowers (water, etc.).
Naphtha. Prescribed by English physicians, means pyroxylic and pyroacetic spirits. In German prescriptions it means ether; often written *naphtha vitrioli*.
Vitrioli. Ether.
Naphthalol. Betol.
Naphthopyrin. Combination of betanaphтол with antipyrin.
Naphthosalol. Betol.
Naphthyl. Naphтол.

Natrium, Natron. Sodium, soda.
Natro-Kali Tartaricum. Rochelle salt.
Neapolitan Ointment. Mercurial ointment.
Neogale. Fresh milk.
Nepenthe. A preparation of opium. (Ferris & Co., Bristol, England.)
Nico. Nickel carbonmonoxide.
Nigramentum. Black ink.
Nihil Album. Crude zinc oxide.
Griseum. Zinc oxide.
Nitratine. Sodium nitrate.
Nitre, Rough. Magnesium chloride.
Nitrobenzin. } Artificial oil of bitter
Nitrobenzol. } almonds.
Nitrum Flamman. Ammonium nitrate.
Saturninum. Lead nitrate.
Nix Zinci. Zinc oxide.
Number Six. Tincture of capsicum and myrrh. (Hot drops.)
Nutrolactis. A galactagogue. (Nutrolactis Co., New York.)
Nux Aromatica. Nutmeg.
Metella. Seed of *Strychnos nuxvomica*.
Moschata. Nutmeg.

O.

Oenanthic Ether. Artificial oil of cognac.
Oeipus. Suint. Impure wool fat.
Oil, "American." Scandinavian for castor oil.
of Bay. Oil of laurel berries. (Generally is understood to mean oil of bay rum.)
of Ben (or Behen). Comes from a *Moringa*, and is not the same as oil of benne, which comes from a *Sesamum*.
of Cassia, Artificial. Probably camphor oil, or neutral oil perfumed with oil of cassia.
Colza. Oil of rapeseed.
Dagget. Empyreumatic oil of birch. (Oil of Russia leather.)
Dippel's. Rectified oil of hartshorn.
of Eggs. By expression from hard-boiled yolks.
Leaurelle. A preparation for the complexion. (Proprietary.)
Lucca. A brand of good olive oil.
of Niobe. Methyl benzoate.
St. Jacob's. A liniment. (Specialty of Vogeler, Baltimore.)
Seneka. Crude petroleum.
of Smoke. Creosote.
Swallow. Infused oil of elder flowers.
of Tartar. Solution of potassium carbonate.
of Vitriol. Sulphuric acid.

Ointment, Black Basilicon. Basilicon ointment with pitch.
Maury's. A compound rhubarb ointment.
Volatile. Volatile liniment.
Oleite. Sodium sulphuricinoleate.
Oleosa. A special brand of eucalyptus oil. (Drysdale & Co., London.)
Oleum Animale Fœtidum. Crude oil of hartshorn.
Anthos. Oil of rosemary.
Betulinum. Empyreumatic oil of birch. (Oil of Russia leather.)
Bubulum. Neatsfoot oil.
Cadinum. Empyreumatic oil of juniper.
Camphoratum. Liniment of camphor.
Castoris. Castor oil. (Has nothing to do with castoreum.)
Cedre (de Cedro). Oil of lemon.
Chaberti. Rectified animal oil.
Chamomillæ Citratum. Oil of lemon, distilled over German chamomile.
Cocois. Oil of cocoanut.
Coctum. Fixed oil (olive oil) infused with the respective herb, etc.
Cornu Cervi (Fœtidum). Crude animal oil.
Fermentationis. Fusel oil.
Juniperi Oxycedri (Empyreumaticum). Oil of cade.
Laurinum. Expressed oil of laurel berries.
Lumbricorum. Infused oil of earthworms.
Napi. Rapeseed oil.
Nucis Moschatæ. Besides the two kinds of oils (volatile and fixed) see also *Balsam Nucistæ*.
Nucistæ. Expressed or volatile oils of nutmeg.
Palmæ Christi. Castor oil.
Petræ. Crude petroleum. (Seneka oil.)
Philosophorum. Olive oil distilled over hot bricks.
Portugalicum. Oil of bergamot.
Rusci. Empyreumatic oil of birch. (Oil of Russia leather.)
Tartari per Deliquium. Concentrated solution of potassium carbonate.
Templinum. Oil of pine cones and small branches of *Pinus pumilio*.
Onguent (French). Ointment which contains resin.
Opodeldoc, Steers's. Solid opodeldoc.
Orellana. Arnotta.
Orexin. Phenylidihydrochinazoline hydrochloride. Phenylidihydroquinazoline. (Appetizer)
Orleana. Annotta.

Orthine. Orthohydrazineparaoxybenzoic acid. (Antiseptic, antipyretic.)

Oryza. Rice.

Os Sepia. Cuttlefish bone.

Oxalium. Potassium binoxalate.

Oxychinasoptol. Orthophenolsulphonate of oxychinoline.

Oxy-di-methyl-chinizin. Antipyrin.

Oxygen Powder. Sodium peroxide containing 20 per cent. active oxygen. (Bleacher.)

Oxymel. Honey boiled with vinegar.

Æruginis. Honey with copper acetate.

Oxymellite (French). Honey with vinegar.

Ozokerite. Earth-wax; an impure paraffin.

P.

Palacetyrus. Old cheese.

Palatinoid. Gelatin capsule with dry powder.

Panacea Mercurialis. Calomel.

Panchymagum Minerale (P. Quercitani). Calomel.

Pancro-Bilin. Ox-gall and pancreatin (Reed & Carnrick, New York.)

Pan-Peptic Preparations. Specialty of Sharp & Dohme, Baltimore.

Papine. A preparation of opium. (Battle & Co., St. Louis.)

Papoid. Digestive principle of the fruit of *Carica papaya*. (Johnson & Johnson, New York.)

Paraffinum Molle. Petrolatum.

Paris Green. Copper arsenite.

Parodyn. Antipyrin.

Passula. Raisins.

Minores. Corinthian raisins. (Grocers' "currants.")

Pasta Cerata. Ointment basis, consisting of yellow wax, water, and potassium carbonate.

Peacock's Bromides. Contains potassium, sodium, calcium, ammonium, and lithium bromides. (St. Louis.)

Pearl White. Bismuth subnitrate.

Pelletierine. Alkaloid of pomegranate bark.

Pental. Trimethylethylene. Betaisoamylene. (Anæsthetic.)

Pepperette. Olive pits. (For adulterating pepper.)

Pepsalia. A peptic salt (probably pepsin and salt) for table use. (Stern, London.)

Perioids. A style of capsules. (Proprietary.)

Persio. Cudbear.

Phenacetine. Paraacetophenetidine.

Phenin. Oxyethylacetanilid. (Antipyretic, anodyne.)

Phenates. Carbollates.

Phenazone. Antipyrin.

Phenetidin. Phenacetin.

Phenetol. Ethyl phenate.

Phenic Acid. Carbolic acid.

Phenin. Paraacetophenetidine. Phenacetin.

Phenocoll. Amidoacetoparaphenetidine. Glycocoll-paraphenetidine. (Antipyretic.)

Phenolid. Mixture of acetanilid and sodium salicylate. (Antipyretic, anodyne.)

Phenolin. Mixture of soap with cresols.

Phenolphthalein. A coal-tar color. Indicator in analysis.

Phenolsulphonate. Sulphocarbolate.

Phenopyrin. Combination of carbolic acid with antipyrin.

Phenosaly. Mixture of carbolic acid, salicylic acid, lactic acid, menthol, and eucalyptus oil. (Antiseptic.)

Phenyl. Phenol.

Phenylacetamide. Acetanilid, *U. S. P.*

Phenyl-di-methyl-iso-pyrazolon. Antipyrin.

Phenyl-di-methyl-pyrazolon. Antipyrin.

Phenylic Acid. Carbolic acid.

Phenylone. Antipyrin.

Phosphin. A coal-tar color. Chrysanilin nitrate.

Photoxyl. Similar to gun-cotton, but made from wood-pulp.

Phyllis Amara. Bitter almond bran.

Physostigmine. Eserine.

Phytoline. Antifat. From poke berries by a peculiar process. (Walker Pharm. Co., St. Louis.)

Pichi. *Fabiana imbricata*.

Picrol. Diiodoresorcinmonosulphonic acid.

Picropyrin. Combination of picric acid with antipyrin.

Pills, Eternal. Pills of metallic antimony, about 15 grains each, which, after use, were recovered from the stools and washed.

Lapactic. Sharp & Dohme's specialty. (Baltimore.)

Perpetual. See Pills, Eternal.

Pinguedo. Lard.

Pinguoleum. Fixed oil.

Pink Powders. Contain calomel and sugar, colored with a little carmine.

Saucer. The coloring matter is derived from safflower.

Pinus Canadensis, Kennedy's. Dark: compound fluid extract of *Pinus canadensis*. White: compound solution of zinc sulphate.

Piperazidin. Piperazin.

Piperazin. Diethylenediamine. Ethylenimine. (Uric acid solvent.)

Pip-Menthol. Menthol from American and European oil of peppermint.

Pissaleum Indicum. Petroleum.
Plasma. Glycerite of starch.
Plasment. Basis for urethral injections.
 A slimy solution of Irish and Iceland moss with admixture of glycerin and benzoïn.
Plaster, Diachylon. Lead plaster.
 Nuremberg. Brown plaster. Mother plaster.
Platt's Chlorides. Contains aluminum, sodium, zinc, and calcium chlorides.
Plumbago. Black lead. Also a genus of herbs.
Plumbum Album. Tin.
Scytodopsisicum. Moist lead tannate.
Plutonium. Barium.
Poivrette. Olive pits; adulterant of pepper.
Polysolve. Alkaline salts of sulpholeic acid.
Poma Aurantii (-lorum). Orange buds.
Pommade (French). Ointment which does not contain resin.
Pompholix. Zinc oxide.
Pond's Extract. A private make of "distilled extract of witch-hazel" (hamamelis).
Potash for Gargling. Potassium chlorate.
Potassium Chromate (neutral). Yellow potassium chromate.
Hydriodate. Potassium iodide. (Kalium hydro-iodicum of German prescriptions.)
Rhodanate. Potassium sulphocyanide (-cyanate).
Pot-Pourri. Fumigating species, chiefly flowers, generally preserved with salt.
Powder, Digestive. Compound powder of pepsin. (Proprietary.)
 of Algaroth. Antimony oxide.
Précipité Blanc (French). This, in French prescriptions, for internal use, is calomel (by the wet process), and for external use it generally means white precipitate.
Primuline. Sodium thioparatoluidine-sulphonate.
Prussian Blue. Iron ferrocyanide.
Pulvis Ærophorus. Effervescing powder. (Soda, Seidlitz.)
Diatrageacanthæ. Starch, liquorice root, gum arabic, and sugar.
Digestivus. Rhubarb, saltpetre, and cream of tartar.
Gummosus. See *Pulvis Diatrageacanthæ*.
Infantum. When for internal use: magnesia and rhubarb, with oil of fennel. When for external use: baby dusting-powder.
Jacobi. Antimonial powder.
Puerorum. See *Pulvis Infantum* (internal use).

Pumiline. A distillate from *Pinus pumilio*, in a variety of forms. (Stern, London.)
Punicine. Pelletierine; alkaloid of pomegranate bark.
Purple of Cassius. Gold precipitated from solution by tin chloride.
Putty Powder. Polishing substance. Tin oxide.
Putz Pomade. A polishing ointment, containing ferric oxide, and probably pumice-stone.
Pyoktanin, Blue. Methylviolet.
 Yellow. Auramine.
Pyracine. Antipyrin.
Pyrazolone. Antipyrin.
Pyretin. A new antipyretic of, as yet, unknown composition.
Pyrodine. Acetophenylhydrazine. Hydrazet. Acetylphenylhydrazine.
Pyrcenus. Alcohol.
Pyrogallopyrin. Combination of pyrogallol with antipyrin.
Pyrolignine. A "ligneous" (sic) product from wood tar. (Borst, Montreal, Canada). (Antipyretic.)
Pyrophorus. A mixture of certain substances which ignite spontaneously when exposed to the air.
Pyroxylin. Gun-cotton.
Pyrozole. One of the coal-tar chemicals. (Pyrozole Chem. Co., St. Louis.) (Antipyretic.)
Pyrozone. Hydrogen peroxide rendered permanent in ether. (Specialty, McKesson & Robbins, New York.)

Q.

Quaker Button. *Nux vomica*.
Quaker's Black Drop. Vinegar of opium.
Quassation. In pharmacy, the act of reducing roots and tough barks to morsels.
Quévenne's Iron. Iron reduced by hydrogen.
Quickine. A solution of 1 part of carbolic acid and 0.02 part of mercuric chloride in 100 parts of dilute alcohol.
Quickwater. Solution of mercuric nitrate.
Quinine, Amorphous. The ether soluble part of quinoïdine.
Quinole. Hydroquinone (for photographic purposes).

R.

Radical Vinegar. Glacial acetic acid.
Raisins, Corinthian. Grocers' currants.
Ramenti Ferri. Iron filings.
Realgar. Red arsenic sulphide.
Reddle. Red chalk.

Regulus (Antimonii, etc.). The pure metals, when separated by fusion.

Resina Elastica. India rubber.

Empyreumatica Liquida. Tar.

Empyreumatica Solida. Pitch.

Flava. Rosin. (Colophony.)

Pini. Turpentine (solid, hard).

Resopyrin. Compound of resorcin and antipyrin.

Resorcinol, Resorcin. This name has also been given to the fused product of resorcin and iodoform. (Bielaiew.)

Resorcinyrin. Combination of resorcin and antipyrin.

Retinol. Rosin oil. **Rosinol.** Resinol. (Antiseptic, astringent.)

"Rex." Extract of beef of Cudahy, Omaha, Neb.

Metallorum. Gold.

"Rham. Cat." Abbreviation of *Rhamnus catharticus*. (Buckthorn berries.)

Rizoline. Artificial oil of turpentine.

Rizine. Rice, partially acted upon by superheated steam.

Rob (Roob). Inspissated juice (of elderberries, carrot, juniper berries, etc.).

Rodinal. Paraamidophenol. (For photographic purposes.) Solution of paraamidophenol hydrochlorate, sodium sulphate, and potassa in water.

Rose Pink. Whiting colored with decoction of Brazil wood and pearl ash.

Rosinol. Rosin oil.

Rotterin. Antiseptic solution, containing zinc chloride and sulphocarbonate, salicylic acid, boric acid, citric acid, thymol, and sodium chloride. Also in pastilles.

Rotulæ. Lozenges.

Rouge. Red ferric oxide.

Card. Sodium carthamate, from safflower.

Rubigo Ferri. Iron-rust.

Rubramentum. Red ink.

Ruddle. A kind of red chalk.

Rufus's Pills. Pills of aloes and myrrh.

Rusot. Extract of *Berberis lycium*.

S.

Sacchari Fœx. Molasses.

Saccharin. Orthosulphamidobenzoic anhydride. Benzoyl sulphonicimide. (Sweetener.)

Saccharolé (French). Any moist liquid preparation (except syrup) which contains sugar in large proportions.

Saccharum Acerum. } Maple sugar.

Canadense. }

Candum (Candisatum). Rock candy.

Saturni. Sugar of lead.

Saccharure (French). Dry saccharolé; medicated sugars.

Saffranin. A coal-tar color.

Saffrol. A concentrated oil of saffras; now mostly obtained from oil of camphor.

Saffron, American. Safflower.

Saim. Adeps.

Sal Absinthii. Potassium carbonate.

Acetosellæ. Potassium oxalate. (Generally oxalic acid is expected.)

Æratus. Potassium carbonate.

Alembroth. A mixture of mercuric and ammonium chlorides.

Amarum. Magnesium sulphate.

Ammoniacum Martiale. Iron ammonio-chloride.

Ammoniacum Secretum Glauberi. Ferrous sulphate.

Ammoniacum Volatile. Ammonium carbonate.

Anglicum. Magnesium sulphate.

Argenti. Silver nitrate.

Armeniacum. Ammonium chloride.

Artis. A mixture of mercuric and ammonium chlorides.

Benjamin. } Benzoic acid.

Benzoin. }

Catharticus Amarum. Magnesium sulphate.

Catharticus Anglicanus. Magnesium sulphate.

Catharticus Glauberi. Sodium sulphate.

Chalybis. Iron sulphate.

Cornu Cervi. Ammonium subcarbonate.

de Duobus. Potassium sulphate.

Diureticus. Potassium acetate.

Enixum. Potassium bisulphate.

Essentiale Tartari. Tartaric acid.

Fossilis. Sodium chloride.

Fuliginis. Ammonium carbonate.

Gemmæ. Sodium chloride.

Lactis. Milk sugar.

Marinum. Sea salt.

Martis. Ferrous sulphate.

Microcosmicum. Salts of urine.

Mirabile Glauberi. Sodium sulphate.

Mirabile Perlatum. Sodium phosphate.

Nitrum. Potassium nitrate.

Ossium. Ammonium carbonate.

Panchrestum. Potassium tartrate.

Petræ. Potassium nitrate.

Polychrestum Seignetti. Sodium tartrate.

Polychrestus. Potassium sulphate.

Polychrestus Glaseri. Potassium sulphate cum sulphure.

Prunelle. Potassium nitrate.

Rupellensis. Rochelle salt.

Sapientiæ. Sal alembroth.

Saturni. Lead acetate.

Scientiæ. Sal alembroth.

Sedativus Hombergi. Boracic acid.

- Sal Sedlicensis.** Magnesium sulphate.
Sennerti. Potassium acetate.
Seydschutzensae. Magnesium sulphate.
Succini. Succinic acid.
Tartari. Potassium carbonate.
Tartari Essentiale. Tartaric acid.
Thermarum (Carolinarum). Carlsbad salt.
Urinæ. Sodium phosphate.
Vegetabile. Potassium tartrate.
Vitæ. Sal alembroth.
Vitrioli. Zinc sulphate.
Vitrioli Narcoticum. Boracic acid.
Volatile. Ammonium carbonate.
Volatile Liquid. Ammonia water.
Vomitorium Vitrioli. Zinc sulphate.
Salacetol. Salicylacetol. (Antirheumatic.)
Salamander's Blood. Fuming nitric acid.
Salbromalide. Antinervine.
Salicyl-Bromanilide. Antinervine.
Salinaphtol. Betol.
Saliphen. Salicylphenetidine.
Salipyrin. Antipyrin salicylate.
Salitonia. A saline tonic. (Phenique Chem. Co., St. Louis.)
Salmiac. Ammonium chloride.
Salol. Phenyl salicylate. Phenol salicylate. Phenylic ether of salicylic acid.
Salophene. Acetylparaamidosalol. (Antirheumatic.)
Salt, Fruit. A variety of Seidlitz (or Seltzer) aperient.
Herapath's. Quinine iodosulphate.
Microcosmic. Sodium and ammonium phosphate.
Seignette. Rochelle salt.
Sore-Throat. Sal prunellæ.
of Tartar. Pure potassium carbonate.
of Tin. Tin chloride.
Salve Pencil. Ointment in the shape of a pencil or stick.
Sandiver. See Glass Gall.
Sandyx. Red lead oxide.
Sanmetto. A combination of santal oil and saw-palmetto. For bladder-complaints. (Od. Chem. Co., New York.)
Santal Midy. Gonorrhœa capsules of Grimault & Co., in Paris.
Santoninnoxim. Derivative of santonin.
Sapo Medicatus. A good quality of neutral white Castile soap.
Sapocarboll. Mixture of cresols with soap. (Antiseptic.)
Saponiment. A kind of compound soap liniment.
Saprol. Mixture of crude cresols with hydrocarbons. (Antiseptic.)
Sarco-Peptonæ. Specialty of Rudish. (Meat peptone.)
Saturatio. Solution of sodium citrate.
Saturnus (Saturni). Lead.
Schweinfurth's Green. Copper arsenite.
Sea-Onion. Squill.
Sebum (Sevum). Suet. Tallow.
Sedatine. Antipyrin. Also applied to paravalerylamidophenetol. (A new sedative.)
Sedox. A new dressing for wounds, etc., similar to cotton.
Seignette's Salt. Rochelle salt.
Semen Contra. Wormseed from Barbary.
Semen Cynæ. Santonica. Levant wormseed.
Sanitum. The seed of *Artemisia santonica*.
Semencina. Levant wormseed. (Santonica.)
Semina Strychni. Nux vomica.
Serosine. Bromo-anilid. (Antipyrretic.) (Serosine Chem. Co., St. Louis.)
Serum (Lactis, etc.). Whey (milk, etc.).
Sideros. Iron.
Siliqua Dulcis. St. John's bread.
Sodæ Azotas. Sodium nitrate.
Sol. Gold.
Soluble Glass. Sodium or potassium silicate.
Solution, Goadby's. A preserving solution for animal substances, containing salt, corrosive sublimate, and arsenic.
Solutol. A solution of sodium cresolate in excess of cresol. Solution of cresols in sodium cresylate. (Disinfectant.)
Solveol. A solution of cresolene in sodium salicylate. Solution of cresols in sodium cresotate. (Surgical antiseptic.)
Solvin. See Polysolve.
Somnal. Solution of chloral hydrate and urethane in alcohol.
Sozal. Aluminum salt of paraphenolsulphonic acid.
Sozoiodol (difficultly soluble). Potassium salt of diiodoparaphenolsulphonic acid.
Mercury, Zinc, etc. The respective salts of diiodoparaphenolsulphonic acid.
Sozoiodol (easily soluble). Sodium salt of diiodoparaphenolsulphonic acid.
Spanish White. Bismuth subnitrate.
Sparadrap. Spread adhesive plaster.
Spathum Fluoricum. Fluor-spar.
Species Pectorales. Pectoral species. ("Breast tea.")
Spelter. Zinc.
Speltrum. Zinc.
Sperma Mercurii. Mercury acetate.
Spermine. An aqueous infusion obtained from the prostate gland and testicles of animals. (Nerve tonic.)
Spina Cervina (Baccæ, etc.). Buckthorn berries, etc.

Spirit of Nitre. Crude nitric acid.
Pyro-Acetic. Acetone.
of Salt. Crude muriatic acid.
of Turpentine. Oil of turpentine.
Spiritus. See also *Liquor*.
Inflammabilis. Alcohol (sometimes whiskey).
Juniperi. Generally gin.
Lethalis. Carbonic acid.
Mindereri. Solution of ammonium acetate.
Muriatico-Æthereus. Spirit of chloric ether. (Not that containing chloroform.)
Muriatico-Æthereus Martiatus. *Tinctura ferri chloridi ætheres.*
Nitri Dulcis. Sweet spirit of nitre.
Nitri Duplex. }
Nitri Fumans. } Nitric acid.
Nitri Glauberi. }
Nitrico-Æthereus. Sweet spirit of nitre.
Odoratus. Cologne.
Pyroxylicus. Methylic alcohol.
Sacchari. Rum.
Salis Dulcis. Spirit of chloric ether. (Not that containing chloroform.)
Salis Fumans. Muriatic acid.
Sulphurico-Æthereus. Spirit of ether. (Hoffmann's drops.)
Veneris. Acetic acid.
Vitrioli. Diluted sulphuric acid.
Vitrioli Dulcis. Hoffmann's anodyne.
Spodium. Crude bone charcoal. (Ivory-black.)
Spritz. A laboratory wash-bottle.
St. Germain Tea. Contains senna, manna, elder-flowers, and fennel or anise.
Stannum Cinereum. } Bismuth.
Glaciale. }
Indicum. Zinc.
Steapsin. Emulsifying ferment of the pancreatic juice.
Stearin. Stearic acid.
Steel Mixture. *Mistura ferri composita.*
Stibio-Kali Tartaricum. Tartar emetic.
Stibium. Antimony.
Stilus (Stylus). Ointment in the shape of pencil or stick.
Stipites Dulcamaræ. *Dulcamara.*
Storax Calamita. Solid storax. (Generally sawdust or residue of cinchona preparations mixed with liquid storax.)
Stoughton's Elixir. Compound tincture of gentian.
Stypteria. Alum.
Styracol. Guaiacol cinnamate. *Cinnamylguaiacol.* (Antiseptic.)
Styrone. *Cinnamyl alcohol.*
Succata. "Citron" of the grocers.
Succinum (Oleum, etc.). Amber. (Oil, etc.)
Succolata. Chocolate.

Sucrate (French). A saccharate.
Sucrol. *Paraphenetolcarbamide.* (Sweetener.)
Suffitus. Fumigation.
Sugar Sand. Crude milk sugar.
Suint. *Æsopus.* Impure wool fat. (Antiseptic.)
Sulphaminol. Thio-oxydiphenylamine.
Sulphas Americanus Australis. Quinine sulphate.
Sulphonal. Diethylsulphonedimethylmethane. (Hypnotic.)
Sulphur Antimoniatum Fuscum. Precipitated sulphuret of antimony.
Auratum. Golden sulphur. (Antimony sulphide.)
Nigrum. Impure native sulphur.
Stibiatum Rubrum (Rubeum). Kermes mineral, antimony, sulphide and oxide.
Vivum. Impure native sulphur.
Sydenham's Laudanum. Wine of opium.
Syrup, Cuisinier. Compound syrup of sarsaparilla.
of Figs. A kind of compound syrup of senna. (California Fig Syrup Co., San Francisco.)
Syrupus Communis. Molasses.
Diacodii. Syrup of poppy-heads.
Domesticus. Syrup of buckthorn berries. (Generally molasses.)
Empyreumaticus. Molasses.
Fuscus. Molasses.
Hollandicus. Molasses.

T.

Tabloids. English name for compressed tablets.
Taffetas. Plaster spread on silk and similar thin fabrics.
Tartarus. Crude potassium bitartrate (argols). Then, several potassium salts.
Boraxatus. Potassium and sodium borotartarate.
Natronatus. Rochelle salt.
Tartarisatus. Potassium tartrate.
Vitriolatus. Potassium sulphate.
Terebinthina Cocta. Turpentine (hard, solid).
Terra Cariosa. Rotten-stone.
Foliata. Sulphur.
Foliata Mineralis. Impure sodium carbonate.
Foliata Tartari. Potassium acetate.
Fullonica. } Fuller's earth.
Fullonum. }
Japonica. Catechu.
Ponderosa. Natural barium sulphate.
Sigillata (Alba, Rubra). White and red bole.

- Terraline.** A preparation from petroleum products, for internal use. (Terraline Co., Washington, D.C.)
- Tetraiodpyrrol.** Iodol.
- Tetronal.** Diethylsulphonedithylmethane. (Hypnotic.)
- Thebaicum.** Containing opium.
- Therapol.** Ozonized vegetable oils. (Ozone Co., New York.)
- Theriaca.** Molasses.
- Theriaca Andromachi.** An aromatic astringent confection containing opium, which originally had more than 70 ingredients.
- Thermine.** Tetrahydrobetanaphthylamine. Tetrahydrobetanaphtholamine. (Heat producer.)
- Thilamin.** Compound of sulphur with lanolin. (Dermic.)
- Thioform.** Basic bismuth dithiosalicylate. (Antiseptic.)
- Thiolin.** Salts of thiosulphonic acid. Salt of thiolinic acid. Sulphonated and sulphurated linseed oil.
- Thiolo.** Ammonium salt of thiosulphonic acid. Thiol. Artificial ichthyol.
- Thiosinamine.** Allylsulphocarbamide; by the action of ammonia upon volatile oil of mustard. (Thorncliffe disinfectant.) See Izal.
- Thymacetin.** Oxethylacetamidothymol. (Analgetic.)
- Thymolol.** Aristol.
- Tincal.** Native borax.
- Tinctura Hiera.** Wine of aloes.
- Japonica.** Tincture of catechu.
- Melampodii.** Tincture of black hellebore.
- Thebaica.** Tincture of opium.
- Tincture, Antacid.** Guaiac mixture with corrosive sublimate.
- Antiperiodic.** A kind of Swedish bitters with quinine.
- Bestucheff's.** Ethereal tincture of ferric chloride.
- Huxham's.** Compound tincture of cinchona with saffron.
- Simulo.** Tincture of the seeds of *Capparis coriacea*. (Nervine.)
- Tolphite.** A dusting-powder containing talcum. (England.)
- Tolpyrin.** A new antipyretic. Paratolylidimethylpyrazolone.
- Tolysal.** A compound of tolypyrin with salicylic acid.
- Tongaline.** Contains tonga, cimicifuga, colchicine salicylate, pilocarpine salicylate, according to Mellier Co., St. Louis.
- Tonquinol.** Trinitroisobutyltoluol. Substitute for musk.
- Tous-les-mois.** Canna starch.
- Traumaticine.** Solution of gutta-percha.
- Treacle.** Originally "Theriac." In English prescriptions it means "molasses."
- Treacle, Venice.** See *Theriaca Andromachi*.
- Trefusia.** A natural iron albuminate.
- Tribromhydrine.** Allyl tribromide.
- Trifolium Fibrinum.** Menyanthes. (Buckbean. Bogbean.)
- Tri-Iodides, Henry's.** For rheumatism. (Renz & Henry, St. Louis.)
- Trimethylamine.** Is not exactly the same as propylamine, though often prescribed thus.
- Trional.** Triethylsulphonmethylethylmethane. Diethylsulphonmethylethylmethane. (Hypnotic.)
- Trip.** Iron subcarbonate.
- Tritica.** A kidney remedy. Probably a preparation of *Triticum repens*. (Searles & Hereth, Chicago.)
- Trypsin.** Peptonizing ferment of the pancreatic juice.
- Tuberculin.** A product of the tubercle bacilli, according to Koch.
- Tuberculocidin** (shortened "T. C.," or Alexine "T. C."). Purified tuberculin, according to Klebs.
- "E." Mixture of tuberculin (Koch) and tuberculocidin (Klebs), according to Spengler.
- Tumenol.** A preparation of tumenol-sulphonic acid.
- Powder.** Also a preparation.
- Turbeth Mineral.** Yellow mercuric sulphate.
- Turionis Pini.** Pine cones.
- "Turps." Oil of turpentine.
- Tusche.** India ink.
- Tusky-stone.** A gray zinc oxide.
- Tutia.** Impure zinc carbonate or oxide.
- Tutty.** Impure zinc oxide.

U.

- Ultramarine.** German blue.
- Uncion.** Mild mercurial ointment.
- Unguentum Ægyptiacum.** Honey with acetate of copper.
- Cerussæ Acetate** (P. L. 1787). Cerate of lead acetate.
- Diapompholygos.** Ointment of impure zinc oxide.
- Myrrhæ.** Ointment basis: 1 part of myrrh and 10 parts of wax melted together with oil.
- Nervinum.** Compound ointment of rosemary.
- Ophthalmicum.** A mild ointment of mercuric oxide.
- Quercinum.** Soft (moist) lead tannate.
- Scyotodepsicum.** Moist lead tannate.
- Uralin.** Uralium.
- Uralium.** Chloral-urethan. Uralin.
- Urethane.** Ethyl-carbamate.

Uricedin-Stroschein. Compound, containing in 100 parts 27.5 sodium sulphate, 1.6 sodium chloride, 67 sodium citrate, and 1.9 lithium citrate.

Uropherin. Theobromine, lithium, and sodium salicylate. (Diuretic.)

V.

Valerate. Valerianate.

Vallet's Pills. Pills of ferrous carbonate.

Valoid. English name for fluid extract.

Valonia. Fruit (acorn) of.

Vapor Antiloimius. Chlorine.

Vegetable Optic. Herapath's salt. Quinine iodosulphate.

Venus. Copper.

Crystals of. Copper acetate.

Vervain's Balsam. Compound tincture of benzoin.

Vienna Powder. Potassa with lime.

Vigoral. A mixture of beef extract and powdered beef. (Armour & Co., Chicago.)

Vin Mariani. Compound wine of coca. French specialty.

Vinegar of the Four Thieves. An aromatic vinegar of the French Pharmacopœia.

Vinolia Preparations. Contain zinc oxide and borax.

Vinum Adustum. Alcohol. (Sometimes brandy.)

Crematum. Brandy.

Virgin's Milk. A mixture of tincture of benzoin and water.

Viride Æris. Verdigris. (Crude copper acetate.)

Viscum Album. Mistletoe.

Vitriolum Cupri. Blue vitriol.

W.

Wade's Drops. Compound tincture of benzoin.

Wash Rag. *Luffa ægyptiaca*.

Goulard's. Lead water.

Waterglass. Sodium or potassium silicate.

White Copperas. Sulphate of zinc.

Flake. Lead carbonate.

Liquor. Southern negro term for alcohol.

"Nix." Crude zinc oxide.

Pearl. Bismuth subnitrate or chloride.

Permanent. Artificial barium carbonate or sulphate.

Wolfram. Tungsten.

Wolframate. Tungstate.

Wound Balsam. Compound tincture of benzoin.

Y.

Yellow Arsenic. Yellow arsenic sulphide.

Z.

Zea. Maize. Indian corn.

Zinc Flowers. Zinc oxide.

Zinchæmol. The same as hæmol.

Zootic Acid. Prussic acid.

Zooticum. As adjective to several salts. Hydrocyanate.

Zymine. English name for pure pancreatin.

Z. Z. Anciently myrrh, now zingiber. Ginger.

INDEX.

HEAVY BLACK FIGURES INDICATE FORMULA PAGES.

A.		Acetated tincture of		Acid, carbazotic	1370
Abbreviations, ambiguous		opium	1341	carbolic	783

 List of excipients 1215
 reagents and test-solutions 1069
 Liquor acidi arsenosi 292, 742, 744
 phosphorici compositus 1274
 aluminii acetatis 1286
 acetico-tartratis 1286
 ammonii acetatis 293, 592, 596
 concentratus 1282
 citratiss fortior 1282
 anodynus Hoffmanni 1378
 arsenii bromidi 1276
 et hydrargyri iodidi 292, 742, 746
 barii chloridi 1285
 bismuthi 1299
 concentratus 1299
 bromi 1269
 calcis 292, 614, 616
 sulphuratus 1283
 carbonis detergens 1301
 carmini 1357
 C. C. 1378
 succinatus 1378
 coccineus 1357
 cornu cervi 1378
 succinatus 1378
 cupri alkalinus 1296
 electropoicus 1294
 extracti glycyrrhizæ 1307
 ferri acetatis 293, 656, 685
 chloridi 293, 656, 663
 citratiss 293, 656, 666
 et ammonii acetatis 293, 656, 687
 et quiniæ citratiss 1363
 hypophosphitis 1289
 iodidi 1290
 nitratiss 293, 656, 687
 oxychlorati 1378
 oxysulphatis 1290
 protochloridi 1290
 subsulphatis 293, 656, 688
 tersulphatis 656, 689
 fumans Boylii 1378
 gutta-percha 1363
 hydrargyri et potassii iodidi 1297
 hydrargyri nitratiss 293, 715, 729
 hypophosphitum 1272
 iodi carbolatus 1270
 causticus 1269
 compositus 292, 493, 500
 magnesi bromidi 1283
 acetatis 1282
 citratiss 293, 608, 613
 morphinæ citratiss 1339
 hypodermicus 1340
 morphinæ sulphatis 1341
 opii compositus 1341
 pancreaticus 1352
 pepsini 1363
 aromaticus 1351

Liquor phosphori 1273
 picis alkalinus 1301
 carbonis 1301
 plumbi subacetatis 293, 699, 701
 dilutus 292, 699, 702
 potassæ 292, 293, 522, 526
 arseniatiss potassii et bromidi 1276
 arsenitiss 293, 522, 742, 744
 chloratæ 1275
 chlorinatæ 1275
 citratiss 293, 522, 538
 permanganatiss 1277
 saccharini 1307
 salicylicus, Sellers's 1378
 seriparus 1357, 1378
 sodæ 292, 293, 553, 555
 chloratæ 293, 492, 495, 553
 sodii boratiss compositus 1279
 arsenatiss 292, 553, 742, 745
 arseniatiss 1278
 carbolatiss 1279
 citratiss 1279
 citro-tartratis 1279
 oleantis 1279
 silicatiss 292, 514, 518, 553
 strychninæ acetatis 1345
 stypticus loofii 1378
 tongæ salicylatus 1378
 zinci chloridi 293, 634, 638
 et aluminii compositus 1286
 et ferri compositus 1286
 singiberis 1317
 Liqueores 292
 Liqueoris, aromatici 1307
 elixir 1307
 elixir 1307
 extract 450
 purified extract 1307
 root 808
 syrup 1307
 syrup 1307
 Liriodendrin 950
 Liriodendron 950
 tulipifera 950
 Listerine 1378
 Lister's borio acid ointment 1268
 Litharge 705
 Lithiated hydrangeæ 1378
 Lithii benzoas 585, 586
 borocitras 585
 bromidum 585, 587
 carbonas 585, 588
 chloridum 585
 citras 585, 588
 effervescentis 585, 589
 diborocitras 585
 iodidum 585
 nitras 585
 phosphas 585
 salicylas 585, 590
 sulphas 585
 Lithines 1378

Lithium 520, 585
 borocitrate 585
 bromide 587
 carbonate 588
 chloride 585
 citrate 588
 effervescent 589
 iodide 585
 nitrate 585
 phosphate 585
 salicylate 590
 salts 585, 1277
 tests for 585
 sulphate 585
 Litmus paper and test-solution 1074
 blue 1074
 red 1074
 Litre 41
 flask 1067
 Liver of sulphur 527
 pills, Dr. Chapman 1334
 Liverwort 966
 Lixiviation 263
 Lobelacrin 1011
 Lobelia 1011
 fluid extract of 413, 1011
 infusa 1011, 1015
 syrup 1350
 tincture 372, 1011
 vinegar 1360
 Lobelic acid 1011
 Lobeline 1011, 1015
 Lochman's cork-press 1187
 Loganin 993
 Logan's plaster 1295
 Logwood 963
 London paste 1290
 Looch album 1378
 Loofah 1378
 Loomis's diarrhoea mixture 1339
 Loosphan 790, 1378
 Loss in drying medicinal substances 177
 in powdering medicinal substances 178
 Lotio adstringens 1267
 ammoniacalis camphorata 1281
 flava 1297
 hydrargyri flava 1297
 nigra 1297
 nigra 1297
 plumbi et opii 1295
 Lotion 208
 astringent 1267
 black 1297
 calamine, Dr. Fox's 1285
 Hebra's green soap 1326
 of lead and opium 1295
 Palmer's 1297
 Vleminek's 1283
 yellow 1297
 Lovage 866, 898
 oil 877
 Love-apple 1378
 Lovi's beads 78, 80
 Low wines 813
 Lozenge cutter 1204, 1205
 mass 1202
 punch 1204

Lozenge roller	1204	Magnesi silicas	609	Manioc	792

 for sulphates and sulphuric acid 504
 for sulphites and sulphurous acid 504

Tests for zinc salts 633

Test-Solutions :

Albumen	1069
Alkaline mercurio	
potassium iodide	1075
Ammonium carbon-	
ate	1070
chloride	1070
molybdate	1070
oxalate	1070
phosphate	1070
sulphide	1070
Arsenic, Betten-	
dorff's	1070
Fleitmann's	1070
Gutzeit's	1071
Barium chloride	626,
	1071
hydrate	1071
nitrate	626, 1071
Basic lead acetate	1075
Bettendorff's arse-	
nic	1070
Brazil wood	1073
Bromine	1072
Calcium chloride	1072
hydrate	1072
sulphate	1072
Chlorine	1072
Cobaltous nitrate	1072
Cochineal	1073
Corallin	1074
Cupric ammonium	
sulphate	1072
sulphate	1072
tartrate	1072
Diphenylamine	1074
Eosin	1074
Ferric ammonium	
sulphate	1072
chloride	1072
Ferrous sulphate	1072
Fleitmann's arsenic	1070
Fluorescein	1074
Gelatin	1073
Gold chloride	1073
Gutzeit's arsenic	1071
Hydrochloric acid,	
pure	1073
Hydrogen sulphide	1073
Indigo	1075
Iodine	1075
Lead acetate	1075
Litmus	1074
Magnesium sul-	
phate	1075
Mercuric chloride	1075
potassium iodide	1075
Mercurous nitrate	1075
Methyl-orange	1074
Nessler's	1075
Oxalic acid	1076
Phenolphthalein	1074
Picric acid	1076
Platinic chloride	1076
Potassium carbon-	
ate	1076
chromate	1076
cyanide	1076
dichromate	1076
ferrieyanide	1076
ferrocyanide	1076

Test-Solutions :

Potassium hydrate	1076
iodide	1076
sulphate	1076
sulphocyanate	1077
Rosolic acid	1074
Silver ammonium	
nitrate	1077
nitrate	1077
sulphate	1077
Sodium acetate	1077
bitartrate	1077
carbonate	1077
cobaltic nitrite	1077
hydrate	1077
nitroprusside	1077
phosphate	1077
Stannous chloride	1077
Starch	1077
Tannic acid	1078
Tartaric acid	1078
Zinc-iodide-starch	1078
Tetanine	1059
Tetano-cannabinine	895
Tetrachloride, carbon	836
Tetrachlor-methane	836
Tetrahydroethyl quino-	
line	1015
Tetrahydromethyl qui-	
noline	1015
Tetrahydro- β naphthyl-	
lamine	792
Tetrahydroparaquinani-	
sol	792, 1015
Tetraidopyrrol	838
Tetronal	839, 1386
Tetter ointment, Dr.	
S. G. Morton's	1298
Tenorium	904
marum	904
Thaleichthys pacificus	1059
Thalline	792, 1015
Thea sinensis	877, 1009
Thebaicum	1386
Thebaine	973
Theine	1009, 1075
Theobroma Cacao	926, 1015
oil	926
Theobromine	1015
Theory of emulsification	1181
Therapeutical incompati-	
bility	1178
Therapol	1386
Theriac	1386
Andromachi	1386
Thermine	1386
Thielemann's diarrhoea	
mixture	1339
Thiersch's salicylic mix-	
ture	1303
Thilalanin	1386
Thiol	1059, 1386
Thioform	1386
Thiolin	1386
Thiolinic acid	1059
Thiolo	1386
Thionic series of acids	504
Thiosinamine	885, 1386
Thiosulphuric acid	504
Thioxidyphenylamine	839
Third preparation	1349
Thomas's eye-water	1285

Thomas's mill	187
nipple-wash	1286
tonic laxative	1294
Thompson's diarrhoea	
pills	1295
solution phosphorus	1273
Thomson's compound	
iron pills	1293
salve	1322
vacuum percolator	390
Thoroughwort	900
Thuja	898
occidentalis	877, 898, 941
oil	877
Thujetin	941
Thujigenin	941
Thujin	941
Thymacetin	839, 1386
Thyme, oil	862
Thymene	862
Thymol	862
inhalation, Warren's	1317
Lewin's mixture	1317
Thymolol	1386
Thymus serpyllum	862
vulgaris	862
Tilia	877, 904
americana	904
Tin	698, 1078
oleate	930
Tincol	562
Tinctura aconiti	359, 1005
(Fleming)	1347
aloes	359, 957
et myrrha	359, 360,
	957
amara	1329
antacrida	1297
antiperiodica	1348
arnicae florum	358, 360,
	899
radicis	357, 360, 899
aromatica	1313
asafoetida	358, 360, 912
aurantii amari	358, 361,
	857
dulcis	358, 361, 856
belladonnae foliorum	357,
	361
benzoini	358, 361, 914
composita	358, 362, 914
bryonia	357, 362, 959
calendula	358, 362, 899
calumbae	357, 362, 942
cannabis Indica	357, 363,
	895
cantharidis	357, 363, 1056
capsici	357, 363, 893
et myrrha	1320
cardamomi	357, 363, 875
composita	357, 364, 875
castorei	1358
catechu composita	358,
	364, 963
chiratae	357, 364, 942
cimicifuga	358, 364, 903
cinchona	358, 365, 983
composita	358, 365, 983
detannata	1347
cinnamomi	357, 365, 867
cochleici	366
seminis	358, 366, 1003
